Man's greatest scientific journey began in 1961 when President Kennedy launched Project Apollo. Since that time, the electronics industry has contributed much—from mini-computers to precision navigators. Managing the efforts of 400,000 workers at 20,000 plants was also a major problem. For a complete report, see p. 24

..."I believe that this Nation should commit itself to achieving the goal, before this decade is out, of landing a man on the moon and returning him safely to earth." May 25, 1961
UTC miniature transformers assure high pulse integrity at ET constants exceeding 7500 volt-microseconds

The high ET constants of UTC miniature pulse transformers give you fast rise time plus low droop at highest peak-power for size in the industry. That's pulsepower.

UTC's BIT-P and PIP standard lines are the smallest metal-encased pulse transformers made. Unique structures, plus manufacturing controls, enable UTC pulse transformers to achieve high flux densities and unrivalled temperature stability. All units are individually adjusted in a standard blocking oscillator circuit, assuring parameter uniformity unavailable elsewhere.

UTC's broad lines cover most pulse applications. Note particularly: use in high-gain, low-level, high-density packaged circuits made possible by high shielding of units; SCR di/dt failure reduction due to fast rise time and high pulse-energy capability. The units are also suitable for wide-band applications of 1 kHz to 100 MHz.

UTC's metal-encased standard lines exceed MIL Grade 6 (MIL-T-21038B). They're ruggedized, hermetically sealed, and electromagnetically shielded. Molded units to MIL Grade 7, Class S temperature (+130°C), are available with a dielectric strength of 1250 volts. Where special parameters are needed we'll tailor them to your circuits.

When your design calls for pulsepower—high pulse integrity—UTC has the answer. Check your local distributor for immediate off-the-shelf delivery, or contact United Transformer Company, Division of TRW INC., 150 Varick St., New York, New York 10013.
When you buy a low-cost electronic counter from us, you get a unique bonus. Us.

With 55 service offices in the United States and Canada and 86 offices worldwide, we're always close by if you need help. And we give the same complete, dependable back-up to customers who spend a few hundred dollars for a counter as we do to those who spend a few thousand. That's a good thing to keep in mind when you're looking for an inexpensive way to solve your counting problems. And when you add the price and service to the performance you can expect from these counters, you know you're onto a real bargain.

For instance the Hewlett-Packard 5321A counts frequencies up to 10 MHz, has a 100 mV sensitivity and 1 MΩ/30 pF input impedance, 4-digit readout with display storage, zero blanking for easier, faster reading. All this is $425.

The more versatile and more accurate Hewlett-Packard 5321B gives you BCD recorder output, 5-digit readout, frequency ratio and pulse duration measurement, additional gate times and a quartz crystal time base. Yet the price is just $775.

The Hewlett-Packard 5221A/B Counters are the same in everything but shape. They're higher, narrower and not as long as the 5321A/B.

If you need greater capability, the Hewlett-Packard 5216A will provide it for $985. This counter will totalize, measure frequency, period, multiple period averages, ratio, multiple ratios and pulse duration. It has a 7-digit readout, gate times of 0.01 to 10 seconds, 10 millivolt sensitivity, BCD recorder output, and a maximum count rate of 12.5 MHz.

So when you need a low-cost counter, talk to the people who can deliver the goods and whatever service you need, whenever you need it. Call your local Hewlett-Packard field engineer for all the details. Or write to Hewlett-Packard, Palo Alto, California 94304; Europe: 1217 Meyrin-Geneva, Switzerland.

HEWLETT hp PACKARD
ELECTRONIC COUNTERS

Count on us for as little as $425.
Here's the fastest, most accurate source of programmable pulses available anywhere. The new Datapulse System 140 generates rep rates to 100 MHz, pulse widths from 5 ns, and independently variable rise and fall times from 2 ns.

Your program sets the upper and lower levels of the output waveform to any values between +10v and -10v. Each level can be independently positioned with an accuracy of ±2% of programmed value ±20mv. Pulse amplitude (the difference between levels) may be varied from 50mv to 5v into a 50 ohm load. Accuracy is typically ±2% of value for the other programmable pulse parameters: rep rate, pulse delay, pulse width and transition times.

System 140 can be programmed from computer, punched tape, magnetic tape, or other logic sources. All pulse parameters are controlled by BCD inputs compatible with DTL logic levels.

For complete information contact Datapulse Division, Systron-Donner Corporation, 10150 W. Jefferson Blvd., Culver City, California 90230. Phone (213) 836-6100.

The digital multimeter
you can believe

Announcing the Fluke 8100A, a completely portable 0.02% digital multimeter for $695.

The only way to build a multimeter with no last digit uncertainty is to add an "extra digit." That's exactly what we've done with the new Fluke 8100A. Here is an instrument with nine times the accuracy of three digit units selling at only half the price of comparable four digit multimeters. How?

We've used an A to D conversion technique new to the DVM field. The result is an instrument with low power drain, simplicity of circuitry, troublefree operation and the uncommon accuracy you expect from Fluke.

Standard features include ac measurement accuracy of 0.2% and resistance, 0.1%. For real portability, batteries will operate the multimeter continuously up to eight hours without recharging. Battery operation, the only option, is priced at $100. Accessories available include high frequency and voltage probes, switched ac-dc current shunts and a ruggedized case.
Five full digits plus "1" for 20% overranging
Basic unit measures 0 to 1100 volts dc in three ranges
Auto ranging and polarity with active 3-pole switchable filter
25 millisecond sampling speed
Full systems capability with timing signals and ready indicator
Low cost options include ac voltage, millivolt-ohms, external reference (ratio) and fully isolated remote programming and data output.

The first really new DVM in a decade

Announcing the Fluke 8300A, a 0.005% digital voltmeter with full systems capability for $1295

There are a lot of good DVM's around. All but one share a common set of faults—overwhelming complexity and high cost. And as you might guess, the DVM that beats the others cold is the new Fluke 8300A.

Why?
Because Fluke uses a new A to D technique which reduces componentry by up to 500 percent. Obviously, when components are eliminated, good things happen. Power requirements go down, reliability goes up, circuitry is simplified, troubleshooting is speeded and reduced. Most important to the system designer, lowered costs mean we can invest some of the savings in features you need in a DVM.

With all its features and accuracy, the Fluke 5-digit DVM sells for less than many 4-digit units. We price the options low, too. A fully loaded Fluke 8300A sells for $2995. Comparable but not equal competitive instruments cost as much as $5000.

And when the Fluke name goes on the front you know you're getting quality instrumentation...in keeping with the Fluke philosophy of bringing you standards lab performance in portable instrumentation.
The 5104 knows... and tells... automatically. The new Philbrick/Nexus Model 5104 performs 15 different tests in under 3 seconds. Programmable GO/NO GO limits. Readout in engineering units. Maximum input/output flexibility for interface with handling equipment and data acquisition peripherals. Test conditions, supply voltages, and meter scaling front panel control or programmable. Test IC, hybrid or discrete op amps through versatile plug-in sockets. To remove any shadow of doubt from your op amp testing, get the full report on the Philbrick/Nexus Model 5104 Op Amp Tester. Price $4,500
Contact your local Philbrick/Nexus field engineering representative or write, Philbrick/Nexus Research, 46 Allied Drive at Rt.128, Dedham, Mass.02026

Who knows what evil lurks in the heart of that $1 Op Amp?
This is our new .025"/.050" Connector.

It fits all micro-system packaging situations. In all environments. Reliably. The redundant points of contact provided by the spiral springs of the receptacle assure it.

With stacked or staggered centers, the receptacles don't lose any critical contact spacing. Circuit centers of .050" and .025" are standard. The receptacles and pins come housed. The circuit contact tines are pre-solder coated so all you have to do is reflow and plug in. Easy? The low insertion force and the wide misalignment allowance make it even easier.

So, what could be better for sophisticated electronic requirements? A reliable connector that's dense, convenient and versatile.

For further information write to Industrial Division, AMP Incorporated, Harrisburg, Pa. 17105.
We've made child's play out of toroid selection for pulse transformers.
Indiana General's popped up with an end to trial-and-error spec'ing: the first and only toroids with specified characteristics for pulse transformer applications.

Not just the usual irrelevant magnetic properties, either. Each part is designed as a pulse component, and listed by its pulse inductance, pulse magnetizing current and ET product. All according to ASTM methods.

And thanks to our automatic high speed testers, we can guarantee all parameters. Every pulse transformer toroid we make is 100% pulse-tested to performance specifications. So reliability is assured, from samples to production quantities. And all toroids can be coated, to prevent the wire's insulation from being scraped when winding, or penetrated later.

Various toroid sizes from 0.080” are available. Tell us your pulse transformer core problems.
We don't know who'll design it. But we know where he can get the batteries.

At the nearest Burgess Distributor. They're probably somewhere in his stock of batteries. One's bound to be right for the electric spaghetti windlass. And one's exactly what you need for whatever you're designing. Another thing. Whether it's a standard or special, your Burgess Battery will be power-fresh.

All distributor inventories are checked, rotated, and filled-in according to a systematic schedule. So the battery you get comes on strong... and stays that way. When you need batteries, check with your Burgess Distributor. He's a great source of power. And when you need technical information, give us a call.

Burgess has a library filled with the latest, most complete engineering data and technical battery material in the business. Meanwhile, send for our new engineering manual and do a little window shopping. It's got comprehensive listings of all batteries available through Burgess. Clevite Corporation, Burgess Battery Division, Freeport, Illinois 61032.
We have a plot to get you out from under the data avalanche.

Putting those mountains of information inundating today's design engineers into usable graphic form is a wearisome, time-consuming job. End messy, inaccurate hand plotting chores with the ITC Data Interface Plotter Terminal Model PT-1 and save priceless design hours. Working with any Teletype time-sharing terminal, the PT-1 plots 30 points per minute, draws bar graphs and other orthogonal work at the rate of a 15-inch horizontal line and 10-inch vertical line in under two seconds. Seven software packages included with the PT-1 Plotter Terminal at no extra cost give you real freedom from tedium:

**Bode and Nyquist Plotting.** Program plots phase and amplitude data in both Cartesian and polar form either from your data or output from a time-sharing CIRC/ECAP program. Sixty-point plot takes two minutes.

**Antenna Pattern Plotting.** Antenna gain in both polar and Cartesian form from your data.

**Statistical Data Plotting.** Test data is plotted in point form first. Then program asks you to name the range of data. Program then figures out the central tendency and frequency distribution and draws histogram.

**Timing Diagram Drafting.** You name beginning logic levels, transition times, and cyclic repetition. Program produces binary wave forms in your dimensions.

**Block Diagram Drafting.** You make rough layout, specify block locations, dimensions, and interconnections. Program draws finished diagrams automatically.

**Printed Circuit Layout.** Exclusive SKETCH program cuts way down on circuit board layout time and cost. Quickly and accurately produces primary layout from connection list. When plotter finishes, drawing goes to draftsman for taping artwork.

**Transient Response Plotting.** Plots your tabular data or data from CIRC/ECAP in four quadrants concurrently.

The PT-1 Plotter Terminal is easy to install, simple to use. Connects quickly to any Bell System data set or telephone coupler. Ten by 15-inch drawing area and the plotter and Teletype together take up less room than a desk.

Now for the real plot: Under $4,500 complete. Less than half any other time-sharing plotter terminal. Rental and lease plans available also at lowest cost. Get out from under the data avalanche today.

33 reasons why we’re No. 1 in DVMs.

Dollar for dollar we shipped more DVMs last year than anyone else, including the industry giant.

One of the reasons is our Model 5700. It’s the DVM used by laboratories to calibrate other DVMs. Without question it’s the best DVM on the market.

But since not everyone needs the kind of performance and features offered by the 5700, we offer 32 other models. Models for labs and for production lines, bench units and systems’ units, militarized models, four digit DVMs and five, from $1150 to over $8,000. (In fact, with plug-in modules you can come up with 300 different configurations.) In short, we make a model for every application and every budget. All as part of our standard line.
And every DVM we make is put together on the same production line, by the same people, using many of the same components and boards. In fact, quite often the assemblers don’t know in advance which models they’re assembling.

Which means that we’ve got to build every DVM as though it were our most expensive, over $8000, unit. And that may be reason number 34 why we’re No. 1 in DVMs.

For a detailed description of our 33 models, write Dana Laboratories, Inc., 2401 Campus Drive, Irvine, Calif. 92664.
TI announces the “one-shot” heard ’round the world.

(Listen. It could revolutionize your designs.)

The pulse width of this new monolithic TTL monostable multivibrator is variable from 40 nanoseconds to 40 seconds. Stability is ±0.2%. Tagged SN74121, it is primed to trigger off 50 nanosecond pulses or from slow ramps up to one volt per second. Full fan-out to 10 loads and fully compatible with all Series 54/74 ICs. The new “one-shot” comes in a choice of packages: flat-pack and plastic or ceramic dual-in-line. Immediate delivery and reasonably priced. In 100-999 quantities, the plastic dual-in-line is $4.40.

Deploy the SN74121 and start your own revolution. For data sheet, application report and a copy of our new 80-page TTL brochure, circle 182 on the Reader Service Card or write Texas Instruments Incorporated, P. O. Box 5012, M. S. 308, Dallas, Texas 75222.
NEW AMI/MOS — 256 x 10 Bit Read Only Memory. This unique ROM is one of a family of LSI ROM's mass produced by AMI for your immediate needs. Even if you don't need to miniaturize your system, you can stand a substantial reduction in complexity and a startling increase in reliability, can't you? Send for the MOS facts of life. Better yet, hop a jet and visit the new, expanded AMI/MOS production facility — America's largest.
Who Built the Converter Used on the Army's Minigun?

Abbott did. Out of 931 converters delivered during 14 months, only two were returned for repair. Maybe that's the reason, Abbott's Model BL5D-11A converter was selected as a power supply for installation in the SUU-11A/A minigun system, used on helicopters in Vietnam. This system employs a 7.62 millimeter minigun pod with firing rates of 6000 rounds per minute and therefore demands high reliability. This Abbott converter has an MTBF (mean time between failures) of 129,379 hours as calculated from the MIL-HDBK-217 handbook.

Abbott power modules use only the highest quality semiconductors and MIL-T-27B transformers in their construction to obtain the high degree of reliability under tough environments demanded by today's military requirements. To withstand heat sink temperatures of 100°C all silicon semiconductors are used exclusively. High density electronics packaging, coupled with good design, give Abbott power modules a minimum size and weight for their rated power output. One group of Abbott's DC to DC converter line, for example, the Model B05D, is smaller than a package of cigarettes, weighs less than a pound and produces five watts of regulated output voltage. All of the models described in the Abbott Catalog have correspondingly small sizes and weights.

If you have a need for a reliable converter, inverter or modular power supply, take a look at Abbott's. There are over 3000 models listed in their new catalog. They are built to operate in military environment of MIL-E-5272C at 100°C. They include output voltages from 5 volts to 10,000 volts DC with output currents from 2 milliamperes to 20 amperes. A wide range of different types of input power is available:

- 60Ω to DC, Regulated
- 400Ω to DC, Regulated
- 28 VDC to DC, Regulated
- 28 VDC to 400Ω, 1Ω or 3Ω
- 60Ω to 400Ω, 1Ω or 3Ω

TO: Abbott Transistor Labs., Inc., Dept. 07
5200 West Jefferson Blvd., Los Angeles, California 90016

...bring ERIE in early.

Current speeds and directions...temperatures...pressures...salinities. Essential data if Oceanography is to achieve its predicted $9 Billion potential by 1978. Geodyne Division of EG & G International makes instruments combining multiple sensor packages...each capable of measuring up to eight such parameters. And, through new high-speed digitizing systems, all parameters are recorded almost simultaneously. From the start, Geodyne has relied on ERIE TECHNOLOGICAL for the Thick Film Hybrid Circuitry so vital to these new systems. Our unique single-source capability assures total control of substrates, precious metal formulations, components and encapsulants. Proof, once again, that it pays to bring ERIE in early.
Sweating out an RFI/EMI requirement between 1 and 10 GHz?

STODDART'S NOW HOME ON THIS RANGE

Fully portable new Model NM-65T EMI Receiver spans the range from 1 to 10 GHz. Simple to operate, easy to handle, precise enough for the laboratory, rugged enough for the field. Uses integral, rechargeable batteries. Meets requirements of all applicable commercial and military specifications.

Special features and salient specs:

- Makes field intensity (average), direct peak, and slide-back peak measurements
- Selectable 6 dB bandwidths, 100 kHz, 500 kHz, or 5 MHz
- Voltage measurement capability to 120 dB
- Over-all measurement accuracy within 2.5 dB
- True frequency within 2% of indicated value
- Excellent sensitivity over the frequency range
  - Shielding effectiveness 80 dB minimum
  - FM detector for aural and visual display
  - Automatic frequency control
  - 21.4 MHz IF output
  - “X” and “Y” outputs for external recording or remote indication
  - Four simultaneous video outputs; log IF, lin IF, “stretch” lin IF, and FM detected video
  - Expanded output indication
  - Built-in mercury switch impulse calibrator

- Size: 16¾”W x 8¾”H x 18”D
- Weight: 35 pounds

The Model NM-65T will meet your needs ideally for determining the source and analyzing the characteristics of electromagnetic interference:
- Field strength measurement of microwave sources;
- Propagation studies and radiation pattern measurements;
- Scatter propagation studies;
- Low-power-level VSWR measurements;
- Spectral power distribution analysis; and
- Two-terminal microvoltmeter applications.

The Model NM-65T joins the Stoddart family of portable, battery operated EMI receivers, covering the range from 10 kHz to 10 GHz.

MODEL NM-12AT
- Measures voltage within 2 dB, frequency within 2% • Excellent sensitivity • Voltage range 160 dB • Weight 22 pounds

MODEL NM-25T
- Measures voltage within 2 dB, frequency within 2% • Voltage range 140 dB • Solid-state impulse calibrator • Weight 22 pounds

Hottest Product of the Year #2

Schweber Introduces the First Monolithic Voltage Regulator that breaks the voltage barrier.

Motorola's MC1566L/1466L is a precision wide-range voltage and current regulator (Monolithic Epitaxial Passivated). This unique "floating" regulator can deliver hundreds of volts-limited only by the breakdown voltage of the external series pass transistor. Output voltage and output current are adjustable. The MC1566L/ MC1466L integrated circuit voltage and current regulator is designed to give "laboratory" power-supply performance.

Some of the typical applications are: 0 to 15 VDC, 10 Amperes Regulator
0 to 40 VDC, 0.5 Amperes Regulator / 0 to 250 VDC, 0.1 Amperes Regulator / Remote Programming.

Here are some of the features:
- Voltage/Current Regulation with Automatic Crossover.
- Excellent Load Voltage Regulation, 0.01%, +1.0 mV.
- Excellent Current Regulation, 0.1% +1.0 mA.
- Short-Circuit Protection.
- Output Voltage Adjustable to Zero Volts.
- Internal Reference Voltage.
- Adjustable Internal Current Source.

For more detailed information, write to Schweber Electronics, Westbury, N.Y. 11590, Circle No. 242

SPRAGUE®
THE MARK OF RELIABILITY

18 ELECTRONIC DESIGN 17, August 16, 1969
Wescon, 1969, which will be held in San Francisco’s huge Cow Palace, is expected to welcome more than 45,000 visitors. Over 600 companies will display products. p. U81

From liftoff to splashdown, the Apollo manned space program, capped by the Apollo 11 moon landing, proved the need for man in space, the efficiency of NASA’s management approach and the significance of the project to the U.S. economy. p. 24

Also in this section:

...looking for a specific self-mounting 'lytic?

Choose from TWIST-LOK®
or WRAP-LOK CAPACITORS

Two styles for use in entertainment electronics and other commercial equipment with similar environmental conditions. The widely-used Twist-Lok has integral mounting ears which are twisted after fitting through slots in chassis or mounting plate. The Wrap-Lok has sharp-cornered terminals for wire-wrap type connections.

Both styles have unique sandwich-type end seal and dependable venting system. All connections between terminals and capacitor sections are welded to assure freedom from intermittents or open circuits. Available with bare case, Kraftboard tube, or plastic sleeve.

...need a reliable wire-wound resistor?

Specify ACRASIL®
PRECISION/POWER RESISTORS

Excellent stability and reliability, even under extended load life, extremely high humidity, and other adverse operating conditions. Expansion coefficient of silicone coating is closely matched to that of ceramic base to insure against damage to resistance winding. Coating provides exceptional protection against moisture, shock, vibration, fungus. Available with standard and non-inductive windings. Resistance tolerances as close as ±0.05%.

THE BROAD-LINE PRODUCER OF ELECTRONIC PARTS
New Mars photos show a fourfold gain in detail

In just four years, photos of Mars obtained by U.S. space probes have improved at least fourfold. That's the significance of the latest Mariner fly-bys, according to Lawrence Gallagher, program manager for Electro-Optical Systems, designer of the space cameras.

NASA sources put their estimate of the photographic achievement another way: The new Mariner pictures of Mars are at least 500 times better than any taken to date by cameras on the best earth-based telescopes.

Objects as small as 900 feet across were photographed as Mariner 6 and 7 passed within 2000 miles of the surface of Mars. In 1965, during the Mariner 4 mission, the best resolution obtained was 2 miles.

The major findings so far? Though evidence of water ice was found in the Martian atmosphere, the apparent lack of nitrogen, scientists say, “makes it highly unlikely that life as we know it exists on Mars.”

The cameras designed by the Xerox subsidiary in Pasadena, Calif., were of two types for the latest Mariners. One had a wide-angle lens with an 18-degree field of view. The other had a telescopic lens with a 1.8-degree field of view. The cameras had vidicon tubes made by General Electrodynamics Corp., Garland, Tex. The tubes contained 700 lines, against 200 in Mariner 4. This means that not only were the objects three and one half times clearer, by virtue of a higher line density in the vidicon, but they were even sharper than those of a home television screen, which has a picture tube that contains 525 lines.

Mariner 4 returned 21 pictures with a “gray scale,” or contrast, of 64 levels. That means that there were 64 possible shades between black and white. Pictures returned from Mariner 6 and 7 had a significantly higher contrast capability, with 256 levels separating black and white.

The two cameras, on the new Mariners operated alternately. They were timed to provide overlapping coverage. Each camera took one picture every 84.48 seconds.

The vidicon tubes in the cameras had a surface that was sensitive to light striking the surface. An electron beam scanned 665,280 points on the target in 42.24 seconds and generated an electrical current proportional to the charge loss at each point, and therefore in proportion to the light value for each point. This converted the image to intensity information, which was stored in analog and digital tape recorders.

Transmission to earth was always in binary form.

When received on earth, the binary coding was reconverted to electrical impulses representative of the pattern of light and dark elements of the original image on the vidicon tube. These impulses were used to modify the intensity of a beam of light that was swept across a 70-mm negative to expose it at 665,280 points to recreate the original image.

New systems concern attacks urban problems

Street-gang warfare control using computers instead of police action is just one of the radical departures from traditional methods of solving urban problems proposed by Urbdata Associates, Inc.

The new organization, specializing in computerized systems analysis of urban problems, was formed by Dr. Jay Hillary Kelley, a pollution and systems engineer who was formerly a member of the White House Science Staff under both President John F. Kennedy and President Lyndon B. Johnson. He is now negotiating with the Pennsylvania Crime Commission to develop a systems approach to street-gang problems that would substitute computer and technological conflicts for present confrontations.

Kelley, who is president of Urbdata Associates, which has an office in Philadelphia’s new Universi-
News Scope CONTINUED

...ty City Science Center adjacent to the University of Pennsylvania and Drexel Institute of Technology, says that while the gang-warfare study is of unusual interest, it is just one segment of the urban problem. Systems analysis of pollution monitoring, urban structure and services, and law enforcement on a broader scale are being conducted or are under negotiation.

Another basic problem that Kelley hopes to overcome is the fact that it is virtually impossible to police air pollution today. But with a computer simulation of nuisance sources and data collection, as well as meteorological inputs, sources of pollution may one day be predicted ahead of time.

Long analysis precedes Navy's S-3A award

If anything goes wrong during development of the Navy's S-3A antisubmarine warfare aircraft, it won't be because there was more than the usual soul-searching before the contract was awarded.

Five contractors competed on designs for the carrier-based plane for a year. Then two, Lockheed and General Dynamics, were asked to rework their efforts for five more months. Navy experts studied the results of this work for seven months—at the same time delving into the unpleasant business of General Dynamics' involvement in the overweight and now canceled F-111B and Lockheed's role in developing the now-defunct Army AH-56 helicopter and the costly Air Force C-52 cargo plane.

Lockheed, with its teammates—Ling-Temco-Vought and Sperry-Rand-Univac—won the contract.

The selection, the Defense Dept. says, "was reviewed and concurred in at all levels within the Navy," after which the Secretary of Defense approved the Navy's recommendation.

"The initial award is for $461-million, to be funded over approximately five years. It is to lead to production of six R&D aircraft."

The contract also gives the Navy the option to buy 193 production models, contingent upon successful development. Approximately half the cost of the plane—which could run to $3.2 billion—will be for electronics.

Data processing will be handled by a Univac 1832 general-purpose digital computer, supplied by the Federal System Div. in St. Paul, Minn. Univac will provide the computer programing in Burbank, Calif.

Light-emitting diodes headed for wider use

Four big manufacturers—Hewlett-Packard, RCA, Texas Instruments and General Electric—are looking for a big jump in the market for light-emitting diodes (LEDs) in the next few years.

The price is now several dollars apiece, depending on the type of LED and the quantity of the purchase. But designers can expect to see this drop to less than a dollar per unit next year, the three manufacturers say.

Howard C. Borden, manager of solid-state development at Hewlett-Packard, Palo Alto, Calif., says that the market for LEDs "within the next few years will go from less than $1-million to between $50-million and $100-million. Borden and a company colleague, Egan E. Loebner, are presenting a paper on this subject at Wescon this week.

Spokesmen for RCA, Texas Instruments and General Electric agreed in interviews that the diversity and complexity of electronic systems has created a need for more man-machine interfaces, and that LEDs are becoming a basic element in such displays.

For example, phosphors recently developed by Bell Laboratories convert infrared light to blue, green, yellow or red light, and this adds great flexibility to system displays (see "New Phosphors Convert Infrared to 4 Colors," ED 16, Aug. 2, 1969, p. 42). Since this light can be changed from green to red by stepping up the intensity of the infrared source, such phosphors may be highly useful in diagonal systems of all types.

Hewlett-Packard is developing a gallium-arsenide-phosphide LED that emits in the red region of the spectrum. Engineers there say that other materials are being investigated for green and other color emissions.

Troubles still snag Intelsat's expansion

Attempts by the International Telecommunications Satellite Consortium (Intelsat) to set up an expanded worldwide network continue to be slowed by mechanical problems. A bad burn in the third stage of a launching vehicle kept a consortium satellite from going into synchronous orbit over the Atlantic on July 25.

It was the third Intelsat III satellite to run into trouble over the Atlantic. The first one, launched Sept. 18, 1968, failed to achieve orbit and was destroyed by the range safety officer. The second, launched Dec. 18, 1968, was plagued by problems with its mechanically despun communications antenna, which finally froze up completely last June 29. Since then, engineers who have been testing and monitoring the satellite, have succeeded in getting it to function, and it is now in service again.

IBM's System/3 design questioned by critics

IBM has entered the low-cost, small-business computer field with a punched-card system, the System/3, that requires only 150 square feet of floor space, can be operated by one girl, and rents for $945 a month.

The market, IBM says, includes retail and wholesale distributors, manufacturers and food processors. The system comes in two basic models: one that uses only punched-cards and one with direct-access disk storage.

The system uses a new 96-column punched-card that is about one-third the size of an 80-column card yet holds 20% more information.

Competitors criticize the use of "out-moded" punched cards, lack of compatibility with the 360 series, lack of communications capability, and the small card size.
Bodine helps data devices tell it like it is...

Bodine fractional horsepower drives. Small. Quiet. A complete line designed to power information-handling devices precisely, accurately, dependably. Motors built with all the integrity you've designed into your product—that deliver as specified with fewer callbacks and service problems. If this is the kind of power you're looking for, you'll find no better source.

Over 3,500 standard specifications to choose from. Bodine also builds custom fhp motors to meet design requirements. Our engineers will be happy to help you pinpoint the right one for your particular application need. Computers, business machines, instrumentation, copiers—whatever your product, specify Bodine fhp drives. We've been the power behind the leading products for some 63 years. Write for bulletin. Bodine Electric Company, 2500 W. Bradley Place, Chicago, Illinois 60618.
Man on the
Apollo 11 overcomes close calls as mission nears lunar surface and proves that humans and electronics can team up successfully to achieve an ‘unbelievable’ goal

Charles D. LaFond, Chief, Washington News Bureau

"Here men from planet earth first set foot upon the moon, July, 1969, A.D. We came in peace for all mankind."

It's still, to most people in the world, an incredible success. It was the engineering expertise at its pinnacle.

"We've entered a new era . . . it's still hard to believe," says Dr. Thomas O. Paine, Administrator of NASA.

The Apollo 11 flight, from liftoff at Cape Kennedy on July 16 to splashdown in the Pacific on July 24, demonstrated vividly that man and sophisticated electronics can blend successfully in a cooperative, closed-loop system. The three-man crew worked and relied on computers aboard their spacecraft as one might lean on a human companion on earth.

But in going to the moon and landing and walking on that distant planet, man, as usual, learned through his mistakes. None of the errors were close enough to threaten the completion of the mission, but some caused deep concern. One did give rise to brief consideration of aborting the mission within sight of the landing area.

One big lesson that NASA learned: There are limits to the workload that man and electronics can successfully handle in space. When these limits are exceeded, trouble occurs.

Among the problems were these:

- The lunar-module guidance and navigation computer became dangerously overloaded as Eagle approached the lunar surface. But for prompt recognition of the cause
and the competence of flight controllers in Houston in providing remedial action, an abort might have occurred.

- Fully automatic programing on Eagle, if left untouched, would almost certainly have lead the craft to destruction in a boulder-filled crater. The overworked crew could not see the landing site clearly until at low level. Fortunately there was a semi-automatic manual control that permitted last-minute alteration of the flight plan.

- Loss of communications, including telemetry, occurred early in the flight and later during descent of the lunar landing module from a moon orbit to landing. Luckily the radio breaks occurred at non-critical times and then only for short periods.

On the plus side:

- NASA planners had developed the procedures and designers had included sufficient redundancy to handle every difficulty encountered in the mission.

- Inertial navigation accuracy going to and from the moon was almost flawless.

- Voice communications and ground tracking were, on the whole, excellent.

- Television transmission was superb.

As with every mission, experience produces changes in procedures and sometimes in equipment. This certainly will hold true for improving the safety and reliability of Apollo 12, now scheduled for launching on Nov. 14. It can be assumed that NASA will require the crew to pay more attention to maintaining communications lock-on with earth and that the computer problem will not occur again. Other changes will have to await detailed analyses of recorded telemetry data and the debriefing of the three-man crew: Neil Armstrong, Col. Edwin E. Aldrin and Col. Michael Collins.

**Computer trouble quelled**

Eagle’s guidance and navigation computer began to act up when the descending craft was about 40,000 feet above the lunar surface. Warning lights began to flicker on in the form of two display numbers: “1201” and “1202.” These were coded instructions to the crew that
the computer was rejecting the demands for additional information. In short, the computer was saying: "I'm overworked; stop requesting new data."

The crew queried Mission Control in the Manned Spacecraft Center in Houston and was told the flight was still "go."

Again, at 27,000 feet, the alarm flashed insistently. Indications were that a radar problem was involved. Again Houston said "go."

The difficulty, according to officials at Mission Control, resulted from data congestion created by simultaneous inputs of the landing radar, which was keeping track of Eagle's velocity and altitude, at the same time that the rendezvous radar was cranking in Eagle's position relative to the command module overhead. According to some NASA officials, the rendezvous data was required in the event the descent operation was aborted, so Eagle could link up again with the command module. An industry informant, a guidance expert, denies this. "There's no need to use the rendezvous radar during landing or ascent," he says.

It has now been determined by NASA that a three-position switch, calling for different operational modes of the rendezvous radar, was in the wrong position. However, NASA officials say that Eagle's crew had set the switch in the position called for by the Apollo 11 flight plan—"auto track." The result was a repeating electronic interrupt to the computer memory that was nonproductive and took up 14 per cent of the computer's total capacity.

The rendezvous radar antenna is a two-degree-of-freedom steerable unit. The lunar-module switch controlling system operational modes can be set at "LCG" (to search, acquire and lock onto the command-module transponder), "auto track" (to hold automatically onto the command module after lock-on) and "slew" (to permit manual acquisition and lock-on to the command module transponder).

The only reason NASA did not abort the descent was because a specialist in the Houston ground-control team, Stephen G. Bales, recognized the problem and through the flight controller directed the crew to stop querying the computer on the operation of the landing radar. (Houston knew through telemetry that it was operating fine). This reduced the computer congestion and, despite recurring overload alarms, permitted the computer to guide Eagle to a safe landing.

After the mission, Lt. Gen. Samuel C. Phillips, Apollo project director, said: "In my opinion, we almost didn't make it. I could be wrong . . . but I think we came awfully close to having to abort."

Christopher C. Kraft Jr., flight operations director in Houston, commented: "The computer was right on the ragged edge. It was sending alarms that it was working right up to 100 per cent capacity."

Asked if officials in Mission Control were concerned about the computer response and feared an aborted mission, Kraft replied: "You're damn right we were."

Kraft also made a point of clearing the computer design of any blame. He said: "I wouldn't want you to get the impression that the guidance system was improperly designed or that we had some improper problems with the program, because we did not."

Later, industry experts, who requested anonymity, told ELECTRONIC DESIGN that the computer alarms "1201" and "1202" were never intended to indicate a danger that might require a decision to abort. Rather, they said, the signals merely indicated that the computer, which had an automatic restart, was working at capacity on priority tasks and could not accept lower-priority requests. If the overload of queries continued and a point of total congestion occurred, these experts said, the computer would simply reject all further requests, stop and start all over again to accept requests on a priority basis; it would not have broken down.

Industry sources pieced the computer problem together this way:

As the lunar module came around the back side of the moon after firing its engines for descent, there was a time during the coast phase, but prior to the powered descent phase, during which the crew could have checked the operation of the rendezvous radar system. In doing so, it would first energize the rendezvous radar with the antenna position at LGC. On verifying that the antenna had indeed locked onto the command-module transponder, the antenna switch would then have been turned to auto track. But after this, no matter what the flight plan checklist said, the experts say, the rendezvous radar should have been turned off and the antenna switch flicked back to the original LGC position.

Industry informants say they know of no reason for use of the rendezvous radar during descent to the moon's surface. With the radar on and the switch at auto track in Eagle, the antenna servo kept the dish searching throughout the descent in an attempt to locate the command module, and outputs indicating this fruitless search were fed continuously into the computer. This caused the computer overload warnings, the experts explained.

Manual controls prove worth

James Nevins, deputy administrative director of MIT's Instrumentation Laboratory, which designed the computers and developed the mission software, said: "As far as the man interface is concerned, it's the most complicated program we've ever flown."

Yet the wisdom of a decision made years ago by NASA officials to give man the ability to bypass automatic control and take over manually was never better illustrated than in the final landing approach made by Astronaut Armstrong, the first man and engineer to set foot on the moon. Despite all the planning by the best minds in developing the final descent techniques, Armstrong found it impossible to clearly pick out his target site from an altitude of 7200 ft and still perform all his assigned cockpit tasks. There simply was too much for him to cope with.

The descent was fully automatic down to between 400 and 500 feet before Armstrong realized that the touchdown point would be in a dangerous, rock-strewn crater. At this point he switched over to a semi-automatic control program — P66—and flew the craft to a gentle landing in a clear plain some four miles away.

In the P66 "hover" mode, the guidance system provided throttle and descent rate control, and Armstrong controlled attitude and di-
reception. He also could change the descent rate in increments of ±1 foot per second. It has since been calculated that only 40 seconds of fuel time remained at engine cutoff—or about half the fuel supply planned.

Dr. Thomas O. Paine, NASA Administrator, noted later: "We would have had difficulty with a fully programmed landing." And other space officials said that the experience demonstrated that previous successful landings by unmanned spacecraft on the moon were "very, very lucky."

There were other lapses but most appeared to ground observers to be failures in operational technique rather than equipment. For example, early in the flight as the two spacecraft separated from the Saturn V third stage and then redocked, there was a communications cutoff. This interruption was attributed to failure of the Apollo 11 crew to select the correct antenna position.

Both S-band and vhf transmissions were employed to assure transmission continuity, but similar communications breaks occurred throughout the flight. In each case Houston control was heard requesting the spacecraft to alter its attitude to help the ground stations lock onto the craft's steerable high-gain antenna.

Breakup in transmissions occurred at times with use of the vhf radio in the backpacks of the Astronauts Armstrong and Aldrin as they explored the lunar surface. On one occasion it was observed that Aldrin, after donning his equipment, had failed to erect his antenna fully. This was quickly corrected with direction from Houston. Aldrin's technique when speaking into the microphone was blamed at other times.

Astronaut Collins, orbiting the moon in the command module while Armstrong and Aldrin were on the surface, helped relay messages from earth from time to time.

Another unscheduled incident arose when an ascent-stage engine arming switch was broken off as Armstrong and Aldrin re-entered Eagle after the moon walk, but circuit redundancy avoided difficulty.

**Highly accurate navigation**

Accuracy figures are hard to obtain from the space agency. ELECTRONIC DESIGN has on three occasions requested from one manufacturer, AC Electronics, performance figures following earlier Apollo missions, and each time the response has been that NASA refuses to make these figures available. It can only be assumed that the sensitivity results from the similarities between the MIT-designed Apollo system and the MIT-designed Polaris-Poseidon fleet ballistic missile guidance systems.

Nevertheless some figures were released during the Apollo mission. En route to the moon the accuracy was so great that the first mid-course correction was bypassed and the second required only a three-second burn to adjust the spacecraft velocity by 20.9 feet per second. Only a very minor second firing was needed. An even lesser correction was required on the return flight to earth.

As a partial measure of system performance, the spacecraft crew reported the day after launch that the worst drift being encountered by the gyroscopes in the inertial platform was 0.03 degree per hour—and that only with X-axis gyro. The crew also indicated that the worst error for the accelerometers was only 0.006 feet per second—well within the optimistic NASA specifications.

In the final analysis, the guidance system in both craft during the eight-day mission controlled a journey of nearly one million miles, accepted all the real-time changes inherent in such a mission, including a late splashdown target change of over 200 miles, and still returned the astronauts to a point only 2.5 miles off target and only 20 seconds off the original estimated time of arrival.

**Communication good**

Communications performance, both vhf and S-band, were good throughout the Apollo 11 mission. NASA communicators are unanimous in their belief that had communications not been so successful, particularly during the critical lunar landing phase, the flight might well have been aborted.

Ozro Covington, chief of tracking communications at the Goddard Space Flight Center, Greenbelt, Md., when asked by ELECTRONIC DESIGN for his critique of over-all system performance, said: "If someone had asked me four or five years ago how I would like this network to function, I probably couldn't have cited a better example than the recent mission."
Strict control kept out semiconductor flaws

With billions of dollars and the hopes of the world at stake, NASA could hardly risk failure of the Apollo 11 mission because of some obscure transistor or IC defect. Semiconductor manufacturers made sure the risk wasn’t taken.

In their quality-control efforts for the space program, the manufacturers have learned that pre-can internal visual inspection, burn-in on all parts, separate high-reliability facilities and employee motivation are important steps to reliability.

Joseph Flood, director of reliability and quality assurance at Motorola Semiconductor Products, Inc., Phoenix, Ariz., says that all parts, at NASA’s insistence, were inspected visually for workmanship faults before final packaging. These checks uncovered potential problems—bits of wire or foreign particles in the package, for instance—that would probably not have been detected in electrical or burn-in tests. The effect was to minimize the number of latent failures—and the manufacturers ecstatically point to the success of Apollo as proof of their high reliability.

Motorola’s Bert Stelzer, manager of administrative services in the Reliability and Quality Assurance Dept., says the department was, considering extending its visual inspection to include X-ray of the packages. X-ray techniques are especially useful in spotting die-bond voids—the cause of hot spots in operating ICs—and in checking lead bonds. But aluminum metallization and bonding wires are transparent to X-rays, and Motorola was using aluminum bond wires (a monometallic aluminum system is widely accepted as the most economical and reliable interconnection choice); so visual inspection was performed before final packaging.

Stelzer points out that no major process innovation was involved in getting high-reliability components for Apollo. “The problem has been to assure ourselves of the reliability levels that we already have,” he says. “We don’t lose much product in our burn-in tests. Average losses were about 1 to 2 per cent, and many of them were not outright failures but just borderline on some specification or other.”

Stelzer is convinced that a smoothly running process is the key to reliability. “You must have constant production,” he says “under good controls, and at a rate sufficient that you can monitor the process. If you run a start-stop operation, you can’t monitor the process reliably.”

Gordon Russell, national sales manager for aerospace and defense marketing at Fairchild Semiconductor, Mountain View, Calif., reports: “Apollo really taught us a lot about reliability. We implemented internal visual inspections and designed traceability procedures that had never been done before. Our quality-control people can trace lots all the way back to wafer processing.”

But Russell found some of the procurement arrangements uncomfortable. In supplying transistors to Raytheon, he says, Fairchild agreed that it would supply the devices and Raytheon would perform visual and environmental tests—leak test, shake, centrifuge, etc.—plus 100 per cent screen and burn-in.

“If more than an acceptable percentage of a lot failed this critical inspection, we got the whole lot back,” Russell notes. “And we could not give back to them any part of rejected lots.”

The result, of course, was a happy customer, but Russell doesn’t consider it a suitable arrangement for a vendor. “We need control of screen and burn-in in our own house,” he says. “If we don’t have that control, we don’t have a good monitor on our process, and we can’t control what a customer does to our circuits if he tests them at his facility.”

Russell found also that to build to the extreme Apollo reliability criteria, Fairchild needed separate production lines. “Asking girls on a standard line to build to Apollo standards is like asking a guy to study in a room where three other guys are having a bull session,” he says. “The girls must have a separate facility where they can concentrate and maintain their high standards.”

Segregation alone is not enough, of course; the staff must be motivated to do high quality work. And semiconductor manufacturers in Apollo have recognized this. Astronaut Frank Borman, for instance, visited the Motorola plant to tour the production areas and to speak to the staff working on Apollo parts. “The visit,” says Stelzer, “had a very significant effect on the girls on the line. Each girl became very conscientious about doing her job and doing it right. She identified personally with the end result—a safe flight to the moon.”

The girls working in high-reliability areas were given special smocks to wear that identified them with their work, and all containers holding Apollo parts were boldly marked as such. The object of all this was to fix the attention of the production staff on the end use of the products and the need for quality. It worked admirably.

All in all, Russell found Apollo a fascinating project. He notes that the guidance computer was one of the first projects to be committed to the use of ICs, and finds the design a unique example of the use of repetitive elements in circuitry.

The computer was built of RTL 3-input NAND gates throughout. Flip flops were formed of cross-coupled NAND gates, and buffers were built by masking out a collector resistor.

There were two advantages to this approach. By using identical parts in large quantities, the designers at the MIT Instrumentation Laboratory, in Cambridge, Mass., benefited from the efficiencies of volume production. And because of the repetitive nature of the circuitry it was much easier to predict reliability. “The prime consideration of the whole program,” says Russell, “was reliability. This thing had to work.” The reliability, of course, has proven out; there have been no failures to date.

Next: Era of
NASA planning nine more missions to the lunar surface with improved equipment—The goal: a manned ‘Little America’

David N. Kaye, West Coast Editor

It's only the beginning, so far as NASA is concerned. Repeated manned missions to the moon must be made in the next decade, if the world is to gain any real knowledge of the planet, says Dr. George E. Mueller, NASA's Associate Administrator for Manned Space Flight.

Four more lunar landings are planned by NASA in relatively rapid succession—roughly every four months through November, 1970. These are to extend man's "learning curve" by probing different lowland and highland regions of the moon.

Five subsequent landings are to cover other, more rugged regions and to deploy more advanced scientific instrumentation. By the mid-1970's, NASA officials would like their lunar exploration program to include:

- A lunar rover vehicle, capable of providing manned travel on the moon's surface and carrying heavier instrumentation and lunar samples.
- A lunar flyer, to permit rapid coverage by astronauts of otherwise inaccessible areas of the planet.
- A permanent habitat, resembling the early Little America station at the South Pole, where scientists and engineers could work in a safe, shirt-sleeve environment.

Earlier this year, in testimony before a Congressional committee, Dr. Mueller warned of the folly of incomplete lunar exploration. "If we do not take this next step," he said, "we face the hazard of repeating the error of Leif Ericson, who discovered America three centuries before Columbus but failed either to return or to stimulate others to return because he found nothing of interest."

The first follow-on landing—like Apollo 11, which landed in the Sea of Tranquility—is to set down in the safer, flat lowland, or maria area of the moon. Apollo 12 is scheduled to land in Oceanis Procellarum. Apollo 13 and 14 are to

*Saturn V stands poised to blast off for further manned missions to the moon. Nine more lunar landings are planned by NASA in the next decade.*
land in the highlands, first in the Fra Mauro formation and then near the large crater Censorinus, says Dr. Donald Wise, NASA's chief lunar exploration scientist.

"We will start with the plains, then go to a high plateau, like the plateau around Denver. Then we will go to the rugged places, like the Grand Canyon and Yellow stone," he explains.

All of these early missions are in the lunar equatorial region. Apollo 15, however, is to land in a more northerly spot, the Littrow Area, near the edge of the Sea of Serenity.

Each of these spacecraft is to carry the Apollo Lunar Surface Experiments Package (ALSEP), built by Bendix Aerospace Systems Div., Ann Arbor, Mich.

Two different ALSEP arrays have been designed, each with the same experimental subsystems. They differ only in the selection of subsystems designated primary (four) and backup (three). Each package includes experiments for passive and active seismic measurements, a magnetometer, a solar wind subsystem, a suprathermal ion detector and instruments to measure lunar heat flow and charged particles in the local environment.

The ALSEP telemetry system was designed to receive commands from the earth and to transmit collected data to earth through the unified S-band system. All experimental subsystems, when deployed, are connected by flat ribbon cables to a central station, which includes a data subsystem, electronics for the seismic instruments, and the control and communications subsystem. Electrical power for each ALSEP is provided by a SNAP-27 Radioisotope Thermoelectric Generator producing a minimum output of 46 watts.

When installed in the lunar module, an ALSEP array occupies 15 cubic feet and weighs about 210 pounds.

The astronauts in the Apollo 12-14 missions are to be permitted to walk on the lunar surface for up to about 1 kilometer from the lunar module. This is considered the limit that a man can accurately determine distance by eyeball estimate. The modules are to be equipped for stays of up to 36 hours on the moon. An attempt will be made to increase this capability to 72 hours for Apollo 15.

Apollo 16-20 missions

More significant changes in instrumentation and capability are to be attempted in later flights—Apollo 16-20. For example, RCA is developing for NASA an instrumented staff, or walking stick, to be carried by one of the astronauts. It will include, at the top, a laser tracker and other devices to provide very accurate range (less than 1 meter error in 5 miles) and azimuth readings, and also to indicate true vertical. The unit was field-tested successfully for the first time last month. A small TV camera may also be included on the staff.

Some time after Apollo 16, possibly on Apollo 17, a small lunar vehicle is to be transported to the Moon. It would not only increase the mobility of the explorers but further improve their position determination capability during long lunar surveys. The small rover is expected to be equipped with a navigational unit employing a simplified inertial system and an accurate odometer.

By Apollo 20, it is hoped that several types of ground rovers will be in use, including a more highly advanced dual-mode type now under feasibility study by Bendix and Grumman.

Apollo 16-20 missions will most probably carry what is now called the modified, or advanced, Apollo Lunar Surface Experiments Package. These include new sensors and a preliminary astronomical experiment that will explore the practicability of deploying a lunar telescope or more fully equipped observatory on the moon.

Advanced ALSEP packages, according to Donald Beattie, staff engineer in the Apollo Lunar Exploration Office, will include the following:

- Electric field meters.
- A large area heat-flow experiment.
- Instruments to measure sky brightness hemispherically.
- A newly developed, highly advanced deep drill.

The latter will permit drilling down to 10 meters to search for subsurface permafrost. The drill, says Beattie, was developed by Westinghouse for the Marshall Space Flight Center and represents a breakthrough in the technique of dry drilling.

Advanced ALSEP instrumentation, according to Bendix, will be designed for a minimum two-year operational life, but five years will be sought as a goal. Instruments will be designed to permit carrying up to nine experiments per flight.

Studies to determine the feasibility of building a lunar flyer are continuing for NASA under contracts with Bell Aerosystem, Buffalo, N. Y., and North American Rockwell, Downey, Calif. Devices under consideration include both back-pack propulsion systems and one-man platforms capable of traveling at altitudes of several hundred feet and at ranges of 10 to 20 kilometers.

A logical next step in lunar exploration would be the establishment of a permanent lunar station. It could be deployed as early as 1976 or 1977, says Beattie. Two concepts are under consideration, he says. One involves a succession of flights to carry modules to the moon for assembly on the lunar surface. The modules would use largely existing hardware.

A somewhat different approach, however, would employ an orbital lunar station, from which astronauts would shuttle to and from the lunar surface in an Apollo lunar module vehicle. This concept, says Beattie, could offer greater freedom for lunar exploration, but it would also create other problems in logistical supply from earth.

From a safety standpoint and for ease of operation, a majority of scientists tend to support the lunar surface station as offering a greater potential for long-term reliability at lower cost.

NASA studies have shown, Beattie says, that a six-man station to be occupied for six months could be supported by an 8-kw regenerative solar-cell-and-fuel-cell system. This would weigh about 13,000 pounds. For a 12-man station occupied for 12 months, a nuclear SNAP-8 power supply, providing 25-33 kw, would be required.
CRTs

**Multibeam tubes are now a complete family.**

These computer terminal readout tubes can be supplied in a range of standard sizes and configurations.

A few months ago we introduced our first multibeam tube, a seven-beam job designed to give brighter and faster readouts for computer terminals. Now we’ve expanded the line to give you a wide choice of tube sizes, configurations, and phosphor colors. In fact, we can put our multibeam gun in many standard tubes.

Our multibeam approach is a new and unique way of getting more out of a CRT. In conventional single-gun CRTs, brightness and writing speed are intimately related. The higher the writing speed the lower the brightness level. Our seven-beam multibeam tube actually allows you to increase writing speed seven times without loss of brightness. Or conversely, you can get a brightness increase of up to seven times without loss of writing speed.

As an example of what multibeam can do for you, take a look at our 12” SC-5299 seven-beam CRT. Seven separate electron beams are controlled by a common focus coil. Typical written character size is 5/32”, but size can be varied by changing the position of the focus coil on the neck of the tube. Line width of individual spots is typically less than 0.010”. Each beam may be individually modulated and all may be simultaneously varied in intensity with a single variable control grid bias. These multiple electron sources increase the brightness potential of the tube by a factor of seven.

As an example of what multibeam can do for you, take a look at our 12” SC-5299 seven-beam CRT. Seven separate electron beams are controlled by a common focus coil. Typical written character size is 5/32”, but size can be varied by changing the position of the focus coil on the neck of the tube. Line width of individual spots is typically less than 0.010”. Each beam may be individually modulated and all may be simultaneously varied in intensity with a single variable control grid bias. These multiple electron sources increase the brightness potential of the tube by a factor of seven.

Typically, this tube may be used to great advantage in alphanumeric displays, graphics or mapping. The advantages are even greater where high writing speed or viewing in a high ambient is required.

Since alphanumeric character writing is done in this tube simply by scanning lines across the screen and blanking and unblanking at appropriate points, the high speed "diddle" or write-through yoke requirement is eliminated. The yoke current for the horizontal line scan, normally a step function, now becomes a simple ramp. Thus, you eliminate the step-settling time problems usually associated with single-beam operation.

Among the many applications we see for this new family of tubes are air traffic control systems, military identification systems, stock market quotation units, teaching machines, electronic test equipment and airline status boards.

INTEGRATED CIRCUITS

How to design fast adders.

Four basic adder systems give you maximum flexibility in operating speed and package count.

When integrated circuits are used to build an adder there are many design considerations—cost, speed, power drain, etc.—that must be weighed to arrive at the optimum system. Our fast adder series—SM-10, -20, -30, -40—makes it easy to devise the optimum system. The SM-10 full adder is useful for low cost, low power systems where the delays of ripple carry techniques can be tolerated. Only one package is used per bit and only one carry wire is needed per package.
If higher speed is required, the anticipated carry adders SM-20, -30, -40 can be used in several different configurations. For maximum speed, the 8-bit adder section shown in Fig. 1 should be used. This system will add two 8-bit numbers in 65 ns, and two 16-bit numbers in 105 ns. (These figures are based on the specified maximum propagation delays.) This approach uses 1½ packages per bit and power drain is typically 135 mW per bit.

For any word length greater than 8 bits but not equal to 16 bits, the fastest addition is obtained by adding 7-bit sections (Fig. 2) to the basic 8-bit adder sections. The 7-bit section is similar to the basic 8-bit section except that the SM-20 dependent carry adder is not used for the least significant bit. The ripple carry out from the preceding stage is connected to all 7 bits in parallel. Each added section must wait 20 ns for the carry out from the SM-20 of the preceding section, so the total addition time is 65 ns for the basic 8-bit section plus 20 ns for each added 7-bit section.

When slightly longer addition times can be tolerated, but ripple carry is still too slow, the anticipated carry adders can be connected in 3- and 4-bit sections to reduce package count and wiring complexity. This is accomplished by reducing the need for the SM-40 expander packages.

The basic 4-bit adder section (Fig. 3) is similar to the first 4 bits of the 8-bit adder except that an SM-20 has been substituted for the SM-30 at the fourth bit. This change provides single wire ripple carry to the next section. Anticipated carry is used to add 4 bits in 65 ns. Two of these 4-bit sections can be connected together to add two 8-bit numbers in 105 ns, as compared with 65 ns for the 8-bit section.

For any word length greater than 4 bits but not equal to 8 bits, 3-bit sections should be added to the basic 4-bit section as shown in Fig. 4. This arrangement adds 20 ns to the basic 65 ns addition time for each 3-bit section added. Two 16-bit numbers can be added in 145 ns. Note that this configuration uses only one package per bit. This is a good way to get the speed advantages of anticipated carry with the same package count as a ripple carry system. Power drain is typically 125 mW per bit.

Slightly faster addition times can be achieved by using the system shown in Fig. 5. Here an SM-40 expander package is used so that 4-bit sections can be added to the basic 4-bit section of Fig. 3. This adds 20 ns to the basic 65 ns add time for each 4-bit section. Two 16-bit numbers can be added in 125 ns using this system. Performance of the four basic adder systems is shown in Fig. 6.
Add economy and versatility to your new portable TV designs.

Four-tube family fills the needs of compact small-screen portable B & W television sets.

We have the answers to your design problems in small-screen B & W sets. Our family of 8", 10", 12", and 15" picture tubes will cover most of your needs to give the advantages of Sylvania's superior design to your new systems.

All of the tubes are of the rectangular glass type with a gray filter glass faceplate. They feature electrostatic focus and do not require an ion-trap magnet. Deflection angles of 85° and 110° give you that short overall length so necessary in compact designs.

The small diameter neck and low G2 voltages of these tubes give you possibilities for extra design economies by reducing power supply requirements. All of the tubes use the T-band implosion protection system.

And perhaps best of all is the pricing structure. Quantity prices are directly competitive with foreign imports. And look at what you get for that price. You get a full range of field engineering services and technical assistance that only a domestic manufacturer can provide. There's no long wait for delivery.

You also get all of the advantages of Sylvania's latest advances in tube design, materials and production techniques that assure high quality at minimum cost.

Why not investigate our new portable picture tube line. You'll be able to market an all "MADE IN USA" set at a price that will meet the foreign competition.

Is multilayer your best bet?

As makers of all types of boards—single, double, and multilayer—Sylvania can help you make the right choice.

Are you looking for a high-speed circuit board? If you need high-density packaging, high-speed operation and low noise levels, multilayer boards may be your answer. Sylvania is especially equipped to aid you in making the right decision. Since our printed-circuit board facilities make all types of boards, our engineers can aid you in choosing the right one for your application.

Sylvania has been producing multilayer boards for over nine years and has made boards with up to 19 layers. Our multilayer operation is a modern 10,000-square-foot facility. Most of this space meets class III clean-room standards. Rigid process controls allow us to meet standards set by the Institute of Printed Circuits, military specifications and varied customer requirements.

Capacity of the plant is presently 1,400 one-foot-square boards per shift with plans now under way to increase this capacity to 2,800 boards per shift.

To provide highest-quality production we continue to use a plan written to meet the requirements of MIL-Q-9858A Quality Program Requirements, and specification NSA No. 68-8, NSA Specification for Printed Wiring Boards.

This plan is a working document, detailing and referencing procedures that will provide a total quality system. This assures compliance with all company and customer reliability and quality requirements.

Incoming raw materials are inspected and tested to meet standards established at the time of purchase. Testing and inspection are carried out at every step of manufacture and assembly.

Our multilayer facility is capable of handling boards in sizes from 4 to 350 square inches on a regular production basis. We can hold layer to layer tolerances which meet the demands of today's multilayer board requirements. Our boards can be made in thicknesses up to seven times the diameter of the smallest plated-through hole with a minimum tolerance of ±0.005".

Our engineering staff is ready and willing to help you solve your printed circuit board problems. Why not talk to them soon.

MICROWAVES

Meet our full-line PIN diode family.

Both epitaxial and non-epitaxial types are available in a wide-ranging line of devices.

One of the industry's broadest lines of PIN microwave switching diodes is available from Sylvania. The unique properties of these devices make them suitable for such applications as low- and high-power switches, limiters, phase shifters, voltage-controlled attenuators and modulators.

A PIN diode is made by diffusing P and N type impurities into opposite sides of a wafer of pure intrinsic silicon that has high resistivity. This intrinsic layer provides the PIN diode with its unique properties at microwave frequencies. At low frequencies, a PIN diode exhibits rectification properties similar to an ordinary PN junction. However, at higher frequencies charge storage in the intrinsic region prevents rectification.

Thus, when a forward bias is applied to the device it operates as a voltage-dependent variable resistance. A slight increase in series resistance is observed up to a bias current of 10 µA. This change occurs because the width of the depletion layer in the intrinsic region decreases; therefore, the thickness of the intrinsic layer increases slightly. As the forward current is increased beyond 10 µA, the series resistance decreases rapidly because carriers are being injected into the intrinsic region.

When a reverse bias is applied to the device, a gradual decrease in series resistance is observed since the depletion layer is widened. This widening of the depletion layer continues until breakdown occurs and conduction increases rapidly. Fig. 1 shows the small-signal equivalent circuit of a PIN diode in the forward and reverse biased conditions.

One of the most common applications for PIN diodes is as a high power digital phase shifter for phased array radars. The three major types of shifters are shown in Fig. 2.

The switched-line phase shifter uses two line lengths and two SPDT switches per bit. This means it can switch in either a reference line or a particular length of line depending on the amount of phase shift wanted. As many bits as needed can be added to obtain the accuracy desired in phase shift. The loss for each bit is identical and good accuracy can be obtained.

The periodically loaded line phase shifter uses the PIN diode as a switch. The diodes switch in load susceptances spaced a quarter wavelength apart on a transmission line. Phase shift per diode is small; thus it requires many more diodes to do the same job as the switched line phase shifter.

The hybrid-coupled-bit phase shifter uses a 3-dB hybrid junction with balanced phase shift bits connected to the coupled arms. This type uses fewer diodes than the switched line and has less loss. The problem with this approach, however, is that its loss varies with bits and it has only half the power-handling capacity of the switched line.

If you have an application where PIN diodes can be used, why not discuss it with Sylvania. We're sure to have the right diode for you.

MICROELECTRONICS

Fast custom service solves your interface problems.

Our standard circuit submodules let us tailor an interface circuit to your specs and get it to you within two weeks.

Using our advanced hybrid circuit techniques, Sylvania can give you high reliability and proven designs, and we can do it fast, too.

The secret is in our standard circuit submodule approach. By combining these standard input and output submodules into one 12-lead TO-8 can, we can give you an interface driver circuit that will handle your specific application. Since all the design work has already been done, we can promise delivery in two weeks after receipt of order.

Input circuit functions available (see table) include voltage and current detection, level shifting, gating, inversions and pulse shaping. Schmitt trigger circuits are used for voltage and current detection and to provide a clearly defined output threshold. Logic functions are being added to make the family even more universal in its application.

In the output section, a thyristor, a medium current transistor and a high current transistor driver is available. Our thyristor circuit can handle up to 300 Volts at one Ampere. The medium current output circuit gives you 360 mA at 6 Volts or can be used to drive your own power transistor and load. The high-current transistor driver can be used to drive power transistors and is capable of switching 10 Amperes.

Our interface drivers are now available for positive and negative supply voltages ranging from 4 to 24 Volts. Input voltages can be either positive or negative over a range from 0 to ±25 Volts.

CIRCLE NUMBER 305

General Characteristics of interface driver submodules

**Input sections**

**Schmitt trigger:**

- On at +3V, Off at 0V
- + or — current sense
  User supplies 1 resistor selected to sense in a range of 1 mA to 1A.
- + or — voltage sense
  Standard levels 1, 2, 5, 10, 15, 20, 25 Volts or user can add resistor for any specific level from 1 Volt up.
- + or — logic
  Switches at 1V nominal
- + or — high noise immunity logic
  Switches at 2.5V nominal

**Output sections**

**Thyristor**

- Load current to 500 mA. Voltage ratings of 50, 100, 200 and 300V.

**Medium-current transistor**

- Load current ratings of 150 and 500 mA.
  - Voltage ratings of 20, 30 and 50V.

**High-current transistor driver**

- To drive power transistors switching up to 10A.
Hybrid microelectronics...where does it go from here?

Reading any of the design electronics magazines, an engineer can get the feeling that he is “out of it” unless he is committed to several active hardware designs using film hybrid microelectronics. Scarcely an issue goes by that a new technical advance or new utilization is not described.

Is there sufficient justification for all this technical publicity? Has the technology really arrived yet? Where will it develop from here?

The apparent popularity of hybrid technology, coupled with the relatively low dollar investment required, has led to upwards of 500 hybrid film facilities being started within the last 12 to 18 months. Of course, some of these facilities were formed to support in-house engineering groups, but many are oriented toward industry sales activity.

EIA statistics for 1968 certainly do not justify all of this activity in hybrid film technology. In 1968, sales were about $54.6 million in “non-captive” markets (not including in-house usage of self-manufactured circuits). Half of this sales level is in “passive-only” film circuits. The remainder is in film circuits with active components added.

The accelerating interest in hybrid films comes from a growing accumulation of successful applications. Engineers have found that hybrids can solve design problems not readily resolved by available monolithic circuits and/or printed circuit approaches.

With increasing usage of hybrid circuits the vendor-user engineering liaison loops have become more workable and more efficient. The initial strangeness of working with a new technology has worn off. Engineers who have been successful in their first applications are now confidently designing hybrid films into future jobs where they meet the economic and technical requirements.

For this reason, we at Sylvania believe that the growth of film circuit technology will be explosive in the next 12 to 18 months. By 1971, we see engineers designing systems using such devices as multiple beamleaded, nitride passivated integrated circuits arrayed on multi-level alumina substrates. The whole device will be hermetically sealed in a 1”-square flat pack.

To obtain this level of technology by 1971, certain developments are required. These developments include fine-line, low-cost film registration to accommodate beamleads; availability of a broad range of beamlead devices at reasonable prices; and a reliable multi-level substrate interconnect capacity. All of these factors should be available by 1971.

At Sylvania we’re similarly confident of the future place of film circuits in the industry picture as a packaging technology. Hybrid films will complement single chip monolithic devices and printed-circuit board approaches. Each technique will find its proper application through economic and technological review.

Sylvania’s program in hybrid film technology is oriented toward supplying analog and digital circuits in module form. These modules incorporate our own solid-state devices using advanced technologies in design and packaging. Our ten years of film circuit and packaging experience, our in-house source of beamleaded chips, and extensive new developments in film processing techniques allow us to offer broad design and production support to the user of film circuits.

The management was 'superlative'

Richard L. Turmail
Management and Careers Editor

Historians will have to thumb their way back over 25 recorded years to find a management job that approaches the one responsible for placing our astronauts on the moon. Not since the Allies joined forces to invade Normandy in the spring of 1944 had so many people, industrial complexes and resources been united to reach a common goal. But when Apollo 11 touched down on the lunar surface, the National Aeronautics and Space Administration had managed to overcome the obstacles with a gigantic and specifically designed team that fulfilled President Kennedy's decree of eight years ago.

Because of the significance of Apollo 11's accomplishment, ELECTRONIC DESIGN wanted to know how the Apollo program was held together, and how the generally high reliability of the program was achieved. To find out, we put some management questions to George H. Hage, Deputy Director of the Apollo Program.

Hage has been entrusted with top program and technical management responsibilities with NASA for the past two years. Before that he served the Boeing Company for 19 years. Our questions and his comments follow:

Did you ever doubt that the goal of the Apollo program would be reached?

I think in view of the massive research and development nature of the project, there has always been an element of concern that this very ambitious objective would not be met on the time scale laid down by President Kennedy in 1961. But because of the superlative quality of NASA's planning and research, there has never been any doubt in my mind that the goal of landing men on the moon and returning them safely would be accomplished.

What is the main function of the Apollo management team?

A high percentage of our time is devoted to definition and planning. At least half of the job is planning, and half is execution. The ratio is tempered of course by the level of management. Lower levels spend more time on execution than on planning. At the higher levels we may occasionally spend a great deal of planning time looking up a blind alley, but at least we'll know it when we see it the next time, and we won't go down the same alley again. The Mercury program was bold and ambitious, and mistakes were made. Gemini learned from those mistakes, and Apollo, of course, learned even more from Gemini.

Have any managerial innovations been realized during the Apollo program?

The rudiments of management that have been applied to the Apollo Program have been available for some time, and have been applied to many of the big programs such as the Polaris, the Minuteman, and some of the larger aircraft development programs. However, there have been some new applications of technology in the area of communications. Since the project has required a great deal of close coordination among the Apollo team members who are widely dispersed geographically, we established a unique conferencing system last year. It utilizes a wire network that permits us to carry on a conference by telephone in several locations simultaneously. In Houston, Huntsville, Cape Kennedy and Washington, we can also project, simultaneously, printed material in viewgraph form.

It is possible during such a conference to create and transmit to all of these locations, or to any one of the four, a viewgraph sketch or a series of written points in something like 10 seconds.

We have, as a part of the TIE contract (Technica Integration and Evaluation) provided by the...
Boeing Co. at all three NASA locations and here in Washington, a rapid data-retrieval system. It has been computerized to permit us to get information quickly about problems and anomalies so that we can be knowledgeable on the status of their resolution. I don't believe that there has been a central source of this type of information maintained in such a viable quick call-up form in any other program.

What management procedures does NASA utilize?

We have used many of the management disciplines on each phase of the program. For example, we conduct preliminary design reviews when we're trying to settle on a design concept. Then, when we've chosen a design, we stage a critical review that involves a detailed look at the design we're going to commit to hardware. We also conduct many types of technical reviews. We have "change board" meetings, where every change made as a result of some deficiency or weakness in a system is reviewed. Before we're ready to commit to flight, we conduct a design certification review involving a senior management team. The Apollo Program also conducts a flight-readiness review where we sit down with all the principals of the program. In the case of Apollo 11, a nine-hour review was conducted of all the questions and issues that were carried along in preparation for this flight.

These reviews are not innovative in the classical sense, but I think the degree of discipline and insistence used may be more thorough than in any previous program.

How was the Apollo program maintained during layoffs?

I would expand that to the management beyond NASA, to the tremendous industrial complex that is under contract to the space agency. I think that key organization techniques used were these: setting up specifications early in the program, defining what it is we're going to build and how we were going to use it; requiring a series of subordinate documents and specifications at several levels below the top Apollo specs. In this way, each element of the project could look to a set of criteria and requirements at each level and know what was expected.
A new 7-pole monolithic crystal filter line that surpasses those previously available in shape factor and spurious mode suppression. Provides performance comparable to the highest state-of-the-art currently available with discrete filters – yet incorporates all of the inherent advantages monolithics have over conventional multi-component configurations. Now Damon provides the best of both worlds: critical performance, superior temperature characteristics, improved aging, small size, and significantly lower price. All are available in hermetically-sealed metal cases within miniature rectangular packages ranging in size from 0.080 cu. in. to 0.274 cu. in. Immediate off-the-shelf delivery of evaluation quantities. Damon also offers a wide variety of computer-assisted designs, but these take a little longer. Damon/Electronics Division, 115 Fourth Ave., Needham, Mass. 02194, Tel: (617) 449-0800.

</table>
After losing 22 months to unscheduled testing, how did you manage to place a man on the moon within the time schedule?

The Apollo program was stabilized before January 1967, so that there was leeway in scheduling until mid-summer of last year. Then, of course, we changed the mission sequence. The pre-fire version of the projected Apollo 7 had no launch designation. If the Apollo 7 had performed as planned, there is no question that we would have been on the moon by now. But when a program of this kind runs into a deficiency of the magnitude of the fire, you have no alternative but to do whatever is required to fix it. Only then were Apollos 8, 9 and 10 sent on their way. During the testing and redesign of the spacecraft, three unmanned flights were launched.

What effort was necessary to compensate for management mistakes?

Any program of this size is going to be faced with errors in human judgment. I suspect there are those who would be critical of this management in trying to determine the cause of the fire that killed the three astronauts three years ago. I suggest that circumstance was created by a technical blind spot—because we did not recognize the hazard in having present simultaneously all the conditions that could lead to a catastrophic fire of that type. The three conditions are: fuel, and we had materials in the spacecraft that were combustible; ignition sources, and any time you have an electrical system inside a machine you have potential ignition sources; and atmosphere, that will cause the fire to propagate. If all three of these elements are present, you have a potential fire threat. Actions taken as a consequence of that circumstance have been extremely thorough. The interior of the spacecraft, both the Lunar Module and the Command Module, have been redesigned to rigorously remove flammable material. Wiring has been carefully protected to minimize the possibility of short-circuits, and great care has been taken to protect against over-loading circuits. Finally, the atmosphere of the spacecraft at launch was changed to be less of an oxidizing agent. We changed the mixture from pure oxygen to 40% nitrogen and 60% oxygen, an environment that is less sensitive to propagating a fire. Also, a very demanding test program was conducted after this redesign: the interior of an actual boilerplate spacecraft was built with materials, wiring, etc., to duplicate the flight unit. By spotting various ignition sources, we set fires in many places throughout the spacecraft to determine if, in fact, they would propagate.

Resolution of this problem cost us time between January, 1967, and October, 1968.

Is it ever possible to correct minor mistakes before they become public knowledge?

The policy of the spaceflight program has been one of complete exposure, not only nationally, but to the world. That’s a very powerful incentive for those of us who are involved in turning out these programs to be extremely careful, and critical, and to do everything that’s reasonably within our power to make every flight a success. Our “power” takes the form of a very complete and extensive ground test program.

How else do you motivate your people to maintain the program’s generally high reliability?

We have to accomplish with our ground test programs what airplane developments normally do by building 20 or more vehicles before stabilizing on a configuration that will do the job.

We just don’t fly that much. So to insure to the best of our ability that when we do fly we are going to fly right, we use a very thorough disciplined approach to design fabrication and quality control and pay infinite attention to details. Every single anomaly that’s identified in the processing of equipment on the ground, and every one that’s identified in flight, is carefully examined and carefully reviewed, and, where necessary, corrective action is taken.

A tremendous effort is made to train people to be aware. If a guy screws a nut on a bolt up tight, and he feels the thing yield though it doesn’t fall off, it’s an indication that there’s a weakness and he should tell us about it.

What was the most consistently nagging problem in the management of this project?

It’s hard to single out any specific problem. I think the most unique aspect of the program is its size. There have been a number of programs in this country requiring the geographic dispersion of project manufacturing plants, but I doubt if there has been a program in the history of the world where so many different communities and companies and organizations have had a role to play. At the peak of the Apollo program we had about 400,000 people and 20,000 corporations involved in preparation of the moon shot. If I had to worry about something, I would probably worry about the magnitude of the organization and the resources that have to be directed in this ambitious project.

How would you compare the management of Apollo with, say, the direction of the invasion of Normandy during World War II?

If you compare the momentum required of each project, certainly eight years is a long time to maintain momentum with a space program. When you’re dealing with a single objective invasion, the length of the initial activity is relatively short, although the planning that went into it goes back many, many months.

What are the prerequisites for a job like yours and General Phillips?

The general has successfully managed the Minuteman Program, so has already had experience in running this kind of program. He and I are both electrical engineers, but my background is industrial rather than military. Before I left the Boeing Company I served as Chief Engineer of the Lunar Orbiter Program and many of the problems I encountered in carrying through the completion of that
The magic number is nine.

Because that’s how many MSI counters we make at Signetics — more than anybody else. Which lets you choose exactly the counter that’s right for you. (No more buying too much. Or, worse yet, too little.)

You want high-speed counters? We’ve got ’em. Medium- or low-power counters? Take your choice. Binary, decade, divide-by-12 modes?

Just say the magic word. And all are available in either flat packs or DIP’s.

In short: each Signetics counter gives you more complex magic, dollar for dollar, than any other counters in the industry.

And, when you get right down to it, isn’t that the one thing that really counts?

P.S. Coming to WESCON? Look us up in Unit F, and we’ll tell you about a number of these numbers. Or write for specs on the whole line. We’ll rush them to you.

Count on it.
program, however, is carried in the NASA authorization bill as a line item.

What does the future hold for the Apollo program?

The Apollo 12 vehicle is on pad 39 for a September launch. The elements of Apollo 13 are being delivered to Cape Kennedy on a schedule that would support a third attempt for a successful moon landing and return in November. Equipment, hardware and personnel and crew are in a high state of readiness to support these remaining two attempts this year. I have every confidence that we will meet our objectives.

There have been 6 Mercury, 10 Gemini, and 5 Apollo flights. Apollo 11 was our 21st manned space flight. You might say we’ve come of age. ◄

Anatomy of a failure, with a happy ending

There were several small mishaps in the Apollo program as it emerged from development, any one of which, if left unresolved, might have led to the downfall of the entire program. Following is a short case history of one of these incidents:

On April 4, 1968, during the launching of Apollo 6, pieces of the spacecraft’s lunar module adapter shell, which houses the lunar module at launching, broke away 2 minutes and 13 seconds after blastoff.

This unforeseen development, the earlier Apollo fire tragedy and cuts in NASA’s 1968 budget, limiting the number of Saturn, Apollo test flights, threatened to disrupt the space schedule.

On June 14, 1968, Wyle Laboratories of El Segundo, Calif., received a $3.2-million contract from North American Rockwell Corp. to perform static and dynamic tests on the “short stack” portion of the Saturn/Apollo vehicle. This assembly stands 60 feet high, is 22 feet in diameter and weighs close to 22 tons.

It includes the Apollo service module and the spacecraft lunar module adapter; the lunar module; the Saturn instrument unit and the Saturn S-IVB third-stage forward skirt.

Wyle’s job was to verify the structural integrity of the assembly under simulated lift-off, at first-stage boost and at first-stage separation.

Identifying the cause of the Saturn malfunction and finding a solution called for a test program that ordinarily would have required at least a year to complete. Wyle’s contract specified a four-month deadline—90 days for testing to begin and 30 more days to complete it. NASA insisted on this tight schedule so that any modifications required on the Saturn vehicle could be made before the Apollo 8 circumlunar mission.

The problem of assembling a vehicle of this size at Wyle Laboratories’ testing facility in Huntsville, Ala., was huge.

The assembly was done in large concrete pits that resembled fore-shortened missile silos bristling with test structures and instrumentation, all connected to a computer complex.

By Sept. 15, 1968, the instrumentation and data system were installed and testing began. These tests, according to Wyle, were unique in that none previously conducted in the laboratory had simultaneously applied as many different types of loadings for such a large vehicle. The complex structure was subjected to 72 controlled environmental or mechanical conditions, and in each test condition 2000 channels of data were simultaneously checked and read out by Wyle’s CDC 3300 computer. Only five years earlier 60 channels had been considered a sophisticated test setup.

These tests simulated the worst conditions expected during an Apollo flight. They included acceleration loads, aerodynamic loads, heating conditions and side loads that simulated launch-site winds and engine gimballing.

The magnitude of the technological and management tasks according to Wyle is illustrated by the following:

• A data acquisition system that was designed to handle high-speed dynamic data in the range from 20 cycles to 2 kHz had to be converted to a system that accepted 2000 channels—in the range from dc to 10 cycles.

• Sixteen hundred transducers had to be wired to the test setup with a quarter million feet of special transducer cable. Wyle purchasing agents bought every foot available in the United States.

• On-line computer techniques were developed that permitted “instant readout” for the 2000 channels of data. This permitted a test of the stack to be completed and another to proceed within three to five minutes.

• Simulation of aerodynamic heating called for 5 million watts of power, requiring Huntsville Utilities Co. to set poles and string cable swiftly to Wyle-Huntsville and to install the associated transformers, switches and circuit breakers.

On Oct. 7, the tests were concluded. The results confirmed the structural integrity of the short stack. The malfunction was attributed to longitudinal oscillations in the Saturn V stage caused by structural deficiency.

The first stage was subsequently strengthened.
and now...

UNITRODE invents the 12 amp UCR —
the industry's first fused-in-glass SCR.

It has so many superior features it deserves to be called "something else".

- Ideal for pulse modulator applications
- Smallest medium-power SCR
- Efficient switching of high pulse currents
- Peak repetitive pulse current 150A in high frequency modulators
- Anode voltage 100 to 600V
- Low forward voltage drop
- Forward current 12A
- Peak gate current 100A
- 3.5°C/watt thermal impedance

TAKE A LOOK AT THE WAY IT'S BUILT

Two fused-in-glass seals melted, wetted and fused to both silicon and metal surfaces permanently protecting and stabilizing the SCR die in a voidless Unitrode package.

Thermal coefficients of glass, pins, and silicon are matched to withstand extremes in temperature shock and cycling.

True metallurgical bonds from terminal pins to the silicon provide rapid heat transfer and high current capability.

INFORMATION RETRIEVAL NUMBER 21
The indispen
Isn't it preferable to send instruments instead of men into space to gather data and samples and to transmit them to earth?

Dr. Wernher von Braun, director of the Marshall Space Flight Center in Huntsville, Ala., answers the question this way: "Well, back in the 15th century Columbus and his men could have stayed at home, waiting until European science and technology could build unmanned ships to cross the Atlantic. These robots could then have scooped up a handful of sand and transmitted photographs of the Americas. But history would have been different."

When asked the same question, Lt. Col. Michael Collins, pilot of the Apollo 11 spacecraft, also referred to Columbus, a hero to most of the astronauts. "Scrap the manned exploration mission in favor of placing instrument packages on the moon?" he repeated. "That would be the same as Columbus sailing to within 60 miles of the Florida coast and deciding to turn around and go home."

Man's role in the loop

With few exceptions, the consensus of scientists interviewed by ELECTRONIC DESIGN was that man must always be in the loop in space, in one capacity or another.

The most important contribution that man can make to space travel today is his judgment. That was the opinion of Dr. William Pickering, director of the Jet Propulsion Laboratory in Pasadena, Calif. A dramatic example of this came on the Apollo 11 flight when Neil Armstrong seized the manual controls of the lunar module to avoid a boulder-strewn crater and bring the spacecraft to a safe landing on a smooth plain of the moon.

Another contribution is man's ability to evaluate data at the source, said an Air Force officer high in the manned space flight program. In the case of an unmanned system, "bringing it all down" for examination would pose quite a transmission problem.

Still another contribution is man's ability to increase the reliability of a space system by performing maintenance, the Air Force officer pointed out. "We wouldn't have put a LEM on the moon if man hadn't been able to override that gyration Apollo 9 went through," he noted.

And all of these advantages of man in space pertain to the present. In the future, space stations, colonies, travel to the outer planets and military command posts have all been suggested.

"Whether the vehicle is manned or unmanned, man fits into the loop," said Dr. Pickering. "If the vehicle is unmanned, man is on the ground directing it or has the capacity to give it a certain number of commands."

Manned-unmanned mix

As to proportion of control: "I believe that the optimum is a manned-unmanned mix," said Dr.

Seismic experiment package is deployed by Edwin Aldrin Jr. Already in place at left center is the laser reflector. To the left of it is the American flag and, far left, the lunar surface TV camera.
Krafft A. Ehrcke, chief scientist for advanced programs, North American Rockwell Corp. Space Div. in Downey, Calif.

Dr. Ehrcke went on to say that although the proportions of the mix will vary as the technology progresses, man will always have a place in it.

There are those, on the other hand, who argue that exploration can be better accomplished unmanned. Dr. Bruce C. Murray of the California Institute of Technology in Pasadena, Calif., strongly supports this view. He said:

"If one takes any particular function and sets out to do it, he can pretty well arrive at the fact that it's cheaper to do it unmanned than manned. Often you can do it better. For example, in making astronomical measurements from orbit, man interferes. He interferes with the stabilization system. If you want to get a second of arc accuracy in pointing, having a man aboard is a very serious problem. He moves around, and his heartbeat causes problems."

**Man's judgment useful**

Dr. Pickering countered: "Man's judgment in making observations allows him to take advantage of targets of opportunity which would be missed if he weren't there on the spot. Take the example of an unmanned Surveyor sitting on the moon. The television camera can report to earth that there is a rock that looks interesting. But a man accompanying the same Surveyor could say: 'That rock isn't very interesting, but there is one over here, just out of sight, which looks very interesting. Let's go over and get that one.' Man adds the dimension of performing functions which were unanticipated."

**Steps in outer space**

What of the future, now that the U.S. has opted for putting astronauts in the loop?

"Whenever you go into a new environment, there are three basic steps," Dr. Ehrcke said. "They are exploration, occupation and utilization.

"The exploration is the investment. In other words, you find out what is there and what are the conditions of the environment. After you have found out what it is all about, you have to go into the occupation phase.

"That means you have to assure yourself of a good foothold; that you can exist there, work there and you can get there and back. Access and residence are the two major objectives of the occupation phase.

"The final phase is when you finally start to utilize the new environment on a practical basis."

The next step in this nation's moon program is the occupation phase. NASA plans to establish space stations and to develop residence and good access capabilities.

To advance into the utilization phase, Dr. Ehrcke said, we must answer two questions: Are there useful resources in space? If the answer is yes, then is man needed to tap them?

"The answer to question one is definitely yes," Dr. Ehrcke said, "Space is useful in three respects primarily:

1. Information transmission. We are using this already with communication satellites. We will expand this into education from orbit. For example, I can see a portion of our foreign aid being instructions to farmers in lesser developed countries on how to improve their crops.

2. Information acquisition. This refers to observing and taking inventory of our planet. Earth can be thought of as a spaceship. In order to operate our ship properly, we must have proper status reports. There must be a global inventory of our resources.

3. Value generation. Processing the environment of space, for example, could include focusing light and beaming it down at certain territories. Rescue operations could go on around the clock. Certain areas of cities could be illuminated to fight crime at night. That would be processing a natural environment, like sunlight, from space. And that gets us into processing other materials utilizing the environment.

"Weightlessness and vacuum are two very important factors that can be used. I would like to expand on this by saying that space offers the ability to choose your own g level. Weightlessness is just one extreme. Space offers the possibility of extreme weights that can't be produced on the earth. This is due to the fact that centrifuges in space don't have to deal with air drag. Certain alloys can be formed at 10,000 g's. The technique on the earth is called explosive forming, since these g levels can only be provided momentarily rather than for long periods of time as in space."

Yes, Dr. Ehrcke affirmed, wherever judgment, intelligence and rapid responsiveness to unforeseen situations are necessary, man must be in the loop. He fits into all three steps in the space program: exploration, occupation and utilization.

"His place in exploration is with reconnaissance flights," Dr. Ehrcke summed up, "but only after unmanned probes. Man really comes into his own in the occupational phase."

Support for this position is widespread, even outside the scientific community.

Col. John H. Glenn, the first American astronaut to circle the globe and now the president of Royal Crown Cola International in New York City, told ELECTRONIC DESIGN in an interview:

"Up to now, most of the effort in the space program has been concerned with trying to define man's role—what he can do best and what he can't do—and developing the transportation system for him to use.

"I think that the next major thrust in space will be utilizing this transportation system, which we have spent over $20-billion to develop, to get a maximum scientific return from it. We should get as much information as we can: earth resources, and earth orbiting laboratory and new techniques to utilize the weightlessness in space in manufacturing."

Dr. Issac Asimov, professor at Boston University and a writer of science fiction, said: "Men are curious. Men want to go. To not go would ruin the whole thing psychologically.

"A self-supporting colony on the moon is the most important possibility of all. It will establish a psychological frontier once again. The earth has largely vanished as a frontier."
Edwin Aldrin Jr. walking at Tranquility Base, as photographed by Astronaut Neil Armstrong. The lunar module, TV camera, experimental equipment and Armstrong are reflected in Aldrin's gold visor.
Winning the "race" to the moon has cost this country billions. Is it all money down a lunar crater now that the feat has been proved feasible?

Not at all, says NASA. Aside from the breakthrough in scientific research, more than 2500 significant technological advances in the American economy are directly attributable to the space program. "Cross-fertilization" and spinoffs from the national space effort have produced improvements in everything from paints, materials and medicine to communications, computers and television, the space agency says.

Among major electronics industry advances are these:

- The Carousel IV inertial guidance system that has been installed on the new Boeing 747 jumbo jets is based on the same principles as the onboard Apollo system (see "$1 million for 747 Superjet Electronics," ED 15, July 19, 1969, p. 28). The two were developed in parallel.

  Engineers are applying software techniques they learned in developing the inertial systems to the computer control of everything from rush-hour traffic to shifts in the economy.

- TV display techniques used to simulate the rendezvous of the Apollo Lunar Module and Command Module are being used in highway safety research and computer-generated movies.

- Disc-recording techniques used to convert color TV pictures from the moon for commercial telecasting are similar to techniques now being used in X-ray television photography for "stopping" the X-rays at a critical moment. The same technique is being applied to the transmission of graphic displays over telephone lines.

**Inertial guidance for planes**

Present jetliners use radio or radar systems to navigate. Over the ocean, star sightings by a crew navigator may be used. On the Boeing 747 jetliners that are coming into service, the pilot feeds his takeoff point and destination into the Carousel IV inertial guidance system; the system's computer calculates the shortest course to fly. Enroute the pilot has a continuous display of longitude and latitude, true heading, wind direction and speed, ground track and speed, and time and distance to destination.

When connected to the autopilot, Carousel IV steers the plane, while the pilot monitors flight progress on the continuously updated control and display unit. On a recent test flight, the guidance system flew the aircraft automatically across
the Atlantic from Canada to the English coast.

Pan American World Airways says its test flights show the Carousel to be five times more accurate than present forms of navigation. It hopes the improved long-range accuracy will allow ocean air corridors to be narrowed so that twice as many planes can fly in the same airspace. Now planes must stay within assigned corridors over the North Atlantic—corridors fixed by international agreement at 120 miles wide in areas where traffic is heavy. With inertial guidance in general use, airline officials estimate that it would be safe to narrow the lanes to about 60 miles.

The Carousel navigation system includes an inertial reference unit—a stable platform—a digital computer, electronic and heat-control elements, and a power supply. Complete with a case and mounted in the aircraft, the system weighs some 50 pounds. It is less than one cubic foot in volume—smaller than an office file drawer. Federal Aviation Administration regulations specify that each aircraft must have three of these units for redundancy.

The Apollo guidance and control system is far more complex than Carousel IV, but the basic principle is the same. Both systems have an inertial platform. In the Apollo system, the platform is held fixed in space, regardless of vehicle motion, whereas in the Carousel it is held perpendicular to the earth's surface by rotation at a fixed rate. Both systems have a computer that calculates the trajectory in "inertial space"—that is, in the coordinate system determined by the inertial platform.

New software techniques

The ability of a small space or airborne computer to perform complex trajectory calculations stems from new software techniques developed for the space program, says Harlan Neuville, group head of engineering systems for the Apollo program, AC Electronics Div., General Motors Corp., Milwaukee. In the older technique of processing trajectory data—called least-square fitting—all the velocity/position readings were retained over a period of time in the computer memory. For each new reading, the computer recalculated the average trajectory by performing the software analog of drawing a smooth curve through all the readings plotted on a graph.

This technique requires too much memory to be practical for a space computer, says Neuville. "After all, you can't very well send a whole IBM complex to the moon." The technique used in airborne space computers, he says, is based on programming a computer to evaluate data statistically as it is received.

"We make a mathematical model of the Apollo and use all the information from simulated flights, as well as from previous real flights, to update the model," he explains. "In this mathematical model, we put data on the statistical accuracy of every measuring device that will give information to the computer, as well as the statistical accuracy with which each astronaut makes measurements. The computer continuously calculates the estimated trajectory of the spacecraft, updating it as new measurements come in. It weighs every measurement it receives according to the statistical information preprogramed in its memory. Based on this information, it may choose to accept, modify or even reject a measurement, if necessary. In this way the computer only needs to remember a specific position and velocity for a short increment of time, rather than for the duration of the flight, as with least-square fitting. So it doesn't need a huge storage capability."

The same technique of statistical analysis and mathematical modeling, Neuville points out, can be applied to control or monitor any complex process that can be modeled. "You can take measurements from which you derive a model that lets you predict what can happen," he notes.

Traffic control is an obvious application. "You can measure the traffic rate through a certain tunnel at different times and make a mathematical model of it," Neuville says. Then, based on this model, you can set up traffic lights that will allow just enough traffic in the tunnel so that everybody gets home as quickly as possible. Somebody may have to sit on the ramp for 20 minutes, but if you let him go ahead immediately, it would take him a lot longer than that because of the congestion in the tunnel."

Simulating the unknown

One of the biggest developments in the Apollo program has been simulation techniques, says Gordon Heffron, manager of the Guidance and Navigation Dept. of Bellcomm, Inc., a part of the Bell System that performs systems analysis and study, planning and technical support for NASA and the Bell System. Heffron says computer simulations are used to check out every part of the Apollo system.

For example, in checking out the onboard computer, not only is the computer itself simulated, but also its program, the measurements it receives and even the world outside the spacecraft. To simulate what the program calls "the actual world," Heffron says, "we set aside one part of the computer program as the actual world, and we assume that the information it contains is perfectly correct, whereas the information in the rest of the program is off by some amount. For example, we don't know the gravitational attraction of the earth to better than about 1 part in 10^4, so we make it bigger by that amount in the actual-world model than in the rest of the program. We also put some atmospheric drag in the actual-world model."

Although the idea of simulating one computer on another is not brand new to Apollo, Heffron says, "we certainly demonstrated that it was feasible to do this on a very high level of complexity." He believes that simulation techniques will be used in many different areas of computer control in the next few years. In addition to rush-hour traffic simulations, which he says most major cities will be using in the next five years, he sees the measurement of the national economy as a big application area.

"I think we have finally reached the stage in our ability to simulate where probably we will be able to find out how to control our economy better," Heffron says, "and I know there is going to be a big push toward this over the next 10 years."
A powerful tool for generating TV displays by computer and moving them about on the screen has been developed by the General Electric Co.'s Electronics Laboratory in Syracuse, N.Y. In a system built for the Guidance and Control Div. of the Manned Spacecraft Center, Houston, a picture of an object, such as the Lunar Module or a simulated lunar surface, can be projected onto a screen in front of the observer. By manipulating a control stick, he can, in effect, enter the scene and move around in it. On his screen, he can observe the object from any angle and at any distance, in effect moving himself toward or away from the object at an apparent speed that he controls with the stick.

The scenes are produced by computer. The system contains no mockup models or cameras. Instead, a description of the various objects to be displayed are fed into the computer in the form of numbers. These numbers define the shape, color and size of each object. The observer can call up any object in the computer's memory. As he moves his control stick, the system continuously recomputes the appearance of the displayed object from the angle and distance that correspond to the instantaneous position of his stick.

**NASA's 3-display system**

The Apollo system, called the NASA Electronic Scene Generator, has three displays. It can be set up so that an observer at one display may see, for example, the Lunar Module on his screen, while a second observer at another display acts the part of the astronaut who guides the Lunar Module. The second observer sees the Command and Service Module and moves himself relative to it. Each observer sees not only the effects of his own motion relative to the other spacecraft, but also the movements made by the other observer. In addition an observer at a third display can see both spacecraft and control his own motions with respect to the two others.

William Miller, manager of the Simulator Guidance Development and Applications, Guidance and Control Div., Manned Spacecraft Center, says the displays are used mainly to check out system performance. For example, the equipment was used in the development of the guidance and control systems.

"The scene generation equipment," he explains, "is tied in with special 'problem' computers that are programed to simulate the behavior of systems you want to check out. Sitting in a mockup of the spacecraft, the engineer or astronaut can manipulate controls that are connected to the problem computers, causing the display to respond as if he were looking out the window of the spacecraft in flight. What he sees in the display can either be a simulated lunar surface, if he is doing a landing study, or another space vehicle if he is doing a docking or rendezvous simulation."

Most scene generators use a TV camera, which moves relative to a mockup real object. The mathematically modeled display has many advantages, according to Rodney S. Rougelot, manager of visual simulation at GE. For example:

- Mathematically formed images are always in focus.
- The observer can maneuver within his simulated environment with complete dynamic freedom. This capability allows an architect, for example, to inspect the interior of a house, or the driver of a car to pass beneath an overpass.
- Objects in the environment can freely move. Because they are simply numbers, one need not support them with gimbals or tracks.
- In the NASA Electronic Scene Generator, the displays are 21-inch color monitors built originally for commercial TV at 525 lines per frame. These monitors have been improved, however, to allow display of a 600-line by 600-element TV raster. The equipment that drives the display monitors consists of two special-purpose digital computing units, controlled by a modified Raytheon 520 general-purpose computer.

The system creates TV images by computing them fast enough to keep up with the TV scanning rate. Consequently the computing units have a large logic capability—85,000 logic gates—but a relatively small memory—6000 30-bit words and 4000 24-bit words of magnetic core memory. The objects to be shown in the image are stored as coded numbers in the memory, and the computing units reconstruct them in TV form as they are being displayed.

The computing units produce images at a rate of 20 frames per second—fast enough so that there is no flicker—and a scene can be represented by as many as 240 straight edges.

### Applications for highway safety

Since the NASA system was built, says Rougelot, GE has developed a technique for generating up to 1500 straight edges per image at a rate of 30 per second. Such an expanded capability is useful for many purposes, he says.

"For example, according to a study we have just completed for the U.S. Department of Transportation through UCLA, it could be used for highway safety research," he notes. "The user could drive along a simulated highway and look for problem areas—such as dangerous intersections or sudden curves—as they appear on the screen.

"We have also proven the feasibility of making realtime changes in a complex display. Suppose, for example, that you have designed a highway and have simulated it in the computer. In a realtime system, you could make changes as you drove along. One obvious way to implement such a system would be to store in computer memory a catalog of precomputed items, like bridges, signs, overpasses, underpasses, etc. By touching the display with a light pen and perhaps pushing a button, you could call up one of these items and place it where you wanted it. Then, by pressing some more buttons, you could change its color and perhaps its scale."

This interactive capability requires very sophisticated software, Rougelot points out, "but it is definitely feasible."

In the Apollo TV built by Westinghouse, Baltimore, the color signals that arrive from the moon in serial form are stored on a disc recorder at Houston and played back in parallel for retransmission over commercial network channels. Essentially the same technique is being used in other fields—for ex-
Video disc recording system (right), developed by Data Disc Corp., is connected to standard X-ray equipment at Stanford University Medical Center in Palo Alto, Calif. The X-ray motion pictures are recorded and played back at slow speed for the physician.

ample, in stop-action X-ray photography and the transmission of high-resolution images over telephone lines.

The technique is simple in concept. The video signal is recorded on a disc, one frame or field per track, and played back in such a way as to obtain some desired effect. For example, in stop-action TV, a single track (or TV frame) is played back continuously to a TV monitor, causing it to scan the same frame repeatedly.

The Apollo camera—to hold size and weight to a minimum—contains a single tube instead of three (one each for red, blue and green light), as is standard in color TV cameras. Before the light enters this tube, it passes through a rotating wheel that is divided into red, blue and green segments. The wheel rotates at a speed that allows an entire scene to be scanned in each color. Thus the resulting video signal consists of red, blue and green fields transmitted serially. On the ground, a video switch sorts out the fields, so that each is recorded on a separate disc track. The tracks are then read out in parallel to the commercial TV color encoder, just like the output of a standard three-gun color camera.

Stanley Lebar, program manager for the Apollo camera at Westinghouse, says disc storage is the only medium possible for this application. “We need many channels at a time,” he points out, “and it is very difficult to get more than one high-level video channel onto tape because of the wide bandwidth required per channel.”

The total weight of the Apollo camera is less than 14 pounds. Its single tube is a very low-light-level vidicon of the type used in Vietnam for taking nighttime pictures. According to Lebar, the camera, without the color wheel, will take pictures at illuminations down to $10^{-3}$ foot-candles. “This is about the illumination you get on earth from a quarter moon,” he explains. “But to take pictures in color, you need the color wheel, and that filters out the light. So you need about 1 foot candle illumination.”

Medical applications predicted

Data Disc of Palo Alto, Calif., the company that built the disc storage converter used with the Apollo camera, has recently announced a new system for recording X-ray moving pictures. This system has several possible medical applications, according to Dr. Lou Wechsler, head of the Radiological Dept. at Stanford University Medical Center, Palo Alto. Its primary application, he says, is in recording X-rays of the heart during a cardiac catheterization.

“This is a minor surgical operation,” he explains. “We run a catheter into the heart and inject a material that contains iodine through the catheter, so that the particular area of the heart we want to see will show up in an X-ray. We put a fluoroscopic device over the patient’s chest to see the heart. The iodine only remains visible for 4 to 10 seconds—too fast for us to see what is going on in real time—so we take motion pictures at a rapid frame rate—50 to 80 frames per second—and play them back at slow speed.”

Dr. Wechsler points out that ordinarily “you can’t be sure you have gotten the area you wanted in the pictures until you develop them—and that takes at least a half hour, assuming you have a dark room in the hospital.”

“You can’t let your patient lie there with a catheter in his heart for a half hour or more while the X-rays are being developed,” he points out. “On the other hand, you hardly want to remove the catheters, send him home, and risk having to repeat the whole operation if you didn’t get what you wanted the first time.”

This problem—and others like it—can be solved, Dr. Wechsler says, by storing the sequence on a video disc and playing it back immediately.
We make components for guys who can’t stand failures.

We make our capacitors and resistors to perform like 40 million people were watching in on the count down.

And we build an extra measure of performance into all of them, to let you make sure your equipment delivers all you designed into it. Because like you and the guys who use your equipment, we can’t stand failures either.

Take our glass capacitors, for instance. There’s only one reason why they’ve been designed into the Surveyor, Minuteman, Gemini, Apollo, Saturn, Titan, Syncom, Sparrow, Hawk, and a number of other major aerospace and missile projects. With our glass capacitors, circuit designers could get the proven stability and reliability that these important systems demanded. U.S. Air Force tests have established that our glass capacitors have much better stability and reliability than ceramic and mica capacitors can deliver.

And take our precision tin oxide resistors. They’re the best of the metal film class. Because the resistive tin film is completely oxidized and molecularly bonded to the glass substrate, our tin oxide resistors are impervious to moisture and environmental degradation. No other resistor can deliver the same stability and reliability over load life. They offer guaranteed moisture resistance across all ohmic values to set a standard of reliability that can’t be matched by metal film, wire wounds, carbon comps or metal glaze resistors. After a 56-day-long heat test in an environment of extremely high humidity, our tin oxide resistors showed a resistance change of just 0.2 per cent. And in an ambient temperature test—now in its ninth year—not one of the 600 tin oxide resistors being tested has exceeded a resistance change of 1.5 per cent.

But don’t only think of Corning for aerospace and other precision applications. We’ve got something to offer when economy and value are the prime considerations. At Corning we’ve been active in improving these important capacitor and resistor characteristics, too.

We’ve developed the Glass-K™ capacitor to give you the volumetric efficiency and economy of monolithic ceramic capacitors, but with the much improved stability and reliability that only a glass dielectric can add.

In resistors, our tin oxide resistors already offer long term economy over metal film, precision wire wound and metal glaze resistors. And our new C3 resistors, in addition to giving you a small case size, compete costwise with carbon comps.

At Corning we make components for guys who can’t stand failures. Guys like your most important customers. Guys like you. So, next time you’re designing a system, reach for your CORNING® capacitor and resistor catalogs and call your local Corning authorized distributor for off-the-shelf delivery. They’ll help you design-in that extra measure of performance.

If you don’t have our catalogs, ask your Corning distributor for copies or drop us a line at: Corning Glass Works, Electronic Products Division, Corning, New York 14830.
What's the best Monolithic Chip Capacitor?

Centralab Mono-Kap!

See for yourself.

The superiority of Centralab Mono-Kap chips is clearly visible... pin holes that destroy reliability and long life are virtually eliminated. The beauty and superiority of these new monolithic chip capacitors is much more than skin deep, too. Centralab is alone in testing 100% for flash, insulation resistance, dissipation factor and capacitance. We also manufacture our own ceramics, thick film microcircuits and a broad line of capacitors. As a designer of microcircuits, Centralab developed the Mono-Kap to increase the scope of circuits we could manufacture. Centralab's Mono-Kaps have been tried and proven in a wide variety of industrial and military microcircuits. We have a wide variety of materials, physical sizes and capacitance values, all priced competitively and delivered in as little as four weeks. If seeing is believing, and you'd like a closer look, call on your local Centralab Representative for samples and product data. Have requirements for encapsulated Mono-Kaps with terminations? Send your specifications to Centralab, Application Engineering Dept.

Future Mars mission debated

Today the moon, tomorrow . . . . ?

With the nation and its leaders still in the full flush of a spectacular moon landing and return, the question on many lips is: "Where do we go from here?" Many believe that the first hint of a future manned Mars probe has been made by the Nixon Administration. On July 16 at the Kennedy Space Center, just after the launch of Apollo 11, Vice President Agnew stated that he didn't want to see the "wonderful team" assembled in this program dispersed "because someone was too short-sighted to provide enough of the material support to continue with these programs." This view was strongly seconded by NASA's Dr. Wernher von Braun who was also present at the launch.

With each successful accomplishment during the Apollo 11 mission, optimism of key officials increased. President Nixon made several public statements indicating the need to continue this manned adventure with planetary probes and further indicated a possible goal of achieving planetary exploration on a multinational basis by the turn of the century.

NASA officials, during Apollo 11's return to earth, were even more exhuberant. At a press conference, Dr. George P. Mueller, associate administrator for Manned Space Flight, said: "We are this evening on the way back from the moon after one of the most historic occasions, one of the greatest achievements man has ever carried out." Dr. Robert Gilruth, director of the Manned Spacecraft Center in Houston then said: "This is the way to go to Mars when the time comes." Dr. Mueller, in answer to a question concerning the future declared: "It seems quite clear that the planets of the solar system are well within our ability to explore, both manned and unmanned at the present time."

But, of course, there will be a resistance to an early move for a national commitment to a Mars manned exploration. Dr. Lee DuBridge, the President's science advisor and director of the Executive Space Task Force, has stated his belief that "at least 10 to 15 years" will be needed for unmanned planetary investigation before sending man to Mars.

There is in the industry a real fear that our great space team will indeed suffer during the next few years. Of the $24 billion roughly committed to the Apollo program, $22 billion has been spent. There are now only nine more planned lunar missions to complete the Apollo effort by the end of 1972.

Overlapping this is the Apollo Applications Program, several times delayed, which would put a 12-man research station into earth orbit, hopefully by 1972. Also under consideration is a larger 50-man space station to be put into earth orbit by the end of the decade, and the development of a re-usable maneuverable space shuttle to supply it. (North American Rockwell Corp. and McDonnell-Douglas last month were awarded contracts to perform competitive design studies for both orbital stations. But today these efforts are largely on paper.

Defense profit formula hard to work

"We are going to do this—it's going to happen," says Barry J. Shillito, assistant defense secretary for installations and logistics, referring to proposed Defense Dept. contract guidelines prepared more that 18 months ago but still not implemented.

The proposed guidelines would place more emphasis for allowable profits on the contractor's investment rather than simply on direct costs. Thus, in the new procedure, roughly half of the military contractor's
allowable profit for a given program might be based on a return from his capital investment and the other half on direct costs. The intent is to encourage cost-cutting by contractors and at the same time provide incentive to the firm for investing more of its own money in the program.

The problem, says Shillito, is the complexity inherent in applying the guidelines. Military negotiators must have some clear-cut method of establishing how much of a firm's investment can be allocated to a particular program.

The approach is controversial. As might be expected, electronics and aerospace firms are cool to the idea. Opposition from large diversified industrial firms whose defense business represents only a portion of annual sales have remained expectedly quiet, since they normally have expended heavily in capital investment. However, some of the largest defense contractors are almost totally supported by government contracts, and their investments are relatively small. The latter have the most to lose by the new guidelines and have been quietly fighting the proposed profit formula behind the scenes.

**Senate cuts could hit electronics**

If the military procurement reductions in some major programs are accepted by the Senate, the reaction certainly will be felt throughout the electronics industry.

Last month the Armed Services Committee reported out a $20.1-billion authorization bill for fiscal 1970, representing a new cutback of $1 billion. Among those losses the closest to the heart of the electronics industry were complete elimination of a $75-million request for R&D in the SAM-D ground-to-air defense missile; a reduction of $25 million in the Navy S3-A antisubmarine warfare aircraft development effort (leaving $140 million); a reduction in the airborne warning and control system (AWACS) from $60 million to only $16 million; and a cut of nearly $479 million worth of A-7D and A-7E fighter aircraft. The latter item actually involves a procurement swap; the Air Force lost $375 million for A-7Ds but got it back to purchase F-4E fighters.

Untouched, but expected to encounter lengthy argument on the Senate floor were the full request of $345.5 million for the Safeguard ABM, $758 million for the C-5A transport, and merely $460 million for the Navy Poseidon-submarine retrofit program. No argument is expected on the full $239 million for the Navy's F-14A fighter.

**Universities establish space group**

The Lunar Science Institute in Houston may soon have new management. The institute, to which NASA has made available its new Lunar Receiving Laboratory—quarantine center for the Apollo 11 astronauts—is now operated by the National Academy of Sciences, but its contract with NASA ends this fall.

Meanwhile, 48 universities have joined together to form a consortium called Universities Space Research Association (USRA). The intent of this organization, says the National Academy of Sciences, is to "foster cooperation among universities, other research organizations and the U.S. government for the advancement of space research."

USRA plans to acquire, build and operate laboratories and other research facilities. It has already proposed to NASA that it be given management responsibility for the Lunar Science Institute.

The institute functions as both a work and study center for scientists associated with any aspect of lunar science, including the current studies of materials carried back from the moon.
Is your passive component supplier as reliable as his components?

He's fine at meeting industry specifications. Even exceeding them. But what about customer service? Does he sometimes act as if that's a necessary evil? And have you been telling yourself that you have to put up with this kind of an attitude in order to be sure of getting components that are truly reliable?

Then it's time you learned about us. We're one of the leaders in component reliability—and we deliver in every other area as well. You bet we meet deadlines—speed samples—maintain competitive prices—and provide prompt technical assistance. If this kind of extra reliability would be a nice innovation, why not put us to the test.

Give us an urgent request for technical assistance. Or an urgent order. Write AIRCO SPEER ELECTRONIC COMPONENTS, St. Marys, Pennsylvania 15857.

Then watch us perform.

The passive innovators at AIRCO Speer

Speer resistors □ Resistor and conductor paste □ Jeffers JC precision resistors □ Jeffers JXP precision resistors and networks □ Jeffers inductors □ Jeffers capacitors □ PEC variable resistors and trimmer potentiometers.
FETs
TI introduces
8 new ones.

With some new design ideas, too.

Once again, TI extends your circuit design spectrum with new FET products and design ideas. Here's a variety of eight new field-effect transistors that can spark ideas for your circuits. We have a brand-new design brochure, too, which contains a score of FET circuits you can use.

3N160 and 3N161 MOS FETs
If you're interfacing IC logic, you'll want these new 25-volt MOS FETs. Low threshold voltages of 1.5 to 5 V make them ideal for bridging the gap between MOS and TTL or DTL bipolar circuits.

Low leakage and high input impedance keeps drift to a minimum in operational amplifiers and provides high accuracy in electrometer circuits. Use them too for shift-register circuitry, timers, or proximity detectors.

The 3N161 features a zener-protected gate to guard against static-charge damage.

In 100-piece quantities, the 3N160 is $4.50 and the 3N161 is $4.70.

For a data sheet circle reader service card number 145.

2N5545-47 Dual FETs
Designing operational, general purpose or differential amplifiers? Try TI's new n-channel FET duals: 2N5545, 2N5546, and 2N5547. In 100-999 piece quantities for $15, $9 and $7.50.

They're tightly matched: 5, 10 and 15 mV max gate-source differential. Temperature drift of the 2N5545, for example, is less than 10 µV/°C and its output admittance is matched within 1 µmho for superior common-mode rejection.

For a data sheet circle reader service card number 146.

2N5549 High-Frequency FET
For designers of low-level choppers, logic switches, multiplexers and RF, IF and VHF amplifiers... there's the new n-channel 2N5549 switching FET. Only $3.30 in 100-piece quantities.

It gives you high gain and low noise—typically 15dB gain and 3.5dB noise at 100 MHz. For three good reasons: high transconductance—greater than 6,000 µmhos. Low feedback capacitance—2pF max. And low on-resistance—100Ω max.

For a data sheet circle reader service card number 147.

2N5543, 2N5544 High-Voltage FETs
Want to replace a tube with a transistor? Plug in the new 2N5543 or 2N5544 high-voltage n-channel FET. $3 and $2.50 in 100-999 piece quantities.

Use them as one-to-one replacements tubes. In high-voltage switching, Large-signal amplifiers, CRT deflection circuits. And line-operated amplifiers in industrial, communications and home-entertainment equipment.

They have high gate-drain breakdown voltages—300 V (2N5543) or 200 V (2N5544). High transconductance—750 µmho min. And low feedback capacitance—2pF.

For a data sheet circle reader service card number 148.

All eight new FETs are available from authorized TI distributors or TI field sales offices.

"FET Design Ideas" is a must for every circuit design engineer's reference file. It contains: 20 circuit diagrams covering a wide range of applications. How to bias field-effect transistors. Applications literature available. And short-form data on all of TI's standard FETs.

To get your copy, write direct to Texas Instruments Incorporated, PO Box 5012, MS308, Dallas, Texas 75222. Or just circle reader service card number 149.

Prices are manufacturer's suggested list; subject to change without notice.
Intech takes on the Op Amp Boys.

We’re a David among Goliaths. And we know it.
So does Philbrick/Nexus, Analog, Burr-Brown, et cetera, et cetera.
They’re our competition, and maybe your present Op Amp supplier.
We’re out to change that . . . and to give you better FET input op amps.
Here’s our story.
We’ve gotten the best component and design engineering talent the industry had available. We let them have the run of the house.
What they do constantly amazes us.

Like the A-130: a high speed, FET input Op Amp that has a slewing rate of 600V/µs (typ) and a settling time to 0.1% of final value in less than 1µs in an amplifier with a 6 dB roll-off. The price is almost half of the competition’s.

Don’t believe us, or our engineers, though. In this business specifications, performance, and price are the considerations. A test is worth a thousand words.

For more information on our operational amplifier line, contact your nearest Intech representative, or call or write us direct. Intech Incorporated, 1220 Coleman Avenue, Santa Clara, California 95050. (408) 244-0500.

How can electronics be wed to education?

Sir:

Re "Classroom Electronics Still in Groping Stage," (ED 1, Jan. 4, 1969, p. 64): I could not agree more. But are there real opportunities here? Perhaps, but it will take much effort to bring them about.

Few, if any, school administrators are technically able to judge the equipment they buy. They are quite willing, however, to hire an educational consultant to help them make decisions. What they end up hiring is another educator who very nearly duplicates their own knowledge, but in addition has acquired some familiarity with hardware, gained largely through observation and use of the equipment.

Underneath this front, the educational consultant very likely cannot distinguish between a microcircuit and a potentiometer! Such a consultant very likely can acquire some familiarity with hardware, gained largely through observation and use of the equipment.

Let us imagine a technical graduate who then moved over to the educational field and thus managed to spend some 10 years at a university. His knowledge of theory would be high, but his chances to practice the applications of his theory would be nil... Ten years spent at a university will not provide the answers to such problems as device design, integrity, and reliability, nor teach one to see the relation between field conditions and product design. These are the very areas where major problems exist.

In the early attempts to wed electronics to medicine, many of the problems were similar to those now facing educational electronics. I suggest that we re-examine some of these early efforts with the hope that it will disclose ways to overcome the educators' present resistance.

If you are wondering about my background, I have a career spanning more than 30 years in electronic instrumentation and systems, covering fields from batteries to microwaves, with broad experience in audio, fm, TV and communications systems; have chaired several national IRE-EIA-IEEE committees, hold some 19 patents, and have been working in educational electronics about two years.

Charles A. Cady
Consulting Engineer
Wayland, Mass.

No moss grows on this reader of MOS report

Sir:

A number of errors and omissions have crept into your excellent special report on MOS devices (ED 8, April 12, 1969, p. 49). On page 58 you state that the p-type enhancement device is formed by diffusing two wells of phosphorous into the substrate. Actually, phosphorous is an electron-rich dopant that will, therefore, form n-type wells; to form a p-type source and drain, a dopant with an abundance of holes, such as boron, must be used.

On page 59 the cryogenic gain of the MOS is detailed, but no mention is made of the fact that, for the p-type MOS device, power dissipation is a maximum at such temperatures and can be a problem to control.

The statement on page 66, that low-threshold voltages allow direct interfacing with DTL and TTL, is misleading. To properly communicate with these logic types requires

Mepco DTL/MOS Level Shifters eliminate the need for discrete components and add the benefit of miniaturization with higher reliability. This new micro-circuit provides high speed operation and is compatible with most MOS levels. These level shifters furnish the only DTL/MOS buffer stage necessary and require less room on your PC board than with discrete components. The "worst case" design operates over the full military temperature range with all DTL, TTL levels. Packaging compatibility is offered with most system designs. For complete information, phone collect or write for data sheet MC6-669.

#5 OF A SERIES
MASTER MULTI-PURPOSE FM-1/FM-5 SYSTEMS

HAND-HELD...MAN-PACK...PORTABLE...MOBILE...BASE...REPEATER

Designed for, tested and proved in the jungles of Southeast Asia, Models FM-1 and FM-5 transceivers meet the needs of 2-way communications: Commerce, industrial plant, waterfront, law enforcement, fire protection, civil defense, etc. A general purpose radio-telephone, Hallicrafter's Model FM-5 is solid-state, all environment master of all communications needs. It may be used, with equal success as a fixed, portable man-pack, repeater or mobile unit.

Teamed in a single FM system for the 148-172 MHz range, FM-1/FM-5 and available accessories give you the versatility and reliability to be in command of communications requirements. For full details, write for descriptive bulletins, available free on request.

You're in the Global Communications Community with a Hallicrafters.

See us in WESCON Booths 5219 & 5220 at the Cow Palace.
3 exciting reasons to specify

**DIGIELC**

**NEW 1**

**Model 262**

**Digital Multimeter**

(AC, DC, ohms)

A most uncommon .1% Multimeter for those common, everyday measurements. A necessity for design and development, production, quality control, or anywhere that DC volts and current, AC volts, and ohms are measured. **Battery pack available.**

**$375**

**NEW 2**

**Model 311**

**Precision Calibrator**

(voltage & current source)

An .01% precision voltage and current Calibrator that serves as a working standard. In addition, the high current capability may be used as a lab source for developing those critical circuits so essential in electronics today.

**$650**

**NEW 3**

**Model 691**

**21 Column Printer**

(3 lines per second)

A Drum Printer which is expandable from 4 to 21 columns to satisfy your specific requirements. This versatile printer accepts all standard BCD inputs and provides 38 symbols along with "floating" decimal point. Starting at **$770**

See us at booth 1024 and 1025

Solid State Relays

Another big breakthrough from the "little relay" people

We got our nickname "little relay" people because we usually put our big breakthroughs in small packages. (Our success started when we introduced the TO-5 relay.) Now, we've made another breakthrough... a completely solid state, four terminal relay with enormous power gain. Only 1 milliwatt switches up to 5 KVA, and it can be resistive, inductive, capacitive, tungsten or quartz lamp loads.

Our new relay operates on inputs up to 280 VAC or from 3.5 to 300 VDC (either polarity) permitting direct interface with TTL logic. Input-output isolation is $10^{11}$ ohms "coil" to "contact" and "coil" to mounting plate. Dielectric is 2000 VRMS. Output characteristics include contact ratings up to 21 amperes, 280 VAC, 60 Hz. Surge current ratings of 200 amperes, and "contact" resistance as low as 50 milliohms. And, these are real breakthroughs for a relay which doesn't have "coil" or "contacts."

Available options include zero voltage switching for RFI suppression and lamp life extension.

Prices start as low as $18.30 in quantities of 100.

For complete technical data on our Series 6 Solid State Relay... contact us... the "little relay" people.

Why does the best-selling digital printer sell for $335?

Because Victor sells so many of them.
The Victor Imperial digital printer does superbly what any top-quality serial entry printer does. For less money. Because we sell so many.
It prints 8 column figures from remote sources on either 24 or 48 volt solenoids. Addition and subtraction for just $50 more. Ten column capacity? Add $20. Victor's exclusive printing press action reduces wear (and extra parts), and assures legibility and long, long life, under the roughest use.

OEM and quantity discounts available, with factory-trained service representatives covering every county in the U.S.

Does craftsmanship combined with volume manufacturing economies sell digital printers?
The most.

Call on Victor and you're in business.
IMC's master piece.

It's entitled, "The Master Catalog." We squeezed all our products into it. This limited edition available only from your IMC sales representative.

Arizona Division: Rotary solenoids, Electrohydraulic subsystems, Solenoid valves, Hydraulic and pneumatic components
Eastern Division: Airmovers: centrifugals, fans, tubeaxials and vaneaxials, Motors: induction, synchronous hysteresis, reluctance, polarized, torque and servomotors, Solid-state AC-motor controller systems
New Hampshire Division: Boxer, MiniBoxer, SuperBoxer, IMCair and Condor fans, IMCair centrifugal blowers
Western Division: Tormax stepper motors and controllers, Synchros, Resolvers, Solenoids, Flag indicators

All members of the IMC corporate family: IMC Magnetics Corp., 570 Main Street, Westbury, N.Y. 11591, (516) 334-7195
The above specs pretty well tell the story on our standard line of ceramic chip capacitors. Except that they're available in a variety of sizes in rectangular and near-square types.

And they're off-the-shelf items with COMPAR, our nationwide distribution network. But you also should know that we can provide you with many other end terminations, capacitance values, ceramic valuations and voltage ratings. Just get in touch with our Engineering Department. You'll find that even though you've seen one of our chips, you haven't seen 'em all.

BELDOIL SHIELDED CABLE

SOLVED

CRITICAL NASA INSTRUMENTATION PROBLEM!

The unique insulating properties of Belden's exclusive Beldfoil shielding provides 100% protection against "cross-talk" and spurious signal impulses in highly sensitive circuit applications. That's why NASA used Beldfoil cable for its Goldstone Tracking Station.

- In this massive 210 foot diameter antenna, built to track lunar and planetary probes, Belden Beldfoil shielded cables carry instrumentation signals from sensitive structural detectors to an instrumentation facility nearby.

- Every measurement of critical structure deflection, angular position, structure temperatures, and bearing pressures are recorded and analyzed prior to tracking operations.

- Get the same precision analyzation in your critical instrumentation. Specify Belden Beldfoil shielded cable—the only cable providing 100% isolation.

FOR COMPLETE INFORMATION CONTACT YOUR BELDEN DISTRIBUTOR.

at best diffused resistors and another power supply, and at worst extensive buffering and logic shifting circuits at the MOS inputs and outputs to maintain proper bipolar voltage and current levels. Similarly, you have neglected to mention that the 1-0-0 crystal orientation used to attain low thresholds has much higher pn junction leakage currents at elevated temperatures than does 1-1-1, and has problems with unwanted lower voltage field oxide inversions due to the lower Q_m. In addition, 1-0-0 has lower yields because of the greater number of stacking faults and displacements inherent in this orientation.

Accuracy is our policy

Sir:

A mistake crept into my article, “Don’t Shun the Shunt Regulator,” in the July 5, 1969, issue (ED 14). On page 72, the equation for R_s should include E_o in the numerator and read:

\[ R_s = -\frac{E_o}{\left[V_{be}(Q6) + V_{ee sat}(Q4, Q5)\right]} \]

Walter G. Jung
Senior Engineer
Maryland Telecommunications, Div. of KMS Industries, Inc.
Cockeysville, Md.

Gunnar Richwell, author of “Design and match rf amplifiers” (ED 10, May 10, 1969, p. 106) has brought to our attention four errors in the computer printouts. The lines should read as follows:

RFAMP program statements
line 112 0 =-6.2831853*FQ (The left side of the equaton is the letter “O”)
line 146 16 K = 149 (149 was incorrectly shown as 140)
line 316 C = - (R^2, etc.) (The minus sign has been added).

Save $500 - plus pick your purchase plan

That's right, the outstanding acceptance of the HP 9100A computing calculator now allows us to reduce the price $500—from $4900 to the new price of $4400.

Plus you now have a choice of purchase plans. Buy, rent, or lease—you pick the purchase plan that best meets your needs.

How is HP able to do all this? Volume production. In fact, we're adding a new plant to produce more calculators.

Which brings up another important point. Volume production means you don't have to wait in line 6 weeks or 6 months to put this calculator to work for you. Call any of the 135 world-wide HP Sales and Service Offices today. You'll have a 9100A computing calculator on your desk faster than you thought possible.

So, if you have been sitting on the fence—now is the time to jump.

Lease/rental plans start as low as $1.50/computing hour based on average usage. Pick your purchase plan and save money by ordering the HP 9100A computing calculator today.

For additional information, contact Hewlett-Packard, Box 301, Loveland, Colorado 80537. (303) 667-5000. Europe: 1217 Meyrin-Geneva, Switzerland.

HEWLETT PACKARD
IF YOU THINK 13 IS AN UNLUCKY NUMBER...
MEET THE ZELTEX FET SET!

Thirteen FET-input differential op amps that fit just about any application you can name! Low drift—one model has only 2 $\mu$V/$^\circ$C. For high output, another has $\pm$100V. On top of this, we have a very fast 100 V/$\mu$s FET, a dual in-line FET and one that sells for only $15.

Still think thirteen is unlucky? Write or phone today for a complete FET SET data sheet and pick a winner!

1000 Chalomer Road, Concord, Calif. 94520/(415) 686-6660

INFORMATION RETRIEVAL NUMBER 39
Our new mini-computers have built-in programmers.

Most small computers are designed for programmers. Ours are designed for people.

Just tell our 16-bit machines what you want done. The CE16 and CF16 will do it, because their "built-in programmers" (a comprehensive set of sophisticated instructions) let any engineer use them with ease. For example, the single instruction "scan memory" makes our machines compare a given number with the contents of the entire memory.

The CE16 and CF16 have 125 other heroic instructions that specify comprehensive maneuvers. So you give fewer instructions and use far less core memory than with any other small computer. Problem run times are shortened and Input/Output operations are simplified.

The CE16 and CF16 are designed to control and exchange information with a large number of external devices while doing related computation. Their "automatic I/O" enables them to talk back and forth between memory and a group of interrupting peripherals, in order of priority, without needing attention from the on-going program.

Automatic I/O isn't a high priced option. Neither is a teletype, nor three priority interrupts, one of which is indefinitely expandable. They're all standard. The only thing you might pay extra for is speed. The CF16 can do a fully signed software multiply in 42 micro-seconds. But it costs a little more than the CE16 which takes 126 micro-seconds (which isn't bad) for the same job.

Don't take our word for all this. Drop us a line asking for:
- A brochure with straight from the shoulder specs so you can compare.
- A representative with more information than could fit in a brochure.
- Or a meeting between our sales engineer and one from any competitor you want, at your office. The competition can even bring a programmer along. We won't have to.
These new, low-priced Burr-Brown op amps give you more than you bargained for!

Here are two new general purpose operational amplifiers that will meet the performance and price requirements of your most economy-minded applications. There's a FET input unit and a transistor input unit, both with the built-in quality you expect from Burr-Brown... at the unexpected low price of less than $10 in large quantities.

Buckbee-Mears research developed the absolute filter.

Tasting our success was a great experience.

A key step in producing beer is pasteurization. Some of America's leading breweries have found they can produce a smoother beverage by using a precision-etched, Buckbee-Mears fine screen as a filter in the pasteurizing process.

It's no wonder. We make the only absolute filter available. With our process, we can hold the uniformity of holes in the filter screen constant. Our filter customers can choose just about any material they want, including stainless steel, molybdenum, nickel, monel and titanium — in any array.

Buckbee-Mears offers small or large holes in the array. Unlike die stamping, the on-centers can be adjusted close or far apart. Our absolute filters are self-cleaning because of planer construction. That's another exclusive advantage of our photomechanical reproduction process.

We etch absolute filter screens at a one-to-one ratio between metal thickness and hole size. Maximum hole size tolerance to ±10% of metal thickness, minimum to ±.0002".

While we're delighted to help the nation's brewmasters upgrade their product, our absolute filters have many other uses. They include centrifuge, synthetic fiber filters, coffee brewer screens, particle size determination and back-up screens for sub-micron filters. Anyone with a filtering application where an absolute filter is required can use our capabilities.

Producing the only absolute filter screen on the market is another example of creative technology from Buckbee-Mears. We're in business to help you solve your problems. Call or write Bill Amundson, our industrial sales manager, about your absolute filter requirements. Phone 612-227-6371. Skoal!

If speed drives you wild, we’ve got the control.

Our precision Adjustable-Speed Drives will give you precise control over the speed of your application with constant torque regardless of load change. They’re infinitely adjustable from 24 to 3600 rpm (150:1 speed range) with load regulation of better than 1/8 of 1% of rated speed. The Remote Control Head provides precise speed adjustment and continuous monitoring. Built for long service life, the modular plug-in design requires only a screwdriver for servicing. Over 250 models from 1/4 to 2 hp, with or without gear reduction or braking and reversing.

The moon and Wescon, too

The Apollo moon landing was a must story for this issue of ELECTRONIC DESIGN—no doubt about that. But it wasn’t an easy assignment.

The editors were already busy on a 108-page special section covering ED’s traditional August preview of the Western Electronic Show and Convention. This takes months of planning and scrambling to get advance details of technical papers that often have not yet been fully written, and of products that sometimes are barely off the drawing boards.

Somehow the dual effort sped on—a 20-page special lunar news section, plus the Wescon preview—to produce the weighty issue now in your hands.

Special moon-shot features were prepared by several editors. Dick Turmail, Management and Careers Editor, interviewed George Hage, Apollo deputy director. San Francisco Editor Elizabeth deAtley talked with NASA officials and project managers at various West Coast aerospace companies about Apollo spinoffs. The launch at Cape Kennedy and subsequent activities at the Houston Manned Spacecraft Center were covered by our Washington News Chief, Charlie LaFond. And Los Angeles Editor David Kaye interviewed various scientists for his “man-in-the-loop” article.

That joint push, aided by the skills of a talented art department, made this two-star issue possible.

This moon-struck group made the lunar news section in this issue really shine. The talented ED art department includes, left to right, art assistant Bill Kelly; art director Cliff Gardiner; and technical illustrators Rita Jendrzejewski and Lynn Thompson.
The monolithic construction of the new AlSiPak® package gives rugged RELIABILITY. It eliminates problems of hermeticity and has greatly improved strength. It has superior thermal conductivity because there is no glass in this package.

The leads are brazed to the metallized ceramic on the bottom which allows maximum chip cavity and bonding room. The number one lead and every fifth lead are identified inside the cavity for your convenience. Within limits, the standoff height can be tailored to meet special needs. The same basic lead frame is used on all packages. AlSiPak packages are dimensionally accurate and uniform with an index hole and slot for your automated handling. All packages having the same lead row spacing use the same lid. Solder preform tooling and metal lid tooling are available for each package.

Standard designs have the seal ring and chip pad grounded to No. 1 lead. For a slight extra charge you can have seal ring and/or chip pad connected to any other specified lead(s). Electrical flexibility is provided by a disconnect notch which can electrically isolate both the seal ring and chip pad.

The standard AlSiPak packages shown here have been in production for a number of months. They have been developed through many prototype production steps. We are indebted to engineering and production men in leading electronic firms for their collaboration and excellent recommendations. Other sizes and styles are in development and will be standard when demand and developments indicate.

We are now in volume production and can discuss realistic deliveries. Tell us what you need and we can work out firm schedules.
We just stole the automatic stick shift

and put it on our new Counters.

The automatic stick shift. That's the whole idea behind our new family of Counters. Snap to "pre-set" for automatic, knob-free sine wave measurements to 50 MHz or go stick shift with full trigger control if your signal is unsymmetrical.

But there's a lot more to our new Counters than just convenience:

- 500 Microvolt Sensitivity from 10 MHz to 500 MHz with automatic gain control for perfect triggering.
- 8 digits in 1 second with auto-ranging.
- Complete solid state input/output interface in systems models.

And, incidentally, automatic operation improves accuracy, too.

Prices for the DANA Model 8100 start at $1495.

EDITORIAL

The 'impossible' just takes extra effort to achieve

Well, we did it! We did what the average citizen thought impossible even a decade ago. And now that we've walked on the moon, the temptation is strong to ask: If we did this, why can't we put our national mind and will and resources to work to solve some of the great pressing problems on earth?

"Why not?" thousands are asking. "Why can't we wipe out such evils?"

Project Apollo has demonstrated that given the time and money—nine years and $24-billion, in this case—and the skills and efforts of thousands of workers—400,000 to reach the moon—the "impossible" can be turned into reality. But it took more than numbers to do it. What really made NASA's space effort such a magnificent success?

Organization. Good management. And dedication.

Given these qualities, a talented team of workers and the funds to do the job, we could indeed begin to rebuild the earth.

Cannot a technology that built a navigation system that safely guided the astronauts to a pinpoint moon landing a quarter of a million miles away find a way to save the lives of the more than 50,000 people who die each year in traffic accidents?

Cannot a technology that kept three astronauts alive in the vacuum of space and on the alternately boiling-freezing lunar surface provide enough food to feed the world's hungry?

Cannot a technology that enables man to propel a complex payload in space with millions of interdependent parts find a way to purify the air and rivers of this nation?

Those "impossible dreams" await fulfillment.

As Elizabeth deAtley points out in her story on Apollo spinoffs (p. 30), the manned space flight program has resulted in more than "2500 significant technological advances—from paints, materials and medicine to communications, computers and television." These spinoffs, though impressive, cannot alone solve the complex problems of civilization.

What is needed are NASA-like programs, of smaller or greater magnitude.

We have the resources and the technology to continue to explore space and to begin to come to grips with these problems.

RALPH DOBRINER
There's a lot more to making modules than buying a few IC's and slapping them on a board. For one thing, the modules almost never work—the first time. Almost never the second time. Occasionally the third time. And that's only the prototype.

Chances are, Digital already has the optimum design, computer tested, fully debugged, manufactured, and sitting there on the shelf.

Frustrating, isn't it?

Digital's M Series is the most complete, fully compatible, high speed, integrated circuit, inexpensive line of modules anywhere. We manufacture several million a year—many for our own computers—and know how.

Send for our new Logic Handbook. It tells you what, why, and how to build logic systems from modules. But, alas, not how to build the modules themselves.

Accent on quality

iting engineers Aug.19-22. There are 23 technical sessions (compared with 32 last year), but all emphasize what designers can achieve today. On display at 1192 booths are the star products of 600 companies.

You can take the grand tour right now. Read on.
TV brings the university to industry

Stanford's new instructional network allows engineers to take courses for credit without leaving their plants

Jim McDermott
News Editor

Continuing education for graduate students employed in engineering, management, and other careers is being rapidly implemented in California with what is claimed to be the most cost-effective TV network instruction system so far devised anywhere. The new system, which recently began operation with four channels at Stanford University in the San Francisco Bay Area will eventually extend southward to San Diego. System potential and plans are the subject of Wescon's largest conference session: "University Instructional TV Networks and What They Mean to Industry."

Although similar systems have been operating for over five years in Florida and Texas, Albert J. Morris, president of Genesys Systems Inc., and Wescon session organizer, says that the Stanford system is the most cost-effective because it is a third-generation system and is based on a two-year study of how to best accomplish the university-industry tie. Morris further claims that the new system has not only become the pattern for other forthcoming California networks, but is rapidly being adopted throughout the country as well.

How the system works

All of these university instructional networks have an on-campus TV studio-classroom; a classroom in the industrial plant; and a means of transmitting the TV signal from the university to the remote off-campus room. There must also be a means for the students to talk back to the instructor.

An important advantage of the Stanford system is the low-cost method of student talk-back via a low-power fm transmitter located at the industry site. In contrast, the Florida system, with programs piped between Gainesville, Cape Kennedy, Daytona Beach, and Orlando, uses regular telephone lines. And the Texas network, with transmissions between Southern Methodist University, Texas Christian University, University of Dallas, and the Southwest Center for Advanced Studies, uses telephone-system microwave repeaters.

One advantage of all these systems is that the employee need not commute to the university; he can attend the TV classroom set up in his plant. Furthermore, the lesson can be video-taped and played back later in-plant, for those who missed it due to the pressure of their jobs.

Of the present 1500 graduate students on the Stanford University Campus, the majority are full time, but some 300 to 400 of these students are employed in Bay Area industrial, government or research organizations. Because the classes are presented only during the day, much time is lost driving to and from the campus.

According to Joseph M. Pettit, Dean of the School of Engineering, one large company estimated that in one year, the commuting loss of time equalled two and one-half years of engineering time. Now, many students who could not normally be given time off to attend classes can do so through the university-industry TV setup.

Network supported by industry

The Stanford network, when fully implemented, will cover the entire San Francisco Bay area, as shown in Figure 1. This is largely because of the considerable interest in that locality, in combating professional obsolescence. In fact, a non-profit corporation, the Association for Continuing Education (ACE) was formed, in 1968, by 18 prominent Bay Area industries together with Stanford University for the purpose of conducting a large-scale, continuing education program using Stanford's TV facilities.

According to Robert Turk, general manager of ACE, the organization is unique among university-industry television complexes. Actually ACE is an extension of Stanford University, in that it cooperates with industry members in organizing classes and courses appropriate to grad-
uate and other study needs at the particular location.

The curriculum that ACE presents is controlled by participating members, and the courses stress applied knowledge, rather than theory. ACE officially began telecasting in May of this year, with 89 industrial students and four courses.

Present ACE hours are: 7-8 a.m.; 12 m-1 p.m.; and 4-7 p.m. Later, hours will be extended from 7 to 11 p.m. and weekends.

The regular Stanford University daytime graduate courses are handled and programmed by the university. ACE will also provide these same courses, from other schools, through the Stanford network facilities. For example, San Jose State plans to offer, through this network, graduate engineering courses for credit, while graduate courses in business are planned by the University of Santa Clara.

In addition, ACE will program seminars in state-of-the-art engineering classes for which no engineering credit is received. These are taught by industry or university personnel who have done research on the latest developments in engineering, mathematics, and the sciences.

Equipment at the industrial classroom consists of one or two 21-inch TV monitors, plus a microphone for each student, for talk-back facilities through the FM audio link.

How the joint effort began

The Stanford University efforts began, in 1967, with a feasibility study concerned with linking Stanford with classrooms in some 30 industrial organizations participating in the part-time graduate program. This study, Dean Pettit has pointed out, came up with a total capital cost of $600,000 for the Stanford facilities for the four-channel network. This sum was obtained from industry participants on a basis that was graduated according to the size of the organization. The share could be paid in a lump sum or prorated over 5 or 10 years.

It turned out that, for even the largest company, the total annual cost is less than a technician's salary. And according to session organizer Albert Morris, analysis of records for a large company has shown that with a sizable number of graduate students over 10 years, the prorated cost is only twenty cents per student, per classroom hour, for amortization and operating costs of the in-plant facilities.

The Stanford industrial-TV curriculum empha-
sizes graduate courses at the master’s level for which no thesis is required. It is theoretically possible to obtain a degree via the televised course, but Dean Pettit cautions that this is not entirely practical nor desirable. Some courses don’t lend themselves to TV treatment. He also suggests that the student take at least one seminar on the campus to become acquainted with one or more of the faculty.

In expanding the TV-education benefits, Stanford created a “non-registered” option that permits students in industry to take the TV classes without being matriculated at the university. They are tested and graded along with the regular students, but their performance does not affect the statistical standards of the others.

Included in the non-registered category are those who already have degrees, those who don’t want to complete all of the work for a degree, and those who want a degree but are not yet academically qualified. In this last case, Dean Pettit points out, Stanford allows these students to matriculate, and to transfer completed units by petition, provided they perform well enough as non-registered students in competition with the matriculated students.

Future coverage to be broad

Stanford network coverage of the Bay Area is planned to include a two-way link to the University of California at Berkeley for sharing lectures, seminars and courses. Cooperative arrangements with the University of Santa Clara and San Jose State are also being worked out.

For coverage in the Southern California area, plans are being made to link the University of California at Los Angeles with the campus at Irvine: these two, together with the University of Southern California, will serve the Los Angeles basin. Robert M. Saunders, Dean of the School of Engineering at Irvine, told ELECTRONIC DESIGN that they have recently been awarded four ITFS (instructional television, fixed station) channels for the area. According to the FCC notice, construction is scheduled to be finished by mid-February of next year.

Saunders also said that it is eventually hoped to link Irvine, Los Angeles and the University of Southern California with Santa Barbara College, Riverside College, and San Diego State.

The new Stanford educational TV system uses channels in the band of 31 which the FCC designated in 1963 for microwave operation of this type of station. The band extends from 2500 to 2686 MHz, giving a 6-MHz channel to each station, using the standard TV signal format. The channels are allocated in groups of four, with adjacent channels being separated by 6 MHz from another assigned locality.

The audio talk-back capability is obtained by utilizing fm radio talk-back in a 4-MHz band (2686-2690 MHz) adjacent to the top end of the ITFS band for each of the available channels. This system required a rule-making decision from the FCC, which was effective in June of this year. The first type-acceptance models of the talk-back system have been designed by Genesys Systems, Inc., for the Stanford network.

TV signals from the Stanford classrooms are carried by cable to a master control room, then relayed via a 12-GHz link, with 4-foot dishes, to the main transmitter on Black Mountain, which is 7.9 miles from the campus.

Each company requires only one receiving antenna, mast, and down-converter for all four channels. The system is of broadcast quality.

Seven of the 10 available watts are radiated from an antenna covering an arc of 160 degrees, with a horizontal gain of 17 dB. This gives an effective coverage of up to 25 miles for a 6-foot receiving dish. To reach San Francisco (36 miles) 1 watt is fed from a 10-foot parabola, and 8-foot parabolas are used at the industrial receiving sites.

To reach the Emeryville-Berkeley area (39 miles) 2 watts are fed from a 6-foot dish, and 10-foot parabolas are used for receiving.

The talk-back transmitting antennas at the industrial location are mounted in a plane with the receiving antennas and are cross-polarized to reduce cross-talk. On Black Mountain, the talk-back receiving antennas are mounted colinearly with the transmitter antennas.
The above illustrations are from unretouched photomicrographs taken of four \( \frac{1}{2} \)-watt fixed resistors. Compare the anchoring of the leads, the seal provided by the insulating jacket at the ends, the homogeneity of the resistance material, the sharp color code bands—and decide for yourself.

©Allen-Bradley Company 1967

A-B hot-molded fixed resistors are available in all standard resistance values and tolerances, plus values above and below standard limits. A-B hot-molded resistors meet or exceed all applicable military specifications including the new Established Reliability Specification. Shown actual size.
Reliability is six things we do that nobody else does.
We’re fanatics.

We build our relays stronger than we have to. That way, they last lots longer than they ever have to. Our Class E relay (shown on the opposite page) is a good example of our way of thinking.

The industry’s strongest heelpiece.

We make the strongest heelpiece in the industry. A gigantic machine bangs them out extra fat and extra flat.

Extra fat to carry a maximum of flux. To handle big loads. Extra flat so that once an AE relay is adjusted, it stays adjusted.

Since our backstop is part of the heelpiece, it’s just as thick and flat. But, tough as it is, the slightest wear here would throw the entire contact assembly out of whack. So, to be safe, we weld two tiny, non-magnetic pads where the armature arms meet the backstop. You might say we created the no-stop backstop.

Three parts that'll wear like crazy.

When you build a relay like a small tank, you have to think of everything. We try. Right down to the tiniest part. For example, we make our armature arms and bearing yoke extra thick.

Thicker than years of testing and use say they have to be. Then, to make sure they don’t cause wear problems, we insert a hardened shim between the hinge pin and the frame. The pin rides on the shim, instead of wearing into the heelpiece. (You can forget the bearing, it’s permanently lubricated.)

Buffers with lots of muscle.

We make our buffers of a special tough phenolic material that lasts. And lasts. And lasts. All without wear or distortion. Another reason why our relays stay in whack.

To make sure our buffers stay in place, we weld the buffer cups to the armature arms. We weld, instead of using rivets, because our lab found that rivets have a habit of falling out.

For the very same reason, we weld buffer cups to the contact springs. And also use the same special tough phenolic buffers.

No, we didn’t forget the contact springs.

We have some strong feelings as to what makes a contact spring reliable. Our sentiment is that two contacts are better than one. So, we bifurcate all the springs, not just the make and break. This slotting and the addition of another contact to each spring means you get a completed circuit every time.

We make each set of contact points self-cleaning. The bad stuff doesn’t have a chance to build up.

Now, what’s different about our bobbin?

Our bobbin is one piece—molded of glass-filled nylon. This provides the maximum in insulation resistance.

Because our bobbin is nylon, we don’t have to impregnate with varnish. Moisture and humidity have no effect on the stubborn nylon material. No effect means no malfunctions for you to worry about.

What all this means to you.

What this all adds up to is reliability. The kind of toughness no one else can give you. It means an AE relay works when it’s supposed to, longer than it has to.

Isn’t this the kind of reliability you really need? Automatic Electric Company, Northlake, Ill. 60164.

Technology in the world of today

Papers at Wescon stress the practical applications available now in developments that also have a future

Aerospace

Satellites preparing to explore the earth

How to bug the earth and its atmosphere with unmanned sensors that report to stationary satellites is described in detail in session No. 12. The report, part of a session devoted to data-relay satellites, is by S. D. Dorfman of Hughes Aircraft's Space Systems Div., El Segundo, Calif. Examples of the in situ sensors include buoys, balloons, seismic detectors, volcanic detectors, agricultural sensors that even measure the temperature of soil moisture, smoke detectors and weather stations.

Users of such systems are expected to include the U. S. Depts. of Commerce, Interior, Transportation and Agriculture, as well as agencies in other countries. By 1975 Dorfman foresees as many as 26,000 platforms, all serviced by three or four satellites. The cost of the data communication system over a five-year period—not including the platform sensors—would come to about $100 million, Dorfman says. A conventional system, not using satellites, would cost $1.25 million.

Frequency choices are 149 MHz for the uplink and 137 MHz for the downlink.

Wide areas of interest

The session will appeal to a surprisingly large variety of engineers and scientists, session organizer S. H. Durrani of the Comsat Corp. in Washington, D. C., told ELECTRONIC DESIGN. Those who will find it particularly valuable include not only engineers working in the environmental sciences—meteorology, geology, agriculture, oil exploration, geodesy, fishing—but those working for oil or other companies that must collect information from remote, often unmanned, stations. Their equipment suppliers will also be interested.

Another big group consists of communicators—companies that now supply the public with telephone service by high-frequency and microwave radio, as well as those interested in providing industry with quick transmission of correspondence and records.

A satellite communications network for domestic use to provide an “entirely new approach to telecommunications in the United States” is described by W. B. Gross, Program Manager, General Electric, Philadelphia. Whereas a call from Los Angeles to New York via terrestrial means passes through approximately ten distinct switching offices, a call by satellites goes through two.

The system GE proposes would use a minimum of two satellites in synchronous orbit. The earth station is modular in design and uses commercial equipment for the antenna, feeds and rf portions. The automatic digital exchange is a special-purpose digital computer oriented to communications control and processing. Local loop (telephone line) interface equipment is built in modules to provide flexibility in deploying the system.

To fully implement the system by 1980, Gross says, would cost $321 million. This includes initial research and development, the cost of five satellites and boosters, earth facilities, and the continued research that would be needed through 1980. The largest single investment would be the earth facilities, which, Gross estimates, would cost approximately $140 million. This includes 175 earth stations, one routing center, and other administrative facilities.

Building a satellite network

The problem of how to weave a large number of ground users into a satellite network is aired by P. J. Heffernan of the National Aeronautics and Space Administration's Goddard Space Flight Center in Greenbelt, Md.
Heffernan uses as a hypothetical case a system with 70 ground stations. He covers such problems as how multiple access techniques can accommodate this number, how the satellite can be tracked, and how the signal should be designed and modulated.

Multiple access will be different for a domestic system than for that used with Apollo, Heffernan says. Apollo ground stations acquire the carrier and remodulate the received code sidebands and send them back on another carrier. For the domestic system, Heffernan recommends that the user lock on carrier and code, regenerate the code and send it back to the satellite.

Very high frequency should be used rather than S-band or L-band to make the terminal equipment simpler. And tracking will be accomplished by a pseudo noise spread spectrum technique.

Those interested in transmitting photographic data will be interested in W. J. Gill’s report on an experiment made by Philco-Ford of Palo Alto, Calif., in which photographs were transmitted via the Defense Department’s interim communications satellite network.

The key elements in the system are the analog-to-digital conversion and the image-recording equipment—the image appears on a cathode ray tube that is photographed. Although originally designed for the military, such a system could be used commercially.

Coding and signal selection for the data relay satellite interrogation is probably the most technical paper in the session. It is given by G. D. Boyce of General Dynamics Convair in San Diego.

Boyce doesn’t claim to have the best of all possible approaches, but he prefers the majority voting approach to error detection or error coding. He feels that phase lock loops are too complicated; he prefers to use frequency shift keying.

**Defence Dept. unhappy over avionics**

Recent criticism of avionics systems by the Defense Dept.’s Systems Analysis office should add a sense of immediacy to the session on “Future Avionics System Architecture” (No. 19). The dissatisfaction the Defense Dept. expressed, however, came as no surprise to session organizer John A. Alexander of TRW Systems Group, Redondo Beach, Calif.

“We’ve known for a long time that a new approach to designing avionics is needed,” he told *Electronic Design*. “That’s why we used the word ‘architecture’ in our session title. Architecture means the total disciplines and procedures needed to build something—in this case avionics systems.” There is too much redundancy, he says; too many add-ons.

The session begins with a bid for integrated avionics by Richard D. Alberts, Air Force Avionics Laboratory, Wright Patterson AFB, Ohio. Alberts describes work under way by the Air Force on techniques to integrate the communications, navigation and identification functions to and high-frequency avionic systems aboard commercial aircraft (Paper 21/3).
operate on a single radio frequency.

Will one computer solve all the problems in the aircraft or will each subsystem have its own processing unit? This much-debated controversy over "federated vs. integrated computer systems" is discussed by J. H. Crenshaw of IBM Federal Systems Div., Owego, N.Y.

While federated systems (one computer for every task) seems on the way out, a fully integrated system, using a single, central computer, has not yet arrived. Today's advanced aircraft use a combination of the two. After recounting the advantages and disadvantages of both extremes, Crenshaw concludes that integrated systems will continue to gain, with the actual system still remaining something of a hybrid.

To design for military avionics, L. S. Guarino, Naval Air Development Center, Johnsville, Warminster, Pa., tells the engineer where his effort should be directed. If the pilot is to be given more time for decision making with all the collection, integration and processing of information performed by avionics there must be more confidence in the avionic systems.

To do this the engineer should concentrate on:
- The electrical interfaces between black boxes. "This has been a main cause of avionic system failures," Guarino says. "The number of wires between boxes must be drastically reduced. The use of MINCOMS (multiplexed interior communication system) appears promising and should be developed for the avionic system."
- Displays are important. The use of CRT tubes should be replaced with solid-state devices, and color should be added. For more realistic representation, engineer Guarino suggests holo-
graphic techniques be used.

- Man-machine simulators "should be the designer's most valuable tool."

The final paper, authored by J. R. Goodykoontz and V. A. Karpenko of TRW Systems Group, reports an interesting convergence taking place between the design of avionics and space equipment. Avionics on the one hand is getting more complex, while space equipment is becoming cheaper and more reliable, due to more enlightened techniques. 

**Circuit Design**

**ICs and computers growing in influence**

Circuit design and analysis are coming increasingly under the influence of the computer and the integrated circuit. Wescon coverage of such areas as filter design, mathematical modeling and oscilloscope techniques reflects the trend.

Session 4 on "Integrated Circuits in Active Filters" carries filter design through thick and thin films. Dr. George S. Moschytz of Bell Telephone Laboratories, Holmdel, N.J., uses tantalum thin-film RC networks and general-purpose silicon integrated operational amplifiers to construct a family of basic second-order filter building blocks, from which a wide variety of filters can be assembled. His paper, "FEN (Frequency Emphasizing Network) Using Hybrid Integrated Building Blocks," describes three pairs of blocks that operate from 100 Hz to 100 kHz. There is a pair for low-Q and one for medium-Q applications. A combination of the two is used for high-Q applications.

Moschytz derives the response of a medium-selectivity-frequency-emphasizing network and shows how his building blocks can be combined. He also describes techniques to construct the tantalum thin-film devices he uses.

The thick-film technique is upheld by Dennis Hollenbeck of Kinetic Technology, Los Gatos, Calif., in a paper on "Multiloop Negative Feedback Active Filters Using Thick-Film Integrated Circuit Techniques," and by William Broyles of Sprague Electric Co., North Adams, Mass., in "ICs and Thick Films Add Up to Improved RC Active Filters."

Broyles describes a method of producing custom filters that meet tight specifications and tolerances. Four standard topologies can be combined to meet a wide variety of needs. The frequency range is 0.01 Hz to 20 kHz, with Qs up to 300. Input impedance is high, and the output impedance is low. The significant aspects of the approach are to use thick-film resistor networks and bonded-on capacitors. Gain is obtained from IC amplifiers. The desired requirements are programmed into an interactive computer. The designer can continue the computation with refinements, until he is satisfied that he has obtained the best design. The computed thick-film networks are then produced and assembled, along with the ICs, into finished networks.

The combination of accurate computation plus the stability and reproducibility of the thick films make for a superior product, Broyles contends. The size of a completed sixth-order filter is about one cubic inch. "This approach can turn theory into an economical product," he says.

Hollenbeck's designs allow the user of the product to make the final determination of its characteristics. This is done by external trimming. His filters also cover the audio band and may have Qs up to 2000, with high input and low output impedance. The user can choose high-pass, low-pass or bandpass operation, as well as the center frequency. The filters are individually packaged on aluminum substrates, with screened-on resistors in the passive networks and 80-dB operational amplifiers in the active networks. Each package contains one pole pair, and packages can be combined for more complex transfer functions. A key feature of the design is the very low supply power required for operation—between ±2 V and ±15 V.

This Wescon session, organized by Gunnar Hurtig 3d of Kinetic Technology, Los Gatos, Calif., probably holds the greatest interest for the engineer in circuit design.

"High-Speed Oscilloscope Recording," is the subject of Session 13, organized by James R. Pettit of Hewlett-Packard, Colorado Springs, Colo. The ubiquitous computer appears even in this haven of measurement in a paper that discusses the mating of single transient oscilloscopes to on-line machines. Other papers cover photography of transients on oscilloscopes and high-frequency trigger circuit design.

The last listed session of Wescon is No. 23, "Computer-Aided Circuit Design," organized by Ron Rohrer, Fairchild Semiconductor, Mountain View, Calif., and Gabor Temes, Ampex Corp., Redwood City, Calif. This is another of the difficult-to-classify sessions, dealing as it does with both circuit design and computers. A paper presented by Harry B. Lee of Lincoln Laboratory,
Massachusetts Institute of Technology, Lexington, Mass., points out design difficulties in programing circuits. Entitled "Circuit Simulation Present and Future," the paper states that as computers progress from the research stage to daily use, better programs must be written to meet the needs of the circuit designer. In particular, Lee thinks that the programs should be "human engineered" better to enable anyone to use a computer with little or no knowledge of programing. He also advises that new analysis techniques, such as the sparse matrix and implicit integration, be incorporated into computer programs. Implicit integration, by the way, can eliminate the problem of long computation time that arises when a circuit has widely spaced time constants.

Lee is strongly in favor of graphic output displays as an aid to the designer. He especially likes storage CRTs, which permit the designer to study the results of his efforts. He does not believe that elaborate input devices, like the light pen and graphic input terminal, can justify their cost.

Other Session 23 papers cover such diverse topics as transistor modeling, network optimization and layout.

Communications

Solutions offered for digital hangups

Wescon is offering only a limited technical agenda for communications engineers, but what there is promises to be very worthwhile.

The most important session appears to be "Signal Processing Techniques in Digital Communications" (Session 11), which is being held in Meeting Room B on Wednesday afternoon. The chairman, Adam Lender of Lenkurt Electric Co., San Carlos, Calif., says the session is entirely devoted to new designs and techniques, presented from a practical point of view. It is considering the three most significant areas in digital communication:
- Signal design.
- Adaptive equalization.
- Error control.

The lead-off paper, by W. J. Melvin of Collins Radio, Newport Beach, Calif., discusses the digitalization of a communications terminal—both transmitter and receiver—so as to eliminate such analog devices as filters and modulators. The terminal actually becomes a small, special-purpose computer. The idea is explained by referring to a particular differentially coherent, four-phase PSK system with a matched-filter receiver. Performance data includes error rates in the presence of additive Gaussian noise.

Practical adaptive equalizers

The next two papers are concerned with adaptive equalization. This is the automatic adjustment of the receiver to compensate for changes in the transmission medium.

In their paper "A Simple Adaptive Equalizer for Efficient Data Transmission," D. Hirsch and W. J. Wolf, of Bell Telephone Laboratories, Holmdel, N.J., discuss several algorithms for directing the equalizer towards the properly matched condition. The methods vary from zero-forcing to minimizing the mean-square error. A practical example, employing a modified zero-forcing algorithm, is described.

Gerald K. McAuliffe of the IBM Watson Research Center, Yorktown Heights, N.Y., discusses adaptive equalization from an entirely different viewpoint. He focuses on a proposed method employing fast Fourier transform (FFT) techniques. He compares this with the tapped delay-line approach and the carrier-cancellation approach.

The final paper of the session—"Recent Developments in Error Control Techniques," by Allen H. Levesque of General Telephone and Electronics Laboratories, Waltham, Mass.—emphasizes the selection of an appropriate error-control coding technique for any transmission channel.

As many engineers already know, the optimum type of error control depends upon the error statistics of the channel. The usual simple assumption that errors occur singly and independent of one another is rarely valid.

It applies only in deep-space communications and some satellite links. Most other channels, such as hf, tropo and wire, tend to have clusters of errors. Therefore Levesque begins his discussion with a review of the statistics of the different channels and then analyzes the error-control methods appropriate for each.

In the case of channels with bursts of errors, a major objective is to break up the bursts. For block codes, this is done by interleaving the blocks at the decoder. The concept of concatenated codes—codes that make up long blocks by cascading many short ones—is discussed. A dual-mode type of error control, called burst-bracketing, is also described. Burst-bracketing codes actually switch the mode of decoding, depending upon whether densely clustered or independent errors are occurring. A discussion of convolutional codes wraps up the consideration of ways to combat burst errors.

The final error-control procedure being considered is the sequential decoding of convolutional
Array systems engineer Charles Mclean of Viatron Computer Systems Corp. is busy designing a composite layout for a complex MOS array (Paper 15/3).

Monolithic integrated circuit chip containing three operational amplifiers will be used in a hybrid active filter. These filters will be discussed in Paper 4/4 by Dennis Hollenbeck of Kinetic Technology Corp.
codes. This method is really useful only with independently occurring errors, but it approaches the ultimate theoretical performance promised by the analysis of optimum codes.

The entire session is being sponsored by the Communications Systems Discipline Committee of the IEEE Communications Technology Group.

Also of interest to communications engineers is Session 9 on "Linear Integrated Circuits in Communications" and Session 12 on "Data Relay Satellites." For further information on Session 12, see the Aerospace section of the review of technical papers. ■ ■

Computers

Automation spurring efficiency in factories

Two sessions at Wescon are devoted to a growing phenomenon: the use of the computer in factory quality control. Across the country, computers are being used to monitor test lines, control manufacturing processes, collect factory data and assist management. In at least one case, a computer is also being used in the field to test and trouble-shoot airborne navigational equipment from commercial airliners.

Session 8, organized by George H. Ebel of Conrac Corp., Caldwell, N.J., and S. Levy of RCA, Camden, N.J., considers "Manufacturing and Computers." In a paper on "Computer-Controlled On-Line Testing and Inspection," Peter H. Goebel of General Radio Co., Cambridge, Mass., describes how his company was able to make a routine task of the testing of electronic subassemblies used in measuring instruments. A test system was assembled to perform functional logic testing, test-fixture standardization, diagnostic trouble-shooting and go/no go testing. An important consideration was to make the entire test system operable by personnel with no special training.

The computer in General Radio's test system is a standard Digital Equipment PDP-8/L, and it serves as the control device for all peripheral system components. When not in use in the test system, it can be used to prepare test programs and tapes.

The other parts of the system hardware are the system interface, where computer and peripheral equipment interconnections are made; the control panel, which serves as the medium between operator and system; a readout scope, which aids in both go/no go and diagnostic testing, and a high-speed reader, which operates from punched paper tape. A device adapter is used to connect the device that is being tested into the system.

The system software includes an easy-to-use and versatile programming language that can be used by personnel with no prior computer knowledge. Simple and logical commands are provided to perform the test on electronic modules. Some of the statements possible allow listing of test points, forcing of inputs, checking of outputs, repetition of tests and the calling of subroutines.

Among the benefits claimed for the system are reduction of lead time in module testing, fewer false indications of failure, a saving in set-up time and a higher yield of usable modules.

Airliners use many pieces of electronic communication and navigation equipment. These systems, which may be either analog or digital, are housed in individual boxes. Failures in these boxes are usually reported by flight crews. Ordinarily the trouble is diagnosed manually by specialists, and the repairs are made at convenient airports.

Computer testing made easy

In the system designed by Stutesman, diagnosis of the faults and checkout of the repaired equipment is performed by computer, and these two tasks can be done by relatively unskilled personnel. The central computer in the system is the Bendix BDX 6200. The software is based on the Atlas language, developed by ARINC (Aircraft Radio, Inc.). Inputs to the system can be on perforated tapes or via keyboard. Unskilled personnel can interact with the system in a language that closely resembles English.

At this time the system can test 30 to 40 different avionic boxes of different manufacture. An extra dividend is use of the system in the Bendix plant for final inspection of airliner equipment.

Other Wescon sessions are devoted to time-sharing and computer display devices. The time-sharing session stresses applications. The papers in the display session emphasize on-line and real time displays.

In all, at least 13 Wescon papers report on computer applications in some aspect of manufacturing—either quality control or automatic processing. ■ ■
Microelectronics

ICs are changing design picture

From Anaheim, Calif., to Boston, engineers are examining the changes that ICs are causing. Circuit design, system design, engineering communications and vendor-customer relations—all are different in age of the IC. But exactly what are the changes? And what are their effects?

In Session 1, “IC Systems: The Changing Interface,” you learn that systems houses are becoming concerned. Their share of value added to their products is dropping drastically, and they fear that their profits may follow. They are making a serious analysis of the situation.

For instance, the Singer Co., Palo Alto, Calif., finds that about 40% of the factory cost of its Friden desk calculators is accrued in the purchase from outside vendors of semiconductor parts. Parts purchased in the past, from outside the company, for a mechanical calculator accounted for only 10% of factory cost.

How can systems houses make up their loss in value added? George Hare of Singer says, in the first paper of the session, that they probably should plan to produce ICs in-house.

Other papers in Session 1 discuss the growing use of computer aids in the production and testing of ICs, and the changing role of the circuit designer. How, for instance, does a system designer avoid design redundancy?

Typically, an engineer who wants to order a special IC will design and breadboard a prototype, and order the IC only after he has done this. The vendor's engineers then duplicate much of the original work in learning the circuit problem, developing the IC and preparing tests for it. But how can the needless duplication of effort be reduced? Clearly, by communicating more concisely, but how is this accomplished? Answers are given in Session 1.

Designers in a dilemma

You can take a close look at MOS ICs in Session 15, “MOS ICs: A Critical Review.”

“Every systems designer,” says Glen Madland, president of Integrated Circuits Engineering Corp., Phoenix, Ariz., in the first paper, “must decide whether to go MOS, bipolar, or hybrid, and the technical and economic success of his project depends on getting the right answer.” Madland discusses the implications of MOS in device design, circuit design, and partitioning.

In the second paper, Ralph Parris, staff engineer at Burroughs Corp.'s Circuits and Packaging Dept., presents guidelines on choosing MOS processes, and packaging and testing schemes, and he gives his views on the proper choice of an MOS vendor. In another paper, Dr. Leland Seely, general manager of General Instrument's Microelectronics Div., tells how the vendors are achieving TTL compatibility in their MOS.

For the designer who is having nightmares over his vulnerable single-source situation, Larry Drew, manager of engineering development at Viatron Computer Systems Corp., Burlington, Mass., has some soothing words. Drew sees single sourcing as inevitable, and MOS procurement as a joint business venture between vendor and customer. And a glimpse of the MOS future is provided by Al Phillips, assistant to the president at Autonetics, Anaheim, Calif.

Filters, linears, and power ICs

For engineers whose interest is in circuit design, there are papers galore, covering active filter design, linear ICs and high-power microcircuits.

Possibly the most interesting of these sessions is No. 4, “ICs in Active Filters”. It was organized by Gunnar Hurtig, executive vice-president of Kinetic Technology, Inc., Los Gatos, Calif., and he has chosen speakers for a “practical session, with as much information on hardware as possible”. He says that his company deals with “a lot of engineers who expect to use active filters but don't have a good practical knowledge of their capabilities. They don't know what's available and don't know where the pitfalls are.”

The session opens with a paper by Sanjit Mitra,
a professor at the University of California, on the over-all problems encountered in building active filters. He gives a description of the types that can best be built with ICs. He says that IC active filters are the only economically practical ones.

The next paper discusses the popular methods of designing active filters, with gyrators and with multiple-loop negative feedback circuits, and the merits and disadvantages of each. The remaining four speakers describe the design and construction of actual filter circuits, including a monolithic silicon gyrator and thin-and-thick-film negative feedback filters. They speak from valuable experience with hardware, and they have some invaluable tips for attending designers.

On the packaging and interconnection side, Robert A. Hirschfeld of National Semiconductor, Santa Clara, Calif., gives some valuable design tips on how to use pins efficiently in complex communication systems. And Hans R. Camenzind of Signetics Corp., Sunnyvale, Calif., describes the merits of a system approach to the design of IC communication circuits.

A ‘high-power’ session

And for the designer who works with power—in voltage regulators, amplifiers, or control circuits—there is Session 17, “High Power Microcircuits.” Thomas M. Frederikson of Motorola’s Integrated Circuits Center, Mesa, Ariz., and George Smith of Beckman Instruments Inc., Fullerton, Calif., explore the design and the capabilities of new monolithic and hybrid voltage regulators.

Herb Miezel, Dale Baughes and Leon Balents of RCA, Somerville, N.J., discuss high-power hybrid amplifiers, and William Whittaker Sr. of Texas Instruments, Dallas, Tex., present techniques for controlling power on an IC chip.

James Williams of Hughes Aircraft Co., Culver City, winds up the session with some valuable remarks on what he thinks is needed in power microcircuits. Williams feels that if ICs are to be used extensively in power circuits they will have to cost less, have improved temperature coefficients, and be used in systems designed to exploit their properties—perhaps in digital replacements for present analog circuits. •

Microwaves

EDP is password to clever design

Computer-aided design is the key phrase this year in the microwave sessions at WESCON. The digital designers are not only being used to design microwave integrated circuits; they are developing active devices as well.

Most of the papers on this subject are in Session 6, “Computer-Aided Design of High Frequency Circuits.” Microwave engineers will probably be most interested in hearing the fourth paper, “Microwave Circuit Synthesis and Measurement,” by H. Stinehelfer and W. Atwood of Microwave Associates, Burlington, Mass. It emphasizes the modeling problem in computer-aided design.

The usual design procedure, when computers are used, is to model the active devices and then to use these models to develop passive matching circuits. Often the original model is less than perfect, resulting in the design of less than optimum circuits.

To solve this problem, one can model the circuit by means of a theoretical circuit, with parameters adjustable to fit experimental data. As Stinehelfer and Atwood point out, however, the selection of an algorithm to adjust the theoretical circuit parameters isn’t easy.

Essentially the problem boils down to minimizing a multi-dimensional function of many variables.

Most existing techniques consist basically of searching in some systematic fashion for the desired minimum point. To speed the process, other programs evaluate the gradients of the functions and use them to form a new estimate for the

UHF hybrid receiver module fabricated by IIT Research Institute is contrasted with a conventional coaxial mixer (Paper 3/5).
Computers help design GaAs diodes, as Chung K. Kim of Micro State Electronics, Murray Hill, N.J., will explain in his paper in Session 6. The Varian unit shown here is about to be bonded to a single tuning screw.

do not increase unacceptably.

Aside that, Knox says, titanium dioxide is at least comparable to alumina in all important physical parameters.

For engineers who may have slipped behind the times, two other papers in Session 3 provide a review of the state of the art in two important areas: acoustic delay devices and solid-state sources. In his paper “Solid State Microwave Acoustic Variable Delay Devices,” Ernst K. Kirchner of Microwave Electronics, Palo Alto, Cal., reviews the requirements for variable delay devices and then examines the hardware available to meet these requirements. The major areas of application he cites are array antennas, radar test equipment and electronic countermeasures gear. The first of these areas requires delays of up to 100 ns, with bandwidths of 500 MHz and center frequencies from 0.5 to 10 GHz. The second area needs a much longer range of delay: from about 1 to 150 µs. Most of the characteristics desired for ECM delay lines are classified and cannot be discussed further.

To meet these requirements, a fairly large selection of devices is available. Kirchner believes that the mechanically variable magnetoelastic delay line is particularly promising. Other devices that he reviews include the electrically variable magnetoelastic delay line, the elasto-optical delay line, sliding acoustic crystals, ferroelectric materials and repetitive pulse-memory systems.

The other review paper is “Bulk GaAs and IMPATT Microwave Sources,” by W. Keith Kennedy Jr. of Watkins-Johnson Co., Palo Alto. He compares the avalanche-diode sources (both IMPATT and TRAPATT) with the bulk GaAs sources. He does not distinguish between the various modes of diode operation in bulk GaAs because of the current disagreement in the literature on the exact locations of the boundaries between the different modes.
If your heat dissipation requirements include:
- Maximum selection of heat sink styles
- Fast delivery
- Consistent quality
- Reliability of design
- Specialized engineering

Then heat sinks by ITC TOR are for you.

From a simple flag type dissipator to complex blower-cooled heat sinks; to dissipate 1/4-watt or 500-watts; to cool one component or hundreds; ITC TOR offers a choice of over 200 styles and sizes, in-house control of all engineering and manufacturing phases, and creative engineering to solve any specialized heat dissipation problems.

**AVAILABILITY.** ITC TOR maintains a complete stock of standard heat sink styles and sizes and assures shipment of most orders within 24-hours.

**SPECIAL SERVICES.** Prototype through production-run quantities can be produced—economically and to your schedule—to the most exacting specifications by TOR machinists and fabrication specialists.

**ENGINEERING.** ITC TOR retains a complete engineering department to provide effective design for specialized heat sink applications. Since all engineering and die making is accomplished at ITC TOR, the fastest design and delivery of specialized devices are assured.

**NEW PRODUCTS.** ITC TOR has just completed development of a line of liquid cooled heat dissipators capable of effectively replacing devices 20 to 40 times larger.

1. **LP12 Series** heat sinks are ideal for small space requirements and printed circuit applications. Measuring only 1.60 x 1.60 x .75 with less than 1 mil surface smoothness, they are capable of dissipating 16-watts for 100 degrees centigrade temperature rise. Prestamped configurations include both TO3 and TO66 transistor outline, and are available in a variety of finishes. Also available are special brackets for mounting multiple LP12's on a single side or back-to-back.

2. **400 Series** flag-type heat sinks are one of several types available for TO-5 transistors. Friction mounting, the series provides high heat dissipation while requiring minimum layout space.

3. **Series 1647** are specially engineered heat sinks providing heat dissipation up to 500 watts without forced convection cooling. Heat sinks within this series can be pre-drilled to mount any type component or semiconductor device requiring high heat dissipation. Construction is extruded aluminum, and heat sinks are available unfinished or finished to customer specification.

4. Modular cooling units utilizing forced convection provide maximum heat dissipation performance of air cooled heat sinks. Special multiplane mounting surfaces accept all semiconductor types providing easy access and reduced circuitry. Units are available unassembled or assembled, with or without fan, pre-drilled or undrilled. Heat sink finish is black anodized with end plates of cadmium plated steel.

Heat dissipation problem? ... contact ITC TOR, a division of Industrial Technology Corporation, a Subsidiary of Republic Corporation, 1960 West 139th Street, Gardena, California 90249. Telephone (213) 334-4907. Complete catalog and wall chart on heat dissipators are available on request.

**ITC TOR**

**INFORMATION RETRIEVAL NUMBER 51**
16 million hours of test time without a single failure.

ITC Riedon precision wirewound resistors combine this high reliability with close temperature coefficients, close tolerances, fast rise time and small size.

More specifically, they give you:

- **Stability to 0.002%, provided by actually fusing resistance elements to terminations.** Thermal emf is negligible.
- **Standard temperature coefficient of 0 ± 10 ppm/°C above 100 ohms to 0 ± 30 ppm/°C for 0.1 to 9 ohms between -65°C and +150°C.**
- **Standard tolerance range from 1% down to 0.005%, measured at 25°C.**
- **Operation to 175°C, made possible by unique hot encapsulation, which eliminates virtually all moisture and voids.**
- **Rise time as fast as 10 nanoseconds up to 100KHz frequency input.** (This puts wirewounds where metal film was once the only solution.)

This performance should come as no surprise. Riedon originated the molding process for encapsulating resistors in epoxy. They were first to produce a molded epoxy encapsulated precision wirewound resistor that exceeded MIL-R-39005 and MIL-R-38100. They have qualified to the latest military specifications covering “Hi-Rel” parts (a failure rate of less than 0.01%/1,000 hours at 125°C and 60% confidence level).

These same resistors go into Riedon networks. We design and package them in ladders, voltage dividers, analog-to-digital converters, operational amplifiers or miniaturized components. Combined with capacitors, conductors or diodes in a hermetically sealed package, one ITC Riedon element can replace 20 or more individual items.

We have a new 12-page folder that tells the full performance story of Riedon resistors. Why not send for a copy? ITC Riedon, a division of Industrial Technology Corporation, a subsidiary of Republic Corporation, 7932 Haskell Avenue, Van Nuys, California 91406 (213) 873-3464.

A few no-nonsense words about Multilayer Circuit Board cost vs. quality

We at ITC Circuit Products would like to set the record straight about the cost-to-quality relationship of multilayer boards. When a multilayer circuit board manufacturer installs the most advanced equipment obtainable, institutes the best possible processes, places all development and production activity under rigorous engineering control, he will produce quality multilayer circuit boards.

And the net effect of all of this on cost is to lower it. **Yield is the key to cost**. Sound illogical? Not at all. The reason is that quality processes and equipment produce greater yield, and yield is the primary determinant of cost in any multilayer board production operation.

So when we set up our multilayer circuit board capability, that's the philosophy we built it on—the finest state-of-the-art facilities, equipment, and processes available in order to produce the best boards at lowest cost.

**ITC's Laminating Presses finest in industry**

Take our laminating press system, for instance. It's the most advanced of any circuit board manufacturer in the nation. The new system gives an unprecedented $\pm 1.5^\circ F$ temperature control over the entire platen which means absolute uniformity of resin state and cure. What does this do for us? To date, not a single board has been rejected at ITC for layer shift since the new laminating system was installed, a phenomenal record. Another example is precision cool and cure temperature control. Because the temperature curve is so perfectly defined, we know the exact state of cure at all times and can take the board out of the press for oven-bake at just the right moment to achieve predictable electrical characteristics. We never have to guess on oven curing.

**Advanced equipment proving cost concept**

Precision laminating presses, numerically controlled, high-capacity drills, advanced photore sist processes—all these and many others daily are proving out ITC's concept of low cost through high-yield quality processes and equipment. ITC Circuit Products is ready for your order, be it quick turn-around prototype or long production run. Really, when at ITC Circuit Products quality equals low cost, why take less?

ITC Circuit Products, a division of Industrial Technology Corporation, a subsidiary of Republic Corporation, 1111 Grand Street, El Segundo, California 90245, Telephone (213) 772-2531

U102 U102 ELECTRONIC DESIGN 17, August 16, 1969
COMPARE THESE FEATURES BEFORE MAKING ANY POTENTIOMETER BUYING DECISIONS:

- SINGLE SOURCE FOR ALL REQUIREMENTS. More than 9000 basic models, styles, resistance values and lead configurations assure the exact potentiometer for every application.

- WIDE RESISTANCE RANGE. Rectangular, square, tubular, and slide wire configurations combine to provide resistance selection from ½-ohm to 150K ohms.

- PATENTED WIPER trademarked “Quite Trim” is a most unique wiper design. Utilizing a ring of multiple contacts 360° around the resistance element, the wiper makes sequential contacts on each turn of resistance wire, greatly increasing resolution and decreasing noise even under extreme shock and vibration.

- LOW NOISE. “Quiet Trim” wiper design provides extremely low contact noise. Every “Quite Trim” potentiometer is 100% inspected to assure noise of 20 ohms maximum.

- LOW TC of only 50 ppm/° C of “Quiet Trim” potentiometers is far better than that required by MIL-R-27208.

- ESSENTIALLY ZERO END RESISTANCE. An advanced technique of welding the leads to the resistance element permits the “Quite Trim” wiper to completely encompass the element and resulting in essentially zero end resistance.

- LOW COST INDUSTRIAL units designed utilizing all MIL-SPEC techniques complement a complete line of MILITARY styles per MIL-R-27208. Enough said...? Not quite! We haven't told you about our dual metal end clutch; insulated metal mandrell, imbedded in heat transfer epoxy for highest heat dissipation; emersion proof styles; and, how wire wound potentiometers have greater resolution, higher power capability, and lower TC than film types.

For complete specifications and prices, contact: ITC Control Components, a division of Industrial Technology Corporation, a subsidiary of Republic Corporation, 950 No. Sepulveda, El Segundo, California 90245, (213) 322-4950.

A timetable showing who's giving papers, what the subjects are, and when and where the sessions are being held

**Avionics and Aerospace**

Collection of Data From in Situ Sensors Via Satellite—S. D. Dorfman, Hughes Aircraft Co. (12.1/Wed./p.m./C)

Application of Satellites to Domestic Record Data and Video Transmission—W. B. Gross, General Electric (12.2/Wed./p.m./C)

A Multiple Access Satellite Relay System for Low Data Rate Users—P. J. Heffernan, NASA-Goddard Space Flight Center (12.3/Wed./p.m./C)

Wideband Transmission of Photographic Data Using the IDCS Satellites—W. J. Gill, Philco-Ford (12.4/Wed./p.m./C)

Coding and Signal Selection for the Data Relay Satellite Interrogation Channel—G. D. Boyce, General Dynamics Convair (12.5/Wed./p.m./C)

Integrated Avionics—Richard D. Alberts, AF Avionics Lab. (19.1/Fri./a.m./A)

Federated vs. Integrated Computer Systems—J. H. Crenshaw, IBM Federal Systems Division (19.2/Fri./a.m./A)

Role of Man and Machine in Future—L. S. Guarino, Naval Air Development Center (19.3/Fri./a.m./A)

Realizing Objectives for Complex Avionics Computer Systems—H. Barry Schoenky, Teledyne Computer Systems Division (19.4/Fri./a.m./A)

Design Concepts in Avionics and Space Equipment—J. R. Goodykoontz, V. A. Karpenko, TRW Systems Group (19.5/Fri./a.m./A)

Designing Avionics Equipment for Automatic Testing—Richard O. Barrett, Honeywell Aerospace Division (21.1/Fri./a.m./A)

**Circuit Theory**

Microwave Circuit Synthesis and Measurement—H. Stinehelfer, W. Atwood, Microwave Associates (6.4/Tues./p.m./C)

A Novel Approach to High Frequency Trigger Circuit Design—Richard McMorrow, William Farnbach, Hewlett-Packard Co. (13.2/Thur./a.m./A)

Computer-Aided Circuit Analysis—Harry B. Lee, Mass. Institute of Technology (23.1/Fri./p.m./B)

Bipolar Transistor Modeling for Computer-Aided Design—William G. Howard Jr., University of California (23.2/Fri./p.m./B)

Computer-Aided Layout—Les Hazlett, Motorola (23.3/Fri./p.m./B)

Automatic Test Synthesis—E. R. Jones, Fairchild Semiconductor (23.4/Fri./p.m./B)

**Communications**

VHF MOS Receiver "Front-End"—Richard Q. Lane, Fairchild Semiconductor (9.1/Wed./a.m./C)

Linear ICs in Consumer Television and AM/FM Receivers—S. B. Marshall, G. W. Haines, Sprague Electric Co. (9.2/Wed./a.m./C)

Efficient Use of Pins in Complex Communication Subsystems—Robert A. Hirsfield, National Semiconductor (9.3/Wed./a.m./C)

The Systems Approach to the Design of Integrated Communication Circuits—Hans R. Camenzind, Signetics Corp. (9.4/Wed./a.m./C)

University-Industry Television, Radio and Telephone Links—Albert J. Morris, Genesys Systems (10.1/Wed./p.m./A)

Stanford Instructional TV Network—Joseph M. Pettit, Donald J. Grace, Stanford University (10.2/Wed./p.m./A)

Association for Continuing Education (ACE)—Julian Johnson, ACE (10.3/Wed./p.m./A)

UC at Berkeley-TV Plans and Status—George Maslach, University of California (10.4/Wed./p.m./A)

University of Santa Clara-TV Plans and Status—Charles Dirksen, Univ. of Santa Clara (10.5/Wed./p.m./A)

Television Instruction at San Jose State College—Norman O. Gundersen, San Jose State (10.6/Wed./p.m./A)

UC at Irvine-UCLA-TV Systems, Plans and Status—Robert M. Saunders, UC, Irvine (10.7/Wed./p.m./A)

Univ. of Southern California-Instructional TV Network—Jack Munishian, USC (10.8/Wed./p.m./A)

Computer-Aided Design of Bipolar Transistors—C. K. Kim, Microwave Electronics (6.3/Tues./p.m./C)

Microwave Circuit Synthesis and Measurement—H. Stineheifer, W. Atwood, Microwave Associates (6.4/Tues./p.m./C)

Computerized Wide-Band Amplifier Design—Les Besser, Hewlett-Packard (6.5/Tues./p.m./C)

Computer-Aided Design of Microwave Integrated Circuits—Gary J. Policky, Texas Instruments (6.6/Tues./p.m./C)

Time Sharing: Why, When, Whither?—Robert Forest, Datamation Magazine (7.1/Wed./a.m./A)

What can the Electronics Industry Do for Time-Sharing?—Kas Terhorst, Computer Design Corp. (7.2/Wed./a.m./A)

Computer Languages—Why So Many, and What is the Application for Each in the Engineering Community?—Paul Sleeper, Remote Computing Corp. (7.3/Wed./a.m./A)

Time-Sharing in Engineering Education—And After—Eugene H. Koff, California State College at Los Angeles (7.4/Wed./a.m./A)

The Stand Alone, Central or Satellite Approach for Computer Control of Manufacturing Processes—James E. Stuehler, IBM (8.1/Wed./a.m./B)

Factory Data Collection—A Case Study—James D. Edwards, Lockheed Missiles & Space (8.2/Wed./a.m./B)

Computer Controlled On Line Testing and Inspection—Peter H. Goebel, General Radio (8.3/Wed./a.m./B)

Automated Factory: An Overview and Predictions—Walter R. Anderson, IRA Systems (8.4/Wed./a.m./B)

Bipolar Transistor Modeling for Computer-Aided Design—Alan J. Devibiss, Hewlett-Packard (13.1/Thur./a.m./A)

Theory of Automatic Processing—Frank E. Boerger, IBM Corp. (16.1/Thur./p.m./A)

Equipment for Automatic Processing—Donald G. Pedrotti, Hule Industries (16.2/Thur./p.m./A)

Case History of Automatic Processing—(16.3/Thur./p.m./A)

The Future of Automatic Processing—C. Clifford Roe, Fairchild Semiconductor (16.4/Thur./a.m./A)

Status Trends & Predictions of Display Devices—Edwin H. Holborn, NASA Electronics Research Center (18.1/Thur./p.m./C)

Displaying Engineering Data in Systems Applications on a Color CRT—L. M. C. Griesacker, General Electric Co. & Walter H. Tew, General Electric (18.2/Thur./p.m./C)

Image Distribution System, An Approach Toward Personal Displays—Joe T. Ma, IBM Corp. (18.3/Thur./p.m./C)

The Application of Digital Television Displays to Computer-Directed Control Systems—S. E. Grooms, Philco-Ford (18.4/Thur./p.m./C)

On-Line Graphics for Information Handling & Display—John E. Peyton Jr., Boeing (18.5/Thur./p.m./C)

Designing Avionic Equipment for Automatic Testing—Richard O. Barrett, Honeywell Aerospace Division (21.1/Fri./a.m./C)

Development of Software Systems for Automated Test Equipment (CATE)—Eddie J. Johnson, James V. McCarthy, SDC (21.2/Fri./a.m./C)

A Computer Controlled Test System—Frank M. Stutesman, Bendix Navigation & Control Division (21.3/Fri./a.m./C)

Hardware/Software Management—Computer-Aided Testing—D. S. Bassett, Emerson Electric Co. (21.4/Fri./a.m./C)

Computer-Aided Circuit Analysis—Harry B. Lee, Mass. Institute of Technology (23.1/Fri./p.m./B)

Bipolar Transistor Modeling for Computer-Aided Design—William G. Howard Jr., University of California (23.2/Fri./p.m./B)

Network Design by Mathematical Optimization—Ruth Y. L. Shappire, IBM (23.3/Fri./p.m./B)

Code to abbreviations

a.m.—Morning sessions (10 a.m. to 12:30 p.m.)
p.m.—Afternoon sessions (2 p.m. to 4:30 p.m.)

All sessions will be held in the following meeting rooms at the Cow Palace:

A—Meeting Room A
B—Meeting Room B
C—Meeting Room C

Numerals refer to sessions and to papers within a session—for example, 6/1 is paper 1 in session 6.
Exclusive Technical Session Order Form

Please send me the following WESCON technical session preprints at $2.00 per session (average: four papers per session), plus $1 mailing charge per complete order. I understand this order will be mailed to my address within two weeks after receipt. Offer good until November 1, 1969. Packaging symposium record is also available.

(Note: Papers bound by sessions; no individual papers available).

Material and Packaging

Solid Logic Technology Manufacturing—Walter J. Schuelke, IBM (2.1/Tues./a.m./B)
Bonding Techniques for Integrated Circuits—Robert W. Helda, Motorola Inc. (2.2/Tues./a.m./B)
Beam Lead Assembly Technology—Brian Dale, Sylvania Electronics System (2.3/Tues./a.m./B)
Manufacturing Concept for Beam Lead Assembly—D. K. Thomson, Western Electric Co. (2.4/Tues./a.m./B)

Management and Marketing

Impact of LSI Technology on the Electronic Market—Glenn E. Penisten, Texas Instruments (1.3/Tues./a.m./A)
The Vendor User Interface With MOS Universal Arrays—M. M. Kaufman, G. E. Skorup, RCA Defense Electronics (1.4/Tues./a.m./A)
The Many Routes to the Money Market—William B. Hugle, Hugle Industries (5.1/Tues./p.m./B)
Selling the Package: What They Want to Hear—David C. Thompson, Linear Systems (5.2/Tues./p.m./B)
Holding Your Own in the Money Market—Gordon L. Ness, Ness Industries (5.3/Tues./p.m./B)
Why, How and When to Go Public—David S. M. Lanier Jr., Compar Corp. (5.4/Tues./p.m./B)
European Electronic Market: 1969—R. J. Larkin Jr., Ampex Corp. (14.1/Thur./a.m./B)
Marketing Electronic Products in Japan—James K. Imai, Mentor Japan (14.2/Thur./a.m./B)
The New Asian Electronics Market Outside of Japan—G. B. Levine,

ELECTRONIC DESIGN 17, August 16, 1969
Microelectronics

Who Needs LSI In-House Capability—George Hare, The Singer Co. (1.1/Tues./a.m./A)

Using Computer-Aided Design in Production and Testing of Custom LSI—Robert Ulrickson, Fairchild Semiconductor (1.2/Tues./a.m./A)

Impact of LSI Technology on the Electronics Market—Glenn E. Penisten, Texas Instruments (1.3/Tues./a.m./A)

The Vendor User Interface With MOS Universal Arrays—M. M. Kaufman and G. E. Skorup, RCA Defense Electronics (1.4/Tues./a.m./A)

Solid Logic Technology Manufacturing—Walter J. Schuelke, IBM 2.1/Tues./a.m./B

Bonding Techniques for Integrated Circuits—Robert W. Helda, Motorola Inc. (2.2/Tues./a.m./B)

Beam Lead Assembly Technology—Brian Dale, Sylvania Electronics System (2.3/Tues./a.m./B)

Manufacturing Concept for Beam Lead Assembly—D. K. Thomson, Western Electric Co. (2.4/Tues./a.m./B)

Solid State Microwave Variable Delay Devices—Ernst K. Kirchner, Microwave Electronics (3.1/Tues./a.m./C)

Bulk GaAs and Impatt Microwave Sources—W. Keith Kennedy, Jr., Watkins-Johnson (3.2/Tues./a.m./C)

Microwave Transistor Amplifier Design—James R. Reid, Avantek Inc. (3.3/Tues./a.m./C)

Parameters Used in Specifying Varactor-Tuned Solid State Oscillators—William D. Heichel, Thomas R. Bushnell, Stewart Div., Watkins-Johnson Co. (3.4/Tues./a.m./C)

UHF Integrated Microcircuits—Robert M. Knox, IIT Research Institute (3.5/Tues./a.m./C)

Survey of Active Filtering Techniques Using Integrated Circuits—Sanjit Mitra, University of California (4.1/Tues./p.m./A)

A State Variable and gyrator Realization—Comparison—Robert Bewcomb, Stanford University (4.2/Tues./p.m./A)

Active Filters Employing Silicon Monolithic Gyrators—Robert Hove, Boeing Company (4.3/Tues./p.m./A)

Multiloop Negative Feedback Active Filters Using Thick Film Integrated Circuit Techniques—Dennis Hallenbeck, Kinetic Tech. (4.4/Tues./p.m./A)

FEN Filter Design Using Hybrid Integrated Blocks—George Moschytz, Bell Telephone Laboratories (4.5/Tues./p.m./A)

ICs and Thick Films Add Up to Improved RC Active Filters—William Broyles, Sprague Electric (4.6/Tues./p.m./A)

VHF MOS Receiver “Front-End”—Richard Q. Lane, Fairchild Semiconductor (9.1/Wed./a.m./C)

Linear ICs in Consumer Television and AM/FM Receivers—S. B. Marshall, G. W. Haines, Sprague Electric Co. (9.2/Wed./a.m./C)

Efficient Use of Pins in Complex Communication Subsystems—Robert A. Hirschfeld, National Semiconductor (9.3/Wed./a.m./C)

The Systems Approach to the Design of Integrated Communication Circuits—Hans R. Camenzind, Signetics Corp. (9.4/Wed./a.m./C)

MOS Ics: The Designer’s Dilemma—Glen Madland, Integrated Circuit Engineering Corp. (15.1/Thur./a.m./C)

MOS Ics: Answers to Systems Problems—Ralph Parris, Burroughs Corp. (15.2/Thur./a.m./C)

MOS/LSI: A Joint Business Venture—Larry Drew, Viatron Computer Systems Corp. (15.3/Thur./a.m./C)

MOS Ics: Bipolar Compatibility Is Here—Leland Seely, General Instrument Corp. (15.4/Thur./a.m./C)

MOS Ics: The Promise of Things to Come—Al Phillips, Autonetics (15.5/Thur./a.m./C)

Monolithic Voltage Regulators—Thomas M. Frederiksen, Motorola Integrated Circuits Center (17.1/Thur./p.m./B)

Voltage Regulator Capabilities Using Hybrid Techniques—George W. Smith, Beckman Instruments Inc. (17.2/Thur./p.m./B)

High Power Hybrid Amplifiers—Herb Miezel, Dale Baugher, and Leon Balents, RCA (17.3/Thur./p.m./B)

Controlling Power on a Chip—William D. Whittelkin Sr., Texas Instruments (17.4/Thur./p.m./B)

What is Needed in Power Microcircuits—James W. Williams, Hughes Aircraft Co. (17.5/Thur./p.m./B)

New Solid-State Products—Digital Circuits—Morris Chang, Texas Instruments, Semiconductor Circuits Division (20.2/Fri./a.m./B)
Linear Circuits for Communication Applications—Derek Bray, Fairchild Semiconductor (20.4/Fri./a.m./B)

Microwaves

Solid State Microwave Variable Delay Devices—Ernst K. Kirchner, Microwave Electronics (3.1/Tues./a.m./C)

Bulk GaAs and Impatt Microwave Sources—W. Keith Kennedy, Jr., Watkins-Johnson (3.2/Tues./a.m./C)

Microwave Transistor Amplifier Design—James R. Reid, Avantek Inc. (3.3/Tues./a.m./C)

Parameters Used in Specifying Varactor-Tuned Solid State Oscillators—William D. Heichel, Thomas R. Bushnell, Stewart Div., Watkins-Johnson Co. (3.4/Tues./a.m./C)

UHF Integrated Microcircuits—Robert M. Knox, IIT Research Institute (3.5/Tues./a.m./C)

Solid-State Devices and Theory

Solid State Microwave Variable Delay Devices—Ernst K. Kirchner, Microwave Electronics (3.1/Tues./a.m./C)

Bulk GaAs and Impatt Microwave Sources—W. Keith Kennedy, Jr., Watkins-Johnson (3.2/Tues./a.m./C)

Microwave Transistor Amplifier Design—James R. Reid, Avantek Inc. (3.3/Tues./a.m./C)

Test Equipment and Measuring Techniques

A Novel Approach to High Frequency Trigger Circuit Design—Richard McMorrow, William Farnbach, Hewlett-Packard Co. (13.2/Thur./a.m./A)

Transient Oscillography with Photographic Media—A. E. Ames, R. C. Jones, G. R. Bird, Polaroid Corp. Research Labs (13.3/Thur./a.m./A)

High Speed Single Transient Oscilloscopes, the State of the Art, and Current Potential for Mating to On-Line Computers—Gordon Longebeam, Jay Wiedwald, Larry Ferdner, Lawrence Radiation Lab (13.4/Thur./a.m./A)

The TRAC System—G. S. St. Leger-Barter, Lawrence Radiation Lab, and S. Walter, EG&G (22.1/Fri./p.m./A)

Wideband Attenuation and Phase Measurements on High Quality Coaxial Cables—R. L. Rhoads, A. M. Evans, Lawrence Radiation Lab. (22.2/Fri./p.m./A)

Wideband System Function Analyzer Employing Time to Frequency Domain Translation—A. M. Nicolson, Sperry Rand (22.3/Fri./p.m./A)

An Iterative, Time Domain Method of System Response Correction—M. P. Ekstrom, Lawrence Radiation Laboratory (22.4/Fri./p.m./A)

Model 4500 digital voltmeter in two packaging configurations for rack mount and bench applications will be on display at Dana Laboratories booth 2008.
It's a GRrrrand Counter

Aye, that's what you'll think of our new counter. From its wee size to its big performance, the 1192 is new in every respect.

- It's only 8½ inches wide by 3½ inches high.
- It measures frequency (from dc to 32 MHz), period (single and multiple), time interval, frequency ratio, and, of course, it counts.
- Units of measurement and decimal point are automatically displayed.
- Input sensitivity is another surprise; a wee 10 mV is all you need (up to 25 MHz); and you can control trigger threshold and attenuation.
- An internal crystal oscillator gives more than enough stability for most work.

You can select an 1192 with 5, 6, or 7 digits, with or without BCD output, and for bench or rack use. And if 32 MHz is not enough frequency range for you, add our new 1157-B scaler (same size) to the 1192 and zoom up to 500 MHz. The counter/scaler combination, the 1192-Z, has a common cabinet. There's more, lots more, to tell about the 1192; we'll gladly send you a free data sheet upon request.

But the grandest part of all about the 1192 is the money you'll save when you buy one. Prices* range from $575 for the 5-digit bench model without data output to $845 for a 7-digit rack model with data output. You can add the scaler for another $850. Imagine, a 500-MHz counter for as little as $1425. Man, that's a real bargain.

You can save quite a few more dollars by ordering two or more units and taking advantage of GR's quantity-discount plan. Discounts range from 3% for 2-4 units to 20% for 100 units.

For free literature (postpaid) or a demonstration at our expense, write or call General Radio Company, West Concord, Massachusetts 01781; telephone 617 369-4400. In Europe (except Scotland), write Postfach 124, CH 8034 Zurich 34, Switzerland. In Scotland, write General Radio Company (U.K.) Limited, Bourne End, Buckinghamshire, England, for special attention.

*Prices apply only in the U.S.A.
What's NEW at GUARDIAN

NEW GUARDIAN LEVER SWITCHES

NEW GUARDIAN PRINTED CIRCUIT PLUG-IN RELAY

- Available with two or three switching positions.
- Nine versions combining off, momentary or locked positions.
- Snap-in inserts permit changing actuator switching positions at any time.
- Non-illuminated or illuminated with color coding.
- Contacts rated at both 1 1/2 and 10 amps at 115V AC resistive.
- Up to 4 pole double throw per station.
- .110 Quick Connect Terminals and/or Solder Terminals.

- Unique, compact design.
- All terminals on .1 grid spacing for standard printed circuit board.
- Soldered right on PC board.
- Conforms to UL requirements for Business Machines.
- 1 watt normal power—1/2 watt on request.
- 3500 OHMS coil resistance (120V AC-60Hz).
- Standard voltages 6 to 120 AC—6 to 24 DC.
- Mechanical life over 10,000,000 operations.
- 3 AMP. resistive 115V. 60Hz contact rating.

Circle No. 231 For Literature.
Circle No. 232 For Literature.
GUARDIAN
SOLID STATE RELAYS

- Universal AC or DC control voltage with complete circuit isolation from load switching circuit.
- Externally-adjustable pull-in voltage level from 80-130V AC or DC, with close differential between pull-in and drop-out where accurate voltage sensing is required.
- Control of high inrush lamp, inductive or normal resistive loads from 10 mA to 3 amps.
- Internal filtering prevents random turn-on of "off" contacts.

GUARDIAN
PUSH BUTTON SWITCH BANKS

- Sleek, compact design—only 1½" high. ■ Non-illuminated or illuminated with color coding.
- Buttons on 7/8" centers. ■ Up to 12 stations in multiples of 2.
- Contacts rated at both 1½ amp and 10 amps at 115V AC resistive.
- Up to 4 pole double throw per station. ■ .110 Quick Connect Terminals. ■ End panel has four 9/32" tapped mounting holes.
- Long life—100,000 mechanical operations.

GUARDIAN
LIFT OFF STEPPERS

- All the features of the widely used Guardian MER 24 point electrical reset stepper...
- Solenoid "lifts" wiper contacts when stepping to reduce friction...and arcing. ■ Increased contact ratings to 5 amps resistive at 120V AC. ■ Increased function capability. ■ Increased dependability. ■ Increased life expectancy—now up to 10,000,000 steps. ■ Compact design.

Circle No. 233 For Literature. Circle No. 234 For Literature. Circle No. 235 For Literature.
If Hybrid IC Active Filters with passive filter stability could solve your problems, you'd probably pay more for them than $30 per pole pair.

Try our FS-20 (delivery is off the shelf!)

- Here's what you get: Band-pass, high-pass and low-pass outputs simultaneously
- Any desired form of the second order transfer function
- Complex zeros anywhere in the S-plane
- Multi-loop negative feedback for added stability
- Fc and Q of basic unit can be tuned by adding external resistors
- Frequency range from DC to 50 kHz
- Q range from 0.1 to 500
- Voltage gain is adjustable to 40 dB
- Supply voltages from ±9V to ±15V with 250 mW power consumption
- Dimensions: (14-pin DIP) 0.804” x 0.366” x 0.474”

We call it the DECITRAK® SYSTEM

Selecting from hundreds of off-the-shelf digital transducers and circuits, we assemble a remarkably low-cost, customized digital system for control/display/logging. DECITRAK can perform as simple a job as providing remote digital display of antenna pedestal position. Or, as impressive a task as the precise control of massive prime movers in response to punched-card commands.

Need a computer interface? A code converter? A typewriter driver? Set-point controls? Let a Theta Application Specialist tailor a system to your specific needs from the field-proven line of DECITRAK digital components.

More than 1,000 of these systems are now in use in nuclear installations, satellite tracking stations, wind tunnels, and aboard ships.

Dual-trace oscilloscope boasts a real-time frequency response from dc all the way out to 250 MHz.

Segmented fluorescent readout with alphanumeric capability shrinks envelope to T-5-1/2 size for high-density packaging.
Printing digital voltmeter with 3-1/2-digit readout occupies only 3-1/2 by 8 in. of a front panel.

Bi-pin T-1-3/4 lamps, which come in five different styles, have a tough plastic base.

Streamlined digital multimeter, which costs only $345, never loads the circuit being measured. It has a 3-1/2-digit readout.
The new Delco Radio DTS-701 and 702 NPN triple-diffused silicon high voltage transistors. They were designed for the tough requirements of off-line deflection in large screen TV.

However, they’re built and tested for extra reliability in all high energy circuits. Proved by the surest peak energy capability rating in the business: Pulse Energy Testing.

And right now, they’re available in both production and sample quantities.

Why will you want to use the Delco 701 or 702?

For the tough jobs—high inductive load switching or for circuits subject to transients or fault conditions.

For reduction of weight, size and component costs. Circuit complexity and number of components are reduced, so assembly costs go down, too. And fewer components mean higher reliability.

So now you know. The pioneer in high voltage silicon power has done it again.

For prices, samples or complete data, just call us or the nearest Delco Radio distributor listed below.

**INFORMATION RETRIEVAL NUMBER 58**

Electronic Design 17, August 16, 1969

U117
Dual-trace oscilloscope performs from dc to 250 MHz

Providing real-time response from dc all the way to 250 MHz, a new dual-trace oscilloscope, model 183A, does not sacrifice viewing ease, operating ease, sensitivity, or plug-in versatility. This means that the 183A can be used to view digital words and other groups of short-duration fast-rise pulses found in computers and high-speed digital systems.

It is also useful for displaying single short pulses that occur at low repetition rates, like those generated by laser beam detectors. In addition, the new 250-MHz oscilloscope can analyze communications systems performance, and makes possible pre-detection display of modulation envelopes on rf carriers.

The 183A is a compact, all-solid-state, plug-in instrument that can be operated like any well-behaved dual-trace oscilloscope—with either of two input signals displayed alternately on successive sweeps or at the same time in a chopped (time-shared) mode. It can also present the sum or difference of two input signals.

Calibrated deflection factors are switch selected from a sensitivity of 10 mV per division of 1 V per division. The sweep circuits trigger reliably on internally picked-off 250-MHz signals that produce 1-cm deflections, or on 250-MHz external signals with amplitudes as low as 20 mV pk-pk. Signal delay in the vertical channel allows viewing the leading edge of the signal that triggers the sweep.

The new 183A oscilloscope achieves its 250-MHz performance with a new cathode-ray tube that has distributed deflection electrodes to obtain high-frequency performance while preserving deflection sensitivity. Each deflection electrode is a metallic ribbon, wound in a helix and slightly flattened to improve the electrostatic field deflection between the two electrodes. This new CRT is actually capable of performance beyond 500 MHz.

The high-frequency performance of the new oscilloscope is obtained without restricting its usefulness for general-purpose applications. The mainframe works with all plug-ins designed for Hewlett-Packard's series 180 oscilloscopes. These include a four-channel 50-MHz amplifier, a delaying-sweep time base, and a 12.4-GHz sampling and time-domain reflectometer plug-in.

With its 1840A time base, the 183A triggers at repetition rates from dc to 250 MHz. A variable hold-off control allows stable display of pulse groups by permitting repeated triggering on a particular pulse in the group. Sweep times are selectable from 10 ns/cm to 0.1 s/cm.

Further contributing to precision measurements, the mainframe's calibrating waveform has risetime specified, as well as amplitude and frequency. The waveform is a pulse train with 10% duty cycle and 0.8-ns risetime. Its amplitude can be either −50 mV or −500 mV; repetition rate is 2 kHz or 1 MHz.

Booth No. 1040 Circle No. 412

High-performance dual-trace oscilloscope with distributed-electrode CRT features a real-time response from dc out to 250 MHz. It can be used to analyze the short-duration fast-rise pulses of high-speed digital systems.
EECO just shot switch prices full of holes...
with the NEW revolutionary 1776 series miniature thumbwheel switch

The first thing we did away with was the PC boards. We completely eliminated them. Imagine what that did to the price. Now you can purchase high quality EECoSITCH® thumbwheel switches for only $3.00 in 1 to 9 quantities. How's that for representation without taxation? We've also developed a simplified technique for fast, low-cost assembly of multiple switch stations for this revolutionary new product. The 1776 is the all-American answer to your switch requirements.

Join the revolution! Write today for your campaign button and data sheet on the Series of 1776.

Digital $345 multimeter ends loading problems

Digital $345 multimeter ends loading problems

Digilin Inc., div. of Cum-Container, 6533 San Fernando Rd., Glendale, Calif. Phone: (213) 246-8161. P&A: $340; 30 days.

Able to virtually eliminate circuit loading at all times, a new digital multimeter sells for only $345 in quantities of one to four, with price dropping to $299 in quantities of five to nine. Portable and compact, model 340 is a 3-1/2-digit completely self-contained instrument, free of all plug-ins.

Using a new patent-pending a/d conversion method called an input-amplifier technique, the 340 multimeter keeps its high input impedance constant so that the circuit being measured is not disturbed at all. In many other a/d techniques, such as dual-slope integration, input impedance drops after the measuring cycle. This can interject transient noise into the circuit being measured.

The readout display consists of three Nixie-type plug-in tubes, with memory capacity for a non-blinking display, and a neon "1" indicator. Decimal points are automatically programmed by a range key; a minus sign lights to indicate negative signals.

To eliminate drift and assure instant stability, the new multimeter incorporates an automatic zero adjustment. The unit can operate directly from any ac line since it has a self-contained power supply.

The 340 can measure full-scale ac and dc voltages from 1 to 1000 V, full-scale ac and dc currents from 100 µA to 1 A, and full-scale resistances from 1 kΩ to 10 MΩ. It offers 100% overranging on all ranges and an overvoltage protection of 100 times the range setting.

Its maximum sensitivity is 1 mV for voltage, 100 nA for current, and 1 Ω for resistance. Full-scale accuracies are ±0.1%, ±1 digit, for dc voltage; ±0.2%, ±1 digit, for ac voltage; and ±0.2 to ±1%, ±1 digit, for resistance.

This 3-lb instrument has a measurement cycle of approximately five times per second. Its response time is 20 ms. Dimensions are 6 by 9 by 5-1/2 in., including the integral handle.

Booth No. 1014 Circle No. 406

Dual-beam oscilloscope displays scale factors

Tektronix Inc., P.O. Box 500, Beaverton, Ore. Phone: (503) 644-0161. P&A: $1850; fourth quarter, 1969.

Using fiber optics to digitally indicate current or voltage deflection factors plus the time set on its deflection controls, a new dual-beam oscilloscope is a high-gain, differential, low-frequency instrument. Type R5030 also offers color-coded sections of controls to outline functions and a CRT viewing area that is increased by 50% over conventional 8 by 10 cm units.

Booth No. 2101 Circle No. 297

Digital panel meter has 0.1% accuracy

API Instruments Co., 11655 Chillicothe, Chesterland, Ohio. Phone: (216) 729-7377.

A new digital panel meter, with four digits for a display to 1999, has an accuracy of 0.1%, a resolution of 1 part in 4000, and a continuous BCD output that is DTL/TTL compatible. Other standard features include automatic polarity, display hold, print command, polarity and overrange outputs, and selectable decimal points.

Model 4304 offers a seven-bar segmented display.

Booth No. 1404 Circle No. 352
Gold, silver, stainless steel and uncompromising design produce the Shallcross Series 1 Rotary.

We begin our Shallcross Series 1 rotary switches with the best materials. Materials that promise superior performance and long service.

Like stainless steel in non-current carrying parts. Coin silver contacts and terminals. Gold plating available on all current-carrying parts.

We deploy these materials in an uncompromising design. Enclosed diallyl phthalate construction keeps out airborne contaminants. Contact resistance is 2.5 milliohms max. initially and remains unusually stable. Our double-wipe-to-air action takes care of that.

Solid detent feel is provided by a set of stainless steel balls riding a hill-and-valley stainless plate. Special lubricants are used on all friction points.

Conform to MIL-S-3786/SR 28A
Shallcross one-inch Series switches are built to MIL-S-3786/SR 28A. Temperature range -65° to +125° C. Our new ratings are: 2 amperes (115 vac or 28 vdc)—5000 cycles; 1 ampere (115 vac or 28 vdc)—25,000 cycles.

End-of-life contact resistance typically 5 to 10 milliohms. 30° indexing, up to 12 positions per pole available.

Fast local service
Evaluate our Series 1 for military applications and your most demanding industrial and commercial needs. We're ready to supply prototypes to your specs on short notice. And deliver production quantities to your schedules.

Contact your local Cutler-Hammer Stocking Switch Distributor.

Ingredient for greatness.
TRYGON HAS THE POWER

to deliver wide range constant voltage constant current performance for every lab and system application.

- All silicon design—precision performance
- Wide voltage ranges—currents to 100 amps
- Positive convection cooling—no derating
- Overvoltage and ultra-high stability options
- Automatic load share paralleling
- Priced from $575.

Super-Mercury from TRYGON . . . the competitively-priced series of fully programmable wide-range power supplies, power and value packed.

Super-Mercury: Designed for bench or rack installation with slide provisions at no extra cost . . . in ranges up to 160 volts and up to 100 amps. Regulation of 0.005% and 0.015% stability are standard (0.005% stability optional) as is MIL Spec, RFI-free performance. Total ripple and noise: less than 1 mV RMS; Master-slave tracking, auto-load share paralleling and remote sensing and programming also standard.

Write for the full TRYGON power story.

Prices slightly higher in Europe.

Printing digital voltmeter occupies only 8-in. width

Presin Co., Inc., Trap Falls Rd.,
Shelton, Conn. Phone: (203) 929-1495. P&A: $500, $550 with index; 4 vols.

Designed for either half-rack or base mounting, a new printing voltmeter incorporates a 3-1/2-digit readout within a front-panel space measuring only 3-1/2-in. high by 8 in. wide. The PDM 611 operates from any line voltage; all its power supplies are built in. Measured values are displayed on illuminated numeric readout tubes.

Ranging is indicated automatically on the digital display by a decimal point, and by a fixed decimal point in the printer. Overranging to 100% is shown by a "1" in both the tube and printed readings.

This new digital printing voltmeter has an accuracy of 0.1%, ±1 digit, and a normal-mode rejection ratio of 20 dB at 60 Hz. It also offers overload protection and an operating temperature range of 0 to 50°C.

The PDM 611 is a fixed-range device available for full-scale voltages from 1.999 mV to 199.9 V and full-scale currents from 1.999 µA to 199.9 mA.

Printing can be in one of two modes, either manual or automatic. In the manual mode, a pushbutton is used to trigger a drive pulse to the print solenoid. In the automatic mode, printing occurs at the completion of each encode. Automatic printing speeds can be as high as three lines per second.

As printing proceeds, a two-digit index advances and prints on each line. This serves to help identification.

These two index columns, with a separate type font for the data, can be changed by pushbutton pulsing into both the tens and units registers. The index can be reset by a single command pulse.

The recorded voltage reading is visible immediately after printing, and does not have to be extracted to be read. Fanfold paper, 2-1/4-in. wide, is used in the printer.

Optionally, the paper can be taken up in a box attached to the front panel. Printing is by means of a throw-away inked platen that is adequate for 40,000 lines of print.

Booth No. 1141    Circle No. 407
We call it INCONECT®. Our new Molex modular system that provides five ways of interconnecting electrical-electronic printed circuit assemblies: Two ways to connect circuit boards to chassis, three ways to interconnect printed circuit boards. It's a giant step forward in helping speed production and assembly techniques in the area of printed circuits. Unique flexibility enables you to tailor connector components to your specific product needs. Easily. Simplifies assembly, testing, servicing and model change requirements. It's another example of the Molex creative approach to circuitry problems. One that demonstrates just how reliable and economical printed circuit connections can really be. But see for yourself. Write for details. Or you can make connections by calling (312) 969-4550.
Plug-in oscilloscopes show scale factors

Tektronix, Inc., P. O. Box 500, Beaverton, Ore. Phone: (503) 644-0161. P&A: $250 to $2500; fourth quarter, 1969.

Forming a full measurement system, series 7000 plug-in oscilloscopes consist of two mainframes and 13 plug-in units. The new instruments feature a CRT that displays deflection factors, polarity, and any uncalibrated condition for all channels, corrected for probe attenuators and magnifiers. The plug-ins include six amplifiers, four time-base units, and three sampling units.

Booth No. 2101 Circle No. 388

Digital bridge tests impedance

General Radio Co., 300 Baker Ave., West Concord, Mass. Phone: (617) 369-4400.

Model 1683 is a general-purpose, low-frequency, automatic series-impedance bridge with digital readout that measures capacitors, inductors, and resistors with loss expressed as equivalent series resistance or dissipation factor. Provisions for five-terminal connections to the unknown component ensure accurate measurements by minimizing errors due to lead impedances and stray capacitances.

Booth No. 1726 Circle No. 359
Transistor analyzer reads noise directly

A new transistor noise analyzer directly measures all three bipolar transistor noise characteristics: noise figure, noise current, and noise voltage. Model 4470A has a noise-figure measurement range from 0 to 1000 dB, with source resistance call y infinit e input impedances. Inexpensive DVMs selectab le from 10

Incexpensive DVMs reject 80-dB noise

Series 4500 economy digital voltmeters offer 0.01% long-term accuracy, 80-dB normal-mode noise rejection, and full multimeter capability including dc/dc ratio measurements. Using dual-slope integration, the new instruments provide a full four-digit readout, with a fifth digit for 20% over-ranging. Other features include pushbutton operation, and autoranging and autopolarity in all functions except ratio.

Booth No. 1040 Circle No. 295

Digital phase meter resolves to 0.1°

Wavek, P.O. Box 651, San Diego, Calif. Phone: (714) 279-2200. P&A: $1500; 30 days.

Using a closed loop design to insure stable long-term phase measurements in varying temperature environments, a new digital phase meter gives 0.1° resolution with a plus or minus sign indicating the lead/lag relation. Model 750 has two ranges, -180 to +180° and 0 to 360°, to assure continuous phase data without discontinuities at 0 and +180°.

Parametric supplies ignore line changes

Waless Instruments, 1540 E. Ed­t­ng­er Ave., Santa Ana, Calif. Phone: (714) 537-5171. P&A: from $375; stock.

Providing parametric dc power, series PDC supplies allow input voltage to drop as low as 60 V ac and go as high as 150 V ac without affecting their dc output; voltages above and below this level merely turn off the the units. In addition, normal-mode noise rejection is 80 dB to 1 MHz. Response time is 25 μs.

Booth No. 2119 Circle No. 357
Meet the “Mite”. Only .218” diameter. The toughest ceramic disc trimmer capacitor its size.

New from E. F. Johnson. And it’s this small: :c:

Designed for printed circuit applications where space is at a premium. Stator of High Alumina for greater shock and vibration resistance. The rotor plate is encapsulated in ceramic for environmental stability and long life. The Q factor at 1 MHz is 500 minimum. Precision lapped bearing surfaces give you smooth linear tuning. Pick from a wide capacitance range: 1.0-3.0 pF, 2.5-9.0 pF, 3.5-20.0 pF, 5.0-25.0 pF. Designed to meet or exceed applicable requirements of MIL-C-81.

Return the coupon today for information on Johnson’s new Micro-J. And if you have a special capacitor need, we’d like to work with you. The same engineering that made our air variable capacitors the standard of excellence goes into every new Johnson product.

**INSTRUMENTATION**

**Time-interval counter averages 1000 times**

Able to measure 10-ns pulse rise-times, a new single-event time-interval counter is capable of averaging 1000 times. Model 784 has an eight-digit stored display. It can measure time interval, pulse width, risetime and period through an input signal conditioning discriminator on both channels. Options are available for greater stability and BCD.

*Booth No. 1722 Circle No. 298*

**Lab-test protector covers 5 to 50 V**

Incorporating 23 voltage protection levels from 5 to 50 V dc, a new lab-test protector guards laboratory breadboards, production components under test, and subsystems during checkout against damaging voltages. If a voltage above the protection level is applied, the unit clamps the line to 1 V dc in approximately 500 ns.

*Booth No. 4712 Circle No. 365*
the clean FM Signal Generator

F.M. Signal Generator TF 2006 is another "first" in the field of wide-range solid-state signal generators. Based on separate high Q resonant-line transistor oscillators, this instrument provides wide deviation f.m. on highly stable carriers up to 1 GHz. Rigid mechanical construction ensures that the precision oscillators have very low drift and microphony. Automatic levelling maintains constant r.f. output over the entire carrier frequency range, which extends down to 4 MHz, and accurate step attenuators offer a dynamic range of 120 db. Electrical fine tuning and f.m. may be simultaneously applied by the drive circuitry. As a result of their electrical relationship within the instrument f.m. as well as the fine tuning may be adjusted to a higher accuracy against the comprehensive crystal calibrator. This oven-controlled calibrator indicates carrier frequencies by meter nulls at 10, 1 or 0.1 MHz intervals and therefore provides almost 10,000 check points of the carrier frequency.

Simplifies design and production operations. Saves
time and space. Direct mounting chassis eliminates
need of logic cards — increases flexibility in
prototyping, production and field service. A unique
two dimensional approach to IC packaging with
these outstanding features:

Multiple of 30 pattern sections, up to 180 patterns.
Two pins of each pattern tied directly to power and ground
planes.
Provisions for input-output plugs and adaptor plugs for
discrete components.
Excellent contact retention of flat lead dual-in-line
(.022 max.) with machined closed entry design.
Choice of Wire-Wrap® or solder pocket terminations.
Three levels of connection on Wire-Wrap pins.

**Logarithmic amplifier has 90-dB power range**

Telonic Instruments, Inc., 60 N. First Ave., Beech Grove, Ind. Phone: (317) 787-3231.

Accepting any rf input from 400 kHz to 130 MHz over a power range of -70 to +20 dBm, a new logarithmic amplifier provides a linear detected output for oscilloscope, voltmeter, or graphic recorder presentation. Model 6001 is a solid-state instrument with an output that is accurate to ±3 dB. It can make both steady-state and swept-frequency measurements.

---

**Solid-state instrument analyzes servo systems**

Servo Corp. of America, 111 New South Rd., Hicksville, N.Y. Phone: (516) 938-9700.

Featuring all-solid-state design, a new servo system analyzer combines a function generator, phase shifter, internal modulator and a precision attenuator in one compact instrument. Model 1999 can be used for analysis and test of servo-mechanisms and complex control systems by observing phase and amplitude response with respect to various frequencies and wave shapes.

HOW MANY CHOICES?

"BLUE CHIP" TRANSFORMERS offer 71 different off-the-shelf versions that enable you to custom select transformers for printed circuit applications. The combination of choices in size, frequency, power and impedances available allows you the utmost in design flexibility. Parameter choices available: Impedance: 4 ohms to 100,000 ohms, Frequency: 60 Hz to 100,000 Hz, Power: 30 MW to 7.5 W, Volume: .060 cubic inches to 1.16 inches (6 sizes), Weight: .09 oz. to 2.5 oz. All Blue Chip transformers meet Mil-T-27B, Grade 5, Class S requirements.
**METALIZED POLYESTER CAPACITORS**

Unique, self-healing units that remain in circuit during voltage surges with little or no loss of electrical properties. Use the M2W's where size and weight are limiting factors and long life and dependability are required. The units utilize metalized Polyester Dielectric with film wrap and custom formulated epoxy resin end fill. Available in round and flat styles.

High-performance Pen Pals

Honeywell’s 530 X-Y Recorder: true differential input and proven reliability . . . for under $1250.

Our 530 X-Y Recorder not only records low-level signals from any source, grounded or floating, it records them so efficiently and so reliably, you can depend on it, day in and day out.

And for good reason. This 530 X-Y Recorder has the same kind of improved snap fit pen assembly (with a polished sapphire tip), carriage assembly and cable arrangement that have made our model 550 and 560 Recorders the standard of the industry.

You’ll be happy to know, too, that the Honeywell 530 X-Y Recorder is so simple to operate that even your non-technical people can learn to use it. And yet, it delivers high speed (30 in/sec. on X-axis, 20 in/sec. on Y-axis) and common mode rejection up to 130 db; offers a trouble-free vacuum holddown; and accepts either 8½” x 11” or 11” x 17” paper.

Honeywell’s 540 X-Y-Y’ Recorder: a two-pen recorder with double capability for a price less than $2100.

Even though our 540 X-Y-Y’ Recorder costs less, it doesn’t give you any less. In fact, it’s operating characteristics are almost identical to our 530 Recorder, giving you the exact same true differential input, the same proven mechanical design features, the same unsurpassed reliability. Plus it offers 30 ips. slewing speed on each axis and 1 megohm input impedance on all calibrated ranges, as well as when operating at variable sensitivity. It also provides one millivolt sensitivity (each axis), a stylish appearance, vacuum holddown, and will accept either 8½” x 11” or 11” x 17” paper.

For more information on either of these new X-Y recorders, write or call (collect) Roy Washburn, 303-771-4700, Honeywell Test Instruments Division, P.O. Box 5227, Denver, Colorado 80217.

Honeywell engineers sell solutions
Solid-state signal generator programs frequency and level

Offering superior phase-lock characteristics, a new solid-state L- and S-band signal generator features programmability of its rf output frequency and of 21 standard IRIG subcarrier frequencies as well as rf output level. Model 1522 can also be operated remotely.

This new generator has peak fm deviations as high as ±3 MHz, modulated on its self-contained calibrated deviation meter. The calibrated rf output is adjustable from 0 to -120 dBm.

Packaged for action, the 1522 offers distinct operating controls that are well defined for ease of operation. Output connections are rear mounted for 19-in. rack slides, or may be positioned on the front panel for the cabinet version.

Internal sub-chassis construction is also designed with forethought. Swing-out printed circuit cards facilitate easy and speedy alignment, maintenance and troubleshooting.

The new signal generator performs in L band from 1.4 to 1.5999 GHz and in S band from 2.2 to 2.2999 GHz. Settability of the rf frequency is digitally controlled to 100 kHz.

After one-half hour warm-up, its calibrated accuracy is ±0.002%. Drift plus incidental fm is less than ±2 kHz pk for one minute, less than ±5 kHz pk for 10 minutes, and less than ±15 kHz pk for one hour.

The rf output can be attenuated from 0 to 119 dB in 1-dB steps, and is continuously variable and metered from 0 to 3 dB. Leveling is 1.5 dB pk-pk across each band; overall calibration accuracy is ±1 dB.

All in-band spurious signals are held more than 50 dB below the calibrated output level. Harmonically related spurious signals are greater than 20 dB below the calibrated output.

Frequency linearity is within 1% of a straight line for all deviations up to ±1 MHz at modulation frequencies from dc to at least 1 MHz. Frequency response is ±1 dB from dc to 750 kHz, ±1.5 dB to 1 MHz, and +2 and -3 dB to 2 MHz.

Combining the reliability of solid-state construction with the desirability of remote operation, a new L- and S-band signal generator can be programmed for rf output frequency and level, as well as subcarrier frequency.

Rf power meter reads digitally

Shown at the bottom of a line of logarithmic instruments, a new digital meter makes direct measurements of rf power, on either a linear or dB scale. Model 1009 is designed for both swept- and single-frequency power measurements from 10 MHz to 12.4 GHz. It has a 50-dB dynamic range and, in a completely automated test system, can perform 1000 measurements per second.

Phase-controlled filters fit waveguide and coax

RHG Electronics Laboratory, Inc., 94 Milbar Blvd., Farmingdale, N. Y. Phone: (516) 694-3100.

A new line of L- and X-band phase-controlled waveguide and coaxial filters are computer-designed devices with precisely controlled phase characteristics. Available as fixed-tuned or tunable units, the FC coaxial series provides multipole performance coupled with a very wide tuning range, while the FW waveguide series offers low insertion loss and a readily adjustable passband characteristic.

100 Locust Avenue, Berkeley Heights, New Jersey 07922 • (201) 464-1234
Directional detectors swing out to 8 GHz

Covering octave bands from 500 to 8000 MHz, a new line of directional detectors consists of a maximally flat directional coupler with a crystal detector built into the coupled arm. By including the detecting element in the coupler, the new units feature a net leveling flatness of ±0.2 dB over any octave band.

Booth No. 1138 Circle No. 382

Transfer switches isolate to 18 GHz

Electronic Resources Inc., 4561 Colorado Blvd., Los Angeles, Calif. Phone: (213) 246-7761.

Providing broadband rf performance in a lightweight subminiature package, a new series of coaxial transfer switches features a low VSWR of 1.25 at 12.4 GHz and unusually high interchannel isolation from 0 to 18 GHz. Actuating current for series 09-31 units is just 53 mA at 26.5 V for latching, and 177 mA for fail-safe operation.

Booth No. 1115 Circle No. 373

Small balanced mixer mounts like DIP IC

Said to be the smallest unit of its kind, a new 500-MHz double-balanced mixer features a pin spacing that is exactly the same as that of standard dual-in-line integrated circuits. When mounted on a circuit board, model 10514 occupies a space of only 0.4 by 0.35 in., less than 0.15 square inches. Its volume is under 0.07 cubic in., and its weight is less than 0.06 oz (1.5 grams).

Booth No. 1040 Circle No. 381

Multichannel sources oscillate to 9.6 GHz

A new line of solid-state multichannel crystal-controlled sources provide discrete output frequencies at any point in the frequency range from 800 to 9600 MHz. Series 4000H units achieve tight frequency stability (0.005%) and low-noise operation. Minimum power outputs range from 25 mW to 8 W, and 1-dB bandwidths go from 48 to 800 dB.

Booth No. Unit H Circle No. 380

Small attenuator spans 2-GHz band

Slightly over 2 in. long and weighing less than 5 oz, a new rotary attenuator provides up to 60-dB attenuation in 10-dB steps from dc to 12 GHz. Model 8108 has an impedance of 50 Ω and an insertion loss of only 0.7 dB at 2 GHz. Its accuracy varies with frequency, ranging from ±1% at 500 MHz to ±5% at 2 GHz.

Booth No. 1724 Circle No. 389

J-band generators deliver up to 5 mW

Two new microwave devices, compact J-band solid-state power generators, are low-noise electronically tunable units. Type SSJ9 has an operating frequency range of 12.4 to 14 GHz, a tuning range of 250 MHz and a power output of 5 mW. Type SSJ10 operates from 14 to 16 GHz, tunes over 250 MHz and has a power output of 1 to 2 mW.

Booth No. 4607 Circle No. 383
Introducing Potter & Brumfield's unique
dual thin-line dry reed relays

An entirely new magnetic structure makes possible an exceptionally low seated height of only 0.275 inch for high density board packaging. Circuit boards employing JDT relays may be spaced on 0.5 inch centers.

This design minimizes magnetic flux dispersion, resulting in a very efficient magnetic circuit. This decreases coil power requirements and often permits direct operation of JDT relays in low-power semi-conductor logic circuits. An interfacing amplifier may be eliminated in many applications.

Terminals are similar to those on IC packages, permitting spot testing on either side of a circuit board. The dual in-line terminals on 0.1 inch centers simplify circuit board design. The reed switches are rated at 10 watts maximum resistive (50V or 0.5A DC maximum) switching.

Mounted height is only 0.275”
Power requirements: only 75mw per pole
Combinations of Forms A, B and C are available

A solid state time delay circuit may be incorporated in this small package. Or a Darlington amplifier can be included to compensate for low current applications. However, the number of available poles for switching is reduced by the addition of either of these circuits.

The JDT is completely encapsulated in epoxy, giving protection against environmental contamination. The Series is presently available in many combinations of Forms of A, B and C.

Single Lot Prices:
JDT 4000 Series (4-pole) $ 7.65
JDT 8000 Series (8-pole) $12.95
Quantity discounts apply.
Missing pulse detector takes 5-kHz rep rates

Able to measure the rf energy stability of magnetrons, a new missing pulse detector accepts input video pulse widths of 0.1 to 100 µs and repetition rates from 200 Hz to 5 kHz. Input pulse amplitude can be between 50 and 400 MV and reference pulse (trigger) amplitude can range from ±5 to 50 V. The unit is completely solid state.

Vhf/uhf generator features stability

Covering the frequency range of 220 to 410 MHz, a new solid-state a-m/fm signal generator (with the 63081 rf plug-in) provides a frequency stability of 1 in 10^6 per 10 minutes after only 30 minutes of warm-up. Model 6301 offers audio modulation to 80%, frequency modulation to ±100 kHz or phase modulation, together with 2 V (+19 dBm) of rf output.

Booth No. 1138 Circle No. 290

Digital rf meter responds linearly

Millivac Instruments, Inc., P.O. Box 997, Schenectady, N.Y. Phone: (518) 355-8300. P&A: $1095; 8 to 10 wks.

Model MV-722A solid-state digital rf millivoltmeter features a unique linearizing feedback circuit that allows true linear response within ±1-digit tracking. It has a three-digit readout with overrange indicator. Full-scale voltage ranges are from 3 mV to 10 V. Frequency response is ±3% from 10 kHz to 100 MHz, ±5% from 100 to 400 MHz, and ±10% from 400 MHz to 1.2 GHz.

Now that you're surprised at how different this Howard fhp motor looks on the outside, let's talk about output:

When Howard rates a motor 1/20 hp, we're not about to underpower your system with a 1/25 hp motor. We've always True Rated our fhp motors this way.

Now engineers and designers are finding that a carelessly overrated or underrated motor can cause system problems. And they want no part of either. That's why engineers look to Howard for True Rated fractional horsepower motors. And they get them. Our computer guarantees it. And your products benefit.

Next time you look at the outside of a Howard motor, you won't find mod painting. You will find that if the label says 1/20 hp, we don't mean 1/25 hp. Or 1/15 hp, either.

Get the complete Howard True Rated story. Find out in detail why it makes no difference that all fhp motors look alike. It's the output that counts. Write or call Howard for Fractional Horsepower Motor Information Packet ED-89.

all fhp motors are alike?
Multi-color single-gun CRT responds to current density

International Telephone & Telegraph Corp., 3700 Pontiac St., Fort Wayne, Ind. Phone: (219) 743-7571. P&A: $500; 30 to 90 days.

Using a new type of phosphor screen, a new multi-color single-gun cathode-ray tube generates color shifts from green to orange as the beam current density is changed. This new approach avoids the need for color masks, multiple-electron guns or beam-velocity modulation, previous methods of generating color displays in cathode-ray tubes.

The F3522 is a 5-in.-diameter round CRT that uses electrostatic focusing and magnetic deflection. It can provide the four distinct colors of yellow, red, green and orange, besides various hues of these.

The color shift is obtained by combining two different phosphors; one having a super-linear intensity versus density behavior, and another with linear or sub-linear behavior and a different emission color.

At low current densities, the emission color will be that of the sub-linear phosphor. However, as current density is increased, the super-linear phosphor will contribute more, and the color will shift towards its characteristic emission.

Along with the color shift and higher current density, the brightness of the display will also increase. This is because the sub-linear phosphor continues to contribute, although not dominantly. The resulting color is a blend of the two phosphor emissions.

The new cathode-ray tube operates with a heater voltage of 6.3 V at 600 mA. Maximum anode voltage is 20 kV dc and the second grid voltage is 300 V.

Besides the 5-in. round tube, two other versions will be available. These are an 8-in. rectangular unit and a 10-in.-diameter round one. They will be priced slightly higher than the F3522.

Cermet trimmers sell for $1.14

Costing as little as $1.14 in quantities of 100, a new line of industrial cermet trimmers features a setability of ±0.03%, an average equivalent noise resistance of 1.5% and an average contact resistance variation of only 0.5%. Series 360 units have a power rating of 0.5 W at 70°C and a resistance tolerance of ±20%. Standard resistance values range from 50 Ω to 1 MΩ.

Booth No. 3913 Circle No. 259

Tiny slide switch has 30-year life

Chicago Switch, Inc., 2035 Waban-sia Ave., Chicago, Ill. Phone: (312) 489-5500. P&A: 54¢ to $2.50; 4 to 8 wks.

Offering the ultra-high reliability of a 30-year life or $5 \times 10^6$ flawless operations with low-energy circuitry, a new microminiature switch features a true over-center toggle mechanism for precision snap-action inside a slide switch package. The unit can handle a resistive load of 0.5 A at 125 V ac. Contact bounce on make is 0.5 ms in the spdt version and 1 ms in the dpdt version.

Booth No. 4711 Circle No. 252
Is the 901 counter-timer just too good to be true?

NO!

But we can't blame you if you think so.

Picture a state-of-the-art, 200-MHz, universal counter-timer selling for $250 to $1000 below the competition. Having trouble? Picture won't focus? Of course not. Cheap price tags usually mean cheap products.

Focus in again. This time, picture technological breakthroughs - new circuitry and new components that the competition hasn't caught up with yet. Now, see how easy it is to make a better product and sell it for less, too?

How much better is the CMC 901? Take a look. Range: 200 MHz (instead of 125 or 135) without prescaling or plug-ins. Gate times: 1 µsec to 100 sec instead of to just 10 sec. TIM: built-in, with a resolution of 10 nsec instead of 100. Input sensitivity: 20 mV instead of the usual 50 or 100. Readout: 9 decades not just 8.

But specs aren't everything. How about the Model 901's "universatility"? Besides counting to 200 MHz directly (and 1.3 GHz or 3.3 GHz with optional plug-ins) the 901 also scales signals, measures time interval, period, and multiple-period average. It provides frequency and multiple-frequency ratios as well as total count; and, as an optional extra, it can be operated completely by remote control. The basic price tag? Just $2475. So we can't blame you if you're skeptical, but would you be happy if you bought a lesser model and paid more?

For the full facts, circle the reader service card.

Pushbutton breakers
light green and white

Heinemann Electric Co., 248 Magnetic Drive, Trenton, N.J. Phone: (609) 882-4800.

The top half of series JL lighted pushbutton circuit breakers lights in a soft green to indicate an on circuit, and the bottom half lights in white to indicate an off circuit. The new units are available with either a fast or a slow time-delay response; non-time-delay models are also available. Standard maximum voltage ratings are 240 V ac (60 or 400 Hz), and 65 V dc.

Booth No. 3801 Circle No. 372

Lighted switches
adapt to needs

Arrow-Hart, Inc., Specialty Switch Div., 103 Hawthorne St., Hartford, Conn. Phone: (203) 249-8471.

Using a building-block concept, a new line of lighted pushbutton switches makes possible more than 25,000 switching variations with just 31 stock components. Called Adapt-a-Switch, the easy-to-mount snap-action units have two contact blocks, standard duty and low energy, which can be used to build up to four-pole switches.

Booth No. 5121 Circle No. 263

Lighted pushbuttons
standardize colors

New Uniswitch pushbuttons are now available in red, white, blue, green and yellow colors as standard; clear amber and other colors may be obtained on special order. Series LUS units are compact momentary-action pushbutton switches supplied in both illuminated and non-illuminated types. They provide side, as well as front, lighting that is constant and independent of switching action.

Booth No. 3909 Circle No. 260

Pushbutton switches
accept 2 lamp types

Designed for maximum panel density for aircraft control and display requirements, Mark Eight illuminated pushbutton switches or indicators can accept T-1-3/4 lamps or T-1 lamps with an adapter. These type 16620 units are available in matrix mountings on 0.689-in. square centers or with individual bezel and integral mounting hardware on 0.75-in. square centers.

Booth No. 4515 Circle No. 262

Miniature protector
safeguards to 116 V

Siemens America Inc., 350 Fifth Ave., New York, N. Y. Phone: (212) 564-7674.

A new miniature gas-filled surge-voltage protector guards semiconductors and other electrical and electronic components against power surges and other transients. SVP type BI-C145, which measures only 0.38 in. in diameter and 0.272 in. long, provides protection for equipment with peak operating voltages up to 116 V.

Booth No. 1505 Circle No. 387

Circuit protector
responds in 50 ns

Developed for integrated circuits, transistorized equipment and complete electronic systems, a new protective device can sense and deflect damaging transient voltages and currents in less than 50 ns. This solid-state circuit protector can also guard against sudden losses of voltage below acceptable operating levels. In less than 500 ns, the device will return a transient to nominal line voltage.

Booth No. 4712 Circle No. 250
Dale Metal Film Resistors provide precise voltage attenuation in the Brush Mark 200 Recorder. This highly accurate direct writing system is now in use in the Apollo Deep Space Program.

"Piece by piece selection to insure low noise was eliminated when we began using Dale Metal Film Resistors". C. M. Jeffries, Works Manager, Clevite Corporation
Brush Instruments Division, Cleveland, Ohio

Getting optimum value from a resistor may hinge on a single performance characteristic. For Brush Instruments, this characteristic was the outstanding low noise construction of Dale Metal Film Resistors. For you, optimum value may come from Dale's ability to supply metal film parts with tightly controlled T.C.; or from the excellent stability of Dale MF resistors in critical high frequency applications. Optimum value can also result from the assured fast delivery made possible by Dale's expanded metal film facilities. Check metal film suppliers from every angle— including price and the ability to provide special parts tailored to your special needs. Then call Dale.
We're really rolling on metal film delivery!

Erase delivery from your procurement problems! Expanded metal film production facilities in Norfolk, Nebraska, have enabled us to slash delivery schedules to the bone. Production increases daily on all types listed below. Call Dale for the best all-around value in metal film resistors. The number is 402-564-3131.

Call us for more information on the dry test bath

Yes, that telephone is working perfectly in its bath of Fluorinert® Brand Electronic Liquid.

In your testing procedures, Fluorinert Liquids will show up flaws and leaks with great accuracy. In fact, the MIL-Standard 883 and the MIL-Standard 750A tests for gross leakage in microcircuits approve the use of Fluorinert Liquids...which says a lot about dependability.

They are efficient over a wide temperature range and compatible with the most sensitive materials. Fluorinert Liquids are non-flammable and won't conduct electricity.

And because tested units drain clean and dry fast upon removal from the bath, you can use or package your product right out of the bath.

We have lots of interesting information about these unusual liquids. Send the coupon...or call your local 3M representative.

INFORMATION RETRIEVAL NUMBER 79
**COMPONENTS**

**PC 10-A relays operate in 10 ms**

Available as a standard item, a new series of 10-A printed circuit general-purpose relays features a release time of 8 ms and a mechanical life in excess of $20 \times 10^6$ operations. Series 30 units have a minimum dc coil resistance of 10 kΩ. Contact configuration can be spdt, dpdt, or 3pdt.

*Booth No. 4403 Circle No. 255*

**Fast impulse counters have readout switch**

Landis & Gyr, Inc., 45 W. 45th St., New York City. Phone: (212) 586-4644.

Sodeco ES4 high-speed impulse counters are compact single-digit units equipped with a 10-position readout switch, a transfer contact, a zero contact and a predetermining switch. They can perform a wide range of functions including programing, impulse storage, predetermining, counting and control. These new counteres are enclosed in a clear molded case that protects the units from dust while allowing full observation of the mechanism during operation.

*Booth No. 4208 Circle No. 266*

**Monolithic filters yield seven poles**

Four new monolithic crystal filters provide a seven-pole characteristic, with a center frequency of 10.6 or 21.4 MHz. Types 6457MA, 6457MB, 6458MA and 6458MB offer a minimum 3-dB bandwidth of 6 to 15 kHz; maximum 60-dB bandwidth is 18, 40 or 45 kHz. Their ripple is 1 dB maximum, and insertion loss is 6 dB maximum.

*Booth No. 5206 Circle No. 254*

**Spst reed relay switches 10 kV**

With a peak contact load rating of 10 kV at 1 mA, a new high-voltage spst relay offers a nominal coil power of 850 mW, an operating time of 20 ms and a contact resistance of 100 mΩ. Typical life at rated load is one million operations.

*Booth No. 4311 Circle No. 253*

**Double-gun CRT separates X and Y**

Developed for applications where it is necessary to compare waveforms with widely differing frequency characteristics, a new double-gun cathode-ray tube features completely independent X and Y deflection systems. Genalex LD 708 is a 13 by 10-cm rectangular flat-faced tube having a scan size of 6 by 10 cm for each beam with a 5-cm overlap.

*Booth No. 4607 Circle No. 264*

**Fixed delay lines up risetime ratio**

Spiradel distributed-constant fixed delay lines boast delay-to-risetime ratios of over 20 to 1, with good temperature stability and pulse fidelity. The new units cover a delay range of 100 to 1000 ns. Standard impedance is 325 ±10%, but any impedance from 200 to 600 Ω is available. The compact delay lines are encapsulated for maximum environmental protection.

*Booth No. 4713 Circle No. 275*
These ¾-inch-long rectangular trimmers are made and perform like bigger, more costly units. Only IRC offers a miniature general-purpose unit with these features:

- All-metal adjustment shaft that eliminates breakage or distortion, even under repeated use.
- Silver brazed terminations on Metal Glaze and Wirewound types end resistance buildup associated with pressure connections.
- Ultrasonic bonding of the housing into a one-piece unit that is free of seams or laps.
- Resistance to normal board washing. Units sealed to MIL-R-27208 are also available.

Metal Glaze Type 950 has a rugged, thick-film element that provides excellent high-frequency characteristics and infinite resolution over the entire resistance range of 100Ω to 1 megohm. ¾-watt @ 25°C. ±10% tolerance.

Precision Wirewound Type 900 has a long-wearing precious metal wiper spring that reduces noise and contact resistance. 1 watt @ 40°C. 100Ω to 20K. ±10% tolerance.
**COMPONENTS**

**Bi-pin T-1-3/4 lamps have plastic bases**

Industrial Electronic Engineers, 7720 Lema Ave., Van Nuys, Calif. Phone: (213) 787-0311. P&A: 18.7¢ to 23.4¢; stock.

Supplied with a tough plastic base, standard bi-pin T-1-3/4 lamps are now available in five styles. These new lamps require less space than bayonet or screw-base lamps and sockets, yet provide comparable protection for the glass seal. Gas vent slots are designed into the base to prevent solder blowout during dip-solder operations.

Booth No. 3715 Circle No. 283

**Segmented readouts have mosaic look**

Alco Electronic Products, P. O. Box 1348, Lawrence, Mass. Phone: (617) 688-3887. P&A: $8.25; stock.

Series MSM single-phase mosaic-style readouts display numerals 0 through 9 and some alphabetic indications by illuminating a combination of incandescent lamps through a simple diode matrix or encoding switch. The closely interlocked illuminated segments provide a wide viewing angle of approximately 150°. Miniature T-1 lamps are used.

Booth 5120 Circle No. 395

**Pressure switch takes 30,000 psig**

Bristol Div., American Chain & Cable Co., Inc., P.O. Box 1790, Waterbury, Conn. Phone: (203) 756-4451.

Used for switching circuits in response to pressure changes in gases and liquids, a new adjustable pressure switch features a calibration range of 100 to 10,000 psig and a burst pressure up to 30,000 psig. Weighing less than 4 oz, model 506351 has an externally adjustable range that may be field set with a screwdriver or can be furnished factory setting, depending on calibration range.

Booth No. 3921 Circle No. 261

**Magnetic heads track 48 mils**

Clevite Corp., Brush Magnetic Products, E. 37th and Perkins, Cleveland, Ohio. Phone: (216) 361-3315.

Featuring satellite erase heads and connectors, a new series of digital magnetic heads offers track widths of 48, 30 or 40 mils for a seven-track format and 44 or 40 mils for a nine-track format. These IBM-compatible devices have a gap length of 250 microns and a gap depth of 0.016 in. nominal. They also feature a full metal face and 12-in. lead terminations.

Booth No. 4522 Circle No. 251

**Broadband emi filters handle 60 mA to 10 A**

Potter Co., 500 W. Florence Ave., Inglewood, Calif. Phone: (213) 678-2651. P&A: $4 to $15; stock to 8 wks.

Ideal for low-voltage ac or dc applications, Micro-Brute subminiature emi suppression filters operate over the frequency range of 30 kHz to 10 GHz with a current capacity of 60 mA to 10 A. Series 8330 units fulfill the requirements of broadband emi situations where size and weight must be held to a minimum, such as in airborne computers and radar.

Booth No. 5112 Circle No. 265

**Readout tubes shrink envelope**

Suitable for high-density component packaging, three new Digivac S/G digital readout tubes now come in a small T-5-1/2 envelope. The DT1704B is 9-pin-base alphanumeric readout, the DT1705D is 10-pin-base alphanumeric readout with a decimal, and the DT1707B is a "±1" readout. All three are single-plane segmented fluorescent indicators.

Booth No. 4710 Circle No. 394
The One Inside is FREE

Not so many years ago, the prudent transmitter engineer discharged a high voltage capacitor bank by dropping a shorting "crowbar" across its terminals. Today's "crowbar" is a protective overvoltage circuit found on DC power supplies — usually at extra cost. Now HP includes a crowbar as standard on its recently updated series of low-voltage rack supplies . . . at no change in price.

Long established as preferred system supplies for component aging, production testing, and special applications, these supplies have now been redesigned and expanded to meet the stringent demands of today's power supply user. Advantages include low ripple (peak-to-peak as well as rms), well-regulated constant voltage/constant current DC with outputs to 60 volts and 100 amps.

Where loads are critical and expensive, the extra protection — say, against inadvertent knob-twiddling — from a crowbar is invaluable. On all internal crowbars in this series, the trip voltage margin is set by screwdriver at the front-panel.

Pertinent specifications are: triggering margins are settable at 1V plus 7% of operating level; voltage ripple and noise is 200 µV rms/10mV peak-to-peak (DC to 20 MHz); current ripple is 5 mA rms or less depending on output rating; voltage regulation is 0.01%; resolution, 0.25% or better; remote programming, RFI conformance to MIL-1-6181D.

Prices start from $350. For complete specifications and prices, contact your local HP Sales Office or write: Hewlett-Packard, New Jersey Division, 100 Locust Avenue, Berkeley Heights, New Jersey 07922 or call (201) 464-1234 . . . In Europe, 1217 Meyrin, Geneva.

FE149 SENIOR FET METER
The only true Senior FET meter available today with outstanding accuracy and unbelievable ease of operation.

- Unmatched Accuracy. 1.5% on DC, 3% on AC, plus large 7-in. meter and mirrored scale, assure the most accurate tests possible.
- Eight AC and DC ranges .5V to 1500V full scale.
- Zero center scale with .25v. either side assures measurements to less than .1 v. for transistor bias measurements.
- AC peak to peak readings to 4500V maximum with freq. response of 10HZ to 10MHZ ± 3DB.
- Eight resistance ranges to R x 10 megohms with 6 OHMS center scale.
- Nine DC and nine AC current ranges 150 µa to 5 amps.
- Eight decibel ranges for audio measurements.
- Three HI-Voltage ranges, 5 KV, 15 KV, 50KV with 39A21 high voltage probe.
- Absolute meter and circuit protection against circuit overload.
- Non-breakable, scuff-proof, vinyl-clad steel case.
- Three-way power. Operates on AC, on self-contained rechargeable batteries, or on AC with batteries plugged in. Same readings all three ways.

$149.50

Exclusive push-button design. Just push two buttons for any test - top row selects function, bottom row selects range. Action is instant and automatic.

FE14 and FE16 popular
4 1/2 inch FET Meters
- Hi Accuracy. For unsurpassed measurements. Mirrored scales prevent parallax errors.
- Minimum circuit loading. 15 megohm input resistance on DC; 10 megohm on AC.
- Zero center scale ± 0.5 v. readings for transistor bias measurement.
- Full meter & circuit protection against possible circuit overload.
- 7 DC & AC voltage ranges 1 to 1000 volts full scale.
- AC peak to peak readings 2800 v. maximum with freq. response of 10HZ to 10MHZ ± 3DB.
- 5 resistance ranges to 1000 megohms.
- 5 DC current ranges 100 µa to 1 amp.
- 3 Hi-Voltage ranges, 3 KV, 10 KV, 30 KV, extended with 39A19 ($9.95) high voltage probe.

$69.95

That's right. 5000 initial permeability. And we mean it!
Perhaps your designs for pulse transformers have gone up in smoke for want of a powerful enough material. Well, now you've got it. And then some. Stackpole Ceramag® 24H ferrite material.
Ceramag® 24H is a precision engineered product. Exact processing, density checks, rigid kiln controls and precise sintering. You get more out of it simply because we put more into it.
Here are a few more conservative characteristics. Maximum permeability, 6900. Typical. Saturation flux density, 4100 gauss and residual magnetism of 850 gauss. If curie point is significant to your operation, how about one of 175 °C. Then there's temperature coefficient. Ceramag® 24H goes +0.700%/°C at -25°C to 25°C and -0.450%/°C at 25°C to 75°C. And all of this with a disaccommodation factor of $1.4 \times 10^{-6}$.
Ceramag® 24H is ready. Are you? Drop us a line and we'll send you some even more interesting facts about this fantastic new material. And the charts to prove it. Stackpole Carbon Company, Electronic Components Division, St. Marys, Pa. 15857. Ph: 814-834-1521.
LSI analog multiplexer chip combines bipolar and FETs

Radiation Inc., sub. of Harris-Intertype Corp., Microelectronics Div., P.O. Box 37, Melbourne, Fla. Phone: (305) 727-4295. P&A: $360; September, 1969.

Using large-scale integration, a new monolithic bipolar 16-channel analog multiplexer combines n-channel junction field-effect transistors with complementary npn/pnp bipolar transistors on the same dielectrically isolated substrate. This combination of both vertical and horizontal integration technologies doubles the number of bipolar-compatible data channels available to the systems designer.

Said to exceed the performance of discrete IC or MOSFET systems, the new RS-1000 multiplexer offers the advantages of complexity on a single chip, weight reduction and reliability. Systems applications for the new device include telemetry and guidance systems, and process control computers. Circuit applications include a/d and d/a converters, function generators, and sample-and-hold and analog cross-point circuits.

The device features near-ideal on-chip analog switches with a 100-nA off-state input leakage, 500-Ω on resistance, 4-pF off-channel input capacitance, and an access time of 800 ns. The high off impedance virtually eliminates signal leakage to the load; the very low on impedance greatly reduces signal loss in the switch. In addition, there is effective isolation between the on-channel signal and all other input signals.

Operating at twice the rate of MOS devices, the RS-1000 has a commutation speed of 1.3 MHz because of its extremely fast access time. It requires a single negative and single positive power supply, accepts bipolar analog inputs of -10 to +10 V, and is compatible with standard DTL and TTL circuits.

There are 16 analog input lines and two analog outputs that can be used independently, or bussed together for 16-channel operation. Since the JFET switch elements are symmetrical, the new circuit can also be used as a demultiplexer where a one- or two-line input is commutated to eight or 16 output lines.

Random-access channel selection is accomplished through a four-bit binary address input. There is also an address enable input that can be used as an address expander for applications employing several multiplexer circuits. A mode control input provides one-out-of-16 or two-out-of-16 channel selection. In addition, an external bias control allows optimization of signal input range and switching time.

Besides all these performance benefits, the RS-1000 can operate over the full military temperature range from -55 to +125°C. It meets the mechanical and environmental requirements of MIL-S-883 via its 28-pin hermetically sealed flatpack.

Two other new products from Radiation Inc. on display at Westcon are high-speed internally compensated operational amplifiers. Model RA-2510 has a unity-gain slew rate of ±50 V/µs and a large-signal bandwidth in excess of 500 kHz. Model RA-2500 slews at ±20 V/µs at unity gain and offers a large-signal bandwidth of greater than 200 kHz.

The RA-2500 has a voltage gain of 35,000, an offset current of 20 nA, and an offset voltage of 2 mV. The RA-2510, on the other hand, gives a voltage gain of 15,000 and offers input characteristics identical to those of the RA-2500.

Output impedance is 100 Ω and output current is ±20 mA for both amplifiers. They are packaged in TO-86 and TO-99 metal cans.

Also on display is an expanded line of radiation-hardened TTL integrated circuits. Booth No. 4503 Circle No. 413

Achieving true interchannel isolation, a new monolithic 16-channel analog multiplexer forms near-ideal on-the-chip analog switches by combining complementary bipolar transistors with n-channel junction FETs. This large-scale integrated circuit uses dielectric isolation to separate all structures, both horizontal and vertical.

INFORMATION RETRIEVAL NUMBER 83
OIL FILLING

SATURATION AT FULL LOAD

NO RINGING

“LOSSYLINE” SCREEN ROOM/POWER LINE EMI FILTERS

“LossyLine” screenroom/power line filters provide unsurpassed EMI suppression by use of a lossy approach. Conventional filters use L-C networks to reflect, reject or transfer unwanted RF energy. Lundy filters use “lossy” elements which absorb and completely dissipate this energy. No chance for it to escape, feedback or leak. By absorbing and dissipating the RF energy, shunt capacitance is minimized and reactive current is negligible. Attenuation does not fall off with current, since there are no saturable inductors.

- No oil leaks to worry about, either. A lossy type filter develops a minimum amount of heat, therefore does not require oil for cooling.
  - 100 dB from 14KHz to 100GHz
  - Oper. Cur: 25-1000 amps
  - Freq: 25, 50, 60, 400, & 1000 cps

Sylvania Electric Products, Semiconductor Div., West Main St., Hillsboro, N.H. Phone: (603) 464-5533. P&A: $45 to 50¢; 2 to 4 wks.

Designed to conserve space in computer, industrial, and consumer applications, seven new plastic miniature diffused silicon rectifiers are capable of delivering 1 A of output current and of withstanding overload currents as high as 30 A. Types 1N4001 through 1N4007 offer peak reverse voltages of 50 to 1000 V.

Booth No. Unit B Circle No. 887

Plastic rectifiers take 30-A surges

Power SCRs go to 150°C

Westinghouse Electric Corp., Semiconductor Div., P.O. Box 868, Pittsburgh, Pa. Phone: (412) 255-3693. Price: $80.50 or $86.50.

Two new high-temperature silicon-controlled rectifiers will operate at a junction temperature of 150°C. Type 2615 has a forward current of 200 A rms and is rated at 125 A half-wave average. Type 2605 has a forward current of 275 A rms and is rated at 175 A half-wave average. Both SCRs have a guaranteed voltage change of 300 V/µs and forward blocking voltages to 600 V.

Booth No. 4601 Circle No. 345

Hot-carrier diodes trigger at 410 mV

Suitable for mixer and detector applications at frequencies up to 3 GHz, a new line of hybrid hot-carrier diodes have a junction capacitance of only 1.2 pF, a forward conductance of 20 to 35 mA at 1 V, and a low turn-on voltage of 410 mV. The new units also boast the near absence of recovery time. Peak inverse voltage is 20 V for type 5082-2810 and 15 V for type 5082-2811.

Booth No. 1040 Circle No. 845

Tiny LEDs emit IR

General Electric Co., Miniature Lamp Dept., P.O. Box 2422, Cleveland, Ohio. Phone: (216) 266-2258. Price: $3 or $4.

Measuring only 0.1 in diameter, two new solid-state lamps produce noncoherent infrared radiation that peaks at 9400 A. Type SSL-15 is a hermetically sealed unit with a standard top-mounted glass lens, while type SSL-25 is a plastic encapsulated device. Power output when driven at 20-mA forward current is 9.5 mW for the SSL-15 and 1.5 mW for the SSL-25.

WRITE TODAY for full details on the totally new Cherry Selector Switch. It may change all your old ideas about programming devices.
WHAT?
Still chopping light
with a wheel?

Hey Mister,
get a FORK!

Many engineers already use Bulova/American Time Products
tuning forks to chop light and similar energy beams. Those who
are not are a bit behind the times, and should know the fork's tremendous
advantages over motor-driven light choppers —

- No wearing parts / No lubrication needed
- Low power requirements / Much longer life
- More efficient light handling / Smaller and lighter

How is all this achieved? By attaching to a fork's tines a pair of vanes —
slotted, notched, or pierced, to suit the need. Then the vibrating fork chops
light or similar energy beams to produce optical effects never before
achieved. What's more, it's all done in a very, very small package. For
example, a 2 cubic inch package can chop 1,000 times per second!

Another variation is a scanner that uses a torsional fork scanning at a
uniform repeat rate. A mirror or other optical device can be attached to
vibrate the device torsionally.

Whatever your application, from burglar alarms to infrared spectrophot­
meters, if you've got some light to chop or scan, call American Time

Tiny glass diodes
rectify 160 mA

Sylvania Electric Products Inc.,
Semiconductor Div., Hillsboro, N.H.
Phone: (603) 464-5533. P&A: 65¢
to $1; 30 days.

Encased in a DO-34 whiskerless
package, five new silicon epitaxial
diodes can dissipate 500 mW of
power in free air and can handle
average rectified output currents
of 160 mA. Reverse breakdown
voltage for types IN4531 through
IN536 ranges from 35 to 100 V.
Applications include frequency
detectors, fast logic circuits, and
clamping and chopping circuitry.

Hybrid regulators
supply 5 to 36 V

Transformer Electronics Co., P. O.
Box 910, Boulder Industrial Park,
Boulder, Colo. Phone: (303) 442-

Supplied in a 14-lead dual-in-line
package, series VR hybrid voltage
regulators provide fixed output
voltages of ±5 to ±36 V. All units
deliver 500 mA of output current
with a voltage regulation of 0.01%. 
Attenuation of noise and ripple is
typically 10,000:1 (80 dB). The
built-in reference voltage has a
temperature coefficient of
0.005%/°C.

Tantalum Foil

3 ways better than solid in non-polar applications:

- smaller than solid tantalum
- more reliable than solid tantalum
- delivers more microfarads than solid tantalum

Design is the big difference between General Electric's Type 29F non-polar tantalum foil capacitor and an equivalent solid tantalum capacitor. A design that's specifically for non-polar applications. GE Type 29F non-polar tantalum foil is about half the case size of an equivalent solid, yet accepts voltage and current variations in either direction. And from one small, single roll that in no way impairs the inherent reliability characteristics of tantalum foil. (Totally unlike its bulky solid counterpart that requires two slugs connected back-to-back and, in most cases, within a single case.)

The difference doesn't end with just size and reliability. Consider microfarads. GE tantalum foil delivers 50 percent more microfarads per case size, in practically all cases, when compared with solid tantalum. So for your next non-polar application, contact your General Electric Sales Representative and ask to see the Type 29F tantalum foil capacitor. It could make a big difference. In size. In reliability. In microfarads. Electronic Capacitor and Battery Dept., Irmo, S.C. 430-36

GENERAL ELECTRIC
One size, four power ratings supply the power needed for any cordless product.

Now you can match power to product with one of Sonotone's Sub-C nickel-cadmium sealed cells. Pick from these four:

S113, the industry standard, is a dependable, nickel-cadmium sealed cell rated at 1.2 ampere hours. This is the one that started the cordless revolution. Now in use in cordless toothbrushes, slicing knives, communications and standby power equipment.

For fast recharging, specify Fastback (T).
The S313 recharges fully in just 3 hours. This new nickel-cadmium sealed cell is rated at 0.9 ampere hours. Currently used in cordless shavers and cordless hair clippers.

S413 is a high rate discharge nickel-cadmium sealed cell with 1.0 ampere hours. Puts out up to 75 amps. of surge power... ideal for engine-starting applications.

And finally, the economical S213 with performance the same as the S113, except 0.7 ampere hour capacity. It is used in many of the same applications as the S113 where running time is less critical and economy most essential.

What we've done with the Sub-C cell, we can do with any of our battery products.

Write for full information:
Battery Division, Sonotone Corporation, Elmsford, N.Y. 10523.
Scotchpar's producer uses more supporting players than any other big name film producer.

3M Company has the largest sales force—all engineers and insulation specialists calling exclusively on the electrical market—to make sure Scotchpar® polyester film turns in a stellar performance for its customers.

They're supporting a great film.

It's thin, tough, transparent, flexible and durable. It also has high dielectric strength, great temperature stability, and resistance to moisture and solvents.

Our men help capacitor manufacturers get the right kind of Scotchpar film for their product—they can choose from a complete lineup of thin films down to .25 mils, plus Scotchpak® film if they want heat sealable features.

They work equally hard for manufacturers who use Scotchpar film as insulation in transformers, motors, wire and cable.

With all these men on the job, we still work harder than anybody else helping electrical men get the most out of polyester film.

All because we want our Scotchpar film to win over a very critical audience.

3M Company, Film & Allied Products Division, 3M Center, St. Paul, Minnesota 55101.
Around here, it's affectionately called just that. But you can simply refer to our newest creation as the CML Model CRS-2000A Frequency Converter until you get used to the idea of a Bippy hanging around. It features low distortion sine wave output and excellent regulation — less than 0.1% voltage regulation, less than 0.5% frequency regulation. Full power is available into leading and lagging power factor loads. The Bippy is solidly built (as all Bippys are), air cooled, and extremely quiet (as all Bippys are not) — measures 19" x 26¼" x 20". Ideal for marine and ground support installation, portable shelters, communications vans, radar systems, aircraft maintenance depots. This truly is the Bippy you can bet on. It socks the power to you!

**MODULES & SUBASSEMBLIES**

**Miniature regulators handle up to 20 W**

Powercube Corp., sub. of Unitrode Corp., 214 Calvary St., Waltham, Mass. Phone: (617) 924-1758. P&A: $225; stock to 2 wks.

Able to handle up to 20 W, a new line of linear regulators measures only 0.5 cubic in. and weighs only 0.8 oz. These type R dc/dc regulators are available for inputs from 10 to 150 W, corresponding to regulated outputs from 4 V at 4 A to 110 V at 10 mA. Standard features include a zener-protected input, and short-circuit and current-overload protection.

**Hybrid amplifier drains only 75 µA**

Philbrick/Nexus Research, a Teledyne Co., Allied Drive at Route 128, Dedham, Mass. Phone: (617) 329-1600. P&A: $49; stock.

Designed for low-quiescent-power applications like long-term battery operation, a new hybrid operational amplifier draws a maximum quiescent current of only 75 µA. Operating from supply voltages between ±2 and ±18 V, model 1404 has a typical offset current of 15 nA, typical common-mode rejection ratio of 10⁶, and initial offset voltages from 1 mV.

Booth No. 2014   Circle No. 385

**Modular transformers mount on PC boards**

Transformer Electronics Co., P.O. Box 910, Boulder Industrial Park, Boulder, Colo. Phone: (303) 442-3837. Price: $15.50 to $21.30.

Housed in shielded metal cases that measure 1.5 by 1.5 by 0.75 in., a new series of dc-to-dc converter toroidal transformers can be conveniently mounted on a PC board. Fourteen models allow selection of output voltages from 3 to 1000 V dc. Improved regulation can be obtained by preregulating the inverter input voltage.

Booth No. 3601   Circle No. 256

**Wideband op amp costs only $11.90**

Selling for only $11.90 in single quantities, a new FET-input operational amplifier features a minimum unity-gain frequency response of 4 MHz and a minimum full-power response of 100 kHz. Model 3308/12C has a maximum voltage drift of ±50 µV/°C over the temperature range of -25 to +85°C. Its output is ±10 V at 5 mA.

Booth No. 3801   Circle No. 374

Electronic Design 17, August 16, 1969
KEPCO has 62 models whose voltage or current regulators employ a modern linear integrated circuit.

The result: **REMARKABLY WELL-BEHAVED POWER!**

The performance of our monolithic amplifier in the d-c comparison circuits of these 62 power supplies is properly impressive in the usual specifications of power supply performance.... Line regulation is well under 0.0005%; load regulation less than 0.005%.

The performance is also spectacular in the not-so-frequently discussed specifications.

For example, the sensitivity to thermal shock is about nil. The Kepco I-C regulator, eliminates the small differences in component temperature due to self-heating or minor environmental changes, which in conventional designs causes much of the jitter, noise and "bobulation" in the output of d-c power supplies. Our I-C regulators are virtually immune to these influences. Their offsets change less than 20 µV per °C and 5 nanoamperes per °C, respectively!

There are six diverse groups offering you the advantages of I-C regulation.

**CPS**
6V-15V, 60-750W, crowbar-protected regulators for delicate I-C's

**JOE**
6V-100V, 60-750W, linear programmable regulators.

**PAT**
7V-100V, 20W programmable modules

**PCX**
7V-100V, 20W programmable modules 0.2-2A, 20W modular or plug-in metered models

**CC**
0.2-2A, 20W fast recovery current regulators

**OPS**
7V-100V, 20W high speed power amplifiers.

**with KEPCO...IT'S CONTROL!**

TINY . . .  
BUT - MVMs  
CAN TAKE IT!

THESE NEW HIGH Q AIR VARIABLES  
ARE RUGGED

JFD has developed three sizes of unusually rugged air variable capacitors. All three feature a unique internal guiding mechanism with a positive stop. The result: concentricity is constant and these capacitors can withstand conditions of extreme shock and vibration.

Further, newly developed metal biasing elements provide smoother, more constant torque during and beyond life cycling.

Other unique features of the series are:
- Engineered to withstand heat — during soldering.
- Internal air meshing shells are silver plated to provide best surface conductivity and long life.

All MVM's are completely interchangeable with competitive models.

Write for MVM catalogs.

We make our frequency components too good rather than merely good enough. Because sometime, somewhere, it might make a difference.

Motorola's dependable, precision frequency components are now available.

Many of our frequency components are used in emergency communications equipment. That's one reason why we will not compromise our insistence on quality.

And now, for the first time in 30 years, you and other designers and OEM manufacturers can take advantage of Motorola's experience and large production capabilities for frequency components: crystals, filters, oscillators, tone modules, and resonant reeds.

You can choose from an extensive line of off-the-shelf precision components. Or we'll gladly design and produce your devices on a custom basis. If you need it, you'll get application assistance. And all components are made under clean room conditions.

Whatever application you have in mind for our frequency components, you can count on one thing. All are designed with the same precision, the same quality, the same dependability. Because we won't settle for second best.

And neither should you.

below $100 (full 3½ digits) for the OEM to package — we'll supply you with a digital voltmeter to meet your specifications — contact us today (201) 478-2800 Ext. S

as you like it-

below $300 in quantities of 100 — you can get the best specified new 4½ digit panel meters — Model 720 — write today.

Whatever your requirement, open or shut, look into Data-scan . . . we have Uni-polar digital panel meters with or without under-range "Zeroing" capability, 3½ digit and 4½ digit Bi-polar DPM's and an engineering department ready to go to work on your design.

Time-delay relays go solid state

A new line of high-accuracy, long-life variable-time-delay relays consist of a solid-state timing device operating an electromechanical relay. Standard units are supplied in a medium-sized octal-type plastic case with a dpdt function suitable for output switching from dry circuit to 10 A. They have variable delays from 0 to 15 s or 0 to 60 s.

Booth No. 4403 Circle No. 268

Low-cost op amp drifts 20 µV/°C

Providing a maximum voltage drift of ±20 µV/°C over the temperature range of -25 to +85°C, a new low-cost operational amplifier offers a minimum full-power response of 100 kHz and a minimum open-loop gain of 114 dB. Model 3267/12C supplies an output of ±10 V at ±5 mA and a minimum frequency response of 1 MHz. Its minimum slew rate is 6 V/µs.

CHECK OUR DJINNI'S BUILD.

Low profile.
Which means you can build a complete relay only .187" high to fit dual in-line spacing using Hamlin's new Mini-2 reed switch. It has a sensitivity range of 7.5 to 32.5 ampere turns which will rate your relay at 100 milliwatts with an operate time of 200 microseconds.

Like all Hamlin Djinnis, it's built to last longer whatever your application. That's why we're asked to build more types of reed switches for more people than any other manufacturer.

For instance, our Micro-miniature Djinni is the world's smallest. Then, there's the Tiny, Subminiature, Miniature, Compact and Standard sizes just to make sure you won't have any packaging problems.

If your application calls for RF switching, we have a Djinni that will switch frequencies from 30-100 MHz with low resistive losses and an impedance level of 52 ohms. The tiny MTRF-2 measures only .092" glass diameter by .635" glass length.

Ultra-high voltage applications call for the type DRTV that will switch voltages up to 20,000 VDC. Life expectancy is 1 million operations at full load and practically infinite life at lower voltage levels.

Work a little magic of your own the next time you have a control problem. As a starter, send for our free "Switch Lab" kit. Just write to Hamlin, Inc., "Baghdad on the Lake," Lake Mills, Wisconsin 53551.

HAMLIN:

How's that for low-cal magic?
Pinlites Inc. manufacturer of the world’s smallest incandescent lamps, offers a total of 16 different micro-miniature lamps. Ranging in size from .016 to .030 in diameter. Pinlites continue to offer unique design capabilities: Display modules with 200 individual lamps per square inch, optical multi-tracking heads, film encoding units, weapon status, readouts. Styles available are lens head, flat top, and axial leaded, with a broad spectrum of light outputs.

The all new, lower cost, Midgi-Lite® M series is a further advancement in digital and alphanumeric readout displays. The use of incandescent tungsten filaments permits brightness control, wide angle, single plane viewing. The M series are now in a rugged ceramic, metal, glass package. The depth from front to back is only 3/16”.

M SERIES
Midgi-Lites® and Alpha-Lites represent a new design approach in the direct viewing of incandescent tungsten filaments as light bars. The use of filaments permits the most efficient use of power for display purposes. The seven segment Midgi-Lites are now in a new and slimmer, ceramic, metal, glass package for severe shock and vibration environments. Segment brightness has been further increased for readability in direct sunlight . . . up to 12,000 foot lamberts/segment. Alphalites are 16 segment alphanumeric displays with the same new design features and sunlight readability.

For complete design data specification and pricing, write or call: Pinlites Inc., 1275 Bloomfield Ave., Fairfield, N. J. 07006 • Attention: Mr. Bruce Bundy, Sales Manager • (201) 226-7724. Visit us at the Wescon Show in San Francisco, August 19-22, 1969, Booths 4814-4815.

M6-IC
Midgi Coder-Lite — An “M” series, 5/16 character height, seven segment digital display with integral 8-4-2-1 BCD to seven segment decoding/driving. TTL 5 volt logic level is accepted for both decoding and lamp drive. The M6-IC is only 3/16” in front to back depth and allows a display density of 6 characters per square inch. Overall dimensions are .305 width and .465 high, with a total weight of 1 1/2 grams. The combination of the inherent life expectancy of the I.C. and 100,000 hour segment design life team up for an ultra reliable and low cost readout system.

Synchro converter replaces gear trains

Transmagnetics, Inc., 134-25 Northern Blvd., Flushing, N. Y. Phone: (212) 539-2750. P&A: $100; 4 to 6 wks.

A new solid-state synchro-to-linear dc converter can replace gear train servos in dozens of applications at a saving in price and size. Model 1637 converts three-wire synchro inputs to linear dc outputs that are proportional to the synchro angle. The dc output is available directly or after a simple analog-to-digital conversion for computing recording and remote indication.

Failsafe amplifier puts out 100 W

Redifon Ltd., Communications Div., Redifon Electronics Inc., 210 Summit Ave., Montvale, N. J. Phone: (201) 391-2637.

Delivering an output power of 100 W from 1.5 to 12 MHz, a new transistorized wideband linear amplifier needs no tuning and cannot be damaged by incorrect loading, even if the output socket is open or short-circuited. Model GA 480 is protected against excessive drive, is insensitive to wide variations in supply voltage and is safeguarded against supply transients.

Booth No. 5202 Circle No. 270
NEW TI ELECTRONIC CHEMICALS.

They've already made our first customer very happy.

For years, Texas Instruments has been manufacturing electronic chemicals for just one customer: ourselves. They've worked so well for us, we'd like you to try them. The same chemicals we use in silicon production, high-temperature gas reactions and epitaxial technology. All of which require, as you know, purity to parts-per-billion standards plus extremely high integrity in lot-to-lot uniformity.

Perhaps the wealth of experience behind TI chemicals can offer you some improvements... even if it's just the security of a new source. In either case, your files should contain the following data sheets:
- Epitaxy Grade Trichlorosilane (5 and 55 gallon stainless drums)
- Epitaxy Grade Silicon Tetrachloride (5 and 55 gallon stainless drums)
- Boron Tribromide Dopant (50 and 100 gram ampules)

Please write. You'll find us very eager to double our satisfied customer list.

Texas Instruments Incorporated
Chemical Materials Division

Dallas, Texas 75222

A small part of our new, high-capacity electronic chemicals facility.
Ampere
'Two-In-One' packaging gives you Plastic IC's with the Reliability you'd expect only from hermetics.

Through a new, double-encapsulation packaging technique which combines the economy of plastic with the reliability of hermetic sealing, Ampere is able to bring you, at regular plastic prices—a line of off-the-shelf, digital IC's... the most reliable line of all-plastic 74N TTL's in the business. The encapsulation approach is unique... here's how it's done:

1. The chip is mounted on a gold-plated grid and is protected with a lacquer coating. The assembly is then packaged in soft epoxy resin which protects the chip against moisture penetration and prevents thermal fatigue of the bonding wires.

2. This sub-assembly is then welded into the final tin-plated grid structure and packaged in the dual-in-line encapsulation. A special ultra-strong plastic is used for the body of the device to withstand severe bend-pull stresses on the external leads. The leads are specially designed for maximum adhesion to the plastic body. The tin-plating on the leads continues right inside the body of the device, ensuring excellent corrosion-resistance and high quality soldered connections even after storage under tropical conditions.

Aperex
TOMORROW'S THINKING IN TODAY'S PRODUCTS
A NORTH AMERICAN PHILIPS COMPANY
HERE'S HOW WE PROVE OUR RELIABILITY:
Apart from stringent quality control during each step of manufacture, batches from each production run are tested for reliability under every conceivable kind of stress...electrical, thermal, mechanical and climatic, including: • Resistance to thermal fatigue • Endurance under conditions of intermittent dissipation • Bond strength • Bulk leakage • Degradation of electrical performance under severe thermal stress • RTR-circuit endurance • Ability to withstand high and low temperature storage • Switching capabilities under maximum fan-out and temperature conditions • Full sequential temperature treatment tests to MIL-specifications • Solderability, Shock Resistance, Acceleration and Vibration Step-Stress.

A specially prepared Reliability Report, based on three years of constant test procedures, is available. Write for your free copy, on your company letterhead.

Amperex 74N TTL's are available off-the-shelf from Amperex Distributors listed below.

MODULiES & SUBASSEMBLIES

IC power modules regulate to 0.005%

Deltron, Inc., Wissahickon Ave.,
North Wales, Pa. Phone: (215) 699-9261. P&A: $79 to $289; 4 to 6 wks.

Free of thermal transients, a new series of power modules use integrated circuits to provide a regulation of 0.005%. Series N units feature adjustable current limiting, remote sensing, remote programing and fast recovery times. They also offer convection cooling to 71°C, as well as electrostatically shielded transformers.

Booth No. 1508 Circle No. 269

Dual-output converters power entire system

Designed for digital and analog integrated circuits, any single unit in a new line of multiple-output miniature power converters can supply an entire instrument or system. Models 211, 212 and 213 have one output of 5 ± 0.5 V at 5 A; and a second output of 24 V at 1 A, 200 V at 25 mA, or ±15 V at 400 mA, depending on the model.

Booth No. 3609 Circle No. 378

OEM power sources satisfy many needs

Power/Mate Corp., 514 S. River St., Hackensack, N. J. Phone: (201) 343-6294. P&A: $75; stock.

UNI OEM power supplies offer the advantages of an all-purpose wide-range source with the compact size of a narrow-range slot supply. They are available with internal or external controls, internal or external sensing, complete overload and short-circuit protection, and the convenience of three mounting surfaces. They meet the requirements of MIL-E-16400, MIL-E-6272, MIL-E-5422, MIL-E-4970 and MIL-I-6181D.

Booth No. 1433 Circle No. 377

Low-profile supply puts out 6 V at 2 A

Model 1301 is a low-profile high-performance dc power supply with an output of 0 to 6 V at 0 to 2 A. The new unit features an unregulated isolation transformer-rectifier followed by a stable high-gain regulator. It may be mounted on two sides, and it has remote voltage adjustment and remote sensing features for installation flexibility.

U169
New S. S. White system trims microelectronic hybrid resistors at 1,000 per hour... or more

If you're into hybrid circuitry in a big way, or hope to be, our Model AT-701AR may be just what you need. It offers high capacity, accurate trims, high yield — or, just what you need to keep your customers and your comptroller happy.

Model AT-701AR is similar to our highly successful Model AT-701A, but with the addition of a rotary feeding system which lets operator load and unload substrates during the machine's trimming cycle. Capacity is limited only by the manual dexterity of your operator.

Accuracy of the AT-701AR is guaranteed — within 0.5%. 0.1% is attainable with care and some sacrifice of speed. Trimming is monitored by a precision system of electronics featuring a four-wire Kelvin bridge, and tolerances may be programmed from ± 0.1% through ± 11%. (No use making them better than the specs require!)

But suppose the Model AT-701AR is too big or too small for you?

Call us anyway. If you can get by with something like 600 accurate trims an hour, we can offer you our Model AT-701A, to which you can add the turntable feature later. If you're still experimenting, we have Model LAT-100 for breadboarding. It is accurate to 1% better, takes substrates up to 4 x 4 inches and sells for only $5,950. If you're really big, there's the Model AT-704A, a rotary-feed machine that trims four resistors simultaneously, monitors, and inspects them at the breathtaking rate of 4,000 per hour. And if that's not fast enough for you, buy two.

All the S. S. White resistor trimming systems are based on the proven Airbrasive® method of removing resistance material which produces neither heat nor shock, does not alter the substrate.

Call 212-661-3320 to arrange for a live demonstration. Speak to Hal Skurnick or Don Davis. These same gentlemen will be demonstrating the Model AT-701AR and the Model LAT-100 at major electronics trade shows around the country, and if that's not quick enough for you, we will arrange for you to visit our factory. We have also prepared an extensive technical bulletin on this equipment, called, rather cryptically, the "RT-14", a copy of which is yours for the asking.

Write to S. S. White Division, Pennwalt Corporation, Dept. 28, 201 East 42nd Street, N.Y., N.Y. Tel.: 212-661-3320

When run-of-the-mill won't do...

Transitron
THYRISTORS
solve your problems.

in opto-electronics
Our new RTPC Photo-SCR's for example — most advanced in the industry — operational over full MIL temperature range.

in power conversion
Transitron fast turn-off TO-66, TO-64, TO-48 and press-fit thyristors are very big in inverter/ converter applications

in hi-current pulse generation
Radar modulators and other pulse circuits perform better with our ultra-fast turn-on/turn-off thyristors

in video displays
Our TRIAC's, power gate turn-off SCRs and fast turn-off SCRs provide new economical deflection circuit switching.

Design Engineers . . . looking for better circuit performance? Need a thyristor with special characteristics? Tell us your problem. Write details, or call collect (617) 245-4500 - ask for Thyristor Marketing.

New Johanson capacitors help you make ends meet.

- Solder directly on P/C board (minimum stray capacity).
- Solder one end to coupling link and other end to cavity wall.
- Solder ends to terminals of another component.
- Solder one end to P/C board and attach lead to other end.

The new Johanson 7200 capacitor is ideal for balancing of semi-conductors and microwave components, for trimming of small fixed capacitors, for UHF oscillators, for coupling (VHF and UHF), for terminations for UHF coupling links, and for strip lines and modular blocks.

The 7200 features tubular electrodes which provide for low losses and low inductance at microwave frequencies. They also feature a low minimum capacitance 0.1 µF (10:1 tuning ratio) and Q of 500 at 200 MHz. Call or write for complete information.

Electronic Accuracy Through Mechanical Precision

In the open position, the Modulator connector eliminates soldering.

- Transistor heat sink handles up to 20 W
- Simple heat pipes beat metal ducts
- Snap-in panel catch opens with a pinch

Improving the appearance and function of access panels, compartment doors, and hoods and covers of all types, model 60 squeeze-release catch is easily grasped by the fingertips and released in the same motion. Installation is literally a snap, as the body of the fastener is merely pushed into a rectangular hole (0.5 x 0.312 in.) in the door or panel, where it seats permanently. A slightly larger hole in the frame is caught by its spring-like gripping fingers as the panel closes.

Compact and simple, a new heat-transfer device, the heat pipe, is said to have many times the heat transfer capability of metal conductors. Available in rigid or flexible versions, heat pipes are especially adaptable to the cooling of semiconductors, integrated circuits, electron tubes, and other electronic components. They can be inserted deep inside electronic packages.

Dissipating power of 10 to 20 W, a new transistor aluminum heat sink is a flat blank that is folded into a well-ventilated form and slotted in the direction of heat flow. Type 690-1100-H14 accepts the following transistors: TO-3, TO-8, TO-36, TO-59, TO-61, TO-62, TO-63, TO-66, TO-82, DO-8, DO-9, and DO-30. It is a 1.81-in. square, supplied without any finish or with black anodize.

Booth No. 2604 Circle No. 282

Designed for array mounting on a mother board, the new MOJO 6308 card-edge receptacle combines the advantages of modular design with a unique contact that eliminates soldering. Its contact tail combines a square wire-wrapping post with a specially designed shoulder which, when press-fitted into the plated-through hole in the mother board, provides a permanent gas-tight electrical connection without soldering.

Signalite Sets The Pace In Gas Discharge Tubes and Glow Lamps

Signalite started supplying neon glow lamps as an indicator device almost two decades ago. Since then, Signalite developed the neon lamp into a circuit component that has solved problems in areas from voltage regulation to photocell drivers...from SCR triggering to unregulated power supplies.

Today, Signalite is a leading source for Neon Glow Lamps as indicators and circuit components.

Today, Signalite is a leading source for spark gaps designed to transfer energies and act as voltage sensitive switches.

Today, Signalite is a leading source for noise tubes and miniature noise sources for noise figure test equipment and monitoring system receiver sensitivities.

Only Signalite offers you this in-depth experience, capability, facility and technology in gas discharge devices and glow lamps...backed by an R&D program to explore new markets and devices.

Signalite Application Engineers are available to you. Share your design problems with them. They'll choose the right product for your application or design custom units to meet unique requirements.

Yours For The Asking...brochures on neon lamps, spark gaps, noise sources. Application Newsletter on technique and application of these products.
Model 20 Features

Portable — self-contained
Two chart speeds in ratio of 2/1
10 mv/mm sensitivity
DC to 125 Hz frequency response
Gain, position and pen heat controls
Low paper indicator
Front loading
Event marker

PRICE $450.00

An ideal accessory to other instrumentation in laboratory or field applications.

This instrument can be private branded in your color at OEM prices.

MFE offers stock recorders from one to six channels or will design custom recorders to suit your exact needs. Let us know your requirements — we will send complete information.

Polyimide tape takes 7800 V

Mystik Tape, Borden Inc., 1700 Winnetka Ave., Northfield, Ill. Phone: (312) 446-4000.

Designated as Mystik 7367, a new pressure-sensitive polyimide film tape has a total thickness of 2.5 mils and a dielectric strength of 7800 V. This new tape can function as a carrier material in the manufacture of memory sensing devices or as a design component for microcircuitry. It covers the temperature range from -80 to +350°F.

Booth No. 2611 Circle No. 273
NEW UNIVERSAL IC FLAT-PAK SOCKET

FOR TEST BREADBOARD

- For any custom-hybrid flat-pak style with leads on .050 spacing or multiples thereof. Up to 70 leads per side (3½" long) x any width between sides.
- Allows custom tailoring of socket for any special or odd-size device, eliminating large tooling costs, long lead times or expensive hand-fabricated special sockets.
- Allows wide-open access to entire package when mounted in socket.
- Choice of terminations — fanned out on PCB to individual pin sockets or terminals (illustrated), or direct staggered contact terminations below socket.
- All materials good for -65° to 150°C.
- Combination of rugged spring clips on hold-down pressure bar and sliding action of cantilevered contacts against leads provide good wiping action.
- Large guide grooves at end insure precise mating of pressure bar to contact strip every time. Tolerances: Decimals ± .005. Fractions ± 1/4 — unless otherwise specified.

ORDERING INFORMATION: All sockets are supplied as 2 identical strips, or sets, fully assembled and tested. Just mount them on the spacing desired with the self-tapping screws provided.
1) Specify number of contacts per side: Available in 20, 30, 40 or 50.
2) Specify termination style as follows:
   Dash A — Contacts terminate exit directly below socket on .1" staggered spacing.
   Dash B — Contacts are terminated on a PCB on .1" staggered spacing with male terminals.
   Dash C — Contacts terminated as — Dash B above, except uses individual female pin sockets rather than male terminals.

EXAMPLE: Universal IC Socket part number for an LSI device with 60 leads (30 per side) with contacts terminating at male terminals on PCB would be:
NP-305-5 (See #1 above) — (see #2 above), — or — NP-305-30-5

The Friden 1150 Digital Printer.  
It didn’t fail us.  
So it won’t fail you.

For nearly two years now, the Friden* 1150 Digital Printer has been an integral part of our electronic printing calculator.

So we know all about its reliability from first-hand experience, out in the field.

This 50-character-a-second printer is **durable** because it has fewer moving parts than ordinary medium-speed printers. It is easier to maintain. This means less downtime for your OEM product. The 1150 Digital Printer contains a single 20-character print wheel and a synchronized print hammer. Both are driven across the tape from right to left at a uniform speed. The hammer’s short impact time insures quality printing from the continuously rotating wheel. And we have eliminated messy ribbons with our disposable ink roller.

Logic requirements are simple, making it easy to integrate the 1150 Digital Printer into your OEM product.

One more important thing: the 1150 Digital Printer is not expensive. It just sounds expensive. With its low initial cost and desirable operating features, the 1150 Digital Printer gives you a price/performance ratio unique among OEM printers.

The complete specs are all in our Specification 1001. For your copy, write: Friden Division, Component Products, The Singer Company, San Leandro, California 94577.
Chebyshev—you'd be amazed at what ADC puts into a custom designed Filter.

Whether your Filter requirements are simple or complex:

ADC has a staff to solve your problem

Modern filter design is a complex art. Good designs call for careful innovation of the highest order. Sometimes parts of classic designs can be applied to problems, but more and more a highly creative approach is needed to tailor a network to your parameters. Of course, a computer helps determine the element values and their required efficiencies and temperature characteristics for predetermined performance. Still we find there is no substitute for a staff that understands the mathematics, physics, and material specifications peculiar to complex filter networks. This staff is your key to "engineered filters." We'll engineer a filter to fit your requests.

NASA needed an earthbound sun...technically, a Solar Simulator.
They went to Spectrolab.
Spectrolab needed a lens, 36" in diameter, 6" center thickness, that would conform to the stringent requirements set forth by NASA.
They came to Amersil.
Working closely with the Spectrolab designers and engineers, Amersil determined that Infrasil Grade T-18 Fused Quartz had the characteristics to meet the specifications for the Solar Simulator. The lens was molded by Amersil, assembled into the Simulator by Spectrolab, and is now being placed into research operation at the NASA Langley Research Center, Hampton, Virginia.
This cooperation from the raw material to the finished products is common practice at Amersil. Our scientists, engineers and designers have the experience, know-how and facilities to meet the needs of industry for high purity Fused Quartz and Fused Silica. These include the finest casting, molding and drawing equipment available.
Get full information and/or technical assistance by writing Amersil today.

New High Voltage High Power Rectifiers

VC Series from Varo.

Our new VC Series rectifiers may be tiny (3" long, 3/4" high, 3/4" wide), but they're plenty tough enough to stand up under high voltage, high power conditions.

They have voltage ratings of from 2 KV to 8 KV, current ratings of 1 to 2 amps, and they're available with an optional 300 nanoseconds recovery time.

Varo VC Series rectifiers are made to handle the biggest jobs. Like X-ray power supplies, radio and radar transmitters, and things like the new microwave oven power supplies.

And they'll handle most of the new high voltage, high power system demands that'll be coming along in the future, too.

The new VC Series from Varo.

It's the kind of thing we know you've come to expect from us.

$4.18 EACH
VC-80 (8,000 Volts — 1 Amp).
1,000 quantity.

DATA PROCESSING

High-speed calculator finds square roots

Specially designed for engineering, statistical and scientific use, a new electronic calculator contains a key that extracts square roots instantly. Model 1162 calculates in milliseconds and flashes answers silently on its built-in miniature cathode-ray tube. There are five registers, each holding up to 14 digits, for calculation and storage.

Booth No. 2021 Circle No. 343

Wideband system keys data quickly

To answer the need for data-channel or data-terminal field keying, a new data keyer is capable of keying nonsynchronous data transmitters over wide ranges to facilitate adjustment and maintenance of data systems. Model 3865 permits neutral negative, neutral positive and EIA interfaces. Keying speeds from 2 dot cycles to 22k dot cycles are possible.

Booth No. 1606 Circle No. 342

Computer/calculator handles 16 terminals

Mathatronics Div., Barry Wright Corp., 241 Crescent St., Waltham, Mass. Phone: (617) 895-1650.

A new computer/calculator system permits up to 16 remotely located keyboards or 16 page printers (typewriters) to be operated at the same time. The terminals may be direct wired for short distances (1000 ft.) using four-wire telephone-type cable, or for unlimited distances with an acoustic coupler. The CS3 simultaneous central station performs all operations in floating point arithmetic.

PROVEN RELIABILITY-
SOLID-STATE POWER INVERTERS,
over 260,000 logged operational hours-
voltage-regulated, frequency-controlled,
for missile, telemeter, ground support,
135°C all-silicon units available now-

Interelectrics all-silicon thyatron-like gating elements and cubic-grain toroidal magnetic components convert DC to any desired number of AC or DC outputs from 1 to 10,000 watts.

Ultra-reliable in operation (over 260,000 logged hours), no moving parts, unharmed by shorting output or reversing input polarity.

High conversion efficiency (to 92%, including voltage regulation by Interelectrics patented reflex high-efficiency magnetic amplifier circuitry.)

Light weight (to 6 watts/oz.), compact (to 8 watts/cu. in.), low ripple (to 0.01 mv. p-p), excellent voltage regulation (to 0.1%), precise frequency control (to 0.2% with Interelectrics extreme environment magnetostriuctive standards or to 0.0001% with fork or piezoelectric standards.)

Complies with MIL specs. for shock (100G 11 mils.), acceleration (100G 15 min.), vibration (100G 5 to 5,000 cps.), temperature (to 150 degrees C), RF noise (I-26600).

AC single and polyphase units supply sine waveform output (to 2% harmonics), will deliver up to ten times rated line current into a short circuit or activate MIL type magnetic circuit breakers or fuses, will start gyros and motors with starting current surges up to ten times normal operating line current.

Now in use in major missiles, powering telemeter transmitters, radar beacons, electronic equipment. Single and polyphase units now power airborne and marine missile gyros, synchros, servos, magnetic amplifiers.

Interelectrics—first and most experienced in the solid-state power supply field produces its own all-silicon solid-state gating elements, all high flux density magnetic components, high temperature ultra-reliable film capacitors and components, has complete facilities and know how—has designed and delivered more working KVA than any other firm!

You'll be surprised! In spite of its low price, the Model 4200 exhibits extraordinary performance. It excels in those specifications most eagerly sought by men who really know oscillators. Krohn-Hite's twenty years of frequency-generator know-how has produced a unique circuit* that makes low-priced high performance a reality at last.

Here's how the Model 4200 stacks up against several competitors:

**BROADER FREQUENCY RANGE:** The Model 4200 out-ranges most of the others, including more expensive units.

**MORE OUTPUT POWER:** The Model 4200 has from 2.5 to 50 times the power of the other units.

**BEST WAVEFORM PURITY:** The Model 4200 is unexcelled.

**BEST BUY:** The $350 price speaks for itself.

See for yourself. Write for data. Then contact your Krohn-Hite Representative for a no-holds-barred demonstration. The Model 4200 is a lot of oscillator for $350.

*Patent applied for.
This is the world's smallest all-pluggable DPM.

Then there's our less expensive model.

We brought out our 3½-digit compact DPM just last March. It's the one that plugs into a panel slot only seven inches square, and pulls out for servicing or replacement. If you need the accuracy of 3½ digits, Model 1290 is still your best buy. But if you can settle for a digit less, you can have our new Model 1260 at less than half the price. Don't be fooled by the price tag, though... there's nothing "cheap" about this 2½-digit version. Housed in the very same plug-in case and fully compatible with its more sophisticated brother, Weston Model 1260 offers 0.5% ±1 digit accuracy—with far greater resolution capability than mechanical movements provide. Full scale reading is 199, with 25% over and under-range capability, remote command signal and Weston's usual high rejection characteristics. In addition to the convenience of front panel pluggability and circularly polarized viewing, we've included front panel calibration as a built-in bonus feature on the 1260. Write to the originators of the DPM, WESTON INSTRUMENTS DIVISION, Weston Instruments, Inc., Newark, N.J. 01774.
BARNES ELIMINATES MANUAL LEAD STRAIGHTENING/CARRIER LOADING... FOR TO-STYLE IC'S

Are you tired of the high cost of straightening IC leads by hand? Then it's high time you tried the Barnes Oriole* Lead Straightener/Carrier Loader. You'll straighten 3 to 12 leads on TO-5's, 3 or 4 leads on TO-16's, or load them into Barnes Carriers. There's a manual model that straightens leads, or loads carriers, at 600 devices an hour. The semi-automatic model is pneumatically operated at 800 an hour. And conversion kits are available that add almost unlimited flexibility. Write or call us for the complete story.

DATA PROCESSING

Fast a/d converter works 10 bits/µs

Model ADC-F analog-to-digital converter combines successive-approximation methods and single-card modularity to achieve complete 10-bit conversions within 1 µs. This new technique results in the elimination of sample-and-hold and multiplexing circuitry in many interfacing applications. Relative accuracy is 0.05%, and temperature coefficient is 50 ppm/°C from 0 to 70°C.

INFORMATION RETRIEVAL NUMBER 118
How much space can I save by using the new “tini-telephone” jack panels and accessories?

You can figure on a fifty-percent reduction in space by using the Switchcraft “tini-telephone” patching system. And, we do mean system! These aren’t just scaled-down versions of standard-size patching components. The “tini-telephone” jack panels and accessories (see Fig. 1.) were designed from scratch to offer quality and convenience features never before available. (Just circle the reader service number to receive complete information.)

Sounds good, but how about the accessories? I don’t want any compatibility problems in matching components from different vendors.

Let’s take the accessories one-by-one and you’ll see what we mean by “tini-telephone” system:

PATCH CORDS —

Circuit-wise, you can have two or three conductor single plug patch cords or three or five conductor twin plug patch cords in a variety of cable lengths. The cable is high quality stranded plastic-jacketed type with shielding rated at 70-80%. All connections are soldered, and improved strain relief is accomplished by crimping a long tubular metal sleeve 360° around the cable jacket and plug sleeve. Flexible, molded PVC handles minimize cable breakage and absorb any tolerance variations between twin plugs and mating panel jacks. Terminating, dummy and looping plugs are also available.

SWITCHES —

A gusseted extra-strength frame is provided on “tini-telephone” switches. Plenty of throw is provided to assure contact wipe and required pressure for low contact resistance. The switches are rated 2 amps 200 watts max., A.C. non-inductive load with circuit configurations up to 2C (or 3A) and momentary or push-pull actuation may be specified.

LAMP JAX —

“tini-telephone” lamp jax accept standard bi-pin lamps and offer convenient front panel relamping. Special heat sink fins dissipate heat and a unique jewel and sleeve assembly eliminates the need for special insertion or withdrawal tools when relamping. (See Fig. 2.)

The jack panel, itself, has an extra wide flange for better rigidity and the molded panel inserts permit the jack bushings to protrude slightly from the panel face for more positive electrical continuity in the sleeve circuit with the mating jack. Then there’s the snap-on designation strips and reusable marking strips for fast, frustrationless nomenclature changes. Additional accessories such as, blank panel inserts, opaque-black hole plugs, plus designation strip kits gives you the most versatile, compact patching system ever designed.

Looks like you’ve thought of everything. I’ll need complete specifications for my engineering group.

Just request our “FORUM FACTS” catalog on “tini-telephone” jack panels & accessories on your company letterhead.

**PRODUCTION**

**Ultrasonic cleaner goes solid state**

Esterline Angus, div. of Esterline Corp., P. O. Box 24000, Indianapolis, Ind. Phone: (317) 244-7611.

Designed for continuous operation, a new ultrasonic cleaner features completely transistorized all-solid-state circuitry. Model EA12 has a fine-action cleaning system that works on pens without damaging their points, the print wheels on strip-chart recorders, and many other items. It supplies 50 W of cleaning power.

Booth No. 1022 Circle No. 285

**Semiconductor bonder handles 2-in. wafers**

Unitek Corp., Weldmatic Div., 1820 S. Myrtle, Monrovia, Calif. Phone: (213) 589-8361. P&A: $10,000; 60 days.

Performing thermocompression bonding, a new flip-chip and beam-lead bonder works on substrates up to 2-in. square. Model 8-152-01 is a semi-automatic unit that produces bond characteristics that are totally controllable and repeatable. Critical adjustments are programmed and preset to make operation extremely simple.

Booth No. 2924 Circle No. 340

**Dual-action cleaner consolidates its tanks**

A new dual-action ultrasonic cleaner features two transducerized tanks capable of simultaneous ultrasonic cavitation to double cleaning capacity and cut cleaning time; each tank may also be run separately. Handsomely packaged in a console cabinet with built-in generator, model 320D-2 has two 1-1/4-quart tanks with a multi-selector switch and automatic electrical timer.

Booth No. 3304 Circle No. 287

**Lead straighteners correct TO packages**

Series 450-021 Oriole lead straighteners and series 450-022 carrier loaders can straighten leads on TO-5 and TO-18 packages or can load the packages into series 029-535 carriers. Both series accept TO-5-type axial-lead packages with 3 through 12 leads in TO-5 styles and 3 or 4 leads in TO-18 styles. Lead lengths can be 1/2 and 3/4 in. Both manual and semi-automatic versions are available.

Booth No. 2606 Circle No. 411
Component printer marks 16,000/hour

Markem Corp., 150 Congress St., Keene, N.H. Phone: (603) 352-1130.

Model U-1184 high-speed component printer can mark components, such as TO-5 and TO-18 packages, on both their top and side, at speeds up to 16,000 parts per hour. Pieces are bulk stored in a bin and automatically fed to the conveyor from a vibratory feed bowl. The new system can also perform associated functions like component counting and packaging.

Booth No. 3407 Circle No. 369

Detector/controller counts 400 parts/min

Eagle Signal Div., Gulf Western Co., 736 Federal St., Davenport, Iowa. Phone: (319) 324-1361.

Model EW 70 metal detector system accurately counts and controls metal products in all shapes and sizes, from pins to locomotives. This compact solid-state system can count up to 400 parts per minute in any attitude. Dirt, oil, moisture and vibration are said to have little or no effect on its accuracy.

New bank book for savings

Send for our new 1969 Relay Catalogue and we guarantee it will open your eyes to ways of saving money on most frequently used Industrial Type Relays.

It will help you save time, which is worth money. Avoid production delays, which is worth money. And cut rejections to the bone, which is also worth money.

Besides, a quotation from Line Electric will be competitive every-time, which could save you a lot more money, too.

We send out catalogues the same day we receive your request and, if you are in a great hurry, we will even try to give you a quotation over the phone. Just call 201-887-8200 and ask for our Relay Sales Manager. We’re dedicated to service.

Don't just fight semiconductor noise—analyze it. p. 228.
Ideas for Design. p. 238
Don't be fooled by risetime specs on pulsed microwave tubes. The Darlington modulator is the key to producing narrower pulses.

Many high-resolution radar applications require the transmission of narrow pulses with very high peak powers. The chief drawback in producing these pulses is that the risetime limitation placed on the radar's power output tube is often misunderstood.

In particular, the rate of rise of voltage (RRV) specification imposed on users of magnetrons and other cathode-pulsed crossed-field devices unnecessarily restricts the pulse widths obtainable from high-power radars. By learning the story behind the RRV specification, the designer can construct modulators to work with the tubes so that performance levels far beyond the published ratings can be achieved. For example, we have built several radar systems in which the maximum specified RRV has been exceeded by as much as seven times.

RRV limited to critical range

Typically, magnetron specifications place a limit on the maximum rate of rise of voltage that may be applied to the cathode for proper operation. The transmitter designer presumes this to mean that, if the modulator voltage pulse rises faster than this specified limit, the magnetron will fail to start, or else that moding, missing pulses, tube arcing, excessive jitter and/or shortened tube life will result. If this limitation (usually 200 to 300 kV/μs for high-power conventional magnetrons and 75 to 160 kV/μs for high-power coaxial magnetrons) is observed, it practically precludes the generation of pulses with durations of less than a few tenths of a microsecond at power levels above 100 kW.

Fortunately, the RRV limitation does not have to be observed except during a small fraction of the total risetime of the modulator pulse. It is only for the critical range of voltage—called the starting-voltage range—over which the rf oscillation is being established that a minimum time limitation must be observed. The other two voltage ranges—from zero to the bottom of the starting-voltage range and from the top to the full operating voltage—are not subject to any such limitations.

The only other restriction on the shape of the modulator pulse is that it should not overshoot the maximum operating voltage; in well designed magnetrons, improper moding and arcing can occur only if the proper operating voltage is exceeded.

What is the time required for oscillations to start? Pierce has found that the buildup time (Δt) can be expressed in terms of the effective buildup Q, namely Qₙ, of the cavity as:

\[ \Delta t = -Q_n \log \frac{\tilde{V}}{\omega} \] (1)

where \( \tilde{V} \) is the rf voltage and \( \omega \) is the radian frequency. For a typical high-power magnetron (\( Q_n = -25 \)), \( \Delta t = 36.6/f \), where \( f \) is the frequency in Hertz.

Thus, for a conventional magnetron operating at X-band, the buildup time is in the order of four nanoseconds. At K-band, the buildup time can be less than one nanosecond. Considerable experimental evidence has confirmed that this relationship is approximately correct.

All that the designer must do, therefore, is to make sure that the modulator pulse spends enough time traversing the starting voltage range for oscillations to be established in the proper mode. As we shall see, simply using a
Darlington modulator will assure this result.

The ideal pulse shape for narrow-pulse magnetron applications is shown in Fig. 1. The rise-time from zero to \( E' \) is usually of little concern since only noise is produced in the tube during this period. The length of the interval from \( t_0 \) to \( t_1 \) is dependent primarily on the output impedance of the modulator and the input impedance presented by the tube before it starts drawing current. The voltage \( E' \) is the lower limit of the starting voltage range. The voltage \( E'' \) is the upper limit of the starting-voltage range, and it also is dependent on the pulser impedance. This voltage is approximately 80% of the operating voltage. The time interval \( t_1 \) to \( t_2 \) must be of sufficient duration to permit oscillations to become established in the desired mode. Once the oscillations have been established, the voltage can then rise to full operating level in a very short time, because at time \( t_2 \) the tube is oscillating in the proper mode and is drawing approximately 10% of full current.

Once the voltage has reached the operating level \( (E_o) \) it should be held constant for the duration \( (t_3 \) to \( t_4) \) of the rf pulse. It can then fall as rapidly as possible on the trailing edge until it again reaches the voltage \( E'' (t_4 \) to \( t_5) \); at this point steady-state oscillations are no longer sustained. Ideally, the voltage should then fall slowly to zero to alleviate backswing difficulties.

It is one thing to describe a desired waveform and quite another to generate it. The usual type of modulator used in radar work is the line-type pulser (Fig. 2). Units of this type can be designed to produce pulses only as narrow as approximately 0.25 \( \mu s \) in these high-power microwave applications. The resulting rf pulses can be as small as perhaps 0.18 \( \mu s \) if optimum design techniques are used.

**Problems in generating the ideal pulse**

However, overshoot is inherent in modulators of this type because of the leakage inductance of the transformer and the capacitance of the transformer secondary and the tube. Because the pulse shape produced by the line-type circuit is rather steep through the starting voltage range, the despiking circuit and primary delay coil shown are often required to slow down the rate of rise of voltage for proper magnetron operation.

It is this characteristic of the line-type modulator that probably first gave rise to the formulation of maximum RRV specifications. As we have seen, however, the specification isn't very useful unless it is accompanied by a description of the modulator for which it was formulated.

Various special line-type modulators have been tried for overcoming the pulse-width limitations

---

2. **Risetime limitations** make the conventional line-type pulse modulator unsuitable for the generation of very narrow pulses. About the best they can do is 0.25 microsecond in these high-power radar applications.
of the conventional pulser. The simple Darlington modulator shown in Fig. 3 has been found to be the optimum choice in most narrow-pulse applications. This circuit produces pulses whose risetimes far exceed the maximum specified RRV for typical magnetrons. By its very nature, however, the modulator tends to slow down the rate of rise at the time of current drain into the tube. It does so in a way that assures adequate starting time and no overshoot.

The Darlington modulator

The Darlington modulator consists of a series of four-terminal pulse-forming networks ending with a final two-terminal network. The resistor $R_1$, shown across the load, provides the charge path for the last network and also dissipates the positive-voltage portion of any post-pulse energy. The diode, $CR_1$, is a backswing device that allows the energy in any negative backswings and negative transients to be dissipated in $R_2$.

All of the networks must have the same delay and phase characteristics for a single voltage pulse to result. The impedance of each four-terminal network is given by:

$$Z_k = R_{j,k}(k + 1)/n^2$$

where $k = 1, 2, 3, \ldots n-1$, $n$ is the total number of networks, and $R_{j,k}$ is the resistance of the magnetron at full power output. The impedance of the last (two-terminal) network is:

$$Z_n = R_L/n.$$  

As in a conventional line-type pulser, each capacitor in each network is charged to a voltage approaching twice the B+ voltage. When the modulator switch is fired, a voltage wave is launched along the Darlington line. It meets a discontinuity (impedance mismatch) at each network boundary in the line. The discontinuity causes the magnitude of the wave to increase, and it also causes a wave to be reflected back toward the source.

The magnitude of the reflected wave, $V_r$, is given by:

$$V_r = V \left[ (R_L - Z_0)/(R_L + Z_0) \right]$$

where $V$ is the magnitude of the forward-traveling wave, and $Z_0$ is the output impedance of the Darlington line. All networks in the line are designed to have the same two-way propagation delay so that reflections between networks are canceled out.

The voltage multiplication of the forward-traveling wave begins when the first network is shorted by the modulator switch $S_1$. This reverses the potential across the first network, placing it effectively in series with the second network. The voltage reversal process then continues down the line until a single pulse appears across the load. Theoretically, the amplitude of the pulse across the load will be equal to $nE_s/2$, where $E_s$ is the voltage to which the line was charged before $S_1$ was closed.

Since $E_s$ can be on the order of 1.9 times the power-supply voltage (B+) when a low-loss charging circuit is employed, the load voltage can ideally approach 0.95nB+. Actually, experience has shown that the Darlington line becomes very inefficient when the number of networks exceeds five. The limitation is in the capacitance of the n-1 network, which approaches stray capacitance values in a six-network design.

In practice, it has been found that with careful network design, a five-network Darlington can multiply the power-supply voltage four times.

The payoff: an almost universal design

Because the Darlington line is a “soft” modulator—that is, its rate of rise decreases when it is loaded—there is very great flexibility in its application.
design. It is not necessary to know the exact values of $E'$, $E''$ and $Q_n$ to design a modulator. The softness of the line prevents the voltage from rising too fast during the starting period.

To specify a line, choose the number of networks, $n$, to provide the necessary cathode voltage, bearing in mind that it is impractical to have $n$ greater than five. The individual network impedances are then calculated from Eq. 2.

Specifying the desired pulse width then makes it possible to calculate the number of sections in each network and the values of each inductor and capacitor. Standard methods, like those described in Ref. 4, may then be used to design the networks, although the usual practice today is to supply the specifications (voltage level, $Z_k$, pulse width) to a company specializing in network design.

Most of the crossed-field devices used in our work have been of approximately the same power level and so have had roughly the same impedance. Therefore, we have been able to use the same network designs in different transmitters.

It really works

Because of the complete absence of overshoot and the controlled risetime during the starting period, we have detected no missing pulses. Most of the transmitters (see table) have been delivered in large quantities and have had tube lives typically over 1000 hours. It is probable that the life improvement is at least partially because the voltage never exceeds the operating voltage (no overshoot minimizes arcing).

Because the rate of rise is extremely high prior to tube conduction, the Darlington technique should be beneficial in obtaining narrow pulses from coaxial magnetrons in which lower voltage modes can exist. It would seem that by passing through the areas of low-voltage oscillations as rapidly as possible, the tendency for these modes to cause difficulties should be reduced.

One final point should be made for the benefit of the device manufacturers: More meaningful information, such as the buildup $Q$ of the device cavity, is in order on tube data sheets to aid the modulator engineer in selecting an optimum design for narrow pulse applications. ■

References:
250 ns memory at a new low cost...

Typical system speeds— from Series 74
TTL decoder inputs to sense amplifier outputs
Read cycle time — 250 ns
Access time — 230 ns

Now you can get both high speed and low cost in the same memory system...and you can save space at the same time.

TI's new TMS 4003 MC is one of the fastest standard memories on the market. It yields total system speeds of 80 to 250 nanoseconds, depending on whether ECL or TTL decoders are used.

The cost is low. Systems are in the same cost range as many slower memory systems.

Power dissipation is modest... less than two milliwatts per gate for the entire system.

And it's compact. The 256-bit array, shown here actual size, measures only 1.99" x 0.60" x 0.25".

The TMS 4003 MC is a 256 word by 1-bit random-access array with non-destructive readout. Memory elements are cross-coupled MOS flip flops. No clocks are necessary. Only one 18-volt supply voltage is required, and it may be pulsed to reduce power consumption.

These new arrays are ideal for high speed scratch pad and buffer memories or for main memories in large computers where utmost speed is essential.

Other Memories
The TMS 7A 4800 series are 1024-bit read only memories that may be set up as 128-by-8 or 256-by-4 arrays.

The TMS 2A 4840 series are 2240-bit read only memories (character generators) that are used to drive five-by-seven dot matrices. Output is column sequential. Storage capacity is 64 characters.

The TMS 2A 4880 series are 2660-bit read only memories (character generators) that are also used to drive five-by-seven dot matrices. This series features 74-character storage and full 35-dot simultaneous output.

Find out more about the entire line of MOS integrated circuits from TI. Ask your TI sales representative, your authorized TI distributor, or, drop us a note on the back of your business card. For a complete application report on the 256-bit RAM, circle 120 on the reader service card. Texas Instruments Incorporated, P.O. Box 5012, M.S. 308, Dallas, Texas 75222.
...and MSI decoders to drive it.

SN7445 BCD-to-decimal MSI decoder/drivers combine the high-speed decoding and the high voltage drive required to take full advantage of the TMS 4003 MC memory arrays shown on the opposite page. The result is a memory system that gives extremely fast cycle times at a moderate cost.

The NPN output transistors, used in the circuit, feature full 30V break-down and 80 mA sink current capability to drive the memory without any added interface.

Open collector outputs may be wire-OR connected...a real advantage in large memory systems.

Inputs are buffered to reduce loading of driving circuits. Each input is one normalized Series 74 load. No additional buffering is necessary.

Only four SN7445s are required to drive each 256-bit memory array. Two circuits, connected as shown at the left, drive the X address lines and two more drive the Y lines.

High sink-current capability make SN7445s—and the 15V SN74145s—ideal as lamp or relay drivers, also.

And there are 21 more MSI TTL circuits from TI including shift registers, adders, counters, and bipolar memories. For full information on all these, circle number 121 on the Reader Service Card for our Integrated Circuit Catalog supplement. If you prefer, ask your distributor or write Texas Instruments Incorporated, P.O. Box 5012, MS 308, Dallas, Texas 75222.
Avoid pitfalls in computerized testing
by using these design ground rules that cover data acquisition, processing and transmission.

Demand for the flexibility and speed of computer-controlled test systems has increased the need for the design of interfacing hardware that will permit effective inter-machine communication. By following a few general ground rules, the designer of the interface is able not only to simplify the basic design but also to develop an interface “black box” that will be independent of the operating speeds of the computers and testers to be joined.1

Buffer system saves computer time

Computer-controlled systems may be divided into two general classes: where computer and tester are in close proximity (10 feet or less); and where computer and tester are remote from each other (more than 10 feet apart).

Where the computer and the system it controls are physically close, the designer can concentrate on the data acquisition and processing functions, since data transmission will be a relatively simple task.

In general, interfacing a tester to a computer requires that the computer transfer a memory word to the tester, wait for some action to be taken, and then proceed with another transfer or receive a word from the tester. It’s needless to tie up computer time with useless waiting when it can be processing some task or controlling other devices. Therefore, the foremost objective is to have buffered operation.

In this way, the computer transfers a memory word to the interface buffer, signals the tester that data is available, and is freed to perform other tasks. When the tester is ready, it accepts data from the buffer and signals the computer (through an interrupt line, for example) that it’s ready to accept another piece of data. In the case where the tester provides data to the computer, it loads an output buffer and signals the computer that data is available. The computer then retrieves this data at its earliest free moment and signals the tester that it may load another word.

The signal from computer to tester may be generated either internally by the computer, or in the interface by-reserving a bit position in the memory word so that the bit position, on transfer to the interface input buffer, generates a pulse notifying the computer or tester that data is present in its input buffer. Additional bits in the memory word may indicate to the tester that the word is a piece of data or an instruction word that has to be interpreted by the tester.

In general, then, with buffered operation and control signals, the computer is tied up with a particular tester for a minimum length of time. In addition, due to the “handshaking” type of operation, the system runs closed loop and data won’t be lost because of differences in timing between computer and tester.

For the case where the computer controls a number of test systems, the interface should have an address decoding capability so that data or an instruction is transferred only to the addressed tester.

Even though data cannot be lost, it can be outdated if the computer takes a lot of time acknowledging that a tester has data ready to be accepted. Most computers have only one interrupt line that has to be shared by many functions and external testers. To determine which tester is interrupting requires some kind of polling scheme. This can be time-consuming and, by the time the interrupting tester is found and data accepted, the data may be several milliseconds old.

For real-time control or data acquisition, an interrupt system should be designed to minimize polling time. Since some testers may be assigned higher priority than others, the interrupt system, or computer software, should be able to service the higher-priority testers first.

Remote systems need low noise

For controlling a test system that is remote from the computer—as, for example, in a manufacturing plant where a central computer con-
controls a number of scattered test stations—several precautions will ensure maximum reliability:

1. Digital transmission between computer end and test-station end of a transmission channel is favored because of low error rate and established error correction techniques. (If the tester needs analog voltages, a digital-to-analog converter should be placed at the tester end of the transmission channel.) However, noise problems in digital transmission can be more severe, since a most significant bit is just as likely to be picked up or dropped as the least significant bit.

2. For long transmission distances, serial transmission is desirable to keep costs of interconnecting cables and transmitting and receiving circuitry down. The trade-off is a reduced transfer rate for a given transmission channel bandwidth.

3. A delayed-strobe technique should be used at the receiver so that transients in the data lines are allowed to die away before sampling the received bit or bits. For serial transmission, a common method is to synchronize the receiver clock on a received start bit so that one edge of a 50\% duty cycle clock coincides with the beginning of a bit, and the other edge coincides with the midpoint of the received bit (when all transients have died down). The midpoint of the received bit is then strobed into a receiving shift register (hence, the term "delayed strobe").

4. Bandwidth limiting and low-impedance termination at the receiver end and risetime limiting at the transmitter end (especially when multiconductor cables are used) increase ac noise immunity and reduce crosstalk between lines. The bandwidth, however, must be wide enough for accurate transmission; a bandwidth of three to four times the bit rate is more than enough if edge triggering at the receiver is not utilized (i.e., a delayed-strobe technique is used).

5. Shielded twisted pairs (preferably each pair shielded) should be used for transmitting data to reduce the effect of noise pickup. The shield affords protection against capacitive-coupled noise from external noise sources, while the twist cancels the effects of magnetically coupled noise. The twisted-pair, balanced-line scheme makes it possible to eliminate pickup due to other external sources by having the receiver discriminate against common-mode noise contributions. Twisted pair transmission is practical for distances up to a thousand feet and bit rates up to 1 megabit per second.

6. The computer and all remote test stations should be ground-isolated from each other to reduce ground-loop noise and to guard against ground differential between systems. Isolation may be provided, for example, by transformers for pulse transmission, or by optical isolators where transmission extends to dc. Optical isolators are capable of providing isolations in terms of hundreds of volts.

Computer I/O follows ground rules

As an example of how the ground rules can be put into practice, let's examine the makeup of I/O (Input-Output) features of a Hewlett-Packard computer family that was designed with the interfacing problem in mind. These computers were designed to work in an instrumentation environment with temperatures ranging from 0°C to 55°C and where humidity may reach 95\%. In addition, the computers will work with a ±10\% line voltage variation and with line frequencies varying from 50 to 60 Hz.

Machine word length is 16 bits, and memory cycle times range from 1.6 \( \mu s \) to 2.0 \( \mu s \), depending

---

1. **Computer interfaces with testers** through a series of plug-in interface cards. Circuitry on the cards can be tailored to the requirements of the tester although all cards feature a certain degree of standardization.
A portion of the computer main frame is devoted to the input-output system. This consists of a rack into which up to 16 interface cards may be plugged. (This can be increased to 48 by an additional I/O extender). Each slot accepts an interface card that mates the computer to an instrument, as shown in Fig. 1. A number of interface cards exist for interconnecting to standard Hewlett-Packard instruments, as well as general-purpose interface cards to interconnect to customer-designed devices. But all of them feature a certain amount of standardization.

The backplane of the I/O system rack is identically wired for each of 16 slot positions. The backplane signals consist of the following:

- An input bus, consisting of 16 lines for the 16 bits. Data placed on this bus is steered to the computer A or B register (accumulators).
- An output bus, consisting of 16 lines. Data placed on this bus is accepted into the input buffer of an addressed interface card.
- Control signals that are actuated by software. For instance, an assembly language statement “OTA 12” (output from A register) will place the contents of the A register on the output bus and will produce a strobe pulse that strobes the data bits into the input buffer. The “12” in the statement selects the interface card in slot 12 so that only that interface card will strobe the data bits into the input buffer. Seventeen such signal lines are available on the backplane to translate software commands to hardware pulses. These software commands have been incorporated into the computer instruction repertoire and are used specially to control the I/O system.
- Address decoding lines, which enable a particular device to be software addressed so that it, and only it, interprets the backplane signals.
- A number of lines necessary for the interrupt system.

**Interrupt system raises efficiency**

The computer family has a multichannel priority interrupt system that allows it to service instruments interfaced to it rapidly and in real time. The priority of each instrument is determined by the slot occupied by its interface card, and each slot is assigned a different interrupt location in computer memory. When an instrument signals the computer that it is ready to transmit or receive data, the computer doesn't have to poll all interface cards to find out which one is interrupting, but instead goes directly to the computer memory location for that interrupting device.

When several instruments are trying to inter-
rupt at the same time, only the instrument with highest priority is allowed to interrupt. Once it is serviced, the instrument next in priority is allowed to interrupt. In this way, the computer locates the highest-priority interrupting instrument and its computer service subroutine in a few microseconds, transfers the data, and goes on to the next-lower-priority instrument in turn. When all interrupting instruments have been serviced, the computer returns to its regular program, having spent a minimum of time away from it. The ability of the instrument interface card to cause an interrupt is software-controlled, and so the computer can inhibit interrupt signals from one or more instruments.

Figure 2a shows the circuitry on each interface card associated with the interrupt system. To enable an instrument to interrupt, the computer sets the CONTROL FF by means of a software instruction STC X (set CONTROL FF at slot position X). Alternatively, it can inhibit an instrument to cause an interrupt by clearing the CONTROL FF. At the same time, for instruments that require it, the STC instruction sets the COMMAND FF, which provides a command line that causes the instrument to take some action.

When the tester is ready to transmit data, or accept data, it sets the FLAG FF. This causes the setting of the interrupt request FF (IRQ), provided no higher-priority instrument is interrupting. The IRQ signal causes a computer interrupt, and, since there is a distinct IRQ signal line from each slot position, it encodes the address of the interrupting device. The encoded address is the address of the location, in computer memory, of the service subroutine for this instrument.

Figure 2b shows how several interface cards are connected to form the priority chain. Assume that Card Q interrupts. The high output of Gate A forces the priority low (PRL) output to go low. The low PRL output is the priority high (PRH) to Card R, and hence inhibits Card R to cause an interrupt while its PRH line is low. The low PRH line on Card R also forces its PRL line to be low and inhibits all succeeding lower priority cards from interrupting.

Note that if Cards P and Q want to interrupt at the same time, the Card P interrupt will be recognized first, since it is in a higher priority position on the interrupt chain. When the Card P interrupt signal is recognized by the computer, which enters the Card P service subroutine, the subroutine may turn off the entire interrupt system if this is desirable. If the entire interrupt system is not turned off by the service subroutine, then it may be interrupted by higher-priority instruments. When these higher priority instruments have been serviced, the computer returns to the lower-priority service subroutine.

Once the service subroutine is completed, or to allow lower-priority instruments to cause an interrupt while in the service subroutine, the computer has to clear the interrupting card FLAG FF by means of the CLF X instruction (Clear FLAG FF at position X).

Figure 3 shows the typical ingredients in an interface card. The interrelationship of the components may be understood by looking at the following typical input and output interrupt sequence:

**Input interrupt**: The typical operation sequence for an input interrupt involves the following steps (refer also to Fig. 2):

1. An STC instruction sends a command (equivalent to "read" for many instruments) to the external device.
2. The device reads its inputs, then puts the data into the Input/Output buffer on the interface card.
3. Simultaneously, the device supplies a flag signal (equivalent to "record" or "print" for many instruments) to the interface card.
4. The flag is converted to an interrupt request
5. Block diagram of 9500A shows relationship of test instruments to data acquisition and processing system.

</table>
by the device interface card (if no higher-priority device is interrupting this time).

5. The resulting interrupt causes a service subroutine for that device to begin, temporarily suspending operations of the main program.

6. The service subroutine enters data from the buffer into the computer, then returns control to the main program.

**Output interrupt:** The typical operation sequence for an output interrupt is as follows:

1. An OTA or OTB instruction puts data from the A or B register into the Input/Output buffer on the interface card.
2. An STC instruction sends a command to the external device.
3. The device accepts (records) the data currently in the buffer.
4. After the data has been accepted, the device returns a flag signal (equivalent to the end of “hold off” or “inhibit” signal in many instruments) to the interface card.
5. The flag is converted to an interrupt request by the device interface card.
6. The interrupt causes a service subroutine for that device to begin.
7. The service subroutine loads new data into the buffer, repeating the sequence.

**Computer controls test system**

Figure 4 shows the Hewlett-Packard 9500A Automatic Test System, which is an example of a high-speed automatic, computer-controlled test system. Figure 5 is a block diagram of the system. Each instrument is interfaced to the computer with a fully buffered interface card. The card accepts instructions in computer language and converts the information to a form that controls the instrument.

The block diagram of Fig. 5 shows the system complete with all options. System control is either through manual keyboard entry on the teleprinter or by previously prepared programs via the punch tape reader. The stimuli consist of dc, ac to 100 kHz and ac to 500 MHz. Dc and low-frequency ac stimuli are routed through the distribution switch to the unit under test.

Measurement inputs consist of dc, ac to 1 GHz, ohms, and frequency. Ac measurements above 100 kHz are recorded on the digital voltmeter (DVM) as a dc voltage by routing the dc outputs of the ac meters through the measurement scanner to the DVM. The input scanner also has signal switching to route ohms, frequency, and ac/dc inputs to the appropriate DVM connector for direct measurement.

A program, written in BASIC, for testing an audio amplifier with the 9500A test system is shown in the box. This program includes setting all power supplies, checking the gain at five frequencies from 1000 Hz to 5000 Hz, and outputting appropriate messages, including amplifier serial number.

After the program is typed in on the teleprinter, the operator types RUN to start the program. If he wishes a copy of the program, he types LIST. The program may be changed by retyping a statement. New statements may be added between existing statement numbers, and statements may be deleted by typing only the statement number with nothing following.

INFORMATION RETRIEVAL NUMBER 125
The Transient Trappers are in the RCA-40673, the industry's FIRST dual-gate MOSFET with INTEGRATED PROTECTION-CIRCUITRY.

Back-to-back diodes, diffused within the same silicon pellet as the MOS Field-Effect Transistor, guard each gate against:

· static discharge during handling operations prior to circuit installation without the need for external shorting mechanisms.
· in-circuit transients.

Now you can design and build around the inherent, superior performance characteristics of dual-gate MOSFETs with assurance that RCA’s TRANSIENT TRAPPERS are the real answer to transient-voltage problems.

Typical characteristics of the RCA-40673 are:

- Power Gain (MAG) = 20 dB @ 200 MHz
- Noise Figure (NF) = 3.5 dB @ 200 MHz
- Superior Cross Modulation Characteristics
- Wide Dynamic Range Without Diode Current Loading
- Reduced Spurious Response
- Extremely Low Feedback Capacitance = 0.02 pF
- Simplified AGC Circuitry
- Excellent Gain-Reduction Characteristics
- Reduced Oscillator Feedthrough

For more information, see your local RCA Sales Representative or your RCA Distributor. For technical data write to RCA Electronic Components, Commercial Engineering, Section EG-8-2 Harrison, New Jersey 07029.

The MOSFET Transient Trappers

The major technical challenge associated with the development of the RCA-40673 was that gate protection must not significantly degrade the RF performance.

Special back-to-back diodes were developed as the answer to this objective. These back-to-back diodes are diffused directly into the MOS pellet and are electrically connected between each insulated gate and the FET’s source. The back-to-back configuration of the diodes permits the device to handle a wide dynamic signal-swing. In addition, the low junction capacitance of the diodes adds little to the total capacitance shunting the signal gate. Further, the resistive components of these diodes are such that they do not materially affect the overall noise performance of the unit.

The net result of this engineering program is a MOSFET which is more rugged than any other solid-state amplifier providing comparable RF performance.

RCA-40673 in TO-72 pkg. $1.25 (1000 units).

Block reverse gain in your transistor amplifier. Transistors pass signals in both directions—if this is your problem, correct it with this technique.

Circuit designers are familiar with unwanted signals. Noise and spurious oscillations are two well-known culprits. Another is the signal that is considered desirable in one part of a circuit but has shown up where it’s not wanted. Often this happens because transistors pass signals in the reverse as well as the forward direction.

To deal with this problem, both the forward and reverse power gains of the various transistor configurations must be studied.

To find forward current and voltage gain, a transistor model is selected, an input signal is assumed and the resulting output is determined. Similarly the reverse current and voltage gain can be determined by injecting a signal at the output and measuring the signal that appears across the source resistance. The three basic transistor amplifier configurations, as well as the $y$-parameter equivalent circuits that are used to determine reverse current and voltage gain are shown on the next page. The forward and reverse gains can be calculated in a straightforward manner and are also shown on the next page.

Compare reverse gains

We can compare the reverse gains of the common-emitter, common-base and common-collector configurations by assuming a moderately high-performance transistor: $y_{ce} \approx 10^{-6}$, $y_{be} \approx 10^{4}$, $y_{oe} \approx 10^{-3}$, $y_{oe} \approx 10^{3}$, and $\Delta y = y_{oe} - y_{be} = 10^{-6}$ and substituting in the appropriate equations. The analysis is carried out on the next page.

Good signal isolation is a process of precluding power transfer in an undesired direction along some path. Where this path exists because of improper shielding, etc., it is essentially a packaging problem. But when the path is there because it is being used for other desired purposes, careful analysis is required. Both current and voltage isolation are necessary because we are concerned with a power transfer mechanism. Since no one configuration for a transistor stage has both good current and voltage isolation, a two-stage amplifier is required. A common collector stage with good current isolation and low output impedance driving a common-emitter stage with excellent voltage isolation is the optimum combination.

Design examples show how

The general procedure for designing amplifiers will be the same, regardless of type. This is illustrated by two examples:

Case I. A single-ended mixer with a voltage gain of at least 20 dB at 20 MHz and a reverse voltage gain of at most $-40$ dB at 18 MHz.

Case II. An amplifier for a 70-MHz phase lock loop with a voltage gain of at least 10 dB and a reverse voltage gain of at most $-40$ dB.

In both cases, the same 17-step procedure outlined in Box 3 will be used. Let's begin with the single-ended mixer.

Comparative circuit performance

**I—Common emitter**

\[ A_v' = \left( -\frac{j10^{-6} - 10^{-9}Z_v}{(R_v' + Z_v)} \right) \left( \frac{\alpha_v}{\alpha_i} \right) \]

Assume \( R_v' \leq 10 \). Then, if \( Z_v \) is small or zero

\[ A_v' = \frac{j10^{-6} - 10^{-9}Z_v}{1 + 10^{-9}R_v' + 0.1Z_v} \]

That is, we get fair current isolation and input-output bias circuit current splitting. If \( Z_v \) is on the order of \( 10^3 \) or higher, we get \( A_v' \approx (-1+j) \times 10^{-2} \frac{\alpha_v}{\alpha_i} \). There is a phase shift and the isolation is impaired. The higher \( Z_v \) is made, the worse will be the current isolation. The larger \( R_v' \) is made, the better will be the current isolation.

\[ A_v' = \frac{j10^{-6} - 10^{-9}Z_v}{1 + 0.1Z_v + 10^{-9}Z_v} \]

If \( Z_v \) is small or zero, \( A_v' \approx j10^{-5} \) which gives excellent voltage isolation. If \( Z_v \) is on the order of \( 10^3 \), \( A_v' \approx -10^{-7} + j10^{-5} \) which is even better isolation with an additional phase shift. Increasing \( R_v' \), however, worsens the isolation in an almost direct proportion.

Thus the common emitter has fair current isolation and excellent voltage isolation.

**II—Common base**

\[ A_v' \leq \left( \frac{10^{-4} + 10^{-9}Z_B}{10^{-4} + 10^{-9} (Z_B + 10)} \right) \left( \frac{\alpha_v}{\alpha_i} \right) \]

Assume \( R_v' \leq 10 \). If \( Z_B \) is small or zero,

\[ A_v' \leq (1) \left( \frac{R_B}{R_B + R_v'} \right) \left( \frac{R_L}{R_L + Z_v} \right) \]

Aside from input and output bias circuit current splitting, no current isolation results. Increasing \( Z_B \) will not increase the current isolation significantly.

If \( R_v' \) is increased, it will tend to improve the performance but only by an infinitesimal amount. For voltage isolation

\[ A_v' \leq \frac{10^{-4} + 10^{-9}Z_B}{1 + 0.1 (10) + (10^{-3} + 10^{-8}) Z_B} \]

If \( Z_B \) is small or zero,

\[ A_v' \approx 0.5 \times 10^{-4} \]

This is good voltage isolation. Increasing \( Z_B \) increases the voltage isolation only slightly.

If \( R_v' \) were of the order of \( 10^3 \) we would get \( A_v' \approx 10^{-6} \) for small values of \( Z_B \).

It can be concluded that a common-base stage provides good voltage isolation and poor current isolation.
III—Common collector

\[ A_{i}' \approx \left( -\frac{10^{-3} + 10^{-5}Z_c}{0.1 + 10^{-9}(10 + Z_c)} \right) \left( \frac{\alpha_i}{\alpha_o} \right) \]

Let \( R'_o \leq 10 \)
If \( Z_c \) is small or zero:

\[ A_{i}' \approx (10^{-4}) \left( \frac{R_E}{R_B + R_E} \right) \left( \frac{R_L}{R_L + Z_o} \right) \]

We get good current isolation besides the usual current splitting. Increasing \( Z_c \) does not have a great effect nor does increasing \( R'_o \). For voltage isolation:

\[ A_{v}' \approx 10^{-2} + 10^{-5}Z_c \]

If \( Z_c \) is small or zero,

\[ A_{v}' \approx 10^{-2} \]

which is mediocre voltage isolation for low \( R'_o \). If \( R'_o \) is on the order of \( 10^3 \),

\[ A_{v}' = 10 + 10^{-6}Z_c \]

It can be seen that just about no voltage isolation is achieved.

It can be concluded that a common-collector stage provides good current isolation and poor voltage isolation.

II—Common base

\[ A_{i} = \frac{(y_{le} + y_{oe}) Z_L'}{1 + y_{le} Z_L'} \]

\[ A_{i}' = \frac{(y_{le} + y_{oe}) \alpha_i \alpha_o}{y_{le} + y_{oe} + y_{le} + \Delta y Z_L'} \]

\[ A_{i}' = \left[ \frac{y_{le} + y_{oe} + \Delta y Z_B}{y_{le} + \Delta y (Z_L + R_e') - \Delta y Z_L} \right] \left( \frac{\alpha_i}{\alpha_o} \right) \]

where \( Z_B = R_n X_n/(R_B + X_n) \)
\[ \alpha_o = R_B/(R_B + R_c) \]
\[ R_e' = R_n R_c/R_e + R_c \]

And \( \Delta y, R_n, Z_L' \) and \( \alpha_i \) are the same as in the common-emitter case.

II—Common collector

\[ A_{i} = \frac{(y_{le} + y_{oe}) Z_L'}{(y_{le} + y_{oe} + y_{le} + y_{le} + \Delta y Z_L')} \]

\[ A_{i}' = \frac{(y_{le} + y_{oe} + \Delta y Z_o) \alpha_i}{(y_{le} + \Delta y (Z_o + R_e') + \Delta y R_e') \alpha_o} \]

where \( Z_c = R_c X_c/(R_c + X_c) \)
\[ \alpha_o = R_c/(R_c + R_{in}) \]
\[ R_e' = R_c R_{in}/R_e + R_c \]

And \( \Delta y, R_{in}, \alpha_i, R_e' \) and \( \alpha_o \) are the same as in the common-emitter case.

The complete derivation of these formulas in both \( h \) and \( y \) parameters is in UCRL 70888.
Step 1. Choose a common-collector stage driving a common-emitter stage.

Step 2. The 2N918 has a gain-bandwidth product of 900 MHz, and complete data on it is available. Since \( V_{ee} = 15 \, \text{V} \), select \( V_{dc(+)} = 15 \, \text{volts} \) and \( V_{dc(-)} = 15 \, \text{V} \).

Step 3. Common-emitter stage: Assume an output swing of 10 V peak-to-peak as the maximum necessary. With \( V_{ee} = 8 \, \text{V} \), there is sufficient voltage across the transistor for it to stay out of saturation on the positive input peak. This leaves 7 V across the dc path, which should be enough to prevent clipping on negative input peaks.

We are free to choose one more variable in the circuit; this is usually done by setting the collector current. Let \( I_c = 4 \, \text{mA} \). This leaves more than enough dynamic range. Hence we have: \( V_{ee} = 15 \, \text{V} \), \( V_{cc} = 8 \, \text{V} \), \( I_c = 4 \, \text{mA} \).

Step 4. For each stage \( P_{dc} = V_{cc} I_c = 8 \times 4 \times 10^{-3} = 32 \, \text{mW} \). The 2N918 is rated at 200 mW at 25°C ambient. This is well within the allowable range.

Step 5. From the spec sheet, at the required operating point we see that \( I_B = 0.054 \, \text{mA} \) and \( V_{BE} = 0.8 \, \text{V} \). For \( I_E = I_c = 4 \, \text{mA} \),

\[
V_{RB} = 4 \times 10^{-3} \times 150 = 0.6 \, \text{V}
\]

and hence the voltage at the base, which is the voltage drop across \( R_{B1} \), should be

\[
V_{R_{B1}} = 0.62 + 0.8 = 1.4 \, \text{V}
\]

This leaves more than enough dynamic range. Hence the voltage at the base, which is the voltage across the transistor for it to stay out of saturation on the positive input peak. This leaves 7 V across the positive input peak. This leaves 7 V across the common-emitter stage. (This will result in operation at a favorable point on the 2N918 characteristics.) This is usually done by setting the collector current. Let \( I_c = 4 \, \text{mA} \). This leaves more than enough dynamic range. Hence we have: \( V_{ee} = 15 \, \text{V} \), \( V_{cc} = 8 \, \text{V} \), \( I_c = 4 \, \text{mA} \).

Step 6. For each stage \( P_{dc} = V_{cc} I_c = 8 \times 4 \times 10^{-3} = 32 \, \text{mW} \). The 2N918 is rated at 200 mW at 25°C ambient. This is well within the allowable range.

Step 7. From the spec sheets at the desired operating point we see that \( I_B = 0.054 \, \text{mA} \) and \( V_{BE} = 0.8 \, \text{V} \). For \( I_E = I_c = 4 \, \text{mA} \),

\[
V_{RB} = 4 \times 10^{-3} \times 150 = 0.6 \, \text{V}
\]

and hence the voltage at the base, which is the voltage drop across \( R_{B2} \), should be

\[
V_{R_{B2}} = 0.62 + 0.8 = 1.4 \, \text{V}
\]

Step 8. Since \( V_{RB} = 7 \, \text{V} \) and \( I_E = 4 \, \text{mA} \),

\[
R_E = \frac{7}{4 \times 10^{-3}} = 1.75 \times 10^3 \, \Omega
\]

Let \( R_{B1} = 22 \, \text{k} \).

Step 9. \( V_{BE} = 7 \, \text{V} \) and \( I_E = 4 \, \text{mA} \),

\[
R_E = \frac{7}{4 \times 10^{-3}} = 1.75 \times 10^3 \, \Omega
\]

Let \( R_{B2} = 2.7 \, \text{k} \). For good bias stability, let the bias circuit current be ten times the base current so that changes in \( I_B \) will not shift the operating point markedly.

Hence \( I_{R_{B2}} \approx 0.054 \, \text{mA} \) and

\[
R_{B2} = \frac{1.4}{0.54 \times 10^{-3}} = 2.6 \times 10^3
\]

Let \( R_{B2} = 2.7 \, \text{k} \).

Step 10. The coupling capacitors should have an impedance of a few ohms or less at 20 MHz; 0.01 \( \mu \text{F} \) should be sufficient. At these frequencies capacitors must have high self-resonant frequencies, and leads must be kept short. For good design, bypass only 100 ohms of the emitter resistor and put in a 51-ohm degenerating resistor.

Step 11. The output impedance of the common collector stage is found by noting that \( Z_c = 0 \).

Two-stage amplifier satisfies the requirements of both of the design examples.

Therefore,

$$Z_o = \frac{1 + y_{ie} R_o'}{y_{ie} + y_{re} + y_{fe} + \Delta y R_o'}$$

$$R_o' = \frac{R_f R_o}{R_o + R_f} \quad R_f = \frac{R_{b1} R_{b2}}{R_{b1} + R_{b2}}$$

$$R_B = \frac{12k \times 15k}{12k + 15k} = 6.67k$$

$$R_o' = \frac{50 \times 6.67k}{6.72k} = 49.5$$

$$Z_o = 11.3 \angle 16.7^\circ = 10.8 + j3.24.$$

The input impedance of the common-emitter stage is given by

$$Z_i = \left( y_{ie} + y_{re} + y_{fe} + \Delta y Z_o \right) Z_o' - y_{re} \Delta y Z_L'$$

where

$$Z_L' = Z_{l}' \frac{R_e}{Z_L + R_e} = \frac{(1.6k) (5k)}{6.6k} = 1.21k.$$  

$$Z_i = 439 \angle -70.7^\circ = 145 - j415$$

The output impedance of the common-emitter stage is given by

$$Z_o = 1 + y_{re} R_o' + \left( y_{re} + y_{fe} + y_{ie} \right) Z_o + \Delta y R_o' Z_o$$

$$R_o' = \frac{Z_o R_{b1} + R_{b2}}{Z_o + \Delta y R_o'} \approx 11.3 \angle 16.7^\circ,$$

$$R_B = \frac{R_f R_o}{R_f + R_o} \quad R_f = \frac{R_{b1} R_{b2}}{R_{b1} + R_{b2}}$$

$$R_B = \frac{2.7k \times 22k}{24.7k} = 2.41k$$

Step 15. The equations for $A_v$ and $A_v'$ for the CC case are in the Table. $Z_L'$ has already been determined to be $364 \angle -51.3^\circ$

$$A_v = 0.983 \angle -1.8^\circ$$

$A_v'$ has already been determined to be $49.5 \Omega$.

$$A_v' = 0.127 \angle 29.4^\circ$$

Step 16. $A_v(TOT) = A_v(CE) \times A_v(CC)$

$$A_v(TOT) = -17.7 \angle -10.30 = 24.9 \text{ dB}$$

$$A_v(TOT)' = A_v(CE)' \times A_v(CC)'$$

$$A_v(TOT)' = -0.133 \times 10^{-3} \angle 135.2^\circ$$

$$= -77.5 \text{ dB}$$

Step 17. The over-all design requirements have been met and exceeded. However, if the forward and reverse current gains are calculated, the results are $A_i = -8.75 \text{ dB}$ and $A_i' = -47 \text{ dB}$. That is, this amplifier lacks current gain but has good reverse current attenuation.

Phase-lock amplifier is another example

Now, let's examine case II, the 70 MHz phase lock amplifier.

Step 1. (Same as case I)

Step 2. (Same as case I)
Step 3. Assume that an output swing of 3 V peak-to-peak is the maximum necessary. The operating points and signal levels should therefore be about the same as in case I. Thus, for the common-emitter case, 
\[ A_v = 3.2 = 10 \text{ dB (design goal)}, \quad V_{ce} = 8 \text{ V}, \quad I_c = 4 \text{ mA} \quad \text{and} \quad V_{cc} = 15 \text{ V}. \]
And for the common-collector case, 
\[ V_{ce} = 8 \text{ V}, \quad I_c = 4 \text{ mA} \quad \text{and} \quad V_{cc} = 15 \text{ V}. \]

Step 4. (Same as Case I)

Step 5. From the spec sheet at the required operating point and at \( f = 70 \text{ MHz}, \)
\[ y_{ce} \cong 4 \times 10^{-3} + j4 \times 10^{-3} = 5.66 \times 10^{-3} \angle 45^\circ \]
\[ y_{re} \cong j0.5 \times 10^{-3} = -0.5 \times 10^{-3} \angle 90^\circ \]
\[ y_{fe} \cong 44 \times 10^{-3} - j39 \times 10^{-3} = 59 \times 10^{-3} \angle 138.4^\circ \]
\[ y_{oe} \cong 0.25 \times 10^{-3} + j1.0 \times 10^{-3} = 1.03 \times 10^{-3} \angle 76^\circ \]
\[ y_{ie} + y_{oe} + y_{fe} + y_{re} = (48.25 - j35.5) \times 10^{-3} \]
\[ = 60 \times 10^{-3} \angle -36.4^\circ. \]
\[ \Delta y = y_{ie}y_{oe} - y_{re}y_{fe} = -(22.6 + j17.1) \times 10^{-6} \]
\[ = 28.3 \times 10^{-6} \angle 217.2^\circ. \]

Step 6. Since \( e_o = 3 \text{ V p-p}, \quad V_{in} = 1 \text{ V p-p} \) and the negative input will be 0.5 volt. Therefore 
\[ R_E \geq \frac{0.5}{4 \times 10^{-3}} = 125 \Omega. \]
Let \( R_E = 150 \Omega. \)

Now with a total resistive drop of 7 V at 4 mA we have \( R_E + R_e = 7/4 \times 10^{-3} = 1.75 \text{ k} \)
Hence \( R_e = 1750 - 150 \approx 1600 \Omega. \)
Let \( R_e = 1.6 \text{ k} \), which is a standard 5% resistor.

Step 7. (Same as Case I)

Step 8. (Same as Case I)

Step 9. (Same as Case I)

Step 10. Bypass the emitter resistor with a capacitor that will have an impedance of about 1 ohm at 70 MHz. Thus 0.01 \( \mu \text{F} \) should be sufficient. At these frequencies capacitor leads must be kept short, and capacitors with high self-resonant frequencies must be used. It is good practice to bypass the 0.01- \( \mu \text{F} \) capacitor with a 330-pF capacitor because of self-resonance phenomena. As good practice, bypass only 100 ohms of the emitter resistor and put in a 51-ohm degenerating resistor.

Step 11. Select a capacitor that gives an impedance of 10 ohms or less at 70 MHz. Therefore, 
\[ C = 0.005 \mu \text{F}. \]

Step 12. (Same as Case I).

Step 13. \( Z_o = 0, \) therefore \( Z_o \) is given by the same expression as in Case I. \( R_B \) and \( R_e' \) are also the same, and the output impedance turns out to be \( Z_o = 17 \angle -35.66^\circ. \)

In a similar manner the input impedance of the common-emitter stage is found to be \( 82 \angle 99.2^\circ. \)

Step 14. Using procedures identical to those of Case I, we find:
\[ A_v \approx 5.75 \angle -56.3^\circ. \]

Noting that, in this case, \( R_e \) is the output impedance of the common-collector amplifier in parallel with its emitter resistor — that is, \( R_e \approx 17 \angle -35.6^\circ — w e \) find that \( A_v' = 8.6 \times 10^{-3} \angle 121.6^\circ. \)

Step 15. To calculate \( A_v \) for the CC case, we'll need to know \( Z_L'. \)
\[ Z_L' = Z_iR_B/(Z_L + R_B) \] and \[ Z_L = Z_iR_B/(Z_i + R_B). \]

From earlier calculations, \( R_B = 2.41 \text{ k} \) and \( Z_i = 88 \angle 99.2^\circ. \)
And using these numbers,
\[ A_v \approx 0.9 \angle 91^\circ. \]

Using the previously determined value of \( R_e' \) of 49.5 \( \Omega, \)
\[ A_v' = 0.22 \angle 41.2^\circ. \]

Step 16. \( A_v/\text{TOT}_1 = -5.18 \angle 142.8^\circ = 14.3 \text{ dB}. \)
\( A_v/\text{TOT}_2 = -1.89 \times 10^{-3} \angle 17.2^\circ = -54.5 \text{ dB}. \)

Step 17. The design objectives of at least 10 dB of voltage gain and at most \(-40 \text{ dB} \) of reverse voltage have been met. Comparing this with Case I, which is the same amplifier, we observe that there is now 10.6 dB less of \( A_v \) and 23 dB less of \( A_v'. \) This is due to the degradation of the transistor parameters at higher frequencies.

Figure 1 shows the actual amplifier resulting from the design examples. From a practical viewpoint, stray capacitance and inductance must be kept to a minimum. Also, power-supply decoupling is a must. In this case, self-contained batteries were used to minimize power-line coupling and radiation. Measured and calculated results are compared in the table.

Test your retention

Here are questions based on the main points of this article. Their purpose is to help you make sure you have not overlooked any important ideas. You’ll find the answers in the article.

1. What are the reverse gain characteristics of the common-emitter and the common-collector configurations?

2. Why should an amplifier with good reverse characteristics have both a common collector and a common emitter stage?

3. Why did the two cases, with different requirements, wind up needing the same amplifier?
There are several sound reasons to use our solid state numeric displays. One of the most important is this: they're so strong, they won't die of shock. So they can be used in the most demanding applications.

Another decisive factor is size: each display package measures just 1"x 0.5"x 0.16". And that's all there is to it. In this tiny framework, you get everything necessary to display numerals 0-9. The chip includes an IC driver/decoder and gallium arsenide phosphide diodes that make the bright red numerals visible clear across a room, even at an acute angle.

The display needs less than 5 volts to drive it, and takes a straightforward four line 8-4-2-1 BCD input. You can vary the brightness. And, as the modules are IC compatible, no special interfacing is required. You can buy our solid state numeric display in three-character packages, as well as the solo component. And our small displays of strength cost just $42 each in 1000 quantities.

For all the bright details about this new technology for numeric indicators, call your local HP field engineer. Or write Hewlett-Packard, Palo Alto, California 94304; Europe: 1217 Meyrin-Geneva, Switzerland.
CLEAN SWEEP

PANEL INSTRUMENTS

A fresh approach to ultra-modern instrument design provides a "clean sweep" of the pointer over the full scale.

1. You get instant readability easier and at greater distances—plus more attractive designs to integrate into your equipment.

2. Self-shielded, accurate, reliable D.C. instruments have the exclusive Triplett BAR-RING movements.

3. Whatever your panel instrument requirement, look to Triplett for the right size and style, the right capability at the right price.

Exceedingly Rugged and Accurate

DIE CAST ONE-PIECE FRAME HOLDS IRON CORE IN EXACT ALIGNMENT

TRIPLETT ELECTRICAL INSTRUMENT COMPANY, BLUFFTON, OHIO
Make systems fail-operational by using multiple channels with automatic voters to select best signal.

A fail-operational system is one that will continue to operate properly in spite of a failure in one or more signal channels. Signal redundancy provides the necessary backup signals to keep critical controls in operation, and a selector circuit (voter) chooses the best signal from among several sources. The voter, Fig. 1, is the key to the use of such multichannel signal redundancy.

Three redundant channels can survive any one failure, while four channels can survive any two failures. The choice of control signal for the good channel is made according to a predetermined schedule; the largest signal, the smallest, or an in-between signal may be the one chosen to control this channel. The voter circuit then transmits only the chosen signal to the rest of the system.

Voters may be used at several points along each channel. Besides preventing any channel failure from being transmitted throughout the system, a voter can compensate for tolerance buildup, or it can eliminate tracking errors by means of signal redundancy.

Different kinds of voters

The voter may be viewed as an automatically controlled selector switch, as shown in Fig. 1. Actual implementation of the circuit can be a diode gate that selects the more negative or the more positive of two signals, Fig. 2 or Fig. 3, respectively. In this case, the diode drop, $V_d$, is introduced as an error by these gates.

Another type of voter circuit makes use of pnp and npn transistors, as shown in Fig. 4. This more elaborate gate chooses for transmission the next to the most positive of the inputs. That is, if $E_1 > E_2 > E_3 > E_4$, then $E_{out} = E_2$, and if $E_1 > E_3 > E_2 > E_4$, then $E_{out} = E_3$. There are 24 possible combinations of the four inputs, and they can be arranged in a truth table to define the outputs. An advantage of this voter is that the

Paul M. Rostek, Senior Electronic Engineer, Interstate Electronics Corp., Anaheim, Calif.
5. Operational-amplifier gate passes the more negative signal and avoids the drawbacks of simple diode and transistor gates. This operational amplifier configuration is the N gate of Figs. 7 and 8.

6. A trio of operational amplifiers passes the most positive signal. The effect of the diode drop is reduced by the loop gain of the amplifier. This is the P gate of Figs. 7 and 8.

$V_{be}$ drop of the npn transistors in the first gates is canceled in the pnp transistors in the second gate. Circuit accuracy, however, depends on the stability of bias levels and on the accuracy with which the transistors are matched.

An operational-amplifier voter avoids these problems because of its greater flexibility, linearity, accuracy and low offset errors. An operational-amplifier gate that selects the more negative of two inputs is shown in Fig. 5. Figure 6 shows a similar gate that chooses the most positive of three inputs. In both cases the diode drop is reduced by the loop gain of the amplifier. If the gate in Fig. 5 is designated by $N$, and that in Fig. 6 by $P$ then Fig. 7 shows how these $N$ and $P$ gates may be combined so that the output signal is the middle absolute magnitude of the three inputs. Figure 8 shows this selection as a truth table.

In any multi-input voter where $m$ is the number of inputs, $m!$ is the number of possible combinations of signals. A four-input voter with 24 possible combinations is shown in Fig. 9. The output in this case is not at all obvious. One must assign an order of magnitude to the four inputs and then trace the output of each gate. Note the asymmetry of this example: channels 1 and 4 are used as the inputs to one gate each, while channels 2 and 3 are used as inputs to two gates each.
Three two-input P gates are combined with a three-input N gate (a). The 3! combinations are arranged in a truth table (b). The chosen signal, always the middle magnitude, is circled.

Figure 10 shows the output for each of the 24 possible combinations.

There are several possibilities of selecting middle inputs by rearranging input connections to the gates or by using additional gates. This flexibility is especially important in applications where three sensors must drive four channels. In such cases, at least one sensor must drive two channels. Protection against the failure of this "common" sensor is illustrated in Fig. 10. Observe that if both channels 1 and 4 are most positive or most negative, neither can be chosen.

Fail-safe comparators monitor system

Almost all fail-safe operational systems include fail-safe comparators that monitor the entire system. These comparators can detect and indicate a failure. In addition, they can take such corrective action as grounding out any failed channel. When a sensor is used to drive more than one channel, the fail-safe comparators can detect a sensor failure by cross-monitoring all channels, and can take appropriate action, such as grounding out the signals at the voter inputs. The voter then passes only good signals into the control system.

The most desirable way to operate m redundant channels is to use m separate, independent sources. In this way, a true m-plex system can be made virtually fail- operational for any m-2 sensor failures.

The use of integrated circuits makes feasible the economical construction of complex systems that can survive multiple failures. This is extremely important as automation takes over more and more critical applications. ■

Test your retention

Here are questions based on the main points of this article. Their purpose is to help you make sure you have not overlooked any important ideas. You'll find the answers in the article.

1. What are the advantages of operational-amplifier gates?

2. Why are fail-safe comparators used in fail-operational systems?

3. How does the number of signal combinations vary with the number of signals present?

4. If one sensor must drive more than one signal channel, how may the system be protected against the failure of this sensor?
If you’re in the market for a mini computer, look at the Micro 800 first.
You'll probably end up with one anyway.

Here's one reason why: Microprogramming

Microprogramming gives you a more efficient system, tailor-made to your requirements, for less money. Since firmware absorbs many functions normally handled by core memory and interface hardware, requirements for both are reduced substantially. On the other hand, standard hardware can be retained even while changing architecture to match your particular demands. With little time and practically no effort, you can optimize computer characteristics for a particular operation without making a single hard wire change.

Here's another: Delivery

We began building 800's before we began selling them, and now we're in volume production. It's only natural then that delivery is off-the-shelf with custom variations taking a modest 30 days extra. Try us. Especially if your requirements are urgent.

Here's one more: Price

The Micro 800 costs $3200 with quantity discounts ranging up to 40%. For $3200 you get a basic processor with 16 multi-purpose registers, 256 words of read-only store, basic console, enclosure and power supply to function as a micro programmed controller. In addition, you get the fastest digital computer in its class with a $1.1\mu s$ memory cycle time and a 220ns micro command execution time. Core memory capacity is 0-32K bytes.

We also sell a microprogrammed adaptation of the 800 with 512 words of read-only store, a 4096-word by 8-bit core memory and a teletype interface. We call it the Micro 811 and it goes for $6300. Our third model, the $6900 Micro 810, is like the 811 except that 768 words of read-only store are used to implement an expanded instruction repertoire, including multiply and divide.

Just about any question you'll have is answered in our new mini-seminar booklet. We'll send you a copy gladly. But we'd really rather have you ask for a call from our marketing representative. You'll save a lot of time if you do because we're sure you'll end up with an 800 anyway. It's irresistible.
Amplify biological signals with ICs.
Monolithic op amps in special circuits offer high CMRR, high input impedance and tolerance to dc noise.

The human body is virtually a bag of poorly conducting fluid. Measurements on a small part of it always result in large background signals being superimposed on the much smaller desired signals, and this places a severe burden on the amplifiers used.

Three main factors — large common-mode signals, high source impedance and unpredictable dc noise signals — set the specifications for all biological amplifiers.

To distinguish the signals from the noise, designers of biological equipment use balanced or differential amplifiers. The background noise is then common to both inputs, provided the electrodes are not too widely separated, and the desired signal appears between the two inputs. The two signals are discriminated as common-mode and differential-mode components, and are separated by the amplifier.

Amplifiers face severe requirements

Biological sources generate signals of very low energy. Currents are small, and tissue conductance is low. A typical source has a high impedance, about 100 kΩ, and generates only 100 mV. At the skin surface, of course, these signals are attenuated and the impedance is increased (Fig. 1). Voltages measured within muscle tissue are usually less than 1 mV, and the source resistances are between 2 kΩ and 150 kΩ.

The interface between the body and the measuring device — the skin — is a fairly good insulator, but it also acts as a membrane that is semipermeable to ions. When the detector electrodes (usually discs of metal or metal-halide) are placed on the skin, they inevitably set up metal-ion half-cells. An attempt is generally made to stabilize these half-cell potentials by providing a supply of ions in metal-halide conductive gels used beneath the electrode. This tends to minimize the potential difference between the pair of electrodes and to hold it constant, but slight movement, temperature change, or perspiration can cause changes. A good biological amplifier must reject these changes as unwanted dc noise.

Among the many low-cost IC amplifiers available are some bipolar differential amplifiers with gains around 50,000, common-mode rejection ratios (CMRR) of 80 to 120 db, and input impedances of greater than 500 kΩ. They are ideal for biological use but must be properly applied.

The essential core of these amplifiers is the balanced differential stage (Fig. 2a) with the common emitter tail. In many cases the tail is replaced by a constant current source (Fig. 2b) presenting an effective large resistance, and often this is fed from a second differential stage (Fig. 2c) to improve the common-mode rejection and reduce temperature effects. The analysis of these circuits is adequately covered elsewhere.

The matching of the transistors in the basic IC differential stages is much better than that achieved in discrete versions, because of the production techniques employed and the fact that the transistors are formed simultaneously. Some of the current devices have exceptional matching of characteristics, even at collector currents of a few microamperes, but even small differences can become important in biological applications.

Gain adjustment can be a problem

One of first requirements of a biological amplifier is that the gain should be adjustable. The standard voltage-divider feedback connection (Fig. 3), however is unacceptable. The input impedance of the amplifier is low compared with that of the source, and the source impedance is somewhat variable. This leads to an uncertain overall gain. Also, the CMRR is poor, where it is defined as the ratio of differential-mode to common-mode gain.

A change of feedback to achieve higher input impedance and to reduce the gain uncertainty (Fig. 4) simply produces further deterioration in the CMRR. Even the non-inverting amplifier connection, with its very high input impedance and accurately determined gain ($A = 1 + R_2/R_1$), does not improve the CMRR.

Electronic Design 17, August 16, 1969
1. Biological signal sources generate millivolt signals and exhibit high output impedance. The skin layer adds series impedance, electrode-skin contacts add dc noise in the form of contact potential, and common-mode induced noise acts to swamp out the signal making detection of nerve or muscle signals difficult and high-gain op amps must be used.

2. The differential pair is an essential part of every biological amplifier (a). For better common-mode rejection the common emitter resistor is replaced by a constant current source (b), which can be controlled by the common-mode output of a second differential stage (c).

3. The conventional op amp connection is unsuitable for biological use, because the over-all gain depends on the unstable value of the source resistance, $R_s$. Common-mode rejection is poor. Typically, $R_s = 2 \, k\Omega$ to $150 \, k\Omega$, $R_1 = 10 \, k\Omega$, $R_2 = 1 \, M\Omega$, $A_0 = 30,000$, $R_{in} = 10 \, k\Omega$, and the gain is 10 to 100.

4. A further deterioration in CMRR results from this modification of the voltage divider feedback arrangement, although gain stability is improved due to increased input impedance. Typically, $R_s = 2 \, k\Omega$ to $150 \, k\Omega$, $R_1 = 1 \, M\Omega$, $R_2 = 1 \, M\Omega$, $R_3 = 100 \, \Omega$, $R_4 = 10 \, k\Omega$, $A_0 = 30,000$, and gain is 90 to 100.

5. The CMRR of a 709 op amp is reduced, and the corner frequency is lowered, if the source impedance is increased (a). If the source impedances are unbalanced (b), the CMRR is decreased at all frequencies, and the corner frequency is further reduced.
Common-mode rejection problems result from imbalances in the input stages of the op amp (a), which results in an imbalance of the equivalent bridge circuit (b). The difference in the input impedances of \( A_1 \) and \( A_2 \), results in gain curves as shown in (c). Subtraction of log gains \( A_{\text{DM}} \) and \( A_{\text{CM}} \) gives the CMRR (d).

And even if the source impedances are balanced (Fig. 5a), an increase in them causes the CMRR to fall off at lower frequency. When the source impedances are unequal, the CMRR is lower at the outset and begins to fall off at still lower frequency (Fig. 5b).

These effects are due mainly to the base-emitter impedances in the op amp input stages (Fig. 6a). At low frequencies the resistive components cause an imbalance of the input bridge,\(^{5,6}\) represented in Fig. 6b, and this side-to-side difference of gain, shown much exaggerated in Fig. 6c, gives rise to lower common-mode gain. The base-emitter capacitance difference leads to the difference in break points, \( f_{\text{br}} \), \( f_{\text{br}} \), and causes the characteristic mid-frequency increase in common-mode gain. The amplifier gain roll-off at still higher frequencies, \( f_3 \), can be assigned to later stages of amplification, shown in Fig. 6 as \( A_3 \).

Since the CMRR is the ratio of differential-mode to common-mode gains, it is the difference in the logarithmic gains shown in Fig. 6d. For a high CMRR, then, the stages at which the rejection is effected must see low, balanced source impedances.

Balance the amplifiers, not the sources

The simple expedient of interposing matched amplifiers between the biological sources and the rejection stage allows separation of the problems of input impedance and balance. This has been attempted, using a non-inverting connection, as shown in Fig. 7.\(^7\) Although this arrangement presents large input impedances to the electrodes, the CMRR is now more dependent on the matching of the gains of \( A_1 \) and \( A_2 \), and thus the precision of the divider resistors \( R_{1-4} \).\(^6\)
Assuming the rejection stage to be perfect, the CMRR depends on the closed-loop gains, so

\[ \text{CMRR} = 20 \log \left( \frac{A_1 + A_2}{2(A_1 - A_2)} \right) = 20 \log \left( \frac{1 - R_2/R_1}{1 + R_2/R_1} \right). \]

These gains are greater than unity but substantially less than the open-loop gains. Resistor tolerances of 1% can produce a CMRR as low as 28 dB, and 0.1% tolerances improve this to only a little better than 48 dB.

Component tolerance difficulties can be eliminated, however, if the unity-gain (voltage follower) connection is used (Fig. 8). The accuracy matching gains is now dependent only on the difference of the open-loop gains, and

\[ \text{CMRR} = 20 \log \left( \frac{A_1 + A_2}{2(A_1 - A_2)} \right) = 20 \log \left( \frac{A_1 A_2}{A_1 - A_2} \right). \]

If these gains spread between 15,000 and 45,000, the CMRR arising from this input configuration can still exceed 87 dB. This means that the CMRR is limited, almost entirely, by the design of the next, differential stage.

Re-examine the common-moding stage

If the common-mode rejection is determined by the nature of the second stage, we must consider the factors that are important at this point.

The source impedances seen by this stage are the output impedances of the voltage followers. With large feedback, these impedances are reduced to about an ohm or two (the device output impedance is nominally 100 Ω) and can be safely ignored.

Consider the amplifier as providing two uncoupled voltage gains, \( A_{10}, A_{20} \), from the input terminals to the output (Fig. 9a). For simplicity, let the input resistors be the same, \( R \), but the resistor ratios on respective sides be \( \alpha \) and \( \beta \). It can easily be shown that the output voltage is

\[ V_o = \frac{1 + \alpha}{1 + \alpha + A_{10}} \left( \frac{\beta A_{20}}{1 + \beta} V_2 - \frac{\alpha A_{10}}{1 + \alpha} V_1 \right). \]

With some approximations, the differential-mode gain is \( A_{DM} = \alpha \) and the common-mode gain is

\[ A_{CM} = \frac{1 + \alpha}{1 + \alpha + A_{10}} \left( \frac{\beta A_{20}}{1 + \beta} - \frac{\alpha A_{10}}{1 + \alpha} \right). \]

Separating the effects of gain and resistance variations, we have

\[ \text{CMRR} = 20 \log \left[ A_{20}/(A_{20} - A_{10}) \right], \]

when \( \alpha = \beta \), and

\[ \text{CMRR} = 20 \log \left[ \alpha(1 + \beta)/(\beta - \alpha) \right], \]

when \( A_{10} = A_{20} \).

The difference \( (A_{10} - A_{20}) \) is very small if the source resistances are near zero, as discussed earlier. With the differential-pair circuit and common-mode stages, this difference is smaller than one part in 40,000 (CMRR = 90 dB).

The same insensitivity cannot be claimed for the resistor-ratio error (Fig. 9b). For various nominal

9. The common-mode rejection stage can be considered as an amplifier providing two uncoupled voltage gains to the signals applied to the two inputs. The CMRR is dependent on the matching of both the amplifier gains and the resistor ratios (\( \alpha \)), and increases as the closed-loop gain, \( \alpha \), is increased (b).
values of \(a\) (closed-loop gain), there is the expected decrease of 20 dB per decade, per unit mismatch between \(a\) and \(\beta\). But the most interesting feature is that the CMRR increases with the nominal closed-loop gain of this stage. It is thus better to place the gain here than in succeeding stages of the measuring circuit.

In a practical circuit, using 1% resistors, it is easy to achieve a CMRR of over 70 dB at a stage voltage gain of 100.

**Minimize the dc noise with RC networks**

In simple balanced and differential amplifiers designed with discrete components, it is easy to decouple the direct voltages that arise from dc noise due to electrode movement. Series decoupling capacitors can be used, for instance, with alternate paths provided for the dc input currents of the first-stage transistors. With ICs, however, the scope for such additions is severely limited.

The level of the noise signal due to the variations in electrode conditions is of the order of 100 mV.

This magnitude of differential-mode signal is certain to saturate the IC input amplifier.

A workable solution is to provide for bias paths with suitably large resistors and then to bypass as much of this series resistance as required to fix the gain in the working frequency band (Fig. 10). The low-frequency break point is determined by \(R \cdot C\), and below \(\omega RC = 1\) the gain approaches \((R + R_1 + R_2)/(R + R_c)\); (unity gain if \(R > R_1 + R_c\)). Thus the gain for the noise signals is approximately unity, and, except for some charging transients, they are no longer objectionable.

A word of caution about the matching of the capacitors: Intuitively, one supposes that if the break points of two preamplifier stages before the differential stage are located well below the power line frequency — say at 1 Hz compared with 60 Hz — the difficulties of matching the capacitors would be eliminated. This is not the case. If low-frequency roll-off is designed only a decade below the power line frequency, it will produce a CMRR at the latter frequency roughly 14 dB below that shown in Fig. 10b.

In compound differential circuits, in which frequency shaping is arranged in the preamplifiers before the stage at which common-mode is removed, there can be a serious deterioration of CMRR due to mismatch of the capacitors. Fig. 10b shows the effect of this mismatch when it is the controlling factor in the CMRR and the nominal low frequency breakpoint is 1 Hz.

The CMRR can be shown to be given by:

\[
\text{CMRR} = 20 \log \left( \frac{A}{A-1} \right) \left( \frac{\omega}{\omega_0} \right) \left( \frac{C}{\Delta C} \right)
\]

in which \(\omega_0 = 1/CR\), \(A\) is the closed-loop gain and \(\Delta C/C\) is the fractional mismatch of capacitance between the two stages. Observe that if one uses low values of \(R_1\) for high CMRR within the preamplifier stage, then \(C\) must be large to achieve a low cutoff frequency. This usually implies electrolytic capacitors, and consequently inherent mismatch.

**Avoid latch-up difficulties**

Latch-up occurs when the voltage excursions cause a transistor in an amplifier to saturate, in turn causing a sign reversal to be associated with the incremental gain. With such a condition the output holds the input to a stable saturated level through the feedback divider path.

The usual protection technique is to limit either the input, the output or the feedback excursions to avoid the initiating saturating conditions (Fig. 11).

By using the unity dc gain configuration, the problems of inadvertently overloading an amplifier when the operator adjusts an electrode or switches ranges are removed. In fact, in the whole...
measuring system there is no tendency to latch-up under any signal or operating condition.

Of course, there are other factors that can influence the proneness to latch-up. Of these, the three most important are: the IC amplifier type (experience and trials are the only sure criteria); satisfactory provision of bias current and fixing of biological potentials relative to the supply voltages; and favorable conditions of feedback (low resistances and good grounding). These are fairly well known and need not be elaborated on.

**AC noise is not a problem**

Until quite recently, the noise characteristics of transistors formed in monolithic constructions ruled them out for use in biological amplifiers. But now transistors can be formed that operate at collector currents of a few microamperes, with noise voltages, referred to the input, of a few microvolts.

The manufacturers' data for the 709 and MC 1533 devices indicated noise voltages of about 16 µV for a 10 kHz bandwidth and a source impedance of 100 kΩ. For the voltage follower stages only one input is used, so that the effective noise voltage is expected to be around 11 µV, and succeeding common-mode stages see low source impedances that add less than 1 µV. In the actual circuit the noise level was observed by oscilloscope to be around 16 µV, p-p, preferred to the input. This is only a few decibels above the integrated thermal noise from the source resistance of 100 kΩ.

**Shape the frequency response**

It is advisable with biological amplifiers, as with most others, to reduce the bandwidth to that required to handle the desired signals. Excessive bandwidth decreases the signal-to-noise ratio by about 6 dB per decade for high source impedances, and 10 dB per decade for low source impedances.

Most IC amplifiers have terminals to which a variety of lead and lag compensation circuits may be connected. Simple schemes of lag compensation reduce the upper break frequency of the open-loop amplifier, but this is adequate for situations requiring limited bandwidths and low gain. Fig. 12 shows the components that are involved in the process.

The above circuits were evolved after considerable unrewarded effort was expended on packaged FET amplifiers and hybrid FET circuits. Much of this development was intended to raise the input impedance, but the increase did not justify the high costs and certain other disadvantages.

The matching and biasing of FET devices is a problem. And MOSFETs can easily be destroyed by voltages that exceed their input ratings — voltages that are common in biological sources.

**Use the three-axis myoelectric amplifier**

Figure 13 shows the results of applying the theoretical considerations described to the problem of a three-axis measurement of myographic (muscular) response. The data measured was used to determine the optimum alignment of electrode

---

11. Latch-up is prevented by limiting the input or output voltage excursions with diodes or by increasing the feedback with diodes or zeners in the feedback line. Protection is needed because input transients are common.

12. Frequency response is shaped by simple lag compensation networks connected to the op amp, as suggested by the manufacturer. The bandwidth can easily be set to that desired, to eliminate out-of-band noise.
13. A 3-axis biological amplifier uses the techniques discussed to measure low-level signals in muscle tissue. Data collected with this amplifier is being used to determine optimum alignment of electrode pairs on the trunks of handicapped children for electronic control of artificial limbs.

pairs on the trunks of children who are candidates for myoelectric control of artificial limbs.

The system consists of preamplifiers near the three-axis electrode block on the patient, main amplifiers and several signal processing units. (The latter are not shown.) The preamplifiers are separated from the main amplifiers by some three meters of coaxial cable.

The rejection of power line induction was poorer on the final circuit than on the bench version. This was eventually traced to the common supply leads, and was dramatically reduced when the preamplifiers were given their own battery supply and the common ground link was removed.

The over-all performance of the system is an example of what can be achieved with inexpensive IC amplifiers in biological applications. This performance is summarized as follows:

- Over-all gain: 1000 to 10,000 at ± 4% accuracy
- Bandwidth: 1 Hz to 10 kHz
- Input impedance: > 50 Ω
- 50/60 Hz CMRR: > 70 dB
- Input referred noise: \( \leq 16 \mu V \), p-p
- Voltage offset at output: \( < 150 mV \)
- Direct voltage transient time constant: \( \approx 100 ms \)
- Complete freedom from latch-up.

Here are questions based on the main points of this article. Their purpose is to help you make sure you have not overlooked any important ideas. You'll find the answers in the article.

1. What are the three main problems of biological instrumentation?
2. How does the author suggest you achieve high input impedance without incurring poor balance and low CMRR?
3. How does the suggested circuit avoid latch-up problems?
4. How does the author overcome the problem of dc noise?

Acknowledgment:
This development was part of work sponsored by the U.K. Dept. of Health and Social Security to investigate feasibility of electromyographic control of artificial limbs by handicapped children. The Lady Hoare Thalidomide Appeal provided related support and facilities. Sincere thanks to P. J. Jarvis, who assisted in the practical work throughout.
Give your designs the flexibility of these newest RCA "Building Blocks"

Box full of linear circuit "building blocks"—Your RCA Distributor has QK2202, RCA’s linear circuits sampler containing 10 types of circuits (23 devices). Here’s thorough documentation—virtually everything you need to sharpen your circuit ingenuity using linear "building blocks." The QK2202 is available at $37.95 (optional distributor resale price). Get yours today.

Ask your local RCA Representative or your RCA Distributor for full details. For specific product data, write RCA Electronic Components, Commercial Engineering, Sec. ICG 8-3, Harrison, N. J. 07029.

4 AC Amplifiers in a Package
Four independent AC amplifiers with 53 dB (min.) voltage gain per amplifier @ 10 kHz, for use to 300 kHz. For low-noise and general AC applications in industrial service.

DC to 200 MHz Dual Diff Amp
Dual independent diff amps for low-power applications. Power gain 23 dB (typ.) @ 200 MHz; noise figure 4.6 dB (typ.) at 200 MHz. Wide application potential over the full military temperature range.

Darlington-Connected Dual Differential Amplifier
Two Darlington-connected diff amps with diode bias string for low-power applications from DC to 20 MHz. CA3050 for full military temperature range; CA3051 for -25 °C to +85 °C operation. Both feature high impedance input, low bias current, low offset current.

Economy Multi-Purpose Linear IC
New economy linear IC combining performance and versatility—at a new low in cost. 40 dB (typ.) cascode voltage gain @ 10.7 MHz, 30 dB (typ.) differential voltage gain @ 10.7 MHz. Recommended for IF and general-purpose applications. 6- or 12-V operation.

120 MHz Dual Diff Amp in 14-lead DIP
Matched diff amps with independently accessible inputs and outputs. Max. input offset voltage = 5 mV; max. collector current = 50 mA. Forward current transfer ratio (hFE) (typ.) = 110. For 0° to 85 °C operation. Also available as CA3026 in TO-5 package for full military temperature range.

Visit the RCA Electronic Components exhibit at WESCON, Unit C, in the Cow Palace Arena.
Everybody talks about beam lead.
This is the dawning of the age of the leaded chip. In other words, sports fans, August is the month Raytheon uncorks beam lead, and the old semiconductor business will never again be the same.

Simply meaning that now you can buy semiconductor chips with leads already formed and integrally attached. This lets you control packaging, save system assembly time and boost reliability.

Take a for instance. With a beam lead chip, bonding's a step, not a career. Every lead's bonded at once, whether you're working with diodes or LSI.

And the chip stays healthier. Your operator can mash down on those little leads and cook them to a turn. The chip sits there, to one side of the action, calm, cool and uncracked.

But there's more. Every beam lead chip sports a Silicon Nitride passivation coat to give it complete hermetic sealing at all junctions. Raytheon's wafer separation process exorcises that evil old chip-cracker, the scribe.

Chips are separated by a delicate anisotropic etching process that eases those little babies apart with TLC. No more hidden cracks to surprise you in final testing, or after your system's been fired up for a week. And just to sweeten the pot, in case you really hate surprises, we can provide 100% chip testing against all AC and DC parameters at -55 to +125°C.

In segments of 5 chips only.

Commercial grade units at lower prices; delivery to start 4th quarter 1969.

We're kicking off our Beam Lead Derby with an even dozen types, available in quantity from our exclusive beam-lead-franchised distributors, Avnet Electronics and Cramer Electronics. Later on you can buy our whole line in beam lead... TTL, DTL, linears, transistors, diodes.

After that, onward and upward to multi-chip arrays, MSI, LSI and so on. Proving once again the wisdom of doing business with the company that puts its chips where its mouth is. Send for data, including Raytheon-approved list of sources for beam lead bonders. Raytheon Semiconductor, Mountain View, California. (415) 968-9211.
Don't just fight semiconductor noise. Analyze it — learn its sources, predict its magnitude and design your circuits to tolerate it.

There is no such thing as a noiseless semiconductor. All devices — resistors, diodes and transistors — generate internal electrical noise that cannot be eliminated. But it can be tolerated, even in critical designs, if its sources are known and its magnitude is predicted.

The designer must understand the origins of noise and develop circuit models that accurately simulate the devices he designs with. He must ask: Where does the noise come from? How much is there? How can I best live with it? And the answers come only from a thorough analysis of the devices themselves.

Model of noise mechanism needed

Noise analysis is fairly easy, especially at intermediate frequencies, from about 1 kHz to 1 MHz. Here, thermal and shot noises predominate, and they have been described by Johnson and Nyquist, and by Schottky. But at high and low frequencies, discrepancies develop.

Noise observed experimentally exceeds thermal and shot noise predictions at frequencies under about 1 kHz. The excess noise varies inversely with frequency (1/f noise), and it appears that, in some cases, it is related to surface states within the semiconductor device. At high frequencies, too, excess noise is observed, but here the discrepancy is caused by the decreasing gain of the semiconductor device.

Whatever the cause or the effect, the designer must have a model of the noise mechanism if he is to allow for it in his design. And a good model can be derived very easily. It's based on the noise mechanisms that are important in resistors and vacuum diodes, and it's supported by experimental data.

Begin with the basic mechanisms

Due to the random thermal motion of free electrons within a resistor, an open-circuit voltage

Andrew S. Grove, Director of Engineering, Intel Corp., Mountain View, Calif., and S. T. Hsu, Member of the Technical Staff, Fairchild Semiconductor Research and Development Laboratory, Palo Alto, Calif.
Shot noise is caused by the particle-flow of electrons. Each electron carries a discrete amount of charge, and as it arrives at, say, an anode, it contributes a very short pulse of high current (a). At high dc current levels the pulses merge (b), but the shot noise contribution remains superimposed.

The noise spectrum of a vacuum diode follows the shot-noise prediction developed by Schottky, except at low frequencies. Below 100 Hz the 1/f excess noise becomes very significant.

Fluctuation is developed across its terminals, as indicated in Fig. 1. This voltage fluctuation, or thermal noise, was first discussed and studied by Johnson and by Nyquist, and is consequently often referred to by their names.

Johnson and Nyquist have shown that the mean-square value of the open-circuit voltage fluctuation $\overline{v^2}$ across any resistor with resistance $R$ is given by

$$\overline{v^2} = (4kTR) \Delta f$$

where $\Delta f$ designates the bandwidth of interest in Hertz ($k$ is Boltzmann’s constant, 8.62 x 10^{-5} electron volt/°K; $T$ is the temperature in °K; and $R$ is the resistance in ohms). The spectrum of the thermal or resistance noise, which is the quantity inside the parenthesis, is independent of frequency.

Experimental data on the noise spectrum of a 10$^4$Ω resistor are shown in Fig. 2, where the dashed line indicates the theoretical noise value calculated from Eq. 1. The experimental results are in agreement with Eq. 1 for frequencies above about 100 Hz, but below this frequency considerable excess noise is observed.

The excess noise is frequency dependent, rising in power approximately in proportion with 1/$f$, and is referred to as 1/f noise. It is observed in all types of electronic devices, including resistors, vacuum tubes, and all semiconductor devices. No definite explanation of its physical origin has yet been established.

Thermal noise, above the frequency range where 1/f noise is observed, can be represented in circuit designs by replacing a real, and therefore noisy, resistor with a noiseless one of equal resistance in series with a noise voltage generator (Fig. 3). While the current in a resistor is carried by free conduction electrons, it is carried in many other electronic devices by individual electrons that flow as particles. The simplest example of such an electronic device is a vacuum diode, in which current is carried by electrons traveling from cathode to anode.

The current flowing in a vacuum diode fluctuates because each electron carries a discrete amount of charge. Current varies with time, and at low current levels it appears as shown in Fig. 4a. Each of the pulses corresponds to the charge carried...
by one electron traveling from the cathode to the anode. If the current level is higher, the individual pulses will merge together, but current versus time is ragged in appearance as shown in Fig. 4b. The discrete-particle nature of charge carried by the individual electrons leads to a fluctuation of current, and hence to noise.

This type of noise, called shot noise, has been analyzed by Schottky, who has shown that the mean-square current fluctuation is
\[ \overline{\Delta I^2} = (2qI) \Delta f \]
where \( I \) is the dc current in amperes, \( q \) is the electronic charge—1.6 x 10^{-19} coulomb—and \( \Delta f \) is the bandwidth in Hertz. The spectrum of shot noise (quantity inside of parenthesis) is independent of frequency.

Experimental data on the noise spectrum of a vacuum diode operated at two different dc current levels are shown in Fig. 5. The experimental results follow Eq. 2 above about 100 Hz; below this frequency 1/f noise is observed.

The noise in a vacuum diode can be represented by replacing a real vacuum diode with a similar but noiseless vacuum diode and a noise current generator of the magnitude given by Eq. 2 connected in parallel, as shown in Fig. 6.

**Shot and 1/f noise in pn junctions**

The nature of the current flow in a junction is illustrated schematically in Fig. 7a. Holes flow across the resistance provided by the p + region; then they move as particles across the junction depletion region and recombine with electrons, either within the depletion region or in its vicinity. The electrons flow to the point of recombination through the resistance provided by the n-type region. Thus we expect to find resistance noise, associated with the motion of carriers through the regions in which they are majority carriers, and shot noise, associated with the particle flow across the depletion region.

The appropriate noise sources for a model of the pn junction are shown in Fig. 7b. The mean-square magnitudes of these noise sources are given by the formulas developed by Johnson and Nyquist, and by Schottky:
\[ \overline{\Delta I^2} = 2qI_\text{f} \Delta f \]
\[ \overline{\Delta v_n^2} = 4kTR_n \Delta f \]
\[ \overline{\Delta v_p^2} = 4kTR_p \Delta f \]
where \( I_\text{f} \) is the forward dc current in the diode, and \( R_n \) and \( R_p \) are the series resistances of the n- and p-regions, respectively.

Figure 8 shows the results of experimental measurements on a planar silicon pn junction diode in which the series resistances were small and therefore the resistance noise was negligible.

6. A simple circuit model of a vacuum diode, useful at frequencies above the spectrum of 1/f noise, consists of an ideal diode in parallel with the current generator developed by Schottky.

7. Current flow through a pn junction includes resistive flow of electrons and holes through the n and p regions, with associated resistance noise, and recombination in the depletion region, with associated shot noise (a). A simple model includes all of these noise sources (b).

8. The noise spectrum of a silicon pn junction diode shows excellent agreement with the shot-noise prediction at mid frequency, and has the inevitable 1/f excess noise at frequencies under 1 kHz. In this diode the series resistances are very small, and the noise associated with them is negligible. The two curves indicate noise performance before and after the density of surface states was increased, demonstrating a correlation between surface states and low-frequency noise.

9. Surface states lead to excess noise because some carriers are trapped, and subsequently escape, many times on their way across the depletion region, causing a pseudoshot-noise effect.
In this figure the noise spectrum is shown plotted as a function of frequency. Above approximately 1 kHz the noise spectrum is flat, and its magnitude is given by the shot-noise formula, Eq. 3. Further measurements show such agreement over a wide range of current. Below 1 kHz, however, the noise spectrum rises in proportion to $1/f$.

A certain type of surface state (a permissible energy level, normally forbidden, that electrons can occupy at the semiconductor surface), when introduced at the silicon-silicon dioxide interface in a silicon pn junction, leads to an increase of $1/f$ noise, according to the results of recent experiments. Some of these results are given in Fig. 8, in which the noise spectrum of the pn junction is indicated both before and after the density of surface states has been increased. The current fluctuation $\overline{\xi}$ at low frequencies is evidently proportional to the density of surface states introduced.

A qualitative picture of how surface states can lead to excess current fluctuation is shown in Fig. 9. Some carriers travel straight across the depletion region, but some get trapped in surface states several times. It is reasonable to expect that in the latter case the current as a function of time will be more ragged than in the former case; hence, for a given dc current, there will be an increase in fluctuation.

According to this model the excess noise will be much like shot noise, except that it will be larger, since each trapping event will increase the noise over and above shot noise. In fact, experimental data show that this excess noise has a dependence on dc current very much like that of shot noise. It is found, experimentally, that the mean-square excess noise component in a pn junction can often be adequately represented as

$$\overline{\xi^2} \propto \frac{1}{f} N_s I_F^n$$

where $n$ is between 1 and 1.5, $N_s$ is the surface-state density per square centimeter, and $I_F$ is the forward dc current in amperes. Unfortunately, the necessary proportionality constant remains undefined to date.

There is no good general explanation of this type of noise, but McWhorter has proposed one that appears to be relevant to cases where the excess noise can be tied to surface states. According to him, the frequency dependence of the excess noise is due to the distribution of the trapping times (the periods during which the carriers would be localized in surface states).

**Junction transistors — a simple model**

A picture of the dominant noise contributions in a junction transistor can be constructed in a manner similar to the pn junction case (Fig. 10). The collector current consists of holes that flow across the emitter-base space-charge region, through the
base itself, through the depletion region of the collector-base junction as particles, and then pass through the series resistance of the neutral collector region.

Note that the injected carriers drift across the base in much the same way as they would drift across the region between the cathode and anode in a vacuum tube. If the collector series resistance is small, the dominant noise associated with collector current is shot noise.

The base current consists of electrons that flow through the resistance of the n-type base region and then recombine with the injected carriers in the emitter space-charge region or within the neutral base or emitter. The base-current noise includes both resistance noise and shot noise.

Figure 10b indicates three important noise contributions: the shot noise $\overline{i^2}$ associated with the motion of the collected carriers, the voltage fluctuation $\overline{v^2}$ due to the resistive flow of majority carriers in the base; and the current fluctuation $\overline{i^2}$ due to the particle motion associated with the base current. The magnitude of these three components is given by

$$\overline{i^2} = 2qI_c \Delta f$$  \hspace{1cm} (7)

$$\overline{v^2} = 4kT \tau_b \Delta f$$  \hspace{1cm} (8)

$$\overline{i^2} = 2qI_b \Delta f$$  \hspace{1cm} (9)

where $I_c$ and $I_b$ are the collector and base dc currents, respectively, and $\tau_b$ is the base resistance.

To calculate the noise figure of a transistor amplifier, we have to express all noise contributions as a noise voltage source and a noise current source at the input of the device. In the case of a common emitter transistor, these input noise sources can be obtained by referring the collector current fluctuation $\overline{i^2}$ back to the input and dividing by the gain of the device. Thus the input noise voltage source will be

$$\overline{v^2}_{in} = \overline{v^2} + \overline{i^2}_{in}/g_m^2$$  \hspace{1cm} (10)

where $g_m = dI_c/dV_{EB} = qI_c/kT$ (the transconductance of the transistor) and the input noise current source is

$$\overline{i^2}_{in} = \overline{i^2} + \overline{i^2}_c/\beta^2$$  \hspace{1cm} (11)

where $\beta = dI_c/dI_B$, the current gain of the transistor (Fig. 10c).

Experimental results support this model. Figure 11 shows input voltage measurements as a function of base resistance. These data were taken using different transistors at a collector current high enough so that the principal contribution to the input noise voltage was just the first term of Eq. 10. The input noise voltage fluctuation closely follows Eq. 8, even at frequencies as low as 10 Hz.

The noise current of a planar silicon transistor, 11. Transistor noise is directly proportional to base resistance according to these data, obtained at 10 Hz on planar silicon transistors.

12. The noise current of a planar silicon transistor, referred to the input, closely follows Schottky noise at frequencies above a few kHz. At the lower frequencies, excess 1/f noise become significant.

13. The base current shows more excess noise than the collector current in the planar silicon transistor. It appears that the excess noise in junction transistors is mainly due to fluctuation of the recombination current.
The measured noise figure of a planar silicon transistor corresponds to the noise figure calculated from the model only for mid-range frequencies. At low frequencies the 1/f excess noise predominates, and at high frequencies the decreased current gain of the transistor leads to an increase in the noise figure.

Referred to the input as a function of frequency for several values of base current, is shown in Fig. 12. At high enough frequencies, say above 1kHz, the measurement results are predicted by $i_n^2 = 2qI_b\Delta f$. (Note that the second term in Eq. 11 is negligible for a device with a reasonably large current gain.) As the frequency is lowered, excess noise becomes significant and its magnitude, as in the case of the pn junction diode, increases as 1/f.

The noise spectra of the collector and the base current of another planar silicon transistor are shown in Fig. 13. In each case, the dc current was 10 µA. It is obvious from these results that the base current contains far more frequency-dependent excess noise than the collector current. It appears, therefore, that the excess noise in junction transistors is principally associated with the fluctuation of the recombination current. This observation is consistent with the fact that 1/f noise in pn junctions is found to be a fluctuation of the diode current, since in a pn junction the entire current represents recombination current. Excess low-frequency noise can be represented by adding a term analogous to Eq. 6 to Eq. 9, which should then read

$$\frac{\bar{i}_n^2}{\Delta f} = K \left( \frac{1}{f} \right) I_b + 2qI_b$$

(12)

where $n$ is between 1 and 1.5. The constant $K$ is determined experimentally.

Transistor data sheets usually present noise data in the form of noise figure plots (See box). To establish the connection between such plots and the preceding equations, we combine Eqs. 7 through 11 with the general expression for noise figure,

$$F = 1 + \frac{r_i}{4KTR_s} + \frac{r_i R_s}{4KT}$$

(13)

The noise figure at high frequencies (high enough so that the excess 1/f noise is negligible) is then given by

$$F = 1 + \frac{r_b}{R_s} + \frac{I_c R_s}{2kT} - \frac{I_c R_s}{2kT} \left[ 1 + \frac{1}{\beta} \right]$$

(14)

For $\beta > 1$, and $I_c > kT/qr_b$, this takes on the simpler form,

$$F \approx 1 + \frac{r_b}{R_s} + \frac{I_c R_s}{2kT} \frac{1}{q}$$

(15)

Note the similarity of this equation to Eq. 13: The second term on the right-hand side represents a voltage fluctuation; the third term represents a current fluctuation.

Figure 14 shows the noise figure of a planar silicon transistor, as a function of frequency, for two different collector current levels. The dashed lines indicate the corresponding values calculated from Eq. 14. Reasonable agreement is found between these values and the experimental results over the intermediate-frequency range, but below and above this range the noise figure increases rapidly.

The low-frequency excess noise, according to the preceding discussion, is due to excess fluctuation of the base current. Accordingly, the noise figure increase at low frequencies should be greater at

---

**Figure 14.** The noise figure of a planar silicon transistor, as a function of frequency, for two different collector current levels. The dashed lines indicate the corresponding values calculated from Eq. 14. Reasonable agreement is found between these values and the experimental results over the intermediate-frequency range, but below and above this range the noise figure increases rapidly.

**Figure 15.** Noise voltages of field effect transistors, referred to the input, show that low-frequency excess noise predominates over a wide range, and that the junction FET has less low-frequency noise than the MOSFET. This is to be expected, since in the MOSFET, conduction occurs in the vicinity of surface states.

---

**Electronic Design** 17, August 16, 1969
Know your noise figure

The maximum sensitivity of an amplifier is limited by the noise that it introduces to the amplified signal. A popular measure of amplifier noise performance is the noise figure $F$, expressed as

$$F = \frac{N_{out}}{GN_{in}}$$

where $N_{out}$ is the total output noise power, $G$ is the power gain of the amplifier, and $N_{in}$ is the noise power input from the source (Fig. A). Of course

$$N_{out} = GN_{in} + N_{amp}$$

where $N_{amp}$ is the noise power generated within the amplifier, referred to the output. Substituting this expression for $N_{out}$ in the definition of noise figure, yields

$$F = 1 + \frac{N_{amp}}{GN_{in}}$$

For a perfectly noiseless amplifier, $F = 1$.

It is convenient, for circuit design purposes, to represent an actual noisy amplifier as an ideal amplifier, with two noise sources, $v_{in}$ and $i_{in}$, connected at its input (Fig. B). Both sources must be included if the magnitude of the noise sources of the model are to be independent of the source resistance. They are chosen to cause the same output noise as is observed in the real amplifier. Both quantities vary, in general, with the dc bias applied to the amplifier and with signal frequency.

If the two noise sources represent different physical causes of noise, which is often the case, the noise figure of the amplifier can be expressed in terms of these two input noise sources by the relationship

$$F = 1 + \frac{v_{in}^2}{4kTR\Delta f} + \frac{i_{in}^2}{4kT\Delta f}$$

where $\Delta f$ is the bandwidth of interest.$^1$

The magnitudes of the mean-square noise voltage and current generators depend on the physical causes of noise generated within the amplifier. If we can calculate these quantities in terms of the characteristics of the semiconductor devices from which the amplifier is made, we can then readily calculate the noise figure of the amplifier.

The noise powers and the representative voltage and current generators are functions of frequency. They may represent the value of noise at a particular frequency or a total noise power over a specified band of frequencies – the frequency bandwidth passed by the amplifier, for instance. The noise figure at a particular frequency is called the spot noise figure; if average noise powers over a band are compared it is called an average noise figure. Spot and average values coincide if the gain is constant over frequency and the internal noise source is white noise over the band of frequencies considered. (White noise has an available mean power bandwidth that is constant over frequency, and noise current or voltage sources are white if the functions $i_{in}^2$ and $v_{in}^2$ are constant over frequency. A white noise source supplies all frequencies in equal magnitudes and with random phases).
higher base, and hence higher collector currents. The data shown in Fig. 14 bears this expectation out. It is also evident from Eq. 15 that the current fluctuation becomes increasingly important as source resistance $R_s$ is increased. Since the low-frequency excess noise is a current fluctuation, its effect will be more noticeable with higher source resistances.

As is evident from Fig. 14, the noise figure also increases at high frequency. As the measurement frequency approaches the cutoff frequency of the transistors, the current gain of the transistor begins to decrease. This in turn brings about an increase in the noise figure (Eq. 14).

**FETs — excess noise at low frequencies**

The dominant conduction mechanism in both junction field-effect transistors and surface field-effect transistors is resistive. In both devices the resistance of a conducting channel is modulated by an applied gate voltage. Accordingly, the expected noise contribution of the channel resistance is ideally given $^{11,12}$ by

$$\overset{\text{r}}{v^2} = 4kTR_n\Delta f$$  \hspace{1cm} (16)

where $R_n$ is the channel resistance.

Experimental data on the input noise voltage fluctuation of MOS$^{5,43}$ and junction field-effect transistors as a function of frequency is shown in Fig. 15. Low-frequency excess noise dominates over a wide frequency range, but the low-frequency noise of junction FETs is considerably lower than that of the MOS surface field-effect transistor. This is to be expected since the entire current flow in such devices is in the vicinity of surface states.

The excess noise may again be associated with surface states, as indicated by the experimental results shown in Fig. 15. The data show the noise of the MOS transistor as a function of frequency both before and after introduction of surface states, using the same method that was employed in the case of junction devices.$^5$

Since the channel-resistance fluctuation of field-effect transistors appears within the input circuit, the noise figure of the device can be calculated by setting $\overset{\text{r}}{v^2} = \overset{\text{r}}{v^2}$. This yields

$$F = 1 + \frac{R_n}{R_s}$$  \hspace{1cm} (17)

using Eq. 13.

According to Eq. 17 the noise figure should monotonically decrease as the source resistance increases, but this is not observed experimentally; a slight increase, in fact, is observed at relatively high frequencies.

There can be several reasons for such an increase. It has been proposed$^{15,16}$ that the increase is due to neglected parasitic resistances and capacitances associated with the device. Alternatively, the increase could be due to the fact that the nature of the current flow, through the depleted or pinched-off region of the channel near the drain, has been completely neglected in the above experiment.

According to the generally accepted picture, the current flow here takes place by particle-type motion across a depleted region. One would expect a shot-noise contribution to the output current associated with this current flow, but shot noise would lead to much more noise at high source resistances than is observed experimentally. This discrepancy between the predicted noise figure and the observed noise figure remains unresolved. ■ ■

Timing circuit has independent turn-on and turn-off delays

Power supply design requirements often necessitate a turn-on delay after input power has been applied. And these requirements can be easily realized using a unijunction transistor timing circuit to energize an SCR. In some applications, however, occasional power interruptions of several milliseconds duration, short enough to be tolerated by the load, can occur at the dc power source, causing the timing circuit to be reset. The result is unnecessary equipment down time. The modified timing circuit shown provides a simple but effective remedy.

The timer is intended to operate from 12 to 36 volts dc, and has a turn-on delay of about 30 s, controlled by the time constant of \( R_1C_1 \). In addition, a reset, or turn-off, delay is incorporated and controlled by the time constant \( R_2C_2 \). Resistor \( R_3 \) serves both to lock out the UJT oscillator after it has provided the turn-on delay, as well as to hold a fixed voltage on \( C_1 \).

In the event of power interruption, the UJT loses bias on base 2, which immediately allows \( C_1 \) to discharge through the emitter, and hence to charge \( C_2 \). The longer time constant of \( C_2R_2 \) maintains this voltage to prevent SCR commutation during short power interruptions, yet still allows the circuit to reset under actual shut-down conditions.

Gary W. Vest, Project Engineer, Clevite Corp., Piezoelectric Div., Bedford, Ohio.

Low-power timer drives stepping relay

A low-power and inexpensive timing circuit that can drive inductive loads (stepping relays, etc.) can be constructed using the low forward blocking current of some SCR's (for example, the General Electric C106B, which has \( I_{f\alpha} \approx 0.1 \mu A \) typical).

The time interval is determined by \( R_1C \), while \( R_2 \) determines the minimum time interval. The neon lamp conducts at approximately 65 volts, triggering the SCR. The capacitor is thus rapidly discharged through the relay coil, causing the resetting of \( C \) to a low voltage, and the
The first LSI subsystem employing NPN's, PNP's and J-FET's in a monolithic structure.

- Bipolar signal handling range in excess of 20 volts
- Full military temperature range
- Lowest input leakage current
- Most versatile multiplexer with random access capability
  - 16 channel
  - Dual 8 channel
  - Differential 8 channel
  - Enable input for all channel blanking or address expansion
- TTL address decoding logic for TTL or DTL compatibility
- Complies with MIL-STD-883
- Off-the-shelf delivery

Analog-to-period converter can simplify telemetry systems

Many telemetering systems employ analog-to-frequency conversion to facilitate reliable information transmission over communication links. One accurate and precise method for recovering the analog information is by using a frequency counter to measure the frequency of the converted signal over a relatively long period of time. A much faster method of recovering the analog information is to measure the period of the converted signal or multiples of the period.

The circuit input can be rectified ac (half-wave, full-wave), or it can be battery driven. With the component values shown, half-wave rectified 110-V ac power gives 10-minute intervals, while a 90-volt battery yields 5 minute intervals. The current drain is around 25 µA for a one ppm rate, permitting a portable battery-operated unit.

Larry Eaton, Design Engineer, University of Nevada, Reno, Nev.

Unfortunately, this technique requires an additional computation, since the analog information is usually directly proportional to the frequency of the converted signal—hence inversely proportional to its period. It would be advantageous, therefore, to make the initial conversion linear with respect to the period rather than the frequency.

The analog-to-period converter shown will convert an input voltage, \( V_{in} \), to a sawtooth signal whose period, \( T \), is a linear function of the input voltage.

The converter is built around an analog-to-frequency converter previously described (ED 14, July 4, 1968, p. 96), but includes an additional operational amplifier that is used as a summing amplifier (op amp 1). It was shown that the output frequency of the original converter can be expressed by

\[
f = \frac{I}{V_o C_o},
\]

where \( I \) = input current to op amp 2.

\( V_o \) = voltage supplied to the FET gates (Q4, Q5)

Hence, the period, \( T \), is

\[
T = \frac{1}{f} = \frac{V_o C_o}{I}.
\]

But in this case,

\[
I = -\frac{V_{ref}}{R_a},
\]

and

\[
V_o = 2 V_{in} + V_{ref}.
\]

Combining equations (2) through (4),

\[
T = A + B V_{in},
\]

where

\[A = C_i R_a,
\]

\[B = 2A / V_{ref}.
\]

With the values shown on the illustration,

\[
A = 750 \mu s,
\]

\[
B = 240 \mu s.
\]

The converter is linear within 0.02\% over an input signal range of \(-1 \) V to \(+1 \) V. Zero shift over the temperature range of 0 to 85 °C is 0.25 \( \mu s /°C \). This may be improved by replacing the operational amplifiers and the critical components \((R_1, R_2, R_3, C_1)\) with extremely stable types.

Sam Ben-Yaakov, Electronic Engineer, Dept. of Geology, Univ. of California, Los Angeles.

IDEAS FOR DESIGN

put of the other, resulting in a very stable series-mode crystal oscillator.

The output waveform from the buffer is a perfect square wave, having rise and fall times less than 30 ns. The output level of 0.2 V to 3.6 V is suitable for most logic applications. Stability of the oscillator approaches that of the crystal itself. (There was less than 1 Hz change at 1 MHz when the supply was varied from 2.5 to 5 V.)

If an accurate frequency is needed, capacitor $C_1$ can be replaced with a 27-pF capacitor in parallel with a 2-to-10-pF trimmer. The crystal should then be of the antiresonance mode of operation, with a load of 32 pF.

For higher fan-out, the output can be replaced by a DTLμL900.

Leonard Roque, Senior Design Engineer, Coulter Electronics, Inc., Hialeah, Fla.

Pre-pulsed diode bias is a feature of novel duplexer

A novel lumped circuit duplexer employing PIN diodes can be used from 10 MHz to about 200 MHz. When transmitting (see illustration), incident energy is reflected by a short circuit at the junction point due to a pre-pulsed forward bias circuit through the diodes. Energy is summed up at the antenna terminal due to the quadrature relationship of the hybrid. In the receiving mode, the pre-pulsed bias current is removed and energy at the antenna terminal is routed to the receiver terminal with the transmitter terminal isolated. Summation occurs due to an in-phase addition of energy from the two hybrids.

The duplexer shown has been fabricated using printed circuit techniques and operates at a center frequency of 170 MHz. It has been operated with a peak power of 750 watts over a 20% bandwidth yielding the following experimental data:

- Transmitter—Antenna Insertion Loss: 0.9 dB
- Antenna—Receiver Insertion Loss: 0.5 dB
- Transmitter—Receiver Isolation: 28 dB

Charles Lamensdorf, Supervisory Engineer, Hazeltine Corp., Little Neck, N.Y.

PIN diodes at each junction point between hybrids reflect incident energy when forward biased.

Circuit keys twin-T oscillator without generating transients

The keying of an oscillator can often result in unwanted and bothersome transients. Here is a way to start and stop a twin-T oscillator smoothly without generating such transients.

In the popular twin-T design, the shunt resistor in the twin-T network determines the amount of regeneration. Above a critical value of resistance the circuit will not oscillate. In the circuit shown, this resistor is replaced by two adjustable resistors, \( R_1 \) and \( R_2 \), in series. The values are such that the circuit will not oscillate unless \( R_1 \) is short-circuited. The rate at which oscillation builds up when \( R_1 \) is short-circuited depends on the setting of \( R_1 \). The rate at which oscillation decays when the short circuit is removed depends on the setting of \( R_2 \). Both buildup and decay can be varied over a wide range.

A single npn transistor, \( Q_1 \), serves satisfactorily as the switch, because the circuit is dc isolated by \( C_1 \) and \( C_2 \). A 100-µA base current is sufficient to turn the stage on.

The frequency of oscillation of the circuit is, of course, determined by the capacitors. \( C_1 \) and \( C_2 \) should be the same value, and \( C_3 \) should be twice the value of \( C_1 \).

In one application of this technique, a 160-Hz signal pulsating at 1 pulse per second was needed. To accomplish this, the base of the switching transistor was connected to one emitter of a multivibrator. \( C_1 \) and \( C_2 \) in this application were 1000 pF, and \( C_3 \) was 2000 pF.

Donald E. Johnson, Chief Engineer, Carolina Medical Electronics, Inc., King, N.C.

Diode bridge protects sensitive circuits

Many a battery operated circuit has been inadvertently wiped out by the simple act of plugging the battery in backwards. Here is a solution for this type of problem.

Wire a full-wave bridge into the front end of the circuit, polarized to provide the proper polarity for the circuit to be protected. The battery can now be plugged in, in either direction, without damaging the circuit.

One word of caution: Observe surge ratings.

for the bridge and be sure that the rectifier can handle the full-load current. The input voltage will be lower by two diode drops; therefore, if the circuit is voltage sensitive the input voltage may need to be raised about one and a half volts.

Reliable semiconductor replaces centrifugal motor starting switch

A single-phase induction motor starting circuit makes use of a solid-state switch to improve reliability. Usually these motors require a start winding which is only used until the rotor reaches a speed of approximately 75% of full-load speed. Most motors of this type use a mechanical centrifugal switch which deenergizes the start winding after the proper speed is reached. These switches tend to be unreliable since they interrupt high current. They also are subject to corrosion and pitting, and cannot be used in hostile atmospheres.

A triac is naturally suited to this application since it will conduct current in both directions and it can be triggered ON by either positive or negative gate drive.

The schematic shows the motor starting circuit. In this circuit, a triac is connected in series with the start winding, replacing the centrifugal switch. The main winding inrush current during starting of the motor is several times the running current. It drops as the speed-dependent back EMF rises. Thus the main winding inrush current can be used as the source of control for the start winding. The voltage developed across resistor $R_1$, which is proportional to the main winding current, is used to gate the triac. The resistance must be large enough for start current to develop sufficient voltage to turn on the triac, but not so large that the full load running current will keep it on. Some trial and error selection of this value may be necessary to accommodate the triac that is used; a slide-wire resistor may be used to select the proper trigger level.

When the current drops to zero in a triac with an inductive load, the device turns OFF and the voltage across it increases rapidly to line voltage. If the rate of rise of this voltage ($\frac{dv}{dt}$) is too great, the triac will again turn on. Therefore, a circuit must be provided to assure that the $\frac{dv}{dt}$ is low enough. The network, consisting of $R_2$ and $C_1$, is used to limit the $\frac{dv}{dt}$ across the triac to within the capability of the device. This rating is lowest at high temperatures; thus, the network values should be chosen for proper operation at the highest expected temperature.

The values shown on the schematic were used with a 1/2-hp, 115-volt motor. The peak starting current of the motor was 40 A, while the peak running current was 8 A. The value of the resistor was chosen so the triac would not turn on when current was less than 12 A. This occurred after 12 cycles. It should be possible to use the triac shown for integral-horsepower motors since the triac conducts for only a few cycles. Of course, maximum current ratings must be observed. The circuit, as shown, has been operated at temperatures as high as 80°C, but the motor-starting capacitor limits the maximum ambient temperature to +65°C. In addition, the duty cycle of the capacitor limits the circuit to a maximum of 60 starts of one-second duration per hour. The triac has performed satisfactorily under these conditions.

IFD Winners for April 26, 1969

E. E. Barnes, Research Assistant, Penn State University, University Park, Pa. His Idea “Simple circuit ‘tags’ beginning and end of square-wave signals” and Walter G. Jung, Engineer, MTI, Div. of KMS Industries, Inc., Cockeysville, Md. His Idea “IC differential amplifiers yield matched zener pairs” have been voted the Most Valuable of Issue Award.

Vote for the Best Idea in this Issue.
PLATED-WIRE, HARDENED SENSE AMP

- The first application of linear and digital technology in one monolithic subsystem
- The RA-2540 system in a single chip performs the functions of a hardened differential amplifier and a hardened voltage comparator
- 1 mv signal sensitivity in high noise environment
- 10 ns access time
- Internal D.C. restoration
- Selectable dual channel
- Hardened
  - Photo current compensation
  - Dielectric isolation
  - Thin film resistors
  - Advanced device design
- Complies with MIL-STD-883
- Off-the-shelf delivery

You get the BEST IC for the job from Radiation's fast expanding hardened digital line.
MOS. Now.
20 standard Philco types are ready to ship from stock.

Our line of standard production MOS integrated circuits keeps growing broader every day. From our Lansdale plant, one of the largest MOS facilities in the country, you can now get instant delivery of many of the devices that you'll need for your next generation designs. For example:

- Shift registers; including the longest (256 bits) and the fastest (5MHz clock) commercially available in production quantities.

- Compatible gates, up to 2MHz clock, in a variety of configurations.

- Binary counters . . . 16-channel sequential/random access multiplexer . . . 1024-bit dynamic read-only memory, programmed to your bit pattern; off-the-shelf model is a sine look-up table.

Many more are being readied for production. When you want MOS now, we're the people to see. Write or call MOS Marketing, Philco-Ford Microelectronics Division, Blue Bell, Pa. 19422. (215) 646-9100.

**Device** | **Description**

Magnetic laboratory equipment

Walker Integrating Fluxmeter and Hall Gaussmeter
A line of precision magnetic measurement instruments to accurately measure magnetic flux and produce an accurate analogue voltage proportional to the flux for recording hysteresis loops or measurement of magnetic fields. Light weight, solid state design. Fast, accurate, easy to use.

Walker Hysteresigraphs
A line of magnetic material test equipment including the Model MH-1 Hysteresigraph for materials with coercivities ranging from 100 to 3000 oersteds and saturation inductance up to 18,000 gauss, the Model MH-2 Hysteresigraph for soft magnetic material testing and the Model MC-1 Coercivity Meter.

Walker Regulated Power Supplies
5, 11 and 15 Kilowatt Current Regulated Models
One Part in 100,000 or Better Stabilities
All Silicon Solid State Circuitry
Ultra Stable Low Noise Input Circuitry
Automatic Polarity Reversal (Optional)
Electronic Sweep Circuitry (Optional)
Impedance Matched to the Walker Line of Precision Laboratory Magnets

Walker Superconductor Magnets
Available in bores up to 3" with intensities up to 65 kilogauss. Compensated solenoids are available for applications requiring high field uniformity. A complete line of accessories is available for these magnets.

Walker Custom Coils
The O.S. Walker Company produces to customer order numerous coil systems including Helmholtz coils, air core and iron core solenoids, plasma coils and laser coils.

Walker Special Magnet Systems
Typical special magnet systems, designed and produced at O.S. Walker.
COS/MOS

RCA’s unique approach to digital design—at new low prices

For practical circuit designs...
High performance and new low prices combine to make COS/MOS—RCA’s unique COMplementary Symmetry MOS integrated circuits—an even greater value for a broader range of digital equipment designs. Now you can re-evaluate—and find even more advantages in—these COS/MOS features that no other logic circuitry has matched to date:
- Quiescent power dissipation in nanowatts
- Noise margin—4.5 volts
- Fanouts up to 50
- Single power supply required—6 to 15 V, positive or negative
- Logic level swing—“0” to power supply voltage
- Compatible gate level and MSI functions
- Frequency capabilities from DC to 5 MHz
- Single-phase clocking
- Full military operating temperature range—from -55°C to +125°C
- Hermetic packages—DIC or ceramic flat pack

To get acquainted with COS/MOS, see your RCA Distributor for the COS/MOS Sampler QK2201, yours for only $50.00 (optional distributor resale price).

For new economy...
Effective now, new low prices—combined with unrivaled application advantages—put COS/MOS squarely in the picture for all your digital designs. Check the list of device numbers, descriptions and prices. Then ask your local RCA Representative or your RCA Distributor for details. For specific circuit data, write RCA Electronic Components, Commercial Engineering, Sec. 1CG8-3, Harrison, N. J. 07029.

Dual-trace oscilloscope views dc-to-5-MHz signals with an accuracy of 200 µV/cm. It is accurate to 2 mV/cm over the frequency range of dc to 50 MHz, p. 284.

Monolithic integrated circuit is a complete a-m radio receiver on a single chip, p. 254.

Single-chip high-speed operational amplifier gets settling time down to 300 ns, p. 254.

Also in this section:

Low-cost FET op amp offers military specs in hermetic TO-8 case, p. 262.
Compact status indicators display 12 messages within 2-in. square, p. 272.
High-speed data modem shows line status on its front panel, p. 278.
Evaluation Samples, p. 300 . . . Design Aids, p. 302 . . . Annual Reports, p. 304
Linear IC op amp settles in 300 ns

Said to be over ten times faster than any IC operational amplifier now on the market, the µA715 is a monolithic linear integrated circuit that features a typical settling time of only 300 ns. The new op amp also offers a unit-gain non-inverting slew rate of 20 V/µs to give an acquisition time of 800 ns.

MSI TTL circuits dissipate 16 mW

Texas Instruments Inc., Components Group, P.O. Box 5012, Dallas, Texas, Phone (214) 238-2011. P&A: $13.30 to $46.41; 6 or 10 wks.

Two new low-power MSI TTL integrated circuits, the SN54L95/74L95 and the SN54L93/74L93, feature power dissipations of only 19 and 16 mW, respectively. The SN54L93/74L93 is a 4-bit binary register that will perform right-shift or left-shift operations. The SN54L93/74L93 is a 4-bit binary counter consisting of four master/slave flip-flops.

CIRCLE NO. 416

Voltage-variable diodes offer Qs as high as 200

Crystalonics, Inc., a Teledyne Co., 147 Sherman St., Cambridge, Mass. Phone: (617) 491-1670. P&A: from $16; stock.

Featuring all-epitaxial construction, twelve new silicon voltage-variable capacitance diodes boast Qs up to 200, and dc ratings up to 100 V. Series VA521-824 units offer capacitances up to 1320 pF and tuning ratios as high as five. They are ideal for such applications as uhf/vhf frequency multiplication.

CIRCLE NO. 417

Plastic tuning diodes sell for 60¢ each

Motorola Semiconductor Products Inc., P. O. Box 20924, Phoenix, Ariz. Phone: (602) 273-6900. P&A: 60¢; stock.

With a price tag of 60¢, EPI-CAP silicon voltage-variable capacitance diodes are now available in a low-cost injection-molded plastic package. Designated as types MV2101 through MV2115, these new plastic tuning diodes cover the capacitance range from 6.8 to 100 pF nominal, with typical tuning ratios of 3.

CIRCLE NO. 418

Complete a-m radio is monolithic IC

Ampex Electronic Corp., Semiconductor and Microcircuits Div., Providence Pike, Slatersville, R. I. Phone: (401) 762-9000.

Available in a 14-lead dual-in-line package, a new monolithic IC is a complete a-m radio receiver on a single chip. Model TAD100 contains all the active components for a complete receiver: oscillator, mixer, i-f amplifier, detector, and agc, audio preamp and driver stages. Its a-m sensitivity is 50 µV/m for a 100-mW audio output.

CIRCLE NO. 419

FET choppers switch in 15 ns

National Semiconductor Corp., 2950 San Ysidro Way, Santa Clara, Calif. Phone: (408) 245-4320. P&A: $2.50 to $3.50; stock.

Three new FET choppers feature a typical fast switching time of 15 ns and a low leakage of 100 pA maximum. Types 2N4391, 2N4392 and 2N4393 are also said to offer very high reliability. They are designed for optimum performance in microvolt amplifiers and meters, multiplexers, commutators and oscilloscopes.

ICs & SEMICONDUCTORS

Miniature rectifiers can carry up to 6 A
Semtech Corp., Newbury Park, Calif. Phone: (805) 498-2111.

Said to approach theoretical electrical limits, Metoxilite rectifiers are rated at 3 or 6 A with peak reverse voltages as high as 1000 V. Their metal oxides are fused to a metallurgically bonded-junction tungsten-pin assembly to form a tough subminiature package. Recovery times vary from 150 ns to 2 µs.

CIRCLE NO. 422

Hermetic SCRs sell for 45¢
Transitron Electronic Corp., 168 Albion St., Wakefield, Mass. Phone: (617) 245-4500. P&A: 45¢ to $1.50; 3 to 4 wks.

Hermetically packaged in a TO-5 metal can, a new series of planar SCRs with up to 400-V ratings cost as little as 45¢ each. Series RTD04 units have a gate sensitivity of under 100 µA and a holding current of under 5 mA. They will handle 1.6 A rms at 80°C case temperature and will operate up to 125°C at lower current levels.

CIRCLE NO. 423

Flatpack transistors are dual/quad units
Raytheon Co., Semiconductor Operation, 350 Ellis St., Mountain View, Calif. Phone: (415) 968-9211.

Dual and quad versions of the npn 2N2222 and pnp 2N2907 transistors are now available in TO-89 and TO-86 flatpacks, respectively. These devices have a guaranteed short-circuit forward current gain, saturated collector-emitter voltage and saturated base-emitter voltage, with up to 500-mA collector current and a breakdown voltage of 60 V.

Where space and performance are critical, more and more manufacturers are finding that El-Menco miniaturized dipped mica capacitors are the reliable solution. The single coat is available in three sizes: 1-CRH, 1-CRT and 1-CE.

The 1-CRH DM “space savers” easily meet all the requirements of MIL and EIA specifications, including moisture resistance. The 1-CE and 1-CRT units also meet the requirements of MIL and EIA specifications, except that they have less moisture protection because of their thinner coating; these capacitors, therefore, are ideally suited where potting will be used. Note: DM10 and DM15 units are still available in the standard 4-CR size.

Specify “El-Menco” and be sure . . . the capacitors with proven reliability. Send for complete data and information.

*Normally, El-Menco 39 pF capacitors will yield a failure rate of less than 0.001% per thousand hours at a 90% confidence level when operated with rated voltage and at a temperature of 85°C. Rating for specific applications depends on style, capacitance value, and operating conditions.

ICs & SEMICONDUCTORS

Pnp transistors carry up to 20 A

Packaged in TO-3 and TO-66 cases, a new line of industrial pnp power transistors can handle currents of 10 and 20 A. Types 2N5737, 2N5738, 2N5739 and 2N5740 are 10-A devices with collector voltages of -60 or -100 V. Types 2N5741, 2N5742, 2N5743 and 2N5744 are 20-A transistors also having rated collector voltages of -60 and -100 V.

Pnp transistors turn-on in 20 ns

Fairchild Semiconductor, 313 Fairchild Drive, Mountain View, Calif. Phone: (415) 962-3563. Price: $4.50 or $5.40.

Two new high-speed pnp transistor switches boast a turn-on time of 20 ns maximum and a turn-off time of 30 ns at 300-mA collector current. They are intended for a variety of saturated and non-saturated switching applications, including complementary switching circuits. Type 2N5456 has a breakdown voltage of 15 V, while type 2N5456 is rated at 25 V

Silicon thermistors vary package type

Microsemiconductor Corp., 11250 Playa Court, Culver City, Calif. Phone: (213) 391-8271. P&A: from $1.56; stock to 2 wks.

Addohm silicon positive-temperature-coefficient thermistors can be packaged as molded, glass hermetic, transistor can or miniature probe types. Designed to meet the specifications of MIL-T-2364ΩA, the new devices have standard resistance ranges from 10 Ω to 10 kΩ with either ±5 or ±10% tolerances.

Power transistors dissipate 350 W

Offering collector-emitter voltages as high as 300 V, a new line of silicon power transistors feature a power dissipation of 350 W. The new devices, which come in a TO-3 package, have a low saturation resistance of 0.3 Ω as well as low leakage currents and low thermal impedances. Maximum collector current can be 30 A.
When RCA quietly calls its RF power transistors "reliable," RCA means "highly reliable." Read why.

The reliability of RCA RF Power Transistors is designed-in, built-in and finally proved-in.

Evaluation criteria of every RCA RF Power Transistor are determined initially by design engineering—and are used during the analysis of first yields of prototypes. Procedures include tests to destruction, examination of failure mechanisms, checking the expectability of results, and extensive life tests under various rigorous conditions—all aimed at the final determination that every aspect of the new design is "go" for volume production.

In the second stage of assuring reliability, RCA follows a program of dual factory-process control: in-line testing at every major point of manufacturing, plus continuous quality audits on samples. The program consists of life tests, data analysis and failure analysis. Results are fed back to every technical group concerned with each product's evolution—from design through applications engineering.

The final stage, the proving-in of RCA reliability, is high to ultra-high screening. This follows four reliability levels: two meeting MIL-STD requirements and two meeting even more exacting criteria set by RCA—many of which precede the issuance of the military specs. Note the following chart of high-reliability RCA RF Power Transistors—all immediately available.

For detailed information on any of these RCA high-reliability RF Power Transistors, see your local RCA Representative or your RCA Distributor. For technical data, write: RCA Electronic Components, Commercial Engineering, Section PGB-3, Harrison, N.J. 07029.

Visit the RCA Electronic Components exhibit at WESCON, Unit C, in the Cow Palace Arena.
Miniature coaxial cable assemblies in any quantity, shipped complete. Our assembly speed is faster. Our yield greater. Your cost is lower.

Assemblies used in LEM program. Directly soldered into circuits. Operate successfully in temperatures ranging from -54°C to +140°C under environmental pressure of 10^-3.

Assemblies to meet highly individual requirements all fitted with new PDM miniature microwave connectors.

Miniature coaxial cable available in sizes from .020 inches to .325 inches. Tolerance as low as ±1/2 ohm on characteristic impedance of 50 ohm. Minimum VSWR.

Custom designed miniature coaxial cable impedance matching device. Cable is .034 inches diameter and 6 1/2" long. Coll is 1/4 inch I.D. and 1/4" high.

Miniature coaxial cable with solid copper outer conductor, plain or plated, remains crack free under extreme bending and vibration. TFE Teflon dielectric with inner conductors of silver-plated copperweld steel, silver-plated copper or, to meet individual specifications. Available in lengths up to 150 feet.

MINIATURE CABLE ASSEMBLIES

We do all the work. You get 100 percent yield, low-cost and guaranteed performance. As the only integrated manufacturer of miniature semi-rigid coaxial cable and matching connectors we'll cut cable (our semi-rigid or any you specify) to precise mechanical and electrical lengths, bend to your individual requirements, terminate with selected connectors, test to your established parameters and guarantee performance. And we can do this at a price lower than your cost if you were to buy your own coax and connectors and do the job yourself.

Find out how. Write to: Phelps Dodge Communications Company, 60 Dodge Avenue, North Haven, Connecticut 06473.

With EECO 2D computer-automated plug-in IC Hardware...

less than 30 days separate schematic and final system...

When you specify EECO 2D Hardware a computer converts your “Pin Logic List”* into a wire plan and checks for errors and omissions before wiring begins. EECO plugs in the IC’s, machine Wire-Wraps the backplanes and in days...your schematic is a drawer of working electronics with all necessary computer generated support documentation.

EECO 2D Hardware System provides more than time savings...it’s up to 30% more economical...and it’s versatile...ready for digital or analog IC’s, discrete components, MSI or LSI. It offers higher density — up to 768 IC’s and a power supply fit in one 3-1/2" high standard drawer.

Your first step is simple...just phone, write or circle the reply number.

*You simply choose the module and write the signal name by each pin number. You don’t worry where the wires go or the order of listing.

Catalog available.

See EECO 2D at Wescon Booth numbers 3814 thru 3817.
Low-cost op amp is military device

Bell & Howell Control Products Div., 706 Bostwick Ave., Bridgeport, Conn. Phone: (203) 368-6751. P&A: $30; stock.

Claimed to be cost competitive with plastic units, a new hybrid FET-input operational amplifier is packaged in a hermetically sealed TO-8 case and is operable over the full military temperature range. Model 20-248 has a maximum input bias current of 5 pA plus internal phase compensation. Its voltage offset is internally trimmed to less than 1 mV.

CIRCLE NO. 430

$12 FET amplifier senses 10-pA inputs

Costing only $12 in single-unit quantities, a new general-purpose FET operational amplifier offers a input bias current of only 10 pA. Model KM479 provides an input impedance of 10^6 MΩ and an output of ±11 V at 20 mA. It can be used in integrators, buffers and high-impedance instrumentation systems.

CIRCLE NO. 431

FET amplifiers have 3-pA bias

Data Device Corp., 200 Tec St., Hicksville, N.Y. Phone: (516) 433-5330. P&A: $14.50; stock to 2 wks.

A new series of low-cost FET-input operational amplifiers feature a bias current of only 3 pA. The new devices, series D-4, have internally short-circuit-protected outputs of ±12 V at ±6 mA. Their unity-gain frequency is 3 MHz, and frequency for full output is 130 kHz. Slew rate is 9 V/µs; voltage drift is 25 µV/°C.

CIRCLE NO. 433
What is the life of a good aluminum capacitor?

Sample #7, shown below, survived 100,000 hours. It is one of a group of computer grade aluminum electrolytic capacitors that we put under test back in 1957.

All capacitors were operated at rated DC working voltage, surge voltage, ripple current and temperature range found in typical computer type power supply circuits.

Sample #7 works almost as well today as it did eleven years ago. Mallory capacitors enjoy long, reliable life because they are built to exacting standards and tested for surge voltage, vibration resistance, container seal tightness, shelf life, and capacitance, ESR, DC leakage current and electrolyte leakage.

All Mallory CG capacitors should have a useful life of about ten years, when operated at specified conditions. They will last even longer if derated in one or more operating conditions.

**Temperature Range**

CG capacitors are designed to operate within a range of -40°C to +85°C. They have been tested at 105°C at less than rated voltage without immediate catastrophic failure. Extended operation under these conditions, however, will shorten their life.

**Capacitance**

Capacity is measured at 120 cps and at 25°C. Tolerance of capacitors rated at 3 to 150 volts is -10, +75%. For capacitors rated at 151 to 450 volts, the tolerance is -10, +50%.

**Low Temperature Capacitance**

Capacitance of Mallory CG capacitors at reduced temperatures and 120 cps does not fall below the following percentage of nominal rated room temperature (+25°C) capacity.

<table>
<thead>
<tr>
<th>Rated DC Voltage</th>
<th>Percent of Nominal Rated Capacitance</th>

<tr>
<td>101 and up</td>
<td>85</td>
</tr>
</tbody>
</table>

**Equivalent Series Resistance**

ESR measurements are made at 120 cps and 25°C. ESR for Mallory computer grade capacitors is very low.

Mallory wants the highest possible rating for its CG capacitors—but not at the expense of long life and reliable operation. The object of all our research and care in manufacturing and testing is to provide our customers with the “best” capacitor. For data, write or call Mallory Capacitor Company, a division of P. R. Mallory & Co. Inc., Indianapolis, Indiana 46206.
McDonnell Phantom: the hot one

Eastern keeps its radar cool

Each day of flight operation continues to confirm the McDonnell "Phantom" as the most advanced all-around fighter aircraft in the world today. But high density electronics and the heat loads of high speed flight would soon put the radar nose of the Phantom out of business.

That's where Eastern Industries' cooling systems come in. A liquid-to-air heat exchanger and hydraulic pack combine to remove over 8 KW from the radar, keeping it within safe temperature limits under all flight conditions. For all its performance, the total system weighs less than 17 lbs. and is remarkably compact (hydraulic pack: 3\(\frac{3}{16}\)" x 6\(\frac{3}{16}\)" x 11" and exchanger: 6\(\frac{5}{8}\)" x 8" x 17").

Other Eastern cooling systems are now under development or in production for such aircraft as the Lockheed AH-56A, North American RA5C and F-104.

Write for new literature on Eastern capabilities in thermal control—or for the answer to your particular problem. We may have some cool answers.

MODULES & SUBASSEMBLIES
Compact module houses 5 op amps

Optical Electronics Inc., P.O. Box 11140, Tucson, Ariz. Phone: (602) 624-8358. P&A: $89; stock.

Occupying a volume of only 1 cubic in., model 9432 module contains five separate high-performance operational amplifiers. The new unit is said to provide the designer with a small analog manifold or analog computer. Each amplifier has an open-loop gain of 100 dB, temperature drift of 3 \(\mu V/^\circ C\) and a bias current of 100 nA.

CIRCLE NO. 434

Hybrid multipliers need no added parts

Fully encapsulated and designed for PC-board mounting, series M-4000 hybrid analog multipliers are high-performance units that require no external components for complete operation. The six models in the new series feature wide bandwidths (dc to over 5 MHz), accuracies to 0.1%, fast slewing and high output currents. Their power supply requirement is only \(\pm 15\) V.

Think Straight.

RESOLON® CONDUCTIVE PLASTIC RECTILINEAR ELEMENTS UP TO 36" LONG

Now, Duncan Electronics builds new conductive plastic precision rectilinear elements, to take their rightful place beside our proven RESOLON® CP rotary elements. They're the direct result of over five years' developmental work and production experience in rotary elements and pots. Rectilinear elements are provided with standard electrical travel of ¼" to 16", or custom designed up to 36" on special order. Servo-trimmed for improved linearity tolerances, elements can be ordered as separate segments or in custom housings engineered to your requirements. Write today for full information - if you want the 'straight' story.

DUNCAN ELECTRONICS SUBSIDIARY

INFORMATION RETRIEVAL NUMBER 161
FET-input op amps boast 10^5 CMRR

Intech, Inc., 1220 Coleman Ave., Santa Clara, Calif. Phone: (408) 244-0500. P&A: $33 or $40; stock.

Two new FET operational amplifiers have a minimum common-mode rejection ratio (CMRR) of 10^5 measured with a ±5-V input. Models A-102 and A-103 feature a minimum gain of 10^5 and a minimum power supply rejection of 20 µV/V. Their minimum slewing rate is 10 V/µs and typical settling time to 0.01% is 5 µs. Gain-bandwidth product is 2 MHz.

CIRCLE NO. 435

Untrimmed multiplier is accurate to ±1%

Philbrick/Nexus Research, a Teledyne Co., Allied Drive at Route 128, Dedham, Mass. Phone: (617) 329-1600. P&A: $75; stock.

When untrimmed, model 450 four-quadrant multiplier operates at typical accuracies of ±1% to 10 kHz with full output voltage capabilities to 100 kHz. Its output is representative of the instantaneous product of two input signals. With external trimming, accuracy can be improved to ±0.6% typical, ±1% maximum, referred to a 10-V full-scale output.

CIRCLE NO. 437

Overvoltage crowbar responds in 20 µs

Space Age Microcircuits, P.O. Box 426, Chatham, N.J. Phone: (201) 635-8484. P&A: $12; stock.

Operating in less than 20 µs, a new overvoltage crowbar protects critical loads over the temperature range of −55 to +85°C. Model AOC-1 has a voltage that is internally adjustable; it may be used over a very wide voltage range. The tiny epoxy-encapsulated module has a volume of 0.17 in.³ and measures 0.68 by 0.68 by 0.36 in.; weight is less than 1/2 oz.

CIRCLE NO. 436

Comparator relays match ICs and reeds

Phipps Precision Products, 7749 Densmore Ave., Van Nuys, Calif. Phone: (213) 785-3109. P&A: from 24.95; stock to 2 wks.

Consisting of an IC operational amplifier precisely matched to a reed relay, a new family of differential comparator relays combine the advantages of integrated circuit technology with reed-relay life, speed, and reliability. Self-contained in one integral package, the ICR units are less than one half the size of existing op-amp/relay assemblies.

CIRCLE NO. 438
Best DVM on the market.
For all practical purposes.

It's the simplest way to measure DC levels ... visually and with BCD outputs. The 404 is an extremely accurate DVM at a very reasonable price. It's portable. Easy to operate. Has four full digits with a fifth overrange. Accuracy of 0.02% ± one digit. The 404 offers input flexibility of five voltage ranges with an ultra-high input of 1,000 megohms on 1-volt range. And high noise rejection with differential input and integration techniques providing common mode rejection greater than 100 db at 60 Hz. It has BCD outputs and remote programming for system compatibility. And it costs only $595. That's a lot of DVM for a relatively small investment. Call or write us for a demonstration today. We'll have a 404 operating in your lab tomorrow. Practically. Tyco Instruments Division, Tyco Laboratories, Inc., Hickory Drive, Waltham, Mass. 02154, (617) 891-4700.

For $595, this can lead to almost anything.
Miniature relays operate $10^8$ times

Capable of replacing electromagnetic relays, a new line of environmentally sealed miniature solid-state relays boast an electrical life of 100 million operations. Series SX3 units are 5.2-oz. devices. CIRCLE NO. 439

High-speed multiplexer accepts six channels

With TTL control signals, a new six-channel multiplexer card has a delay and settling time of 12 µs to 0.05% of full scale and 3 µs to 0.01% of full scale. Model MUX-06 can be used in cascade to increase the number of channels in sets of six. The unit can also operate as a sample-and-hold-amplifier. CIRCLE NO. 440

Custom Wound Bobbins • In 10 Days

Custom wound bobbin samples are available in ten days; production shipments start within three weeks after sample approval. Special 16 P35 KV windings for oil-filled high voltage transformers...special coils also are furnished on 10-day sample/3-week production delivery cycle. Bobbins furnished in wide range of inductance and current ratings. If desired, Miller engineers will make recommendations for optimum performance. CIRCLE NO. 441

MOS clock driver has 1-A output

Capable of operating from dc to 10 MHz, a new universal MOS clock driver features a 1-A output current with risetimes and fall-times of 18 ns into a critically damped 500-pF load. The input of model CH1033 accepts conventional logic levels with a low-impedance bidirectional drive such as TTL. The output swing may be clamped from 0 to −27 V or from +5 to −11 V. CIRCLE NO. 442
We make many integrated circuits at a time... on a single wafer of silicon crystal. Then, we divide the wafer into individual circuits (and, sometimes, the circuits into electrically isolated components) by etching narrow slots through the silicon.

But conventional etchants don't cut downward only. They cut sideways, too, making a slot that's wide as well as deep. So, for safety, we have had to leave plenty of space between circuits. Then, Bell Laboratories scientists Herbert A. Waggener, Roger C. Kragness, and A. Lamont Tyler discovered a means of "one-directional" etching.

The new technique makes wedge-shaped slots, separating the circuit elements along precise lines. It depends on a "preferential" etchant, which most strongly attacks the semiconductor perpendicular to a particular crystallographic plane. The slot is wedge-shaped because its walls are other planes toward which the etchant is almost inert.

The process is self-limiting; once a slot goes through a wafer, there is very little further etching. So, we can leave the wafer in the etchant long enough for complete separation of the parts without the careful thickness control formerly required. And, because of the fixed slope of the slot walls, minimum slot width can be much less than wafer thickness.

In the drawing, the light, medium, and dark surfaces represent three crystallographic planes in silicon. The solution etches perpendicular to each of these at different rates. The surface shown light, for example, etches away most rapidly. To cut out an area, a mask is applied onto the fastest—"light"—plane, with the mask edges parallel to the slowest—"dark"—planes of the crystal.

In one example of the new technique, hundreds of 1-mm-square circuits, each with 10 transistors, 14 diodes, and 12 resistors on nine air-isolated areas, were etched at once on a single wafer. Slots were about 17 microns wide with strong "beam leads" for structural and electrical connections. The slot in the photo is only 6 microns wide.

This technique is another step toward making ever better and smaller integrated circuits.

From the Research and Development Unit of the Bell System—
For example, 15 basic styles are available:

- WATTS: 0.25 to 100 W
- RESISTANCE: 10 to $10^4$ ohms
- TOLERANCE: ±1%
- STAND. SIZES: 563" L x 1" dia.
  to 19.687" L x 2" dia.

A variety of terminal configurations are available such as: radial lugs or bands, axial wire leads, and ferrule ends.

### SPECIALS

Only RPC has a special interest in solving those "special" problems. Resistors up to 40" long have been manufactured on request.

### APPLICATIONS

Typical applications include those requiring high resistances, voltage capability from 250 to 125,000 V and high frequency or pulse circuits including power supplies, generators, X-ray equipment, electro-static air cleaners, paint sprayers, photo-copiers and high voltage-dropping monitors.

RPC's carbon film resistors will often exceed the requirements of metal oxide types, and with the lowest rejection rate in the industry.

For more information, call RPC... and give your resistance problems a real kick.

What makes low-cost Dialight readouts so reliable and easy-to-read?

Reliable because of simple module construction and long life lamps. Designed for use with neon or incandescent lamps to meet circuit voltage requirements. Easy-to-read from any viewing angle. 1" high characters are formed by unique patented light-gathering cells, and may be read from distances of 30 feet. Sharp contrast makes for easy viewing under high ambient lighting conditions.

Dialight Readout Features
1. Operate at low power.
2. 6V AC-DC, 10V AC-DC, 14-16V AC-DC, 24-28V AC-DC, 150-160V DC or 110-125V AC.
3. Non-glare viewing windows in a choice of colors.
5. Available with universal BCD to 7 line translator driver.
6. Can be used with integrated circuit decoder devices now universally available.
7. Caption modules available; each can display 6 messages.

Send for catalog

Catalog-folder contains complete specifying and ordering data on numeric and caption modules, translator drivers, mounting accessories. Dialight Corporation, 60 Stewart Avenue, Brooklyn, New York 11237. Phone: (212) 497-7600.

COMPONENTS

Status indicators show 12 messages

Compact, back-lighted, 12-message displays permit their message areas to be illuminated individually, in combination, or simultaneously. Numbers, letters, words, symbols—anything that can be put on film—can be displayed, in any color. Overall size of series 280 status indicators is 2.4 by 1.9 by 2.6 in.

CIRCLE NO. 445

Amplifier valve is 2-in. square

A new miniature all-air fluidic amplifier valve, the Sensiflex SFA3 is a three-way normally closed device with an over-all size of 2.4 by 2.31 in. It will pass more than two cubic feet per minute of free air to the atmosphere at 100-psi inlet pressure. The minimum actuating pressure registers from 0.05 to 0.65 psig, depending on controlled pressure.

CIRCLE NO. 446
Binary switch module holds 64 messages

Providing a six-bit binary output, a new switch module can display 64 messages, with up to 500 messages available on special order. The window opening of model MM-2700 is 1/4 by 3/4-in. to expose up to 12 letters per message. Each module occupies only 3/4 by 1-3/8 in. of front-panel space and 3-7/8-in. back-of-panel depth.

CIRCLE NO. 447

Fluidic converters change Hz to psi

Two new fluidic circuits convert a frequency signal into a steady-state output pressure that is proportional to the value of the input frequency. Model 24MC12A operates at 50 to 400 Hz, while model 24MC12B covers 100 to 1000 Hz. These new frequency-to-analog circuits can be used as building blocks in modulated carrier systems.

Microwave capacitors are porcelain chips

American Technical Ceramics, 1 Norden Lane, Huntington Station, N.Y. Phone: (516) 271-9600. Availability: 1 to 3 wks.

Providing high Q and high stability on a 50-mil square, MiniCube porcelain capacitor chips are intended for use in microwave hybrid circuits, phased-array radar, and coupling, tuning, and microstrip applications. Series 100 units have a capacitance range of 0.1 to 100 pF, insertion loss of 0.03 dB and a power capacity of 15 W.

CIRCLE NO. 449

Cermet resistors look like dots

ASC Microelectronics, Shelter Rock Lane, Danbury, Conn. Phone: (203) 744-1900. P&A: 12¢; stock to 4 wks.

Dwarfed by a 6¢ postage stamp, two new types of cermet chip resistors for soldering (type RS) and wire bonding (type RW) assembly are claimed to be the smallest available in high-resistance values. The chips measure only 50 by 50 by 10 mils and cover resistances of 100 Ω to 15 MΩ. Power dissipation is 0.1 W at 85°C.

CIRCLE NO. 450

Feed-through chips go up to 1.5 μF

Varadyne, Inc., 1805 Colorado Ave., Santa Monica, Calif. Phone (213) 394-0271.

Offering high volumetric efficiency, a new line of feed-through monolithic ceramic capacitors cover the voltage range from 50 to 400 V dc and capacitance values from 0.01 to 1.5 μF. Other features include low inductance, good temperature and voltage stabilities, readily solderable inner and outer electrode terminations and uniform size. Multi-section units for special rf filters are available on special order.

CIRCLE NO. 451

Tantalum chips shape up 2 ways

Two new types of microminiature solid tantalum chip capacitors offer a choice of shapes. Type UTC units are unencapsulated flat rectangular chips, while type UHA devices are unencapsulated cylindrical chips. Capacitance values range from 0.01 to 220 μF; voltage ratings are between 1 and 50 V dc.

CIRCLE NO. 452
60 dB Stop band rejection

in a mil spec ceramic filter for less than $15.

Here's the smallest (less than 0.1 cu. in.), most rugged fixed-tuned filter of its kind on the market today!

Clevite's 11-disc miniature filter is packaged in a hermetically-sealed cylinder, exceeds all military environmental specifications, is ideal for transistorized i-f amplifier circuitry in AM and FM sets plus many other applications that call for a fixed-tuned filter. Stop band rejection: 60 dB. Center frequency tolerance: ±2 kHz to ±3 kHz. Stability: within ±0.2% for 5 years; within 0.2% from −40°C to +85°C. Impedance (in and out) 2000 ohms for B/W less than 12 kHz; 1000 ohms for broader bandwidths.

Following models standard at 455 kHz.

Pulse transformers have 0.625-in. dia

PCA Electronics, Inc., 16799 Schoenborn St., Sepulveda, Calif. Phone (213) 892-0761. P&A: 60¢; 4 to 6 wks.

Designed for use in military and commercial SCR applications, a new line of low-cost pulse transformers measure only 0.625 in. in diameter and 0.85 in. in length. The new units offer turns ratios from 1:1 to 4:1, minimum primary inductances from 100 to 2500 µH, and maximum leakage inductances from 5 to 1000 µH.

CIRCLE NO. 453

Numerical indicator indexes with buttons

Kessler Ellis Products Co., 120 First Ave., Atlantic Highlands, N.J. Phone: (201) 291-0500. Availability: stock.

A new digital switch with bi-directional pushbutton indexing is available with electrical readout in either decimal or one of several binary codes. Small pushbuttons above and below the number display permit indexing of the number wheel in either the forward or reverse direction. Numbers are 1/4-in. high.

CIRCLE NO. 454
Reed switch
uses mercury

The MRC-3 is a miniature mercury-wetted reed switch that combines the advantages of high-speed switching with the low contact resistance and high-power capacity of a mercury switch. Its power rating is 28 W, initial contact resistance is 50 mΩ maximum, and breakdown voltage is 1000 V. It is a single-pole normally open unit.

CIRCLE NO. 455

Air-variable capacitor
trims from 1 to 20 pF

JFD Electronics Co., Components Div., 15th Ave at 52nd St., Brooklyn, N.Y. Phone: (212) 331-1000. Availability: stock.

A new all-metal air-variable capacitor now covers capacitance values from 1 to 20 pF. Model MVM020 utilizes metal biasing elements to maintain smooth torque and minimize noise levels. It is available for panel mounting with turret terminals, lug terminals or threaded terminals, and for printed-circuit-board mounting.

Reed Relays that
deliver more of what you need most...

VERSATILITY • RELIABILITY • ECONOMY

Automatic Controls' Reed Relays — standard, miniature, or your special designs — offer individually supported reed switches, magnetic foil wrapped coils, non-magnetic terminals, and rhodium plated contacts, providing peak performance and reliability. Standardized contact configurations assure off-the-shelf delivery and maximum economy. For more of what you need most — specify Automatic Controls' Reed Relays everytime!

NEW from Automatic Controls...
Front-Connected Screw Terminal Socket.
Accommodates the Automatic Controls' "family" of general purpose plug-in relays and time delay relays.

Our visible solid state light sources are being delivered in commercial quantities. Very bright, typically 1000 ft/L @ 50 mA. Long life: our tests indicate over 1,000,000 hours. Happily compatible with your IC circuitry. Needs only 1 mW for 50 ft/L @ 6300-7000A. Instantly available in package shown or T0-18 header. Ask Kierulff, Schweber, K-Tronics, or Semiconductor Specialists for our data sheets on the MV-10 series.

Monsanto ESP, 10131 Bubb Road, Cupertino, California 95014. Phone: (408) 257-2140.

DATA PROCESSING

High-speed modem shows line status

American Data Systems, 20747 Dearborn St., Chatsworth, Calif.

On its front-panel display, a new high-speed data modem visually indicates relative line conditions, receiver and transmitter data and baud rates, and carrier detection and receiver phase lock. Model ADS-448 automatically equalizes itself within milliseconds after turn-on for completely trouble-free data transmission and reception. It transmits and receives data at 4800 bits per second.

CIRCLE NO. 457

Compact modem connects directly

Model DCM-151 is a new directly connected data modem that provides reliable serial data transmission up to 150 baud over private or leased voice-grade telephone lines up to a distance of five miles. Full-duplex operation with Tele-types is available on a four-wire connection and simplex operation with selectric terminals on a two-wire connection.

CIRCLE NO. 459

Data terminal needs no coupler

Data Access Systems, Inc., P. O. Box M418, Landings, N. J. Phone: (201) 398-2345. P&A: $1550; stock.

Transmitting and receiving 100 words per minute, a new data terminal functions without a data coupler because it has a direct connection to standard telephone lines via built-in communications components. Model DF33ASR-0 is suited to a wide range of applications such as time sharing, terminal-to-terminal communications and computer access.

CIRCLE NO. 458

Equalized data modem transmits 4800 baud

Ideal for multi-point polled applications, a new data set operates at 4800 bits per second over 2400-baud lines. Model PM-48 utilizes a differentially coherent modulation technique, transmitting information in the form of a phase change rather than a unique phase. The unit permits line equalization by means of a built-in variable equalizer.

we have a dozen reasons...

why you should use our MCJ-12 jack...

one for each circuit.

- The Multi-Circuit Jack MCJ-12 is a 12-circuit self-normalizing jack which eliminates costly circuit duplication.
- Any source may be connected to any load by use of patchcord.
- 16 jacks may be mounted in a standard 3½" x 19" panel.
- Cover is of ferrous metal for maximum isolation.
- Patch-cord is completely shielded.
- Connections are made easily to rear terminations with standard wire-wrap tool.
- Entire jack may be unplugged from its cover for maintenance without disturbing external wiring.
- Completely wired enclosures are available to customer specifications.

TC/VCXOs ARE A BETTER WAY TO COMMUNICATE

Center Frequency: 7.5 MHz
Deviation: ±5 KHz
Distortion: less than 5%
Modulation Rate: DC to 10 KHz
Frequency Stability: ±1 PPM
Temp. Range: −40°C to +70°C

Put Arvin's new wide deviation TC/VCXO in your circuits and you'll have better communications equipment—lighter weight, smaller size, more precise frequency control, greater reliability.

The new oscillator permits direct frequency modulation with exceptionally low distortion and a high degree of frequency stability. It'll make your design jobs easier. Write for complete specifications, or phone (317) 463-2589.

Your best choice in enclosures

- oil and dust tight
- EMI/RFI shielded
- rigid one-piece construction
- available from stock

Consoles in versatile stock design, 50" x 24" x 23", with gasketed front and rear doors. Options include rack angles, swing-out and stationary subpanels and writing desk.

Consoles are offered in eleven stock sizes for desktop mounting of remote controls. Floorstand optional.

All units are heavy gauge steel with all-welded seams, easily shielded.

FREE STANDING ENCLOSURES

NEMA 12 units in stock sizes up to 90" x 36" x 24". Rigid 12 gauge steel with all-welded seams, gasketed doors front and/or rear. Oil and dust tight. Options include several interior panel arrangements, rack angles and shielding.

EMI/RFI SHIELDED

Heavy gauge steel boxes with hinged doors, all cadmium plated. Oil and dust tight, fully shielded. Interior mounting panels and terminal block kits optional. Shipment from stock, all sizes.

NEMA 1 ENCLOSURES

For mounting controls where oil, dust and water are not a problem. One-piece heavy gauge steel construction, finished in gray prime. Flush hatches, interior panels for mounting components. Wide size range in stock.

DATA PROCESSING

Modular disc memories handle up to 72 channels

Data Disc Inc., 1275 California Ave., Palo Alto, Calif. Phone: (415) 326-7602.

Incorporating a modular building-block system approach, series 5200 parallel disc memories provide up to 72 independent read/write channels. All of the eighteen models in the new series have a low-cost hysteresis-synchronous motor drive. Two servo drive options are available, a single-loop servo control or a double-loop servo control.

Booth No. 5510 Circle No. 390

IC core memory cycles in 1.75 μs

Standard Logic Inc., 1630 S. Lyons St., Santa Ana, Calif. Phone: (714) 835-5466.

File Store memory system is a four-wire, coincident-current, IC magnetic core unit that features a 1.75-μs full-cycle time, multiplicity of address options, DTL/TTL interface, and full- and half-cycle operation. It is designed for high-speed random/sequential access applications and can operate as a stand-alone or functional memory module.

Circle No. 464

Linking multiplexer handles 18 terminals

A new time-division linking multiplexer is capable of accepting data from 18 simultaneously active data terminals at multiple locations, and channeling it for transmission over one 2400-baud data circuit. Model TDML is designed to work with single-speed terminals (110 baud), and is compatible with Teletype models 33 and 35. It can be adapted to serve data speeds other than 110 baud.

Circle No. 465

High-level multiplexers digitize 256 channels

Scientific Data Systems a Xerox Co., 701 S. Aviation Blvd, El Segundo, Calif. Phone: (213) 772-4511. P&A: $4300 or $7350; 30 to 60 days.

Two new high-level solid-state 256-channel multiplexing/digitizing systems will accommodate input signal ranges of ±10 or ±100 V with optional automatic gain changing. Model CD51 makes 15-bit analog-to-digital conversions in 15 μs; model CD41 needs only 30 μs for a complete acquisition/conversion cycle.

2-piece traps are out!

Zenith uses Dale hybrid Series-Resonant Trap in FM circuitry

Zenith wanted a better way to bypass 10.7 MHz in its FM receivers. To replace the standard 2-component inductor-capacitor trap, Dale provided this unique hybrid.

Dale’s Series-Resonant Trap has the electrical characteristics of an inductor and a capacitor in series and provides a method of controlling both functions. The result: Controlled self-resonance in a miniaturized circuit.

After four years of production use, Zenith says of the Series-Resonant Trap: “It saves space, saves time, works satisfactorily.” Here are the basic specs:

- Resonant Frequency: 10.7 MHz ± .5 MHz (Other frequencies available)
- Impedance at Design Frequency: 15Ω or less
- Impedance at ±50% of Design Frequency: 15000Ω min.

Space and money-saving components like this are a growing part of Dale’s Sioux Division. Write for more information or call Dale at 605-265-9301.

INSTRUMENTATION

Dual-trace oscilloscope senses 200 μV at 5 MHz

Philips Electronic Instruments, 750 S. Fulton Ave., Mount Vernon, N.Y. Phone: (914) 664-4500. Price: $2175.

A new dual-trace vhf oscilloscope accurately displays signals between dc and 5 MHz to 200 μV/cm plus signals between dc and 50 MHz accurate to 2 mV/cm. Model PM 3250 can examine pulse leading edges with minimum signal distortion. In addition, an intensity control circuit allows adjustment of beam intensity without defocusing the CRT.

CIRCLE NO. 467

Pushbutton DPMs measure V or I

Time Systems Corp., 265 Whisman Rd., Mountain View, Calif. Phone: (415) 981-9321. P&A: $279 or $295; stock to 30 days.

Two new multi-range digital panel meters feature pushbutton selection of range setting. Model 703 provides four full-scale voltage ranges of 1.999, 19.99, 199.9 and 1000 V. Model 704 provides six full-scale current ranges from 1.999 μA to 199.9 mA, in decades. Polarity and decimal point indication are automatic.

CIRCLE NO. 468

Programmable supply swings 200 V in 200 μs

Model 6131B digitally programmable power supply can swing its output voltage from -100 to +100 V, or vice versa, in less than 200 μs while supplying any current between 0 and 0.5 A. The new unit can also function as a high-power digital-to-analog converter or as a digitally controlled waveform synthesizer because of its high speed.

CIRCLE NO. 469

Transmission test set offers versatility

International Data Sciences, Inc., 100 Nashua St., Providence, R. I. Phone: (401) 274-5100.

Range Rider is a new pseudo-noise transmission test set that greatly simplifies a variety of tests on any synchronous digital data transmission system. Model 1000, which contains both transmitter and receiver, has a self-test capability and operates with simplex, half-duplex or full-duplex systems. Its capabilities include testing and evaluating modems, dynamically testing digital multiplexing systems, and testing and evaluating error control systems.

CIRCLE NO. 470
Somebody beat you to it.

It was intended for you. But if the 24-page Kearfott brochure we had bound into this magazine is missing, somebody took off with it.

No wonder. The 24 pages are filled with vital statistics and valuable information on Kearfott's products. On servo motors, tach generators, stepper motors and other DC rotary components.

But you can still get it if it's gone. Either circle the number shown on this page on the reader service card, or write us directly requesting it. Singer-General Precision, Inc., Kearfott Division, 1150 McBride Avenue, Little Falls, N.J. 07424.

That'll show 'em.

Two new constant-current power sources provide an output current that changes less than 25 ppm (±5 ppm of range setting) with a load change that swings the output voltage from zero to maximum. Maximum output for model 6177B is 500 mA, with voltage limiting continuously adjustable between 0 and 50 V. Model 6181B has a maximum output of 250 mA with limiting from 0 to 100 V.

CIRCLE NO. 481

Wideband oscillator distorts only 0.25%

Data Royal Corp., 8014 Armour St., San Diego, Calif. Phone: (714) 279-5020. P&A: $795; 30 to 45 days.

Over the frequency range of 10 Hz to 10 MHz, a new test oscillator holds output amplitude flat to within ±0.25%. Model F324A provides simultaneous low-distortion square and sine waves. Its 90-dB step attenuator, in 10-dB steps, and its 3.16-V rms full-scale meter give precise amplitude control for a variety of laboratory test applications.

CIRCLE NO. 482
Low cost, component-test system

Choice of tape or computer control

The Birtcher Corporation Model 8000 Component Test System automatically tests multiple lead components and circuits from simple IC's to over 200 lead logic cards, MSI, LSI units. Modular design allows flexible test applications providing a system that is never obsolete.

Tape control features basic go/no go production wafer probing plus incoming and final inspection testing capabilities.

Computer control is ideal for process control, sorting and high reliability testing. Displayed at Wescon Booths 3104, 3105, 3224 and 3225.

INSTRUMENTATION

**Noise generator is flat to 12.5 MHz**

Supplying true Gaussian amplitude distribution and constant spectral density with frequency, model 421 random noise generator meets the need for an accurately calibrated source that is flat from 10 kHz to 12.5 MHz. The output of this all-solid-state instrument is continuously metered with a variable attenuator and a step attenuator.

**Switching matrix simplifies testing**

Primarily designed to replace patching modules in communications terminals, a new multi-line switch matrix rapidly switches a large number of wired circuits, making possible instant spare replacement during emergencies, simplified on-line monitoring, and back-to-back testing. Model 7255 consists of two independent 30-switch matrices, one for send lines and the other for receive lines.

**Digital counter varies time base**

Attec, Inc., P.O. Box 19426, Houston, Tex. Phone: (713) 468-7971. P&A: $940; 30 days.

Designed to measure rate data, a new variable-time-base electronic counter displays the measurement in engineering units rather than in events per second. Employing front-panel digital switches, model 2300 allows the operator to select any time base from 10 µs to 1 s in 10-µs increments, 100 µs to 10 s in 100-µs increments, and 1 ms to 100 s in 1-ms increments.

**Digital multimeter quadruples functions**

EG & G Laboratory Products Div., 150 Aero Camino Way, Goleta, Calif. Phone: (805) 967-0456.

Using a differential MOSFET input, a new digital multimeter can function as an electrometer-voltmeter, a coulombmeter, an ammeter or an ohmmeter. Model 736A features a 200% overrange capability (2.999 maximum display) for all functions. Range information for each function is clearly identified for ease of operation; function grouping virtually eliminates any confusion or misinterpretation of readings.

Spooled fiber optics trim to exact length

Individual fiber-optic strands are now available in any length for custom building of light guides, either square or odd sized. They come in two sizes, diameters of 10 or 20 mils, and are conveniently wound on spools for easy cutting and measuring. They are capable of transmitting wavelengths from 400 to 1100 millimicrons. CIRCLE NO. 492

DIP IC retainer sinks heat too

A new heat dissipator/retainer is now available for dual-in-line integrated circuit packages with up to 14 leads. The new part consists of a conduction base and a retainer clip that can be used to cool DIPs when sockets are used in the assembly or when the ICs are soldered directly to a board. The conduction base fits between the circuit board and the bottom of the DIP case. CIRCLE NO. 493

Wire chassis helps cooling

E. H. Titchener and Co., 1 Titchener Place, Binghampton, N.Y. Phone: (607) 772-1161.

Replacing conventional stamped and welded aluminum panels, a new skeletonized wire chassis provides maximum air flow for cooling components, as well as easy insertion and removal of circuit cards. Built-in wire guides channel circuit cards into perfect alignment with their connectors. The new chassis holds a row of circuit cards in both its right and left sections, while other components are mounted in the center. CIRCLE NO. 494

All-purpose epoxy room-cures in 60 s

Tescom Corp., Instrument Div., 2633 S. E. 4th St., Minneapolis, Minn. Phone: (612) 331-1311.

Called Minit-Cure, a new multipurpose epoxy has a complete curing time of less than 60 seconds at room temperature (75°F). It can be used to bond metals, woods, plastics, rubber and glass. Applied with a brush, the new epoxy provides a tensile strength of 2900 pounds per square inch. CIRCLE NO. 495
Indicating fuse blocks aid troubleshooting

Thomass & Betts Co., 36 Butler St.,
Elizabeth N.J. Phone: (201) 355-4321.

Able to pinpoint blown-out fuses
in a hurry, a new line of fuse
blocks illuminates an indicator on
a master control panel to tel1 the
operator exactly where the trouble
is located. The blocks use indicator
fuses and have a bus that is contac-
ted by a fuse plunger, automatic-
ically completing a circuit to
the indicator lamp. As many as 20
circuits can be installed in a
12-1/2-in. length.

CIRCLE NO. 496

Electronic aerosols form complete line

Emerson & Cuming, Inc., Dielectric
Materials Div., 59 Walpole St.,
Canton, Mass. Phone: (617) 828-
3300. P&A: $2 to $10; stock.

Eccospray aerosol spray products
for electronics include: a silver
lacquer for rf shielding and mak-
ing electrical connections; a mold
release for use when making plastic
encapsulations; a moisture and
fungus resistant varnish for com-
ponents and circuit boards; an
acrylic lacquer for transparent sur-
face coating protection; and a flu-
orocarbon release, anti-stick, and
low-friction agent.

CIRCLE NO. 497

Until our new Unipulser II came along.

single decade counters were pretty
much alike.

Compare it with any competitor on these eight points:

1. Size. Unipulser II is more compact than any comparable electric counting
decade.

2. Durability. Mechanical and electrical transfer lives are longer than those
of comparable decades. That's because Neyoro g wiper contacts provide the
highest quality electrical contacts available.

3. Power. Three voltages are standard, not just one. 12, 24 and 48 VDC.

4. Readability. Large figures, wide-angle viewing.

5. Unitized metal diecast frame. This makes Unipulser II self-supporting
from the front and simplifies installation. Push button preset model has the
same frame dimensions.

6. Input. Counts from transistorized circuits, photocell impulses or standard
contact closures. Speeds up to 40 cps; count is retained even if power fails.

7. Modular. Each Unipulser II has its own drive input circuit, transfer and
reset circuit and an eleven-line output for control or electrical readout. This
lets you combine Unipulser II's in series for sequential counting or parallel
entry. Control circuitry also lets you use them as recycling or single cycle
predetermined counters—or as counters with remote display. Or even as
readout devices for other counters or recording units.

8. Price. Here's the best part. Our prices begin at $18 and go down just as
fast as anyone else's on quantity buys. Push button preset model begins at
$19. All in all, you won't find another decade that does so much for so little.

For full information and specifications, write for Unipulser II catalog. 622 N.
Cass Street, Milwaukee, Wisconsin, 53202.

The modular Unipulser II has hundreds of uses, from metering to
data processing to all types of production control.
Burns & Towne pre-packaged rectifier circuits represent a significant cost savings over individual components used in multi-rectifier units. Yet, you are always assured of quality and reliability. The low cost BFW family of single phase full wave bridges . . . features high current capability of up to 2.0 amps.

Test connector speeds wiring

A new flexible terminal block can be mounted on rough, uneven, or curved surfaces. This plastic unit completely encloses solderless-type screw connectors, leaving no metal parts exposed. It comes in strips of 12 poles and can be cut with a razor blade to the number of poles required. Three sizes cover wire ranges from AWG #26 to #4.

Testron, Inc., P.O. Box 48237, Chicago, Ill. Phone: (312) 775-2477. P&A: 79¢ to 90¢; 30 days.

Intended to speed testing, inspection, and breadboarding, Zip-Clip test connector saves time when running leads from a circuit under test to associated test instruments, or when making other quick temporary connections. The new device has a unique holding mechanism that permits fast effortless one-hand insertion of wires for a firm low-resistance contact.

NEW VACTEC
"PLASTIC" PHOTOCELLS

VT 700E  VT 700  VT 800  VT 100

Actual size, priced as low as .25 each (±33% tolerance) in 100,000 quantities.

Low Cost Way to Meet Most Photocell Requirements

Are you spending up to a dollar for photocells when Vactec can satisfy your needs for far less? Here's a complete line made the same, and with the same quality characteristics and precise tolerances as their metal cased counterparts. Yet they cost about half as much, because instead of sealing, they are protected by a thin transparent plastic coating. Vactec “plastic” cells are conveniently controlled by ambient light, or from closely coupled low voltage lamps for remote control. Special processing provides resistance to humidity, making these devices suitable for indoor industrial and commercial applications like controlling relays in line voltage circuits; switching SCR’s on or off; phase control in proportional circuits; or as feedback elements for motor speed controls in consumer appliances.

MICROWAVES & LASERS

Hybrid preamplifier holds noise down

Fairchild Semiconductor Microwave and Optoelectronics Div., 313 Fairchild Drive, Mountain View, Calif. Phone: (415) 962-3563. P&A: $350; 30 days.

Operating over the frequency range of 100 to 500 MHz, a new microwave i-f preamplifier yields a noise figure of less than 2.5 dB at 100 MHz and less than 4 dB at 500 MHz. It operates with a dc input of +12 V, a current drain of 55 mA, and a power output of +5 dBm at 1-dB compression.

CIRCLE NO. 605

Fast-pulse rf source delivers up to 150 W

Sockin out 150 W of power, a new lightweight solid-state crystal-controlled pulsed rf source features a fast falltime pulse of 50 ns or less. Model S-1001 can operate from its own internal pulse generating circuits or may be triggered from an external source. Over the frequency range of 100 to 500 MHz, its frequency stability is ±0.005%.

CIRCLE NO. 607

S-band varactors tune over octaves

Featuring octave tuning capability through S band, a new line of microwave varactors offer capacitances ranging from 1.2 to 22 pF with tuning ranges from 0.3 to 0.6 GHz and 2 to 4 GHz. Series GC-1700 devices have standard capacitance tolerances of ±10% and an operating temperature range from -60 to +125°C. Their maximum capacitance-temperature coefficient is 300 ppm/°C at -4 V.

CIRCLE NO. 606

Variable attenuators span 2 to 12.4 GHz

Microlab/FXR, 10 Microlab Rd., Livingston, N.J. Phone: (201) 992-7700. P&A: from $165; stock to 6 wks.

Three new continuously variable attenuators cover the frequency range from 2 to 12.4 GHz. Types AJ-500F and AJ-400N are knob or screwdriver-driven, while type AJ-410N has a calibrated dial. Average power is 5 W for the AJ-400N and AJ-410N, and 2 W for the AJ-500F; attenuation is 40 or 30 dB minimum, respectively.

Fast p-i-n diode switches in 10 ns

Varian Associates Solid State Microwave, Salem Rd., Beverly, Mass. Phone: (617) 922-6000.

The VSD-211 planar p-i-n switching diode offers typical switching speeds of 10 ns and will operate over a wide dynamic range of rf series resistances from 1.4 Ω to 15 kΩ. Suitable for applications requiring rf power control and fast switching speeds, the new device will perform efficiently over a frequency range from 1 to 18 GHz, depending upon rf power and package parasitics.

CIRCLE NO. 609

Power transistors gain 7 dB at 2 GHz

Microwave Semiconductor Corp., 100 School House Rd., Somerset, N. J. Phone: (201) 469-3311.

Two new L- and S-band power transistors, types 2003 and 2005, are capable of delivering power outputs of 5 or 6 W at 2 GHz with 7-dB power gain. At 1 GHz, type 2003 provides 3 W and 10-dB gain, while type 2005 supplies 10 W and 10-dB gain. The new transistors are housed in a stripline package that has extremely low input Q.

CIRCLE NO. 610

MEASURES MILLIAMPERES TO PICOAMPERES AND NARROWS THE GAP BETWEEN PRICE AND PERFORMANCE

See the first digital picoammeter above? It's our new $1495 autoranging Model 445. It simplifies measurements from 10⁻² ampere f.s. to 10⁻¹⁰ ampere and provides both analog and BCD outputs. The second is the Model 440, new too. At $995, it features 10⁻² to 10⁻⁹ ampere f.s. current ranges, has an analog output and an option for BCD.

Both picoammeters are packed with convenience features designed to minimize operator error and maximize performance. Stable to 0.5% of full scale per week, they make low level measurements accurate to 0.2% almost routine. And provide variable display rate to 24 readings per second. But isn't that what you'd expect from a firm with years of analog picoammeter design experience? And an industry-wide reputation for quality? Like Keithley.

See if you don't agree we have the best digital approach to picoampere level measurements. Call your Keithley Sales Engineer for demonstration and details. Or contact Keithley Instruments, Inc., 28775 Aurora Rd., Cleveland, Ohio 44139. In Europe: 14 Ave. Villardin, 1009 Pully, Suisse. Prices slightly higher outside the U. S. A. and Canada.

MICROWAVES & LASERS

Microstrip transition eliminates matching

Ending the need to match or modify circuits, a new microstrip-to-coax transition implements true integration and miniaturization. Model 10-2040 chip launcher permits direct transition from microstrip circuitry into the remainder of the system. Typical VSWR through X-band is 1.2 maximum and dielectric constants range from 9 to 10. The new unit contacts the circuit without soldering.

CIRCLE NO. 611

Variable attenuator goes out to 20 GHz

A miniature calibrated variable attenuator features a flat frequency response from 12.4 to 18 GHz, and can be used from 2 to 20 GHz as a variable level set attenuator. Model 4797 has an attenuation range of 0 to 45 dB and an accuracy of ±1.5 dB. Maximum insertion loss is 1 dB and VSWR is 1.3.

CIRCLE NO. 612

Economy gas laser offers 1-mW output

Metrologic Instruments, Inc., 143 Harding Ave., Bellmawr, N.J. Phone: (609) 933-0100. P&A: $149.50; stock to 2 wks.

Supplied as a complete system ready to plug in and turn on, a new low-cost helium-neon gas laser operates at the visible red wavelength of 632.8 nm and puts out 1 mW minimum with a beam divergence of less than 0.8 milliradian. Model 410 houses its laser tube and solid-state power supply in a rugged aluminum extrusion.

CIRCLE NO. 613

S-band source delivers 0.5 W

Frequency Sources Inc., P.O. Box 159, N. Chelmsford, Mass. Phone: (617) 251-4921.

A new high-power crystal-controlled frequency source develops 0.5 W at 3 GHz with low a-m and fm noise characteristics for communication applications. Model FS-220 is completely solid state and requires only a +28-V dc supply. It uses a 95-MHz crystal oscillator as the base frequency, followed by an amplifier/multiplier chain.

ELECTRONIC DESIGN 17, August 16, 1969
High-gain amplifiers hold noise to 6 dB

Varian Associates, LEL Div., Akron St., Copiague, N.Y. Phone: (516) 284-2200.

Supplying an output power of +5 dBm minimum at 1-dB compression, series OXT-1 solid-state octave rf amplifiers hold noise figures to 6 dB maximum. The new devices operate over the frequency range of 1 to 2 GHz with a 1-dB bandwidth. Their gain is 60 dB, while ripple is only ±1 dB. Both input and output impedances are 50 Ω, and maximum VSWR is 2:1.

CIRCLE NO. 615

Cw local oscillator supplies 10 mW at 9 GHz

General Electric Co., Tube Dept., 316 E. 9th, Owensboro, Ky. Phone: (502) 683-2401.

Using a small planar X-band ceramic triode, a new cw local-oscillator microwave circuit module typically delivers 10 mW of power output from 9.1 to 9.6 GHz. According to the company, pulsed versions of model C-3007A have been designed to give power outputs of 10 to 100 W at duty factors near 0.001 and pulse durations of 1 μs.

CIRCLE NO. 616

Meet the Members of The Board...

...Dual In-Line Conference

For the successful management of analog circuit design, the designer's board members must have background characteristics based upon dynamic response specifications and a proven performance with known sources and loads. The designer's board members must also have the ability to "fit in" with the others whether they be dual in-lines, discrete or flat-pack components. Our packaging configuration allows the designer this freedom.

The guaranteed performance of REDCOR's closed loop module concept frees the system designer from the concern, risk and expense normally experienced with other analog modules.

To support those special circuit and system design requirements, REDCOR can supply not only the modules, but the boards, chassis, and power supplies.

Analog-to-Digital Converters  BUF-FET Ultra Fast Settling Amplifiers
Digital-to-Analog Converters  Dynamic Bridge Amplifiers
Multiplexers  REDIREF Voltage Reference Supplies
Sample and Hold Amplifiers  Comparators
TRICON Fast Settling Amplifiers

REDCOR's board members come prepared to meet any situation. For a complete catalog listing specified performance, write or call:

Laser tooling system
offers repeatability

Electro Optics Associates Inc., 974
Commercial St., Palo Alto, Calif.
Phone: (415) 327-6200. P&A: from
$5445; 30 to 60 days.

Featuring precise measurement
repeatability, a new laser tooling
system with autoreflection can re­
peat angular measurements of 0.2
arc-seconds or linear measure­
ments of 10 microns per foot.
Called LTSAR, the new system
can also be used also for the deter­
mination and monitoring of small
angles and angular deformations.

CIRCLE NO. 621

Generation
Gap

The Wang 700 Calculator
is a whole lot smarter
than its predecessors.

It's the first of a new breed, a third generation programmable
calculator. The difference is more revolutionary than evolution­
ary. It's ten times faster and more powerful than the best of the
2nd generation machines. It handles far longer programs (learns
on a built-in 8192-bit core and stores permanently up to 10
blocks of 960 steps each on snap-in magnetic tape cassettes), has
many more data storage registers (up to 120), and provides more
hardware operations (like logs to base e and base 10, \(\pi, e^x, 10^x\),
etc.), than any existing calculator or so-called desk-top computer.

Execution speeds for various functions range from 300 \(\mu\)sec for
+ and - to 250 msec for trig functions. A dual Nixie-type
display produces 12 digit answers plus 2-digit ( -98 to +99)
exponents each register.

The Wang 700 has commands for loops, branches and subrou­
tines, unmatched power for matrix and array operations. Exclu­
sive integrated circuit design concentrates all these capabilities
into a self-contained, convenient desk-top package. It's the logical
heir to Wang leadership in high performance problem-solving.

INFORMATION RETRIEVAL NUMBER 216
The exclusive Torngren Mecatorn® hydraulically controlled spinning process has produced thousands of spin-to-specification "dishes" in use today by both military and commercial communication networks — at substantial savings over other more costly fabricating methods.

If you have a requirement for parabolic reflectors from 4 inches to 16 feet in diameter call Torngren today for complete details on the cost saving and metallurgical advantages of the Mecatorn® process.

Send for a free copy of our new capabilities brochure today!

Evaluation Samples

Dafting aids
Eliminating much of the material waste and increasing the regularity of master artwork for printed circuits, a line of electronic component drafting aids now includes sequential reference numbers from 1 through 200, plus 12 letters. The new numbers and letters are available in five sizes for 1X, 2X, 4X, and 5X scales. They are precisely printed on matte acetate film with pressure-sensitive backing. These die-cut products are ready for instant use. Free samples are available. Bishop Graphics, Inc.

CIRCLE NO. 622

Tabbed PC board
Bridging the gap between interconnect wiring of conventional components and contemporary solid-state printed circuit boards, a new PC terminal board features standard fast-connect terminal tabs. The tabs, which are available from existing tooling, include 0.11, 0.187, 0.205 and 0.25 in. and enable designers to use existing equipment to produce wiring cables. The new terminal boards adapt directly to all standard fast- connect connectors, thus lowering interconnect wiring costs. Wiring layouts are custom-made to suit individual needs. Free samples are available. Doran Manufacturing Co.

CIRCLE NO. 623

Wire markers
Clip-Sleeve wire markers are now mounted on a new applicator wand for direct wand-to-wire application. The markers move off the flared end of the wand with a simple finger motion, flex open, and snap firmly onto the wire without slipping or sliding. This means that the markers can be fixed in place any time, before, during or after hook-up, without disturbing the connection; they can also be easily removed to change identification. Free evaluation samples are offered. W. H. Brady Co.

CIRCLE NO. 624

Universal connector
A new international connector, model 1991-15 is designed to meet European and Japanese, as well as United States, specifications. This 15-circuit nylon connector features integrally molded mounting ears that enable it to be snap-locked into a panel without hardware. Maximum terminal protection is provided by a honeycomb design that essentially isolates each male terminal; the plug and receptable are also keyed to prevent mis-mating. Crimp-type male and female terminals may be inserted in either plug or receptacle. For a free sample, use the information retrieval card. Molex Products Co.

CIRCLE NO. 625
When the chips are down, they ought to be on our IC packages.

It's not just because we want to sell our products (which we do).
Or because we're proud of them (which we are).
We think you should buy our IC packages for a number of reasons.
First of all, we make all our own parts. (Many of our competitors must buy frames and ceramics for assembly.)
We assemble the packages ourselves.
We test our packages for insulation, thermal shock resistance, hermeticity, lack of internal shorts, excess glass-ceramic flow.
And if one of our growing line of packages doesn’t fit your requirements, we’ll design one that will.
One more thing. Just because you’re getting the best IC package money can buy, don’t think it takes a lot of money. In fact, ours probably costs less than any others.
Isn’t that where you should put your chips?

Sylvania Metals & Chemicals, Parts Division,
Warr. en, Pennsylvania 16365.
Adhesives chart

A chart from which Eccobond adhesives may be selected is now available at no charge. Many of these adhesives are presented in such a manner as to allow comparison of various data—for example, sheer strength, viscosity, and thermal expansion coefficient. There are also many other specifications included in this colorful presentation. Emerson & Cuming, Inc.

CIRCLE NO. 626

Electronic slide rule

Specially developed for resolving problems in the electronic and electrical fields, a new easy-to-read slide rule comprises 18 scales with clear gradations that permit calculations with a relative error as low as 1 to 2% and a saving in time of up to 60%. Decimal-point setting by evaluation is unnecessary since the scales allow a direct reading. Applications include Ohm's law, output power law, apparent and effective reactive power, amplification and attenuation, dBm level, parallel connections of resistance or inductance, and series connections of conductors or capacitance. It costs $27.75; a leather case, full instructions and graphic illustrations are included free. Caltronic Lab.

CIRCLE NO. 627

Core calculator

A durable powder core and ferrite pot core calculator quickly solves equations relating flux to voltage, current to magnetizing force, wire to space factor, inductance to turns, capacitance to frequency, and inductance to frequency and dc resistance. Intended to help inductor, choke and filter designers, the new slide rule easily selects the core that best meets physical requirements and gives the highest valuable Q. An instruction book is included. The calculator is supplied free to qualified engineers. Magnetics Inc., Components Div.

CIRCLE NO. 628

Log graph paper

Ideal for probability plots, extended-range logarithmic graph paper is designed to handle data where the range of the variable observed covers many orders of magnitude. Type SA-8 graph paper eliminates the old-fashioned and time-consuming chore of trimming, matching and taping together several pieces of graph paper with limited ranges. The extended range also permits plotting of several sets of data on the same sheet for comparison and/or multiple displays. There are up to 10 log cycles on a single sheet. Free samples are available. INFO Inc.

1, 3 and 5 watt units in voltages ranging from 6.8 to 200 volts.

microglass rectifiers
1, 3 and 4 amp units with recovery times as low as 80 nanoseconds.
They're priced below comparable microglass devices. Ask us about them!

we're getting very large in very small components built for macro performance at micro prices

Zeners, temperature-compensated devices, tunneling diodes, rectifiers, scr's, silicon semiconductor chips and photovoltaic products
Fiber optics are a Remex exclusive. That’s why a Remex reads with the greatest perception. The greatest sensitivity. The greatest reliability.

The reading light source is a quartz iodine lamp that has a 15,000-hour life (another Remex exclusive). A fiber optic distributor converts the uniform spot beam from a round to rectangular shape. Prevents signal confusion by improper diffusion. Super-sensing of data is the job of a combination fiber optic faceplate and rejection tunnel scheme. Enabling a Remex to successfully read program tapes up to 70% transparent. Or tapes that vary in color.

If you’re designing computers, numerically controlled systems, or automatic test equipment, call us at 213-772-5321 or write for free literature: Remex Electronics, 5250 W. El Segundo Blvd., Hawthorne, California 90250. Remex will give program tapes some extra sensory perception.

See us at the WESCON Show Booths 5503-5504.

The Vega C-Band Transponder Model 345C features a single-knob tuning control which simultaneously tunes both receiver and transmitter from the front panel. This eliminates the need for support equipment for tuning to the tracking radar frequency. Even untrained personnel can tune to radar frequency in 5 minutes in the field or aboard ship. The 345C is extremely useful in airborne applications where the exact tracking frequency is not specified prior to the operation. This unit is compact (56 cu. in.), lightweight (43 oz.) and maintains the electrical and environmental characteristics required of superheterodyne transponders in missile, satellite, drone and target applications.

VEGA
Op amp log circuits

Combining theoretical analysis and practical circuit design information, a 12-page technical article summarizes the concept of logarithmic elements for use in operational amplifier external feedback circuitry. The booklet reviews basic transistor characteristics, the error problems caused by transistor sensitivity to junction temperature variation, guidelines for amplifier selection, and a practical discussion of six representative op amp circuits. Analog Devices, Inc.

High-alumina ceramics

The new 16-page edition of “Standards of the Alumina Ceramic Manufacturers Association for High-Alumina Ceramics” provides information for variety of dielectric, mechanical, chemical, and abrasion-resistant applications. Data and tables are included on high-alumina ceramic properties, test methods, manufacturing procedures, design fundamentals, dimensional tolerances, surface finish, visual requirements, quality assurance, nuclear radiation resistance, metallizing, and recommended uses. Diamonite Products Manufacturing Co., Div. of U. S. Ceramic Tile Co.

Thin-film hybrids

“The Structure of Thin Film Hybrids” is a 12-page brochure that contains a technical review of thin-film hybrids, the seven steps of manufacture, the comparative merits of thin-film and thick-film configurations, and the specifications required for ordering form a manufacturer. In addition to this basic information, the text includes a table for the conversion of thin-film dimensional units which are often used interchangeably to describe thickness. Sensor Technology Inc.

Inductor facts

Equivalent circuits for inductance and capacitance, an explanation of distributed capacitance, and the meaning of inductor specifications are discussed in a 16-page engineering handbook. Specifications are given for communications-grade variable inductors that mount on printed circuit boards and have a recommended frequency range of 500 Hz to 50 kHz. Performance curves depict typical Q versus frequency, typical tuning range, inductance versus temperature, and typical self-resonant frequency versus time inductance. Sangamo Electric Co.

Laser applications

Several new and effective techniques for applying CO₂ lasers to difficult material cutting problems are summarized in a six-page illustrated report. Sheets of hard-to-work metals, microelectronic ceramic substrates, synthetic textiles, superstrength composites as well as many types of plastic, glass, rubber and wood can be separated with ease compared to conventional methods. Coherent Radiation Laboratories.

Motor control

Shunt-motor control and load-matching methods are simplified in the most recent issue of “Motorgram” (Vol. 49, No. 3). Seven equations and how to apply them are given for motor operation in terms of field and armature current variables. The control used determines the speed-torque characteristics and motor responses that will result. A properly controlled shunt motor incorporated into a radioisotope scanner is featured in a related article. Bodine Electric Co.
What does our muffin fan have that other 4 11/16" square fans do not?

Reliability

Performance in excess of 90,000 hours can be expected from 90% of all "muffin fans" manufactured. That's reliability unmatched by any other 4 11/16" square fan. So... where life really counts, and where 100 cfm of cooling air is required you can rely on "muffin fans" to perform longer than others, in computer equipment, copying machines, receivers and transmitters, power supplies, and countless other applications.

For full details on performance, application, life and other pertinent data be sure to send for our latest catalog sheet. Write to Rotron, Incorporated, Woodstock, New York 12498.

Visit ROTRON at WESCON Show Booth No's 3901-02-03.
Temperature paints

Covering the line of 34 DetectoTemp temperature-indicating paints and pigments, a six-page brochure presents applications, techniques and conditions for use, advantages, specifications, and availability charts for ordering and pricing. Generally used for preplanned monitoring and recording of temperature changes on large surfaces, DetectoTemp paints cover temperature ranges from 104 to 2462° F. Each color change is distinctive and readily visible even from a distance.

Instrument rentals

A new 20-page two-color publication listing electronic instruments available for lease or rental, presents evaluations of the instruments offered, in terms of their range, function, accuracy, balanced against their cost and most useful applications. Thus, many instruments are singled out as “best deals” by a system of single and double check marks. Included are digital voltmeters, multimeters, counter/timers, oscilloscopes, recorders, pulse/signal/function generators, microwave instrumentation, analog meters, bridges, and power supplies. Scientific Leasing Services, Inc.

Visual aid guide

Offering practical data for the selection of the correct visual aid, a new publication incorporates a dozen useful charts and tables. These range from one that shows audience capacity in terms of size of screen, seating area, and number of persons, to one that tells the playing time of tape, based on reel size, length of tape, and speed. Other tables show the size of letter needed for various audiences, relative color contrasts, and size of screen required. Admaster.

Light sources

Covering a line of high-intensity light sources, electronic accessories and related products, a new 12-page two-color publication offers general and technical information on mercury and xenon short-arc lamps, flash lamps, mercury capillary lamps, power supplies, pulse generators and lamp housings. PEK Inc.

Computer terminal

A new reference manual provides complete specifications for the AGT/5 computer graphics terminal. The AGT/5 contains its own digital processor that has a 30-bit 2-µs memory, expandable to 32k directly addressable words. Adage, Inc.

Power supplies

Containing specifications, dimensions and prices, a new short-form catalog lists dc power supplies, over-voltage protectors and filters in output voltages from 3 to 200 V dc and currents from 45 mA to 48 A. Also shown are unregulated, dual-output, vacuum-tube and custom power supplies, as well as filters compatible with the unregulated units. Dressen-Barnes Electronics Corp.

Antennas and lines

Offering performance data for antenna system engineers, a new 100-page catalog contains complete information on antennas and transmission lines. Described are microwave antennas and waveguides, telemetry and fixed station antennas, antenna positioners and solid dielectric cables, flexible and rigid coaxial lines, and switching and pressurization equipment. Andrew Corp.

Naval SHP connectors

Amply illustrated, a new 16-page catalog features complete mechanical specifications on many of the basic headers and connecting receptacles used in the NAFI Standard Hardware Program (SHP). Methode Electronics, Inc., Connector Div.

Digital readouts

A new six-page bulletin gives information on miniature digital display readouts, decoder/driver modules, and incandescent lamps. Along with design specifications, coding requirements, truth tables and electrical requirements is included design information on a complete line of miniature connectors. Pinlites Inc.
This new automation solution can reduce your operating costs and increase the yield of better quality products. It's a whole new 4th generation product line...we call it System 18/30.

System 18/30 is a family of compatible GA automation computers designed to work in distributed management information and control systems. The GA worker-level computers permit the user to automate at the primary control loop first, with predictable results and costs — and then add to these automation functions GA supervisory-level computers for total process optimization.

Heart of our new System 18/30 is the 1804 processor, which is software compatible at the binary code level with the IBM 1800 and 1130 computers and will work with or extend existing IBM 1800 installations...and do the work more effectively and at a lower cost.

The 1804 acts as a supervisory computer for several SPC-12 dedicated computers. SPC-12 is our primary control loop computer or worker computer. It ties to your machines, devices, communication networks, sensors and instruments through our unique family of mini-controllers to form a primary control loop automation system. With GA unique Product Software, control programs can be accomplished quickly, economically, and on a fixed price basis.

GA terminals, communication pre/post processors, process I/O, and data processing I/O, and computer to computer couplers provide the system building blocks required to take on large scale automation projects on a predictable cost and result basis.

Our Automation Sciences Division will provide all the process analysis, engineering, programming, installation and start-up service you need. Our System 18/30 Brochure will tell you all about this new computerized automation solution. Write for it today.
NEW SHIELDED BOXES with CARD GUIDES

Rugged die-cast aluminum boxes, slotted to accept ¼" circuit boards and shielding dividers. Excellent for packaging electronic circuitry. Boxes have removable top and bottom covers. Useable inside space: 4" x 2" x 1½". Several models with various connectors.

NEW HERMETIC TINY PAK™

201 & 741 OP AMPS

For Hybrids and Conventional Circuit Boards.

New TINY-PAK™ OP AMPS by MINI-SYSTEMS, INC. provide guaranteed electrical performance in a miniature hermetic flat pack much smaller than any now available in the industry. The diameter of this package is approximately twice the maximum dimension of I C OP Amp dice.

Applications include all those of conventional "101" and "741" types, plus those now made possible and practical by the miniature size of the TINY-PAK™ TINY-PAK™ "101/201" and "741/741C" I C OP Amps are available from stock. Other types are available on special order. e.g. 100, 101A, 102, 107 & 108.

Price: $9.50, "201" or "741C", quantity 1-49

NEW LITERATURE

TTL integrated circuits

Three series of TTL integrated circuits are described in an 80-page catalog that features typical applications, truth tables, design loading rules and pin configurations. The three series comprise standard, high-speed and low-power devices. In addition, there are 35 MSI integrated circuits presented, including data selectors/multiplexers, decoders, memories/latches, shift registers, counters, parity generator/checker and arithmetic elements. Texas Instruments Inc.

CIRCLE NO. 652

Count controllers

Telling of series 310D impulse count controllers, a new four-page bulletin describes their principles of operation, shows three methods for incorporating them into control circuits, and illustrates switch operation throughout the counting cycle. In addition, detailed specifications are provided, along with outline and mounting dimensions. Automatic Timing & Controls, Inc.

CIRCLE NO. 653

PC-board machines

Complete with descriptions, specifications and dimensions, a new 16-page catalog describes seven numerically controlled drilling machines with from 4 to 12 drilling spindles, a tape programmer and inspection machine, and a new computerized controller. Digital Systems Inc. a sub. of Resdel Engineering Corp.

CIRCLE NO. 654

ELECTRONIC DESIGN 17, August 16, 1969
Telemetering modules

A 40-page catalog describes a line of fm-fm telemetering modules, including voltage-controlled oscillators, dc amplifiers, dc signal isolators, frequency-to-dc converters, tone oscillators, pressure transducers and a laboratory telemetering system. All of these units are miniature solid-state devices and can be used for military, industrial and research applications. Solid State Electronics Corporation

CIRCLE NO. 655

Switches

Rotary and pushbutton switches are the subject of a 20-page bulletin. Included are miniature rotary switches for printed-circuit use, tamper-proof key-lock versions, isolated positions and spring return styles; and miniature and lighted pushbutton switches, and bi-pin lamp sockets. Grayhill, Inc.

CIRCLE NO. 656

Switching hints

Eight switch applications for industry, recreation and research are offered for plant engineers, electricians and maintenance men in the latest issue of “Micro Tips.” The four-page two-color publication reviews the prevention of jamming on conveyor belts, the counting of hot steel strips, instrument protection, and a sequencing control in radio transmitters. Micro Switch, a div. of Honeywell Inc.

CIRCLE NO. 657

Waters’ AND ONLY WATERS’ JP/2 RK09 POT conforms to MIL-R-39002/1B

This miniature wirewound trimmer (half inch diameter, quarter inch deep and half an ounce) is designed for extended reliability with performance specified at end of life, and ruggedly built for high temperature operation (150°C). Operational life is long term, with negligible degradation; ENR less than 5 ohms regardless of resistance values.

Options, many not available elsewhere, include non-standard resistance values; sealed bases, special mounting configurations; plain or split bushings; continuous rotation.

Only Waters, with the JP/2, conforms to MIL-R-39002/1B and it is available to you now at competitive price for industrial applications.

Welding equipment

Precision welding equipment is described in a new 20-page catalog that covers a complete line of modular stored-energy welding equipment and accessories. Included are welding heads for every application, all solid-state supplies in a wide choice of power and energy ranges, and welding accessories like air actuators for heavy-duty welding heads. There is also a complete listing of electrodes with a helpful guide to the proper selection of electrode material. Unitek Corp./Weldamatic Div.

CIRCLE NO. 658

Pressure-sensitive tape

A new multi-color folder describes a wide variety of products made from pressure-sensitive tape. These include double-faced die-cut masks, identifying numbers and letters, printed panel circuit pads, valve and tool symbols, chart and graph tapes, and emblems and dots. M & C Specialties Co.

CIRCLE NO. 659

Piezoelectric ceramic

A four-page bulletin describes a piezoelectric ceramic intended for applications in the ultrasonics industry. Properties such as mechanical Q, useful temperature range and aging are discussed. A complete table of constants for the material and graphs showing the effects of temperature on its properties are included. General Electric Co.

CIRCLE NO. 660
Perforated tapes

Depicting a broad line of perforated tapes and related accessories, a new 20-page catalog describes tapes, in oiled and unoiled paper, and mylar laminates and photoelectric varieties in roll and fan-fold formats. Among the accessories is a series of high-speed motorized winders. Robins Industries Corp.

CIRCLE NO. 661

Strip products

Giving general and technical information, a four-page folder tells of thin strip products in stainless steels, nickel alloys, special metals and electrical resistance alloys. Presented are mill and manufacturing limits, coil sizes, and comparative weights table. Techalloy Co., Inc.

CIRCLE NO. 662

Control system

Featuring the Positool 90 numerical control system for new and existing machine tools, an eight-page brochure includes a complete description of the system’s capabilities plus 15 illustrations showing accessory features. Available with from one to four axes, the unit offers automatic backlash compensation without overshoot, one-hand jog control for all axes, plus the ability to stop in mid-program without loss of program. Auto-numerics, Inc.

A division of the Sangamo Electric Company
We've squeezed 105 dB into this Telonic 6001 LOG AMP DETECTOR

The solid state 6001 will accept RF inputs from 400 kHz to 130 MHz with voltage swings as wide as 178,000 to 1. It's calibrated over a 90 dB range (−70 to +20 dBm) and is even equipped with a range switch for closer looks at −40 to −10 dBm and −16 to +4 dBm. An offset control also allows shifting the meter range as much as 70 dB either way.

For fixed frequency measurements, the input signal level can be read directly from the meter — for swept measurements the 6001 provides an output to a 'scope or XY plotter, plus a reference line calibrated in dBm.

In addition to the model shown, smaller versions, without power supply and meter, are available as discrete modules and as a plug-in for the Telonic 2003 Sweep/Signal Generator System.

Data sheets containing complete specs on the 6001 and other models are available on request.

Capacitors

A new short-form six-page catalog describes a line of flatpack, axial- and radial-lead metalized polyester capacitors. All three capacitor types are rated at 50 V and are available in more than 100 standard values. Engineered Components Co.

CIRCLE NO. 664

Trimmer capacitors

"Trimmer Topics", a periodical technical information service, discusses the subject of scaling precision piston trimmer capacitors. The discussion covers the reasons for sealing, the various methods used to provide the seal, and where each is used. Non-rotating piston design, rotating piston designs, and variable air-dielectric trimmer capacitors are covered. A major portion of the text is devoted to capacitance changes at high humidity, and why these changes occur. Voltronics Corporation

CIRCLE NO. 665

Proximity control

A new four-page brochure describes a new proximity control that is completely transistorized and designed specifically for rugged industrial applications. Presented are some specific applications, a description of how the sensing distance varies with respect to material, material thickness and object area, the operating characteristics for both fast-response and adjustable-delay models, and dimensional drawings and prices. Delavan Manufacturing Co.

CIRCLE NO. 666
Core memories

Describing in detail a variety of standard Store 33 core memory systems, a 12-page two-color brochure includes such detailed information as standard word sizes and capacities, system organization, operating modes, and signal interfaces. Also discussed are magnetic construction and in-process testing of these magnetic assemblies. Date Products Corporation

CIRCLE NO. 667

IC readout

A four-page technical folder details specifications for a rear projection readout that uses integrated circuit electronics to decode 8-4-2-1 binary input signals to decimal equivalents. Also given are illustrations and explanations of the use of 12 parallel miniature optical projector systems that display different messages on a single-plane viewing screen. Shelly Associates, Inc.

CIRCLE NO. 668

Circuit protectors

Describing an economical line of panel-mount, single- and multi-pole circuit protectors for consumer, appliance and industrial uses, a new 12-page bulletin gives engineering data like delay curves, trip time for overload ratings, and complete electrical and mechanical specifications. The protectors serve as on/off switches, circuit condition indicators and overload circuit breakers. Ratings are from 20 mA to 30 A, 250 V ac, 60 or 400 Hz, or 50 V dc. Airpax Electronics, Cambridge Div.

CIRCLE NO. 669

New GRITZNER Precision DRAWING BOARD TYPEWRITER

Types uniform nomenclature and dimensions with typewriter-quality letters, numerals and symbols. Block letters comply with Mil. Spec. 100-A, erase easily, reproduce well in microfilming, diazo and other reproduction methods. Speeds fill-in work, allows more time for drawing. Tested averages show the Gritzner lettering technique is 1.75 times faster than hand lettering, 3.5 times faster than stenciling.

1 Sets up quickly right on your drawing board, types directly on all drafting surfaces, including film...horizontally or at any angle.

2 Spaces automatically along indexing rail. Each strike of a key shifts typewriter to next precise letter position. Indexing rail fits standard drafting machines or can be held against T square or parallel bar.

3 Letters are in alphabetical order. With brief orientation, any draftsman can easily use the Gritzner typewriter without conventional typing skills. Special symbols available. Typewriter is 6" x 7" x 3" overall. Suggested retail price, $300.00.

Write or phone today for comprehensive brochure and name of your Gritzner dealer.

For a true record of temperature in service...

Tempilabel

Easy to use...

Easy to read

Self-adhesive Tempilabels assure dependable monitoring of attained temperatures. Heat-sensitive indicators, sealed under the little round windows, turn black and provide a permanent record of the temperature history. Tempilabel can be removed easily to document a report.

AVAILABLE
Within the range 100° to 500°F Tempilabels are available to indicate a single temperature rating each — and also in a wide choice of four-temperature combinations per Tempilabel.

JUST A FEW OF THE TYPICAL APPLICATIONS
• Electrical Apparatus
• Electronic Assemblies
• Appliance Warranties
• Aircraft and Rockets
• Machinery and Equipment
• Storage and Transportation of Heat Sensitive Materials.

For descriptive literature and a sample Tempilabel for evaluation ... (please state temperature range of interest).

Clutches and brakes

Fully assembled, ready-to-install electric clutches and brakes are the subject of a 16-page bulletin. These units range in diameter from 5.5 to 15 inches and cover rated torque capacities of 40 to 725 foot-pounds. They have a simple accurate self-adjust mechanism that assures consistent engagement times. Stearns Electric Corp.

Metals and chemicals

A new 24-page supplement lists over 100 additions to an earlier 1969 catalog of over 2500 inorganic and organometallic chemicals, pure metals and single crystals. The supplement includes lanthanum oxide for calcium determination, nickel halide glymes, grignards, and several new organotin and organolead compounds. Technical data and references are presented on several of these new compounds. Alfa Organics, Inc.

Spectrophotometry

A comprehensive 24-page bibliography on spectrophotometric applications in the ultraviolet, visible and near-infrared fields is now available. The articles, which are arranged in 15 categories, include: luminescence, reflectance, scattered transmission, polarizations, magnetic and electric fields, temperatures and pressures, difference spectroscopy, kinetics, computer applications and spectrophotometric evaluation. Cary Instruments

Wire markers

Listing 6000 stock items, a new 24-page wire marker catalog includes information on self-laminating wire markers with a transparent protective shield, clip-sleeves applied with an applicator wand, circuit identification numbers, terminal markers for labeling hook-up points identically with leads, suffix numbers for a variety of marking codes, consecutive numbers in pairs for identical marking of both wire ends, write-on-cable markers that accept variable coding, and a line of marking sleeves. W. H. Brady Co.

Moldable polyimide

Five new technical data bulletins cover XPI polyimide, a thermoplastic molding compound offering unique advantages in chemical resistance, mechanical properties, dimensional stability, high heat resistance and electrical properties. Of particular interest are its compressive strength of 23,000 psi and a dielectric constant of 3.47. American Cyanamid Co., Plastics Div.

Laser applications

Containing more than 50 pictorial illustrations, a new 16-page brochure shows innumerable applications of laser technology in action. A complete section is devoted to resistor trimming, including chrome thin films, tantalum thin films, helixing, and palladium-silver thick films. Hole drilling and wedging applications are also covered. Laser Nucleonics Inc.
Here It Is Again

Cow Palace - San Francisco - August 19-22
**NEW LITERATURE**

**Analog adders**

Series AA-1100 analog adders are the subject of a new two-color four-page fold-out brochure. Listed are performance specifications along with the base diagrams and pin connections. The units described will sum from one to five inputs and provide performance to 0.05% static accuracy with a bandwidth of 2 MHz. GPS Instrument Co., Inc.

**CIRCLE NO. 676**

**Gases and mixtures**

Listing all essential information including gas composition, contents in grams and liters, container pressure, hazard classification and prices, a new catalog describes more than 40 laboratory gases and mixtures, most of which are available in high-purity and research grades. Catalogued mixtures cover applications in air pollution, biology, calibration, crystal doping, epitaxial crystal growing, medical research and nuclear counting. Lif-O-Gen, Inc.

**CIRCLE NO. 677**

**Gold plating**

Techni Gold-25, a new non-cyanide, mirror-bright, 24-karat gold electro-plating solution, is the subject of a six-page technical bulletin. Described are operating conditions and special use information for electroplating with the new solution, which is shipped ready to use and requires no formulation. Replenishment cycles and equipment for electroplating with Techni Gold-25 are also discussed. Technic, Inc.

**CIRCLE NO. 678**
EMI filters shouldn't be a big deal so we make the smallest ones

You've convinced me EMI filters shouldn't be a big deal. So send me specs before I forget about them completely.

I'm still worried, and anyone can write specs. Send a representative with loads of solutions to the problem I've attached.

Name ____________________________
Company __________________________
Title ______________________________
Address ____________________________
City __________ State __ Zip __________

Send to: Genisco Technology Corporation, Components Division
18435 Susana Road, Compton, California 90221

Our 50,100 and 200 VDC miniature filters for T, L, 2L circuits are at least 20% smaller than any others.

But size isn't their only advantage: resistance is as low as .005 ohms typical, combined with high insertion loss per Mil-Std 220A. And each gold-plated filter meets the ever-popular MIL-F15733.

If the 49 filters described in our spec sheets can't solve your problems, it's not a big problem. We've been designing EMI filters for 15 years. So designing one for you won't cause a hassle. Or high prices.

So send in the big coupon. It can solve a multitude of small problems.

Visual controls

Including both price and specification information, a new 28-page catalog on magnetic visual control systems lists 20 sizes of standard boards and over 80 accessories. Packed with ideas and pictures, the catalog describes a wide variety of boards for maintaining perpetual visual data for daily, weekly, monthly or yearly use. These include computer scheduling, organization charts, sales incentive, and controls for production and maintenance. Methods Research Corporation.

CIRCLE NO. 679

Military wires

A new 24-page catalog describes a line of wire and cable products meeting military specification requirements. Brand-Rex Division, American Enka Corporation.

CIRCLE NO. 680

Maritime silicones

"Silicone Materials for Marine Applications" is a four-page brochure that discusses the underwater evaluation and material uses for a line of RTV silicone rubber and silicone fluids. The brochure details some of the findings of a study sponsored by the Naval Applied Scientific Laboratory where samples of silicone polymers and copolymers were immersed in seawater for one year. General Electric Co., Silicone Products Dept.

NEW LITERATURE

Gas mixtures

Specifically designed to give the prospective gas-mixture user a basic understanding of gas-mixture technology, an 18-page guide details all the steps that must be taken in the preparation, analysis and use of a gas mixture to assure its dependable performance. A key feature of the brochure is the comparative study of the partial-pressure gas-mixing procedure with the method called Primary Standards. Matheson Gas Products, a Div. of Will Ross, Inc.

CIRCLE NO. 682

Ammeter shunts

Ten types of dc ammeter shunts in 175 standard models are shown in a new catalog. Both portable and switchboard types are shown, along with diagrams, dimensions and prices. Included are 50- and 100-mV styles, with current ratings to 30 kA. Empro Manufacturing Co., Inc.

CIRCLE NO. 683

Socket literature

Four new socket lines — including miniature chassis, tube and low-cost SCR versions — are described in four separate product bulletins. Each bulletin includes photographs, line drawings, electrical characteristics and mechanical specifications. The sockets are designed for both solderless wire-wrap terminations and printed-circuit-board terminations. Amphenol Industries Division, The Bunker-Ramo Corporation

CIRCLE NO. 684

SOLID TANTALUM CAPACITORS FOR HYBRID ICs -"MICROCAP"-

Capacitance exceeding 10,000 picofarads obtained despite miniature size. "MICROCAP" features excellent heat resistance, solderability and mechanical strength comparable to conventional discrete components, for easy use in hybrid integrated circuits.

Specifications:

- Operating Temperature Range: -55°C to +85°C
- Standard Voltage Rating: 6.3, 10, 15, 20, 25, 35 VDC
- Standard Capacitance Value: .001 to 22 μF (ES series)
- Standard Capacitance Tolerance: ±10% (M)

MATSUO’s other capacitors include:

- Metallized Polyester Film Capacitor:
  Type FNX-H mylar wrapped.
- Solid Tantalum Capacitors:
  Type TAX hermetically sealed in metallic case.
  Type TSL encased in metallic case and sealed with epoxy resin.
  Type TSL enca..ed in metal..ic case and sealed with epoxy resin.
- Polyester Film Capacitors:
  Type MFL epoxy dipped, non-inductive.
  Type MFK epoxy dipped, non-inductive.

For further information, please write to:

INFORMATION RETRIEVAL NUMBER 803
Electronic Design 17, August 16, 1969,
Capacitor catalog

Showing how to cover most capacitor replacement needs, a new 12-page brochure lists a wide range of miniature electrolytics, dipped paper mylar, ceramic disc, dipped mica, and wax-filled capacitors. Cornell-Dubilier Electronics Div. of Federal Pacific Electronic Co.

CIRCLE NO. 685

Communications stations

Four new brochures include information on a communications station and a television conversational/batch station, as well as two application reports. Computer Communications, Inc.

CIRCLE NO. 686

Slotted angles

Now available is a four-page technical data and information bulletin detailing safe concentric loads (in pounds) for columns and beams of slotted angles. The bulletin also contains a page of helpful hints on how to use slotted angles. Chevron Slotted Angle, Div. of Atlantic Steel Products Co.

CIRCLE NO. 687

Servo motors

Since the advent of solid-state devices, there has been a trend to low-voltage control phase supplies in permanent split capacitor motors. These and other interesting facts on servo motors for ac-instrument-type applications are presented in the latest issue of Motorgram (Vol. 49, No. 2). Bodine Electric Co.

ELECTRONIC DESIGN 17, August 16, 1969
NEW! smallest axial shielded inductor available the "NANO-RED"

Range: 0.10µh to 1,000µh in 49 stock values
Size: ¼ dia. by ¼ lg.
Inductance Tolerance: ±10%

This new "NANO-RED" offers the highest inductance to size ratio available in an axial shielded inductor. Exceptional "Q" and self-resonance characteristics. Max. coupling 2% units side by side. Non-flammable envelope. Designed to MIL-C-15305C. Operating temperature -55°C to 125°C.

Other Lenox-Fugle Subminiature Shielded Inductors:

- **MICRO-RED**
  - The "Micro-Red" is a shielded inductor that offers the largest inductance range in its size: 0.10µh to 10,000µh. "Q" to "L" ratio unsurpassed, with excellent distributed capacity. Inductance tolerance ±10%. Designed to MIL-C-15305C. Stocked in 61 predesigned values.

- **MINI-RED**
  - The "Mini-Red" offers the highest "Q" to "L" ratio available over inductance range 0.10µh to 100,000µh in its size. Inductance tolerance ±10% measured per MIL-C-15305C. Stocked in 73 predesigned values.

- **DURA-RED**
  - The "Dura-Red" is designed to MS-90537 with inductance range 0.10µh to 100,000µh with tolerance ±10%. Stocked in 73 predesigned values.

Spacers catalog

Over 550 different sizes, materials and finishes of standard stock spacers are shown in a new catalog. Also presented are special spacers like headed, flared, triangular, heavy- or thin-walled devices and those of special materials and finishes. C.E.M. Co, Inc.
CIRCLE NO. 689

**Emi/rfi shielding**

An eight-page two-color brochure gives detailed information on Spira, a new concept in emi/rfi gasketing. Spira shields, which are designed to join surfaces in shielded enclosures, are manufactured from wide thin stainless-steel spring stock, wound in helical spring form. The width of the stock used for the spiral varies with the diameter so that the length-to-width ratio of each conductive path is low. Scanbe Manufacturing Corp.
CIRCLE NO. 690

**Computer language**

Featuring a new simplified computer language called BOCOL (Basic Operating Consumer-Oriented Language), an eight-page brochure explains how the language solves problems, simplifies operations, and saves time and money. BOCOL uses clear, precise statements so that even crash programs are easy to create; it requires only one pass for compiling and processing. Fimaco, Inc.
CIRCLE NO. 691
Lock washer guide

Showing various design options, a handy pocket-sized guide tells how to select the right lock washer. This 12-page booklet covers a wide range of general and special applications and shows which lock washer to use and why. For example, a folded-rim lock washer will meet high load requirements while providing an effective mechanical seal at the same time. Shakeproof Div., Illinois Tool Works Inc.

CIRCLE NO. 692

Relay catalog

The third issue of the Micro-Scan relay catalog is now available. It features eight pages of specifications on these high-speed relays, showing a full range of models and illustrative package drawings. In addition, there is applications information on low-level multiplexing for process control, communication systems switching and data acquisition. James Electronics Inc., Components Div.

CIRCLE NO. 693

Analog computer

Describing Comcor 550 analog computer, a 16-page illustrated brochure covers user benefits, details patching facilities, explains keyboard and console controls and hybrid linkage, and lists total component complement. The Comcor 550 is a medium-sized solid-state computer, designed for hybrid performance that provides large-scale capabilities in a compact economical systems package. Astrodatal, Inc.

CIRCLE NO. 694
If you know you can do better than you're doing, communicate.

Engineers: We have immediate openings on these advanced programs:

1. **COMMUNICATIONS SYSTEMS TEST.** Prepare and execute test plans and procedures in the RF area. Strong instrumentation and systems test background required.

2. **COMMUNICATIONS SYSTEMS DESIGN.** Conceptual design in communications, radar, sonar and ECM. Design and develop systems, subsystems and components; generate requirements and prepare specs.

3. **ANTENNA DESIGN.** Design, develop and test antennas and feed systems for aircraft, missile and space applications. Required background in electromagnetic theory and experience in sophisticated broadband feed systems.

4. **RF DESIGN.** Design circuit, component and overall systems for transmitting and receiving. Establish solid-state component specs for RF filters, preamps, mixers, local oscillators and detector elements.

5. **ELECTRONIC SYSTEMS ENGINEERING.** Analyze operational requirements and define hardware specs for broadband monopulse receiving/data processing systems. Optimize system/subsystem requirements within constraints imposed by nontechnical limits.

6. **IR/OPTICAL SENSOR SYSTEMS DESIGN.** Design near, intermediate and long-wave IR systems. Comprehensive knowledge of detectors, optics and scanning techniques, with experience in effects of launch environments on sensor systems.

Applicants must be able to translate state-of-the-art knowledge into practical hardware. Applicable degree plus minimum of 4 years' experience. For further information, please write Mr. H. W. Bissell, Professional Placement Manager, P.O. Box 504, Sunnyvale, California 94088. An equal opportunity employer.

New York, New York 10022
ELECTRONIC DESIGN's function is:

- To aid progress in the electronics manufacturing industry by promoting good design.
- To give the electronic design engineer concepts and ideas that make his job easier and more productive.
- To provide a central source of timely electronics information.
- To promote two-way communication between manufacturer and engineer.

Want a subscription? ELECTRONIC DESIGN is sent free to qualified engineers and engineering managers doing design work, supervising design or setting standards in the United States and Western Europe. For a free subscription, use the postfree application form inside the back cover. If none is included, write to us direct for an application form.

If you do not qualify, you may take out a paid subscription for $25 a year in the U.S.A., $35 a year elsewhere. Single copies are $1.50 each.

If you change your address, send us an old mailing label and your new address; there is generally a prepaid postcard for this inside the back cover. You will have to requalify to continue receiving ELECTRONIC DESIGN free.

The accuracy policy of ELECTRONIC DESIGN is:

- To make reasonable efforts to ensure the accuracy of editorial matter.
- To publish prompt corrections whenever inaccuracies are brought to our attention. Corrections appear at the end of the Letters column.
- To refuse any advertisement deemed to be misleading or fraudulent.

Microfilm copies are available of complete volumes of ELECTRONIC DESIGN at $19.00 per volume, beginning with Volume 9, 1961. Work is now in process to complete the microfilm edition of Volumes 1-8. Reprints of individual articles may be obtained for $2.00 each, prepaid ($5.50 for each additional copy of the same article) no matter how long the article. For further details and to place orders, contact the Customer Services Department, University Microfilms, 300 North Zeeb Road, Ann Arbor, Michigan 48106; telephone (313) 761-4700.

Want to contact us? If you have any comments or wish to submit a manuscript or article outline, address your correspondence to:

Welded stud fasteners — no holes or distortion

This new brochure describes a solid-state-controlled system for welding threaded stud fasteners to steel and aluminum as thin as .016" and .040", respectively. Welds are reliable and consistent because the control may be adjusted quickly and conveniently to all conditions. The one-side fasteners may be located wherever the best design requires. No holes involved — which means no expenses for sealing, drilling, through-bolting, staking. Standard studs, up to ¼" in diameter, from stock. System operates from 115-volt AC outlet, welds studs at production rate of 8 per minute, 15 per minute for short periods.

A hot tip on a new offering that provides long-term capital gains in cooling economy.

Using either warm or cool water as the circumstances require, the McLEAN Heat Exchanger maintains even electronic cabinet temperature in the most simple and reliable manner. Heat Exchanger models are designed and manufactured to meet individual specifications and applications. Using 66°F to 70°F chilled water, an interior cabinet temperature of 80°F maximum is maintained with a 1 KW heat dissipation. Air is re-circulated within the electronic enclosure and cooled by the Exchanger. The system does not use room ambient air, nor does it exhaust warm inside cabinet air into the atmosphere.

The Heat Exchanger is one of many McLEAN temperature control devices for electronic equipment. Write for full information.

INFORMATION RETRIEVAL NUMBER 809
Get away from quavering needles. End interpolations, extrapolations, and meter readings by conjecture. Now you can move up to digital readout with the one low cost digital panel meter with automatic zero adjust. With the new Digilin Type 250 you never worry about accuracy or unchecked drift. The 250 takes away the opportunity to make mistakes.

And while you gain day-in, day-out solid-state reliability and digital accuracy, the Type 250 — an industrial designer’s masterpiece in brushed aluminum — brings an appearance of elegant precision to your system.

Now check these other important features:

- Easy, external programming. With the 250, it’s easy to take advantage of quantity prices. Stock one meter type. Change to a wide variety of current, voltage, or resistance ranges and change decimals all from the rear.
- No internal adjustments. All ranges and functions are programmable from the rear panel. Calibration is accomplished by a single front panel vernier adjustment.
- Constant high input impedance. No errors due to circuit loading.
- Best visibility. Big 0.6” numbers. Parallax-free, filtered wide-angle viewing. Memory capacity gives no-blink display.
- Assured reliability. Exclusive Digilin 100-hour factory burn-in test is the most rigorous in the industry.

How do we give you more features and better quality at the same low price? Because of Digilin innovations in circuitry, design, and manufacturing processes, the step-ahead technology that never means compromise.

At $99.00 each in lots of 100, now you can well afford digital readout where you can’t afford to make mistakes. Get in touch with Digilin today and get off the needle. Digilin, Inc., 6533 San Fernando Rd., Glendale, Calif. 91201. Telephone 213-246-8161, Ext. 40L (A division of Dura-Containers, Inc.)

Need 3-digit readout? Type 330 has same features as the 250, costs just $129 (100-units).

This new "4th generation" I-C plug-in counter/timer Outperforms all others...

And will for years to come!

Why compromise for less? The Model 1500A has a main frame counting range from dc to 125 MHz (to 3 GHz with a single plug-in). This instrument is fully programmable, has provision for external time base up to 10 MHz, and many other significant features, including the well recognized advantages of Monsanto's "4th generation" 90% integrated circuit design.

Shown above is the Model 1104B 3 GHz frequency converter plug-in. Also available: Model 1100A uncommitted plug-in; Model 1101A 500 MHz prescale plug-in; Model 1102A 6-digit preset plug-in; Model 1103A 500 MHz frequency converter plug-in; Model 1107A time interval plug-in; Model 1201A DVM plug-in.

Unparalleled performance plus award-winning design make the Model 1500A the ultimate counter for the no-compromise engineer. The price for the main frame is $2850.00, FOB West Caldwell, N. J. Other models of the 1500 Series offering a wide selection of features and capabilities begin at $1800.00.

Most engineers take Monsanto's reliability for granted because of our 2-year warranty. But, just in case, we maintain 37 Service Centers located strategically throughout the United States and overseas.

For a demonstration, or for full technical details, call your local Monsanto Field Engineer now or contact us directly at: Monsanto Company, Electronic Instruments, West Caldwell, New Jersey 07006, (201) 228-3800.

WESCON Booths 1017-19 and 1026-28

Monsanto
Here's 15 A to 50 A Performance for your High-Speed Switching Circuits.

Now, RCA brings you high-speed, high-current switching in four of the industry's newest high power units—2N5671 and 2N5672 in regular TO-9 case available in production quantities, and developmental types TAJ737 and TAJ737A in modified TO-9 case (two 60-ohm pins) available on a sampling basis.

These high-current transistors now make available for industrial and commercial users a state-of-the-art combination of high performance and reliability originally dictated by the rigid requirements of aerospace.

All four devices are characterized by double-diffused, double-epitaxial design techniques. As a result, you get reduced saturated switching times, increased current handling capability, and low saturation voltage. These silicon transistors have enhanced second breakdown capability under forward and reverse-bias conditions...backed by safe area operating curves.

Among the applications for these units: switching control amplifiers, power gates, switching regulators, DC-DC converters, DC-AC inverters, DC through RF linear power amplifiers and oscillators.

Check the chart for some of the key parameters of these four new types. Then ask your local RCA Representative or your RCA Distributor for prices and delivery details.
