Improvements in power semis have increased their applications but have not made specifying easier. First you must decide whether to use a transistor or a thyristor — and then which of the many devices available in each class. Ratings can mislead and safe operating area specs are often ignored. See page 80.
Good trimmer image!

Low rejection rate, low profile and low cost are putting Dale Trimmers on more prints and boards than ever.

Dale is putting a lot of things together to make its trimmers a better deal for you. Our low rejection rate of .93% (including items not related to quality) guarantees more productive time for you and your people. Our low profile 3/4" models give you a choice of cement and wirewound elements to precisely match your functional needs. Both are completely immersion proof and have pin spacings that shrink packaging requirements by interchanging with many larger models. Matter of fact, Dale trimmers offer broad interchangeability with every competitive line. And that's something to keep in mind when you're looking for more depth in your supply situation.

Send for free trimmer interchangeability guide today ... or call 402-564-3131 for complete information.

SURPRISE!

A quality LED for just 9¢.

Now you can get HP quality in an LED lamp for only 9¢.
That's your price when you order one million. If you only need
one thousand, the price is a low 17¢. And HP is ready to
deliver that kind of volume to meet your schedule.

This T-1 size lamp features a new low profile lens for
high density application in calculators, cameras, computers, appliances
and automobiles. The 5082-4487 and 5082-4488 both
have a clear lens and a 0.8 mcd at 20 mA typical light output.
Get the full story from your nearby HP distributor
or, write Hewlett-Packard directly.

WHAT MADE CRYSTAL CAN RELAYS OBSOLETE?

THE TO-5 RELAY!

Crystal can relays (full size and fractional sizes) have been obsoleted by the outstanding performance, high reliability, low power requirement and cost effectiveness of the TO-5 Relay.

All possibility of contamination is eliminated in the TO-5 Relay. It is completely welded, including the coil termination. This cannot be said for crystal can relays.

Reliability and long life, over ten times greater than the crystal can units, have been designed into the TO-5 Relay.

Teledyne's TO-5 Relays come in hundreds of models, all in the same basic configuration. Typical available models include SPDT, DPDT, sensitive SPDT and DPDT and magnetic latching SPDT and DPDT. Units are also available with transistor drive and diodes for arc suppression, all packaged within the TO-5 case.

By using the TO-5 Relay, reduction in size, weight and number of circuit board components can be realized in your product — all measurable in dollars and cents.

When you buy a Teledyne TO-5 Relay, you buy a 10-year record of remarkable reliability, superior performance, on-time delivery and service from people who really care. Teledyne provides experienced application engineers anxious to assist you with your relay problems.

Send for complete technical data.

The $5,600 computer you don’t have to talk down to.
We've got an idea that ought to interest any OEM who's trying to bring down the price of his product.

Go buy yourself 5 Nova 2's with the new 16K memory boards. (Yes, we know you can probably get away with less memory. Bear with us.)

Now take a look at what you get: a high speed multi-accumulator 16 bit CPU, an I/O system with programmed data transfer, 16 levels of programmed priority interrupt, high speed Direct Memory Access, programmer's console, 4-slot mainframe, power supply and 16,384 words of 1 microsecond memory, expandable to 32K. With 4K and 8K memory modules also available.

That, you'll have to admit, is an awful lot of computer for the money. With twice the memory of other computers in that price range.

Hold on. It gets even better.

With that 16K memory, you won't have to talk down to the computer in machine language. You're going to be able to program in higher level languages.

So your programmers will be able to spend more time on what they want it to do and less on how to say it. Which means they'll get the job done faster. And you'll get your product out on the market faster.

Both of you are going to save yourselves a lot of time and money.

Think about that for a minute.

Consider how your system costs go down when your programming time goes down.

The $5,600 price tag looks even better now, doesn't it? And that's before the quantity discounts get figured in.

*Five systems is the minimum order.

The 16K Nova 2
Data General
Southboro, Massachusetts 01772 (617) 485-9100.

INFORMATION RETRIEVAL NUMBER 4
Reduce Your Power Supply Size  
and Weight By 70% for $49

A new way has been found to substantially reduce power supply size and weight. Consider the large power supply shown at left in the above photo - it uses an input transformer, into a bridge rectifier, to convert 60 Hz to 5 volts DC at 5 amperes. This unit measures 6\(\text{x}4\text{x}5\)" and weighs 13 pounds. It sells for $170 in small quantities. For just $49.00 more, Abbott's new model Z5T10, shown at right, provides the same performance with 70% less weight and volume. It measures only 2\(\text{x}4\text{x}6\)" and weighs just 3 pounds.

This size reduction in the Model Z5T10 is primarily accomplished by eliminating the large input transformer and instead using high voltage, high efficiency, DC to DC conversion circuits. Abbott engineers have been able to control the output ripple to less than 0.02% RMS or 50 millivolts peak-to-peak maximum. This design approach also allows the unit to operate from 100 to 132 Volts RMS and 47 to 440 Hertz. Close regulation of 0.15% and a typical temperature coefficient of 0.01% per degree Centigrade are some of its many outstanding features. This new Model "Z" series is available in output voltages of 2.7 to 31 VDC in 9 days from receipt of order.

Abbott also manufacturers 3,000 other models of power supplies with output voltages from 5 to 740 VDC and with output currents from 2 milliamps to 20 amps. They are all listed with prices in the new Abbott catalog with various inputs:

\[\begin{align*}
60\text{ V} & \rightarrow \text{DC, Regulated} \\
400\text{ V} & \rightarrow \text{DC, Regulated} \\
28\text{ VDC} & \rightarrow \text{DC, Regulated} \\
28\text{ VDC} & \rightarrow 400\text{ V}, 1\text{φ} \\
24\text{ VDC} & \rightarrow 60\text{ V}, 1\text{φ}
\end{align*}\]

Please see pages 581-593 of your 1973-74 EEM (ELECTRONIC ENGINEERS MASTER Catalog) for complete information on Abbott Modules.

Watergate Decoder:
It leaves you up creek

Here is an MSI microprocessor circuit termed a Watergate Decoder (see "Introducing a New Gate With Expandable Output," ED No. 16, Aug. 2, 1973, p. 7). It contains the three basic negative logic gates. Information presented in binary by each faction of the Senate subcommittee is entered at either of the two inputs A, B:

\[
\begin{align*}
AB + AB + AB + AB &= Y \\
B(A + A) + AB &= Y \\
B + B &= Y \\
I &= Y \\
Y &= 0
\end{align*}
\]

The data are then processed and extracted at output Y, in which the resultant is shown by the following logic equation:

\[
AB + AB + AB + AB = Y \\
B(A + A) + AB + AB = Y \\
B(1) + (1)B = Y \\
B + B = Y \\
I = Y \\
Y = 0
\]

Nonexploitable woman decries 'bad taste' ads

It is totally inconceivable to this nonexploitable woman why an EE would cancel his subscription to ELECTRONIC DESIGN because of "pornographic advertisements," (see "Women," ED No. 17, Aug. 16, 1973, p. 41).

Webster defines pornography as follows: "The depiction of erotic behavior intended to cause sexual excitement." I have looked at every ad in every issue of ED for years. The most erotic material I can remember is an ad on mating connectors.

I fully concur with your position. Bad taste in advertising is abundant. But all too often it is successful. Guardian is a prime example of an advertiser whose taste is all in the mouth. I have no objections to the "Guardian Angel," as it is a great tie-in. But I do object to the over-all clutter and gar-

(continued on page 13)
New generation of high-performance, low-cost, ultra-precision resistors

Tolerances: .01% to 1%
Temp. Coeff.: 5 to 25 PPM/°C
T.C. Matching: to 1 PPM/°C

Caught in a cost/performance bind on precision resistors? Solve the problem with TRW/IRC's new MAR Series of ultra-precision metal film resistors. Where speed and precision count, they offer the ultimate in cost/performance ratio. And by "performance," we mean better than premium wirewounds.

With the MAR Series, you get an ultra-stable, ultra-precision resistor with an extremely low temperature coefficient. You also get the non-measurable noise, low voltage coefficient and stress stability previously available only in precision wirewounds. Yet you still have the high-frequency response, reliability, pulse stability and resistance/size ratio of metal film.

Also available as part of the MAR technology are resistor matched sets and modules providing additional performance and cost advantages. For comprehensive technical data and MAR samples, contact your TRW representative. Or write TRW/IRC Fixed Resistors, 2850 Mt. Pleasant St., Burlington, Iowa 52601. Phone: (319) 754-8491.

- For Your System's Sake

Keep the proper relationship between input voltages and your systems with nine new ICs.

The MC7900CP series three-terminal negative voltage regulators have a rating for all reasons. Besides the -5.0, -6.0, -8.0, -12, -15, -18, and -24 V complements to our MC7800 series, new -2.0 and -5.2 V versions offer superb MECL system compatibility.

It's difficult to foil these fast-paced protectors. Their rated output current is a strong 1.0 A plus; even up to 1.5 A with the proper heat sink and input voltage.

No matter how delicate the situation, these single monolithic chip devices put voltage in its place. Internal short-circuit current limiting, internal thermal overload protection, and safe-area compensation make them uncorruptible in nearly any operating condition.

Line and load regulation are well controlled, too, with output voltage tolerances of less than ±5%.

And these guardians come fully prepared for the job. In most applications, only a capacitor is necessary.

Nothing more. Not even for on-card regulation.

You can employ these Case 199-04 Thermopad packaged escorts for an economical $2.75 (100-up) for any of the voltage ratings. They're waiting at your local Motorola sales office or franchised distributor. For your peace of mind, post us at Box 20912, Phoenix, Arizona, 85036, to get further information.

The MC7900 series IC voltage regulators.

Upholding the virtues of your system.

*Motorola Inc.

INFORMATION RETRIEVAL NUMBER 8
We make components for guys who can't stand failures.

There's no such thing as a little failure to some guys. Either your system will perform as you designed it, or it won't. Either the right answer comes out or it doesn't. Anything less is too much to bear.

At Corning we make our components as if all your customers were just that demanding. We build an extra measure of performance into everything we make. Because, like you and the guys who use your equipment, we can't stand failures either.

Some examples:
We make components you can depend on, like our metal film resistors—both standard and flameproofs. Components like our glass, ceramic and glass/ceramic capacitors. Like our solid tantalum capacitors—hermetic and non-hermetic, polar and non-polar, miniature and microminiature. And like our discrete component networks—available with custom combinations of discrete microminiature resistors, capacitor chips and diodes in a dual in-line package.

Metal films in particular:
Take our metal film resistors, for example. They've demonstrated the extremely low failure rate of 0.00013% per 1000 hours, based on approximately one billion unit test hours. This quality is why Corning resistors have been used in high reliability programs such as Minuteman, Safeguard, Mercury, Gemini, Apollo, Mariner and Poseidon, and in virtually every other military program requiring resistors. They're qualified to the new Established Reliability specs, too.

100,000 hours without failure:
The following will demonstrate what we mean when we say that our metal film resistors have proven stability: In 1956, Remington Rand Univac Division of Sperry Rand Corporation began testing 1500 Corning N20, ½ watt, 1% resistors in a 40°C ambient under various power stressing conditions. Resistance deviations resulting from this program were minimal and unsurpassed in the industry. To confirm the stability characteristics demonstrated in the Remington Rand Univac Test, Corning remounted 600 of the original resistors in a 25°C ambient early in 1962, accumulating more than 100,000 total test hours to date. Not a single unit has exceeded a 2% $\Delta R$ from initial resistance at time zero!

Flame proof, too:
Our metal film resistors are available in flame-proof grades, too. Their unique coating precludes flaming. And they're constructed to open under overload—rather than shorting-out as many resistors do—to protect other more expensive parts of your system.

For complete details on our metal film resistors and all of Corning's other extra reliability components, write for our new "General Design Guide" to: Corning Glass Works, Electronic Products Division, Corning, New York 14830.

And for information on availabilities, call your local authorized Corning distributor or D.I.A.L. EEM: (800) 645-9200, toll free. Or in New York state, call collect: (516) 294-0990.

CORNING ELECTRONICS
Dialight sees a need:

(Need: A large \( \frac{5}{8} \)" high LED readout at a low $4.95* price.)

See Dialight.

Each digit in this bezel assembly contains a Dialight light-emitting diode, decoder/driver, and resistor network that produces a bright, highly visible readout that can be easily installed in a panel. The readout display is supplied with discrete gallium phosphide or gallium arsenide phosphide diodes arranged in a seven-segment format. These generate a bright, highly legible red character (0.625 inch high—the largest size character in the industry) with the lowest power consumption for a character of this size. Ideal for mounting on a control panel, or in a digital clock, meter, credit-card verifier, TV channel indicator, or hospital room status-board indicator. The contrast ratio between the illuminated and non-illuminated segments is further enhanced by a one-piece red nonglare window.
Dialight is a company that looks for needs...and develops solutions. That's how we developed the industry's broadest line of LED light sources, indicator lights and readouts. No other company offers you one-stop shopping in LED visual displays. And no one has more experience in the visual display field. Dialight can help you do more with LEDs than anyone else because we have done more with them. Talk to the specialists at Dialight first. You won't have to talk to anyone else.

Here are a few products in this family: 1. Multidigit readout assembly in 0.205" character height 2. Status display module with 6 LEDs with adjustable light cells 3. LED readout in character height 0.625" 4. Alphanumeric display complete with code generator/driver character height 0.300" 5. 5 x 7 dot matrix alphanumeric display in character height 0.300" 6. Hexadecimal display with logic character height 0.270" 7. Single digit LED readout module in 0.125" character height 8. Numeric display with integrated TTL MSI circuit chip with counter character height 0.270" 9. Single digit LED readout module in 0.270" character height (MAN 1 equiv.)

ACROSS THE DESK
(continued from page 7)

ish colors. Yet the ad won in-your "Top Ten" awards. (Bourns' advertising falls into this nauseous category also.)

If a reader does not like or approve of an ad, then he shouldn't buy the product. Conversely he should buy products contained in appealing ads. Or write the advertiser expressing his feelings. But don't put the responsibility for censorship on you—or anybody for that matter.

Let me correct an earlier statement. There is something more erotic in ELECTRONIC DESIGN than ads for mating connectors. Your picture, Mr. Rostky.

Marci Williams
President
Spectra Advertising Inc.
3822 Campus Dr.
Newport Beach, Calif. 92660

Bourns replies

Ms. Williams, like any citizen of this nation, is certainly entitled to express her opinion on any subject—as an individual. However, her comments, made in the mode of a professional advertising practitioner, are quite another matter, because to the noninvolved reader such comments take on the weight of an authoritative, expert opinion, when in actuality they merely reflect her individual, subjective reactions.

What is tasteful? What is garish? It's all in the eyes of the individual beholder. Ugly is sometimes appealing! How many people would rave about the tasteful elegance of the Volkswagen? Or sigh with ecstasy over the muted, well-ordered colors and uncluttered composition of a Picasso or Braque!

A client employs advertising people for one simple objective: to communicate the product message. He pays a significant amount of dollars to attain this objective. In an environment where competition for the reader's attention is extremely fierce, sometimes it becomes necessary to employ brilliant (garish) colors, points-of-emphasis (cluttered) layout as tools to make extraordinary impact on the reader's ad-saturated mind. Just such tools were employed in two recent Bourns ads. Neither ad would ever win so much as an honorable mention in the Art Directors Show for "clean layout," "tasteful" color coordination, etc. Nor were they so designed.

They did, however, generate more readers inquiries about the products than any other two ads in the company's 25-year history! Bad taste? We leave that to each reader's personal judgement. Successful? It attained the objectives.

Ms. Williams' further statement was ever so much more intriguing: "If a reader doesn't like or approve of an ad, he shouldn't buy the product." If that doesn't smack of a cut-off-your-nose-to-spite-your-face philosophy! If ad readers, or TV viewers, were to follow that advice, multitudes wouldn't buy toothpaste, bath or laundry soap, aspirin, laxatives or deodorant. Whew! Think of all the foul-mouthed, stinking, constipated people with headaches!

Roland R. Shane
Director of Advertising
Bourns
1200 Columbia Ave.
Riverside, Calif. 92507

Guardian replies

I am very distressed by Ms. Williams' reference to me as a "great tie-in." Evidently she is under the misapprehension that I am not truly the Guardian Angel of electronic engineers, and believes that I am merely the figment of some admn's imagination.

I suppose I should become used to this sort of agnosticism. After all, there are probably many people who don't believe in Santa Claus, the Jolly Green Giant or the Man from Glad. Ah, how empty must be a life without faith!

I completely agree, however, with Ms. Williams' objection to the "garish color" and "over-all clutter" with which I'm surrounded in Guardian ads. I much prefer a

(continued on page 16)
Who has the broadest line of Potentiometers?

It stands to reason that we wouldn’t ask the headline question unless we were certain of the answer.

And we are. Unquestionably, the answer is BOURNS

Compare catalogs if you like. You’ll find over 12,000 model/terminal/resistance combinations offered in our TRIMMER POTENTIOMETER section. Single-turn and multi-turn . . . round, square and rectangular — BOURNS has them all, in wirewound or cermet models.

No need to look elsewhere for a complete line of PRECISION POTENTIOMETERS. Check the precision section of the Bourns catalog. Over 20 different standard bushing mount models are displayed, including the unique KNOBPOT® integral dial/potentiometer family. If you have servo-mount requirements, or need “something special” . . . our fully staffed custom design and manufacturing organization is at your service. Promptly.

More? You bet.

Bourns popular “SPACE SAVER” line of cermet CONTROLS are finding wide acceptance in cost-conscious consumer and industrial applications. You can expect to see exciting developments in this line.

Our cermet and composition open frame VARIABLE RESISTORS are super for budget PC board applications. They’re priced as low as 10¢ in production quantities. They’re from Bourns, so you can count on cost-effective quality and service . . . even at such low prices.

When you think of variable resistive components . . . look no farther than your Bourns Master Catalog. It’s your supermarket of quality, cost-effective resistive components.
Cut Component Count...

...with SPRAGUE SERIES 480 and 490 DISPLAY DRIVERS

Sprague High-Voltage Display Drivers are bipolar monolithic integrated circuits designed for interfacing MOS, open collector TTL, or other low-voltage circuitry with high-voltage gas discharge displays. They replace most of the discrete components normally required in interface applications of this type. Series 480/481 are high-voltage switches intended for use in the cathode portion of the display, while Series 490/491 drivers are designed for use in the anode portion. Their high reliability and small size make them an excellent choice where space-saving and dependability are important factors.

A bald, unashamed, unsolicited plug

Your magazine was of such help to me recently in suggesting an inexpensive practical solution to a motor-control program that I want you to know of my appreciation.

For the past few years I have been designing special-purpose industrial-control systems, and these are mostly to JIC specifications—a very different world from the military and commercial electronics areas in which I first worked. Presently this world is oriented predominantly to electro-mechanical devices, but it is rapidly opening up to the advantages of solid-state controls. Designs are often a hybrid of relays, with some solid state added.

Since I work in industrial controls, I find your magazine very useful. It is my link with the working man's state of the art in electronics. I read several other trade magazines, too. However, yours has unique features that I appreciate especially, such as (1) Focus, which tells in depth the pitfalls of working in a particular area; (2) The articles by managerial engineers; and (3) Your general editorial policy of telling it as it is without the rose-colored glasses of vendor specs. These things make your magazine uniquely useful.

Peter Haas
Consultant

113 Richmond Ave.
Ridgewood, N.J. 07450

ELECTRONIC DESIGN 23, November 8, 1973
AMP cuts on-board programming problems down to size.

Down to the size of a DIP header—with our miniature Dual In-Line Switch. Because you can use it to program IC’s right on the board without remote wiring, it cuts packaging costs, too.

This versatile switch gives you 4 to 10 single-pole, single-throw switches packaged in a housing with leads on .100 x .300-inch centers. Rocker buttons operate at the touch of a pencil to permit instant programming of data input terminals, computer peripherals, testing and control instrumentation. Plug it into a DIP header or into one of several other AMP IC interconnection products. Or flow solder it directly into the pc board. Gold-over-nickel plating on phosphor bronze contacts makes the DIP switch ideal for "dry circuit" applications. Protective covers are available for all switch sizes, 4 to 10 positions.

For information on other AMP switches, just turn the page.
AMP pc board switches match

AMP pc board switches are suitable for a broad range of digital memory, sequencing, X-Y coordinate, input/output, and other program switching applications. Some are designed to be mounted to the same pc board as other circuit components. Other AMP switches can be panel mounted and interconnected to mother/daughter board with AMP pc connectors for fast, dependable connect/disconnects. All provide savings in packaging space and assembly costs by performing required program functions without remote switch wiring.

Thumbwheel switches offer broad interconnection flexibility.
Wide choice of back-end design options include contacts for use with post and receptacle interconnection systems or wrap-type and TERMl-POINT clip wiring methods, as well as extended board terminals. Extended board terminals can be flow soldered and will accept pc edge connectors and soldered wires. Compact 10-position switches can be used singly or in “ganged” units; are easily mounted in panel cutouts—from front or rear. Decimal and BCD outputs are standard, with optional coded formats available for special data entry, control or programming applications.

PC rotary switches minimize output leads.
All coding is internal to reduce required number of tab outputs and simplify on-board mounting. Output capabilities include 8-position BCO, 10-position BCD, 16-position hexadecimal plus single-pole decimal versions. Small diameter, low profile styles available with coin slot, bar-type knob or thumbwheel, to meet specific packaging requirements. Switch tabs can be flow soldered or hand soldered to etched circuit patterns.

Decimal rotary switch kits eliminate need for external switch wiring.
Because they can be readily designed into the logic board with related components, switch kits offer substantial savings in space and costs. Fully assembled switches in matrix configurations need less space than a pinboard of equal output.

Multilayer rotary switch provides easy coding changes.
A wide variety of coded outputs are possible in volume requirements by simple substitution of internal pc circuit discs. Output capabilities include decimal, hexadecimal and hexadecimal complement codes with up to 6 contacts and 16 positions per switch layer. Switches are stacked on a common shaft for space-saving installation. Available with post contacts for flow soldering directly to pc board, or with pin type receptacles snapped over posts for terminating to pc board connectors.
Matrix slide switches feature unique visual readout, greater positioning accuracy.

Roll-up design of the visual display indicator tape simplifies verification of data prior to entry, and permits maximum slide positions in minimum switch size. Ball detent slide positioning ensures positive, accurate slide setting at required switch location, prevents wear and abrasion between pc board conductors. The special, 5-position version replaces two switch units for compact, hand held calculators and similar applications. Other row and column matrix switches are available with up to 50 data entry output slides, and as many as 40 positions per slide.

Versatile pushbutton keyboard switch.

Fast acting pushbutton offering a choice of switching functions can be manufactured for specific needs: one SPNO or SPNC; two SPNO or SPNC; one NO and one NC in the same switch.

A contact bounce of less than 1 millisecond makes this the ideal component for momentary switching applications. Gold-over-nickel contacts meet low-level logic current requirements. Pushbutton switches can be snapped into panel cutout or soldered directly to pc board.
AMP also has switch designs for unusual applications.

Developing special products to help individual customers speed production and reduce electrical assembly costs has always set AMP apart. So it is with AMP switches. In addition to our complete line of rotary, slide, rocker, thumbwheel and keyboard switches for electronic packaging, we offer products designed especially for automotive, appliance, and other industrial and commercial applications. AMP engineering specialists will work with you to adapt...or develop new ideas for your special needs.

Appliance switch contact assembly.

Automotive dashboard toggle switch.

Automotive safety belt sensing switch.

Calculator slide switch.

Brake safety switch.

AMP engineering...the key to reliable switch performance. Worldwide.

Standard or special, every AMP switch is backed by the full resources of our engineering and customer services staffs. More than 700 qualified application, sales and service engineers are ready to assist you from the earliest stages of equipment design, to determine the best programming or switching method. AMP products and services are available at AMP plant locations and distribution centers in 16 international markets throughout the world. In United States, district offices are located in California, Georgia, Illinois, Massachusetts, Michigan, Minnesota, New Jersey, Ohio, Pennsylvania, Texas, and the District of Columbia.

For more information on AMP pc board switches, circle reader service number 75, or write AMP Industrial Division, Harrisburg, Pa. 17105.
More MOS/LSI engineering pros specify Western Digital’s FIFO (First-In First-Out) buffer memory because it’s the most cost-effective method of data speed buffering available.

The 40 characters x 9 bit formation matches your data. And you don’t have to pay for two devices to tackle the job of one. It’s ideal for terminals, computers or data communications systems. For interfacing high and low speed data with synchronous or asynchronous systems. For formatting. Or even as a digital delay line.

Simply insert the FR1502E FIFO into your data stream. Features like full TTL compatibility, tri-state data lines, master reset and status flags will make you stand up and cheer.

Order our FIFO in the 1 MHz input/output version.

Or now you have the option of half-time at 500 kHz for less price... the FR1502E-01.

There is no industry blackout on delivery at Western Digital. FIFO’s are available immediately in 28 pin DIP packages.

Free NFL Pennant

Our FIFO is the winner in the MOS/LSI league. Find out why. Write us on your letterhead and tell us the name of your favorite National Football League team. We will send you a pennant for your favorite NFL team, along with data on our MOS/LSI favorite. Write Western Digital Corporation, 19242 Redhill Ave., Newport Beach, California 92663. Tel: 714/557-3550. TWX: 910-595-1139.

Go with the action...Go Western Digital!
ATTENTION PROGRAM MANAGERS:
How to win a $10 million government contract with the new $20,250 Rolm Ruggednova:

For $20,250 you can meet Mil Specs E-5400 airborne environment, E-16400 shipboard environment, eliminate software and interfacing problems . . . and still buy the world's toughest computer system with 8K of memory and teletype.

If you're in the business of producing military systems, we don't have to tell you about budgets, risks, deliveries and design problems. Instead, let's talk about the Ruggednova 1602 . . . and how Rolm can help you win those big contracts.

A new technique for armchair control of RPVs (Remotely Piloted Vehicles) has been developed by Motorola Government Electronics Division for the Navy. The Ruggednova in the background helps provide either discrete or proportional control for up to six RPVs of any variety at ranges exceeding 250 nautical miles.

A significant benefit of our system is the availability of a compatible commercial equivalent. Any program written on the Data General Corporation's Nova series will operate on the Ruggednova.

SOFTWARE IS THE FIRST SAVING
You can effectively reduce the most expensive and longest lead-time item in a system's task with our wide selection of proven and documented software. You'll see your program working on the 1602 in less time because the Rolm software set includes assemblers, compilers, debugging aids, utility routines, math libraries and powerful operating systems.

MIL SPECS ARE ALREADY MET
We supply you with a qualification test report free. You don't have the hassle, risk, or expense of qualification testing. The 1602 meets Mil-E-5400 airborne environments, Class II; Mil-E-16400 shipboard environments, Class I; Mil-Std-461A electromagnetic interference and Mil-S-901 for high impact shock. It has an operating temperature range of $-55^\circ$ to $+95^\circ$C case temperature, at altitudes from sea level to 80,000 feet. The 1602 meets shock specifications of 15 g's with 11 ms duration and vibration tests of 10 g's, 5 to 2000 Hz.

NEW DEBUGGING FEATURE
Within the first 15 minutes of loading a program into the 1602 you can localize most program errors. A new "panel breakpoint" switch allows you to execute your program until it hits the address located on the 16 data switches. This allows you to verify good routines and identify program bugs. No more single stepping through 2,000 word subroutines or keying halts. It's a great time-saving software feature.

Now that we've told you about all the ways Rolm can help you get that multimillion dollar contract, there's no space left to describe a host of other features about the Ruggednova 1602. So, drop us a line and we'll send you complete data on the world's toughest computer. If you're interested in getting a head start on that contract . . . give us a call.
Simply the best low cost counter you can buy.....$299.

Now you can buy an economical counter with noise immunity and programmable offset to measure frequency, read rpm directly, or totalize events.

From lab to the production line, here's a rugged low-cost counter with all the most needed features to make industrial and laboratory measurements.

A unique digital frequency counter, the new Fluke Model 1941A operates over a frequency range of 5 Hz to 40 MHz. It measures frequency, reads rpm directly and totalizes. Sensitivity is better than 40 mV rms. Aging rate is a low 6 x 10^-7/day.

All functions are easily selectable and clearly marked. Read out is a big six-digit display clearly readable from a distance in high ambient light.

Functional “burn-in” eliminates marginal parts.

Options include programmable offset for fast, accurate go-no-go decisions even with an unskilled operator and a four line BCD output to directly drive printers and other peripheral equipment.

Best of all, there's no need to wait to put the 1941A to work. Throughout the U.S., Canada, and western Europe, this counter is in stock and available for immediate demonstration or delivery. A worldwide network of service centers provides 48 hour turn-around repairs.
INTRODUCING
THE TWO-FACED SWITCH

EECO introduces the Stripswitch™—a versatile, low cost printed circuit switch that's available in strips of one to eleven stations, for ease of handling and installation.

Because it's two-faced, you can mount it either horizontally or vertically.

And you can wave-solder it directly to the printed circuit board.

Saves you money
Stripswitch is inexpensive to begin with—less than $1 per station in quantity.

And, because you can wave-solder it directly to the printed circuit board, the need for rivetting, eyeletting, mounting hardware, switch-to-board wiring or expensive special plating is normally eliminated.

Actuates three ways
You can actuate Stripswitch by means of:

- knurled wheels.
- screwdriver or shaft extension and knobs.

Guaranteed rugged
The Stripswitch is a simple, rugged design available in a variety of codes and switching functions, backed by an exclusive two-year warranty. And it's constructed from materials that can withstand caustic cleaning solutions.

That's the straightforward story of our two-faced switch.

For more information write to Electronic Engineering Company of California, 1441 East Chestnut Ave., Santa Ana, California 90701. Or phone (714) 835-6000.

INFORMATION RETRIEVAL NUMBER 144
A MINI-LIBRARY OF SEMICONDUCTOR GUIDES FROM HAYDEN...

THICK FILM TECHNOLOGY
By Jeremy Agnew
This volume constitutes an actual working guide to hybrid circuit manufacture and packaging. It begins with an overview of the processes and equipment used, compares them, and underscores the advantages of each. The book details each processing phase, fully describing what to do and what pitfalls to avoid. Other valuable sections cover packaging schemes and processing hazards and cautions. The volume's abundance of practical advice and data make it ideal as an on-the-job reference. 176 pages, 6 x 9, illus., $8.50

TRANSISTOR AND DIODE NETWORK PROBLEMS AND SOLUTIONS
By Harry E. Stockman
This guide demonstrates the latest mathematical solutions for the entire field of transistor and tunnel diode calculations, including linear as well as non-linear applications. It shows how to select the best type of solution, set up the network equations, and carry out the solutions. It also uses new theories — including the author's "Equivalent Generator Theorem" — in the treatment of function sources. In addition, a valuable "do" or "don't" list enables you to avoid any time-wasting calculations. 352 pages, 6 x 9, illus., $9.95

TRANSISTOR AND DIODE LABORATORY COURSE
By Harry E. Stockman
A practical, self-learning course that progresses systematically from simple fundamentals to highly intricate experiments. The experiments in the first half of the course lay a working foundation in transistor technology with two-port-theory viewpoints applied continually to give all the experiments a practical engineering slant. One valuable feature is the negative resistance demonstration — the first presentation of this device ever to appear in print. All experiments can be performed on very low-cost equipment. 128 pages, 7 1/2 x 10 1/2, illus., $3.95

MATERIALS FOR SEMICONDUCTOR FUNCTIONS
By E. G. Bylander
This comprehensive reference enables you to select semiconductor materials aimed at optimum performance, reliability, and profitability. It provides complete selection criteria for a variety of functional applications: diodes and transistors, solar cells, thermoelectric devices, transducers, etc. The guide also covers material processing techniques and device design and manufacturing, listing variables in material manufacturing that influence device performance. 220 pages, 6 x 9, illus., $13.50

FUNDAMENTALS OF INTEGRATED CIRCUITS
By Lothar Stern
Here is a book offering complete coverage of the various techniques of IC fabrication and their importance to circuit performance. Included is a valuable marketing discussion comparing the relative qualities of the IC's currently available in terms of economics and logistics. The guide focuses on basic semiconductor principles, monolithic integrated circuits, thin-film circuits, and hybrid and other integrated structures. Here too is a discussion of packaging, design, and layout principles, and large-scale integration. 208 pages, 7 x 10, illus., $8.95

DURABILITY AND RELIABILITY IN ENGINEERING DESIGN
By Gilbert Kivenson
A unique combination of materials science, reliability, and design, this book examines crucial concepts of material strength, service longevity, and reliability, and describes the fundamentals of breakdown analysis. It covers new materials, design techniques, and fabricating methods and focuses on their probable uses in future products. Current trends in design "philosophies" are outlined, as well as practical design considerations relating to the requirements of the end user. 200 pages, 6 x 9, illus., $9.95

15-DAY FREE EXAMINATION
Please send me the book(s) circled below on 15-day free examination. At the end of that time, I will remit payment, plus postage, or return the book(s) with no further obligation.

$10.00 minimum for free exam orders. Because of higher billing and collection costs, we must ask for payment in full with any order for less than $10.00. Same 15-day guarantee.
Oscilloscopes for most production, inspection, QC and lab applications are not used to their full capability. In fact their full capability in bandwidth may even need to be limited by an external bandpass filter for easier trace readability. In one electronics manufacturing facility a survey of 22 applications discovered 19 applications which were appropriately served by our least expensive $179.95 oscilloscope with recurrent sweep and 2MHz bandwidth. A survey of your facility may reveal similar opportunities for saving. Our triggered sweep scopes with 10MHz bandwidth and 35 nanosecond rise time answer the needs of over 80% of all applications. Sensitivity of 10mV/cm offered by both our single and dual trace triggered sweep scopes is similarly suitable for over 80% of all applications.

Why overspecify your oscilloscopes? It's not necessary if the intent is to be sure you get the repeatability, reliability, ruggedness and versatility that is characteristic of every B&K oscilloscope. Move your ultra-wide bandwidth scopes to other applications where you need them. You'll find the B&K scopes easier to use with their simplified, human-engineered panels and controls.

**10 Day Free Trial**

With more than 20 years successful experience in manufacturing fine test equipment at competitive prices, Dynscan has the confidence in its new B&K instruments to offer them on a 10 day free trial basis. Just properly identify yourself, your company and your application and we'll supply a new oscilloscope that will prove our claim to quality and value. Write on your letterhead for complete specifications and Free Trial.

INFORMATION RETRIEVAL NUMBER 14
If you've been getting more than your share of faulty plug-in and wire-wrapped panels lately, you should talk to us: Garry Manufacturing.

At Garry, we take extra care to insure that you get a better wire-wrapped panel. Whether you buy a plug-in panel from us (and wrap it yourself). Or, whether you let us wrap it for you.

Either way, you get a better panel. Because our unwrapped panels are more "wrappable" (square-ness, for example, is exactly .025 inch).

It never varies. Our precision beryllium spring clip has the most consistent I.C. insertion/withdrawal ratio in the industry. All this because our facilities are among the world's best.

This attention to quality is nothing new to Garry. For 25 years we have been supplying contacts to the connector field. We have the largest facilities for making contacts and do not rely on outside suppliers for our parts. We have plants in the U.S. and Switzerland. And we have a long list of very satisfied customers, including the 5 largest electronics manufacturers in the United States.

Why not find out more about Garry panels? About our ultra-reliable contacts. Our design and engineering service. Our extra-fast delivery/turnaround. And our technically-oriented sales staff.

They just might help you beat a bum wrap.

Garry's panels are available for less cost, with up to three levels of wire wrap, in any quantity. Get all the details. Send for Garry's literature.

Garry Manufacturing Co., 1010 Jersey Ave., New Brunswick, New Jersey 08902.

Garry Manufacturing Co.

We won't pin a bum wrap on you.
Announcing standard off-the-shelf SHP packaging components...

Navy Standard Hardware Program packaging made easy and profitable

If you're supplying equipment to Navy Standard Hardware Program guidelines, our ingenious new SHP Packaging System will make coming up with the packaging absolutely simplistic and halve your packaging costs at the same time.

No sweat SHP
First off, we make designing the packaging so effortless we estimate you'll cut your total design load for the procurement by a third because that's what our first customers are experiencing.

Production consists of putting parts together — just a handful of different kinds — like an erector set. Only easier. That saves you thousands of dollars in design time, in dies and other tooling and a lot of trouble to boot.

Conductive, convective and strong
And when you get finished you'll have packaging for your circuitry with the high order of thermal efficiency you'd expect from industry's leading manufacturer of circuit heat dissipating devices. Plus mechanical integrity that's ready for the most demanding environments.

Packaging that cannot be individually produced for twice the price.

Hold that cost proposal
That's a pencil-sharpening fact you can ill afford to ignore if you're in the middle of preparing a proposal in response to an RFP that calls out SHP — or if you ever expect to bid an SHP program.

Here's how our new SHP Packaging System works:
We've designed six basic parts — plus a few specials for unusual configurations — with which you can build circuit module housings conforming to Navy Avionics Facility, Indianapolis, guidelines and dimensions for any of the common SHP-defined circuit modules using nothing but a screwdriver.

Ad infinitum
You can build these packages to accommodate any combinations of the various SHP modules, and the potential dimensions of the packaging in span and depth are for practical purposes limitless.

In fact, our system is so versatile it can be adjusted to handle non-SHP-dimension modules as well. If you need any kind of module housings and like to save money, the IERC SHP Packaging System is for you, too. OK, you say, I'm interested. What's the first step?

Paper reveals all
Phone, write, or circle to get our hot-off-the-press 17-page paper that gives all the details including engineering drawings of parts and assemblies and a section on how to design SHP packaging using the IERC system.

If you're involved in SHP or ever expect to be, get involved with the IERC SHP Packaging System today.
Ask about our SHP module plates including our revolutionary Metal Core Circuit Board plates for extremely high power densities, too. International Electronic Research Corporation, a subsidiary of Dynamics Corporation of America, 135 West Magnolia Blvd., Burbank, Calif. 91502. (213) 849-2481.
Inverter-Rated components were developed specifically for inverter circuits. This advanced ferrite technology gives you components optimized for low power loss. They keep their cool to 150°C.

Specs that make sense
The improved characteristics of Inverter-Rated components are spelled out in terms of their circuit performance under both maximum and recommended conditions. You get design flexibility and data you can use directly—not just routine magnetic parameters.

You can design precisely with guaranteed component characteristics. And you can select optimum components without using trial-and-error approximations in meeting your power conditioning requirements in computers, motor controls, lighting, telephone systems, ignition systems, displays, watches, appliances, etc.

Circuit performance
We test Inverter-Rated components as inverters to assure performance in your circuit. These new components meet specified electrical characteristics in addition to closer magnetic tolerances.

The performance you design in—stays in. And the production version of your design meets your circuit conditions.

Expanded line
You get design flexibility with the full range of Cross Cores, Pot Cores, Toroids, U Cores, and E Cores. Inverter-Rated components are available now in production quantities. All with factory-ready hardware.

New design guide
Our new design guide speaks your language and gives you complete component specifications, temperature characteristics, application data. Key information you need in applying the latest ferrite technology to your inverter designs.

The reader service card will get you a copy of our design guide and (201) 826-5100 will put you in touch with the men who wrote it. Either way, if you're talking inverters, talk to the ferrite experts.

That's us.
Indiana General, Electronic Products, Keasbey, N.J. 08832.

National distribution through eight Permag locations.
KEMET® Ceramics:

The new "Blue Max."

Meet the KEMET "Blue Max" maximum-range line—a whole new flight of subminiature, precision epoxy-dipped, radial-leaded, monolithic ceramic capacitors.

"Blue Max" Capacitors achieve new heights in precision manufacturing. With a protective epoxy sheath that coats the case, not the leads.

And "Blue Max" Capacitors win highest honors for selection range.

Ultra-stable NPO, stable X7R, or general-purpose ZSU dielectric. Six basic case sizes in over 300 different models, in values from 2.2 pf to 4.7 uf. For 50, 100 or 200 VDC working voltages. All with easy-to-read markings and solder-coated, copper-clad steel leads—ready to assemble in your circuits.

Write for specification data and free engineering samples.

U.S. weighs Israeli request for latest ECM equipment

The U.S. State Dept. is studying a request from Israel for first-line American electronic countermeasures equipment. In keeping with Defense Dept. rules, U.S. allies ordinarily are not supplied with first-line weapons, for fear they might fall into the hands of a common enemy.

The Israelis' specific need is for airborne ECM equipment to foil the Soviet-built SA-6 ground-to-air missile radars, which have been used so successfully by the Syrians and Egyptians to shoot down many Israeli planes. The Israeli aircraft carry Sylvania-built ECM packages to cope with the SA-2 and SA-3, but they have nothing to counter the SA-6. The SA-2 uses a slant range of about 20 miles for defense against high-altitude approaches, and the SA-3 slant range of about 17 miles for low-level attacks. Some Israeli planes also carry the passive radar-homing, air-to-surface Shrike missile, built by Texas Instruments.

Most ECM equipment in Israeli aircraft has been of the deceptive type, as opposed to the straightforward noise jammers, which transmit high-powered noise with a gaussian distribution.

Deceptive ECM receives an enemy radar signal, examines it, reorganizes it and sends it back. The result is an erroneous signal on the enemy radar screen. The pulse reorganization may consist of a change in shape, phase or polarization. These changes cause the radar to present a false reading for the aircraft's direction, speed or distance.

Such ECM has been used by Israel rather than noise jammers for a number of reasons:
- It's simple; noise jammers require a separate receiver in addition to the jammer and also a tuning device to find the enemy's frequency.
- The deceptive ECM package is small and does not require the large amount of power the jammer does.
- The jammer can only handle one frequency at a time, whereas the deceptive package can receive 100 signals, each at a different frequency. And
- Since deceptive equipment operates in nanoseconds, it can handle all the signals.
- The deceptive kits can be programmed to deceive a variety of radars.

Israeli units have been effective against SA-2 and SA-3 radars because there is abundant data on the SA-2 and some on the SA-3. U.S. pilots in Vietnam had seven years' experience with the SA-2, and the SA-3 has been in Egypt and elsewhere for several years. Experience with the SA-6, however, has been extremely limited.

The American EA-6B electronic-warfare aircraft, built by Grumman, is equipped to counter the SA-6 missile radar. But, the U.S. has not tested the plane in combat against the SA-6.

"What's needed," says Roger Bush, Grumman, EA-6B business-development manager in Bethpage, N.Y. "is complete data on the SA-6 acquisition radar—operating frequencies, pulse-repetition frequencies, power capabilities and antenna characteristics, like beam width and scan angle.

Bubble-memory material promises faster readout

A new bubble-material compound promises optical readout of bubble memories with low-power light sources and a hundredfold increase in readout speed.

Developed at RCA's Physical Electronics Laboratory in Princeton, N.J., the compound—known as bismuth thulium garnet—could hasten the commercial application of bubble-memory technology to information processing.

Until now, says Dr. George D. Cody, director of the laboratory, bubble-memory technology resisted optical-readout approaches because bulky and expensive, high-powered light sources—such as gas lasers—were required. With bismuth thulium garnet, light sources as low-powered as light-emitting diodes can be used to read out bubble-memory data, he reports.

This is possible, Cody explains, because light interacts with the new compound 10 times more readily than with other garnets previously used for bubble memories. The interaction is called Faraday rotation.

To detect bubbles optically, it's necessary to shine a polarized light through the garnet material onto photodetectors. When bubbles move through the polarized beam, Faraday rotation causes the amount of light that reaches the detector to vary, and a change in signal is produced.

Non-optical techniques—such as magneto-resistive—have been used in the past to read data out of bubble memories. However, these techniques are slow and reduce the inherent data-storage capacity of the bubble memory by as much as 25%. Optical readout techniques are faster. And since the optical-readout technique doesn't take up a lot of real estate, it should be possible to use many detectors—which would increase the readout speed even more.

AF data link to use time-shared system

A time-shared, X-band data-communication system that allows several thousand users to send, receive or share information simultaneously—but doesn't require any message center or switching facility—is under development by the Air Force.

"Information is not switched from point to point, like in conventional communications systems," explains Lt. Col. K. H. Krunlund, project officer at the Air Force
Univac's complete switch

Medium-scale computer

announced by Univac

A medium-scale, general-purpose

computer has been introduced by

. Called the 90/60, the proc-

cessor has an instruction rate that

is 60% higher than the IBM

but costs 6 to 16% less,

according to Univac.

The new computer uses semi-

conductor memories, which repre-

sent Univac’s complete switch

from plated-wire to solid-state

technology.

The main memory of the 90/60

is a MOS—made with 1-k RAMs—

that operates in a byte-oriented

mode. Access occurs with a cycle

rate of 600 ns for each full word

(four bytes). A writeable control

store (microprogram) implements

each computer instruction and al-

 lows emulation of selected Univac

and IBM machines. Memory size

is expandable from the initial 131-
k bytes to 262 in 32-k steps.

The processor's I/O structure in-

cludes a byte-multiplexer channel

that can operate at rates up to 175-
k bytes and up to three selector

channels (for block-data) with

1.1-M byte/s throughputs. And up
to 30 phone lines—a capacity of

about 100 CRT terminals—can be

supported with an external con-

troller.

The computer handles Univac's

full peripheral line, which includes

119-M byte disc drives with 30-ms

access time. The byte orientation

provides compatibility with most
data formats.

Acoustic-wave filters

studied for TV use

Surface acoustic-wave filters are

fast approaching the point where

they will be used in common, band-

pass applications instead of the
discrete-element filters now used,

according to Roger H. Tancrell,

principal research scientist at Ray-

theon Research Div., Waltham,

Mass. A number of laboratories are

working toward this goal, Tancrell

says, including Zenith and other

TV companies that plan to use

lithium niobate acoustic-wave fil-

ters for the i-f stages. The prob-

lems in producing filters like this

were described by Tancrell this

week at an IEEE Ultrasonics

Symposium, held at the Naval Post-

graduate School, Monterey, Calif.

In a paper on “Design Considera-
tions for Surface Acoustic Wave

Filters,” Tancrell said: “The range

we're interested in lies between

0.1% to a 30 or 40% bandwidth,

with a center frequency from 10

MHz to as high as 800 MHz.”

The latter frequency, he pointed

out, is still fairly experimental,

whereas the lower-frequency de-

vices are close to mass production.

To illustrate the acoustic surface-

wave filter design, Tancrell cited a

filter centered at 50 MHz with a

17% bandwidth.

“The principal problem in this
type of filter,” he noted, “is to

keep the ripple in the bandpass as

low as possible. While we’ve been

able to get the ripple down to ±0.2

dB, a number of adverse factors

have to be overcome. These include

trip-transit echo and reflections

from the edges of the metalization

pattern.

“Triple-transit echo,” he ex-

plained, “is due to reflections

bouncing back and forth between

the input and output transducers.

A principal means of reducing

this echo was the specific use of some

22 dB of insertion loss in the filter

design. This loss was obtained by

using a multistrip coupler between

the two transducers as well as de-

liberately mismatching the input

impedance of the device.

“Reflections off the edges of the

metalization pattern were mini-

imized by splitting the electrodes in

the transducer, thus changing its

mechanical resonance.

A novel use of mass-producible,

acoustic surface-wave filters was

reported by Paul H. Carr, chief of

the microwave acoustics branch of

the Air Force Cambridge Research

Laboratories, Bedford, Mass. He

described the use of 21 filters on a

2-cm-long-by-9/10-cm-wide lithium

tantalate slab as a narrowband fil-

ter bank.

Carr explained that for the syn-

thesizers, a comb of frequencies

ranging between 520 and 650 MHz,

with 5.3 MHz between individual

frequencies, was generated from a

quartz oscillator.

“In our case,” he said, “21 dis-

crete outputs are selected by the

acoustic filter. The very small,
surface-wave filter size as well as

the fact that it can be reproduced

by standard photolithic techniques,
makes the device unique.”

“Based upon our experiments,”

Carr explained, “we can eventually
double the frequency of the device.

To do this, we are now investigat-

ing thin films of aluminum nitride

on sapphire, which has roughly
twice the velocity of lithium tan-

talate.

“In developing the synthesizer

filter, a basic problem—that of re-

fections from the hundreds of

lines on the filter—was overcome

by a technique of “line thinning.

“We omitted transducer lines in

a regular pattern,” he explained.
The Tektronix programmable calculator! At $2,850, it's a natural!

If you know the math language, you're ready to program our Model 31. No computer language is needed... that's how natural it is! It lets you write the way you think. Sequentially stays the same.

It's powerful! A problem-solver close at hand. You have over 30 math functions built into our keyboard. Plus 24 more keys and an exclusive plug-in PROM for functions you define. The 31's memory is expandable up to 8,192 program steps and 1,010 data registers. And it interfaces with peripherals... including our 4010 graphic terminal. That's power.

It's much less expensive. We think when you compare our 31 (or our 21, at $1,850!) in price and function, you'll decide to own a Tektronix programmable calculator.

Prices do not include silent alphanumeric printer ($700—TEK 31; $450—TEK 21) and additional memory. The next step is to send this coupon to Dwain Quandt at P.O. Box 500, Beaverton, Oregon 97005. Dwain will send you our 16-page brochure and a free demonstration, naturally, if you like.

I am in the market for a calculator within

Just a few reasons why we’re

That’s right. We’ve got the largest selection of LED’s anywhere, just waiting to fit into one of your clever application plans. All our GaAsLITE light emitting diodes are versatile and many work for practically nothing (like the MV54 @ 10¢ apiece in quantities of 100,000). And they’re more than prepared to put most conventional lamps out of the picture—from auto dashboards and appliances to computer panels and test instruments. Check into our broad line, now. We’ve got an LED that’s just right for your next application. GaAsLITES are in stock, worldwide, at a distributor near you.

Ask for the LED’s with the reputation for outstanding quality.
first in Light Emitting Diodes.

Putting innovation to work.

Monsanto

A unit of Monsanto Company
A multichannel laser remote control system that can be used to control vehicles and other equipment in hazardous locations has been developed by engineers at NASA's Langley Research Center in Hampton, Va.

The system is said to be particularly useful in areas where radio or hardwire control is unsatisfactory or prohibited. It provides, for example, a means of remotely controlling vehicles vacuuming and removing radioactive debris and waste material from nuclear engine test sites.

Tests have shown the system to be operational over distances greater than 360 feet in direct sunlight.

The over-all system consists of a control station on which is mounted the laser transmitter and a receiving station on the controlled vehicle. A key element in the system, according to E. E. Burcher, one of the developers, is the optical "antenna" located on the vehicle. To capture energy during all vehicle maneuvers the optical antenna accepts a laser signal through an azimuth angle of 360°.

This performance is provided by a "parabocone"—an optically polished conical surface that has a shape defined by rotating one leg of a parabola about an axis through the focus and perpendicular to the parabolic axis (see photo). Incident light from any direction in a plane normal to the parabocone axis is automatically focused on a photosensitive detector.

Around the cylindrical base of the parabocone is a strip of "Scotchlite" reflecting tape. This reflects a portion of the laser energy—the beam is deliberately spread for this purpose—back to the transmitter and to a special tracking receiver that keeps the transmitter pointed at the parabocone antenna as the vehicle moves about.

The laser, a 1-mW helium-neon unit that radiates at 0.6328 μm, is amplitude modulated by sine-wave subcarrier oscillators—one for each of the five command channels necessary to control two vehicle propelling motors and a vacuum blower. A sixth subcarrier channel provides a signal that is used in the transmitter-tracking receiver to keep the transmitter aimed at the parabocone. Six widely separated frequencies in a 10 to 200 kHz range of the laser modulator allow sufficient band and harmonic separation.

**Receiver tracks vehicle**

The tracking receiver is mounted atop the laser on a turntable that rotates in azimuth to follow the vehicle motion. The tracking receiver, which is boresighted with the laser beam, consists of a pair...

---

**Receiving system for laser control** reflects beam onto a photodetector. Five subcarrier signals between 10 and 200 kHz are amplified and passed on to tuned circuits that control the switching functions of motors.
OPEN WIDE AND SAY "Ahhh... Now that's what I call a SNAP SWITCH CATALOG!"

Send for this new Cherry Handbook and Guide

Just what the doctor ordered: "instant access" and "tell-all data" on scores of basic Cherry Snap-Action Switches and tens of thousands of variations. Complete with the unique Switch Selector-Locator that lets you choose—in seconds—the right snap switch for any application. Plus engineering drawings, specifications, operating characteristics and technical data. Plus, never-before-published "inside" information on Cherry's plant facilities, equipment, in-house manufacturing capabilities and worldwide sales offices. All in a handsome new, easy-to-use 72-page format. And it's yours for the asking: Just TWX 910-235-1572 . . . or PHONE 312-669-7702 . . . and ask for Frank.

of photomultiplier tubes with lens systems.

The laser energy reflected from the Scotchlite tape on the parabocone is split in the tracking receiver by an aluminized prism that directs half of the reflected energy onto the face of each phototube. This receiver responds only to the frequency of the sixth subcarrier channel.

The outputs of the phototubes are amplified, filtered, rectified and sent through a nulling circuit that produces a signal when any difference between the outputs occurs, as when the controlled vehicle moves. For such an unbalance, the tracking system output is applied to a dc motor that rotates the turntable until a null position is attained. This keeps the transmitter pointed at the moving vehicle antenna. To reject background noise a narrowband interference filter is employed in the tracking receiver.

To make capture and control of the moving vehicle easy, the laser beam is spread to a 15-inch diameter at the parabocone antenna location. Spreading is accomplished by using a negative lens at the transmitter aperture.

The controlled vehicle station consists of the parabocone, a solid-state detector, a demodulator and switching circuits.

The parabocone collects energy from all directions. The upper support is designed for minimum obscuration, while the lower cylindrical section houses the electronics and also acts as a background-noise shield.

The laser signal from the detector is amplified and fed to the demodulator, which consists of circuits tuned to the individual (five) command functions. When a voltage appears across one of the tuned circuits a field-effect transistor energizes a switching circuit related to that particular command frequency.

The switching circuits control the rotation of the two dc motors that propel the vehicle. A high degree of maneuverability is obtained because both right and left motors may be commanded backward and forward simultaneously.

The system is fail-safe because the presence of a subcarrier is necessary to provide the driving function. Obstruction of the beam or loss of tracking halts the vehicle.

Tracking response of the system is measured by positioning the parabocone Scotchlite area in the center of the laser beam, 45 feet from the transmitter and adjusting the tracker output to zero. The retroreflector is then moved laterally until the tracker follows. In the prototype equipment a dead-zone of ±1.25 minutes of arc was found, that was due to relatively high friction in the prototype turntable. ■■

**Mars Photo process finding earth uses**

A digital image processing and comparison technique, used to process transmitted images of the surface of Mars, is expected to find eventual application in aerial reconnaissance and topographic mapping.

Developed by Dr. Lynn H. Quam of the Stanford University Artificial Intelligence Laboratory, Palo Alto, Calif., the technique was designed to process the images transmitted by Mariner 9 during its orbits of Mars last year. By processing two overlapping pictures of the same object and normalizing the images to remove the perspective effects of different camera angles and lighting, it is possible to digitally subtract one image from the other. Thus, it is possible to compare pictures of the same feature regardless of when they were taken and under different camera and lighting conditions.

The digitized pictures from Mariner 9 were submitted to the laboratory in the form of magnetic tapes which contained more than 50,000 elements per picture. Each element consisted of a 9-bit word showing 512 possible gray shades. Each photographic frame consisted of an 832-by-700 element array. The information from up to 500 individual frames was stored in two IBM 3330 disc packs. The actual image processing and comparison was done with a PDP-10 computer.

A display is then generated showing all the frames that cover a desired area. Two frames are selected that give the best coverage. By using information about the position of the camera in relation to the surface the computer transforms both pictures to a common scale, as though the two pictures were taken from the same distance and position. Because of uncertainties in the camera-pointing information, the two images must then be brought into registration. This is done by breaking the picture up into 25-by-25 element areas, correlating the required displacements of each element and finally distorting one picture to make it match the other. Finally, one picture is subtracted from the other, leaving only the picture elements which are different.

The new technique makes several important contributions to picture processing technology. It permits accurate geometric registration of two images. Similar techniques have been used in character recognition experiments, but they have never been used to align two complex pictures. Also, normalizing the image illumination permits pictures to be compared without the confusion caused by different lighting levels.

Although the technique was devised for astronomical purposes, Dr. Quam is currently experimenting with other possibilities.

"By matching the areas of two parallax views of a scene, the depth of points in the scene can be located rapidly, practically in real time," according to Quam. This means that by comparing two aerial pictures of an area, the map contours can be generated automatically—and accurately, important for military applications. ■■
556: A real IC two-timer.

Man, did you inundate us with applications for the 555 single timer. You used it for every possible function from light switches to audio generators to RF outputs. And then, you often used a second 555 to control the function you'd generated with the first one. We got the message: put two of these babies on one chip. Here it is—the 556 dual timer. Two 555's on a chip. Twice the product at less than twice the cost. 100 up: $1.25. How's that for responsiveness?

Think of what you can do. Each timer on the 556 chip is independent, and needs only the appropriate values of C and R to function as a time delay, oscillator, pulse detector, power modulator, or what have you. Any kind of output you can dream up from one side, and the control from the other side. Go wild—it can become anything from a toy to a household appliance to a communications breakthrough.

Run free or latch with external triggering. You've got a time span from microseconds to an hour, and duty cycles are adjustable from 50% down to 0.01%. If you're a knob twirler, enjoy yourself by changing timing at will on a 10:1 ratio.

No sweat on power, either. Anywhere from 5 to 15 volts does the job, with only 1% maximum timing change from bottom to top. And what you get out will source or sink 100mA. Temperature stability is instrumentation grade, 0.005%/°C. Intrigued? Curious? Want to try one for yourself? For our own amazement, send us any application diagram you can think up for the 556 dual timer. We'll reward you with a FREE sample to tinker with. In timely fashion.

CLIP THIS TO YOUR LETTERHEAD FOR FAST REPLY.

Laser point-of-sale system speeds checkout

Do you sometimes get nervous watching the checker ring up your grocery bill in the supermarket? Didn't she hold down 79¢ five times instead of four?

IBM has developed a point-of-sale system that will let a laser do the job without making mistakes—and do it faster than a clerk ever could.

Using a fast, two-handed motion, a single clerk can both check an item—by pulling it across a 6.5-inch scanning window—and bag it at the same time. No special alignment of the code is necessary. The checker merely holds it face down, and the code can be read on items moving as fast as 100 inches per second.

Called the IBM 3660, the supermarket system consists of a terminal that is equipped with its own buffered storage where scanned or keyed data are entered and checked for accuracy before transmission to the store controller. When a message is received at the terminal, it is edited and transferred to the unit's display and printer.

Terminal adapters are available for the attachment of electronic scales and dispensers at the checkout stand. A high degree of accuracy results when produce and meat are weighed, and when change and trading stamps are issued to customers.

The terminal uses a two-station printer that produces the system's descriptive customer receipt and a summary journal tape for the store. Each printer position prints up to 30 characters with full alphanumeric capability. The journal tape is printed at 50 lines per minute; and the document insert station, which can be used to print information on customer checks, prints at 35 lines per minute.

The comprehensive sales receipt is printed at 80 lines per minute and can contain each item's name or description, number, price and tax status, total amount due, amount tendered and the change and stamps due to the customer. The receipt can also contain the date, time, checkstand number and a promotional statement customized for each store.

A character-display panel shows an alphanumeric message up to 22 characters long. During a transaction, for example, when a checker scans a loaf of bread, the display will show "BREAD .42"; thus visual verification of the entry is provided.

The keyboard consists of a 10-key numeric pad and 25 function keys. These keys are for transactions in which the checker must enter information about items not marked with the grocery product code—for example, item or department number, price, quantity or weight—as well as when the checker must issue a refund, handle a check, food stamps or coupons.

A system that includes a terminal station and a terminal control unit can be bought for $5800. The terminal station alone costs $2700. The scanner will cost $4000. First shipments are scheduled to begin in the third quarter of 1974.
What this country needs is a good $1,000 full-scale computer.

Introducing the computer for everybody, NAKED MINI™/LSI.
It's the computer for people who never thought they could afford a computer for their product.
It's also for people who have always been able to afford more, but have always gotten less computer than this.

NAKED MINI/LSI is the first OEM minicomputer designed for widespread, multi-level use. The first computer able to do more jobs than any computer could ever do before.

To do this, we had to give it an unheard of combination: extensive 16-bit computing power, large memory, and a small price tag. Specifically, NAKED MINI/LSI is the first computer powered to satisfy 90% of all potential minicomputer applications—and yet be priced as low as $990 in OEM quantities of 200. And that price includes 4K words of memory.

Imagine it. For a price less than most hardwired circuitry or even a microcomputer, your product can benefit from a general purpose computer having powerful arithmetic capabilities, up to 256K 16-bit words of memory, both byte and word processing, and uniquely flexible input/output.

Without going into all the jazzy widget features, let's just say that the NAKED MINI/LSI gives your product all the performance it could need to monitor, sequence, and control effectively. Which means your product will be more competitive, more flexible, and more immune to obsolescence.

And because we used LSI technology to make our new computer, you can add all this clout simply by plugging in a single card that measures 1" x 15" x 17" and weighs only 4 pounds.

WHEN THE CHIPS ARE DOWN WE DELIVER!

We said it and we meant it. We're USCC/Centralab and we said we were preparing to meet the capacitor delivery crisis by substantial commitment to automated production machinery and facilities expansion.

We did it, and we've got the chips to prove it — ELEVEN MILLION in stock, most in the following popular sizes:

- **BC** - 0.080 ± 0.010 x 0.050 ± 0.010 .045 T MAX
- **BF** - 0.100 ± 0.010 x 0.050 ± 0.010 .060 T MAX
- **BI** - 0.150 ± 0.010 x 0.050 ± 0.010 .060 T MAX
- **DJ** - 0.180 ± 0.010 x 0.080 ± 0.010 .065 T MAX
- **FH** - 0.125 ± 0.010 x 0.095 ± 0.010 .065 T MAX

We'll also deliver non stock and custom chips in not more than 8 to 12 weeks A.R.O.

Whether it's an immediate or future requirement, contact our applications engineering department now at (213) 843-4222, or our local representative.

INFORMATION RETRIEVAL NUMBER 24
LEDs check transient response of sensors

The light output from a LED array is used in a new test system for measuring the transient response of sensors such as charge-coupled devices, and television camera tubes.

The fast response of the LEDs—in the order of a few nanoseconds—allows a single horizontal line of a TV tube to be checked, according to James M. Moore, system designer. In the test setup, the camera is focused on the output of the LED array.

Developed at the Naval Air Development Center, Warminster, Pa., the system is used to check the transient response, or lag, of TV tubes, which has an important effect on the dynamic resolution and image quality.

Previous equipment built for this purpose has been cumbersome and somewhat unreliable, says Moore. Such data, he notes, is normally obtained from the video waveform displayed on an oscilloscope and covers one or more fields at a time. The accuracy of this data is limited by distortion of the waveform due to preamplifier noise, 60-Hz hum and shading and shifting of the clamping levels.

Several desirable features are incorporated in the new equipment:

- The on and off periods of the LEDs are independently adjustable. Long periods are provided to check for tube hysteresis and overload recovery.
- A method of measuring lag as a function of position on the raster is incorporated.
- Special triggering signals are generated to provide stable, repetitive waveforms on the oscilloscope. A triggering function is included that permits the selection of any single line for viewing, thereby obtaining a high degree of accuracy in measuring the data.
- A means for presenting the total buildup and decay lag is designed into the equipment.
- The driving pulses for the LEDs are adjustable in magnitude to permit measuring tube output levels over the operating range of the tube.

A delay circuit provides the main timing pulses for the unit. A vertical sweep drive input initiates a gate that allows programmable counters to count the number of horizontal drive pulses.

Horizontal and vertical drive signals control the circuits of the tester for measuring lag in TV camera tubes and other image devices. The output of a LED array is pulsed to provide a fast light source for the camera.
Oak presents a short course in keyboard switch selection you can’t afford to miss.

Our course could be called "Basic Economics in Keyboard Switch Design." It sums up more than 40 years of leadership in switch design and manufacture at Oak. Take a look at our course:

At the top: the Oak Series 400 Standard Keyboard Switch. It's what you're looking for if you want economy plus reliability. Millions are in use today in every kind of keyboard application.

And our Series 475 Compact Keyboard Switches (bottom) are about the shortest premium quality units you can buy. And, like the Series 400, they're ultra-reliable and economical.

Next subject: Oak Series 415 Low-Profile Keyboard Switches designed for calculators, security devices and data entry equipment. Note the streamlined silhouette. Select colors, custom caps and legends, % or /%+, single and double keys to fit your needs exactly.

We can say that because our automated manufacturing and test equipment ensures quality. And we design our keyboard switches with the operator feel, reliability, and economy it takes for such applications as data terminals, calculators, business machines, and more.

That's it. Just be sure to follow up on what you've learned. Write for Oak Keyboard Bulletins.

Class dismissed.
Who to call for fast delivery on Oak Keyboard Switches

Oak Series 400 and Series 415 Keyboard Switches are available from a distributor near you. He'll supply your desired quantities and ship standard 10, 12 and 16-button keypads as well. It's the way to get Oak quality switches fast!

Energy meter improves aircraft performance

A new type of electronic aircraft instrument called an energy meter has been developed for use in high-performance aircraft. The instrument promises to substantially improve a pilot's flight efficiency and aircraft performance.

Developed by Honeywell, Inc., Minneapolis, Minn., the device provides the pilot with new parameters that have not been directly monitored before in flight operations. These parameters are: the potential energy of the aircraft due to its height above ground, and the rate at which the aircraft's potential energy is being exchanged with kinetic energy during climbs, dives or turns.

Use of this meter permits the pilot to rapidly and accurately set up optimum flight conditions for a variety of maneuvers, including:

• A minimum-time climb to a given altitude.
• A minimum use of fuel during a climb or during a mission.
• A minimum loss of energy during turns.

The meter is packaged in a standard 3-1/8-inch panel-instrument case and is solid state, according to Nelson R. Zagalsky, project program manager. Both thick and thin-film circuits were investigated, but lowest cost and minimum design time was provided with the thick-film circuitry.

Nine printed-circuit cards plus two needle-driving servos are combined in the instrument, Zagalsky explains.

Two energies are computed and displayed in the energy meter: specific total energy (outside scale) and the rate of energy exchange (inner scale). The dynamic ranges of the scales were selected by analysis and simulation in F-4J aircraft.

The dial and servo assembly use three of the nine PC cards consisting of an unregulated power supply, a transformer and motor mounting plate and an interconnect card. The latter mates with the first of a series of six PC cards containing the analog computer circuits. These cards include the following: dc inverter supply and voltage regulators for positive and negative supplies; true-airspeed squaring circuit and instrument servo drivers; energy rate computation, including angle of attack sine and cosine function generation; angle of attack and altitude interfaces; and true airspeed and accelerometer interfaces.

There is some initial concern regarding the signal-to-noise ratios that could be expected in the accelerometer outputs. But the initial flight test results indicated that additional filtering was not needed and also verified the suitibility of equations.

The initial investigation of the energy meter concept was funded by Honeywell's Internal Investment Program for the development of new ideas.■
Ten-year chemical battery could power future heart pacemakers

The answer to the problem of providing a long-life power source for heart pacemakers lies in the chemical battery and not in nuclear power or even rechargeable cells.

This is the finding of Arthur M. Bueche, vice president for research and development at the General Electric Research and Development Center in Syracuse, N.Y.

The most promising answer to this old and vital problem, he says, is a sodium-bromine battery the company is developing that will operate continuously for 10 years. The battery is already being tested by GE in animals and will ultimately be implanted in humans.

Besides lasting as long as nuclear batteries do, and without the hazard associated with radioactivity, the chemical battery is expected to be "a fraction of the cost of nuclear pacemakers, which are now estimated to be $4800," GE says.

The sodium-bromine battery is only half the size and a quarter the weight of mercury-zinc chemical cells now used to power conventional pacemakers, which have to be replaced every 24 to 36 months. In addition its voltage (3.6 V) is nearly three times that developed by mercury-zinc cells.

The sodium-bromine battery is the size of five stacked fifty-cent pieces (1.25 inches in diameter and 3/8 inch high), and weighs about one ounce. It consists of a bromine cathode, a sodium-amalgam anode, and a beta alumina ceramic electrolyte.

Unlike the liquid electrolyte in conventional batteries, the solid ceramic membrane prevents the growth of metal dendrites and thus prevents contact between the reactive materials. This eliminates the self-discharge and cell shorting that reduces the life of today's chemical batteries.

Ceramic membrane a key feature

The solid ceramic membrane, which is only 2 mm thick (0.008 inch), is a key factor in the battery design, according to one of the developers, Fritz G. Will. Besides preventing shorts, the membrane prevents the formation of gas found in liquid electrolytes. Another advantage is that shelf life is virtually unlimited.

When the sodium-bromine battery is used in a heart pacemaker, sodium ions travel through the ceramic electrolyte and react with the bromine, forming sodium bromide salt. The anode transmits electrons to the pacemaker, producing electrical impulses which are delivered to the heart by wires forcing the heart to contract.

The new cell can store as much as 170 watt-hours of energy per pound, or 15 watt-hours per cubic inch. By comparison, the energy density of a mercury-zinc battery is about 8 watt-hours per cubic inch, and the nickel cadmium battery—being developed by at least two organizations as rechargeable batteries—can store 1 watt-hour per cubic inch.

An estimated 50,000 to 60,000 people in the United States use conventional battery-powered pacemakers, with some 25,000 more expected to receive them annually. Conventional devices sell for about $1000 to $1500 including the required mercury-zinc battery.

Meanwhile, GE has also announced a new pulse generator—a ventricular inhibited pacemaker, called the Sentry 75, which uses an improved mercury-zinc battery. The battery life has been lengthened from two years to five.

Sodium-bromine battery for heart pacemakers has a life expectancy of 10 years, equivalent to that predicted for nuclear sources.
Plug this High-Speed Digital Cassette Tiger into your punched tape system

New Remex Punched Tape Emulator boosts speed four times, storage capacity ten times!

Fully interchangeable with punched tape units, this new P.T.E. digital cassette system now offers added speed, capacity and convenience, with absolutely no change in interface equipment or software programming. It can turn any punched tape system into a digital tiger!

The Remex P.T.E. offers simultaneous read/write capability in a two-drive system, with completely asynchronous operation from 0 to 300 cps. Storage capacity is 1.6 million bits per cassette, the equivalent of ten 130-foot punched tapes.

Built-in microprocessor adds flexibility. A microprocessor functions as a small computer in the control logic. This permits program stacking with a dial-in automatic file search, TTY or RS-232-C capability and internal automatic tape duplication. It also offers off-line capabilities, allowing key-to-cassette, cassette-to-printer, and punched tape-to-cassette operation.

Reliability plus convenience. The Remex P.T.E. assures high data reliability, with less than one error per $10^8$ bits. Designed to the new proposed ANSI and ECMA standards, it can be used with minicomputers, data communications terminals, NC, communications and test equipment to enhance the performance of a data system. Automatic tape rewind before unload assures maximum data protection.

For details on performance and low price of this new Punched Tape Emulator, contact REMEX, 1733 Alton St., Santa Ana, Calif. 92705. Call (714) 557-6860. In Europe, contact S.P.A. Microtencnica, Torino, Italy.

We work with you!

We'd like to simplify your life while you simplify your high energy circuits. These three new devices are all NPN, triple diffused and packaged in Delco's solid copper TO-204MA packages (TO-3 to you old-timers) for man-sized power handling.

DTS-708 and 709 are designed for use in high voltage switching applications—where inductive loads or fault conditions may be giving you problems now. The DTS-710 is ideal for linear regulators and power amplifiers.

Safe Operating Curves on the data sheets let you know where it's at. And our applications engineering assistance is available, too.

You probably know about our reputation for making really tough transistors—for high peak energy handling. You'll find we can deliver, too.

All of the Delco distributors listed have the DTS-700 series in stock.

Give yours a call now for the prices you'll like and the data you'll need.

INFORMATION RETRIEVAL NUMBER 28
Mideast war may block defense cuts

As the U.S.-Soviet detente strains under pressure of the Mideast war, there is less talk on Capitol Hill of massive cuts of the defense budget by the Appropriations Committees. The committees are getting ready to act on the appropriations bill now that the conferees of the House and Senate Armed Service Committees have reported a military authorization bill totalling $21,299,520,000 covering procurement and R&D funding. The bill includes almost the full funding requested by the Defense Dept. for the F-14 ($693,1-million) and F-15 ($918,5-million) fighter aircraft program.

The conferees voted to cut the $8.5-billion R&D budget by $363-million. As part of that funding they voted $13.5-million for a start on a reoriented, three-service strategic cruise missile program. This would permit development of components and subsystems, including terrain contour-matching guidance.

The conferees also approved $135-million for a prototype antiballistic missile system for Minuteman sites and $5-million for improvements on the Maverick air-to-ground missile. Of the missile money $3-million is to be spent to adapt for Maverick the laser seeker developed for the Bulldog missile and $2-million for further improvements on Maverick's TV guidance system. Maverick will have two distinct guidance systems.

B-1 employment protected by Congress

Congress has voted special protection against the firing of Rockwell International employees who are working on the B-1 bomber program. The brunt of a $25-million reduction that Congress made in the B-1 program, therefore, will be borne by electronics contractors and subcontractors. The bill stipulated that the reduction be achieved partly by a delay in the award of a contract for defensive avionics and partly by a reduction in the effort on offensive electronics.

White House organizes Federal communications

Industry should get some beneficial fallout in the form of better design and market planning information in the Government communications field as a result of a plan by the White House Office of Telecommunications Policy to tighten the management of Government communications systems.

The plan calls for long-range planning (annual and five-year programs) and for management of specific functions by experts in the field.
example, the Defense Dept. has responsibility for the national security of all Government communications systems. Transportation involved in Government communications will be the responsibility of the Transportation Dept., and environment, that of the Dept. of Commerce, law enforcement by the Justice Dept., and Government administrative communications by the General Services Administration.

OTP hopes that supervision by categories by agencies with experience in the particular field will eventually trim 20% from the annual $6-billion spent for Government communications.

Air Force looking for cheap missile

The Air Force plans to develop a new dog-fight air-to-air missile, guidance system unspecified. One thing the Air Force does specify, however, is that it will be cheap, the exact figure to be in black and white in the design contract. The contractor who wins the award will design, develop, fabricate and flight test 30 missiles—extensively—before the service will consider production.

Capital Capsules: The Defense Dept. is proposing an amendment to the Armed Service Procurement Regulations to protect contractors who use software developed at company expense in a subsequent Government contract. The proposed regulation recognizes that software is “much more easily duplicated than hardware” and present rules do not afford adequate protection to contractors. . . . Fairchild Industries vice president Dr. Wernher von Braun told the Senate Space Committee that NASA’s move out of the communications satellite field was a bad one. This, he said, could “give the game back to the established monopolies, who, in view of their vast investments in old fashioned wire communications, never had much of an incentive to explore the satellite potential in the first place”. . . . The National Science Foundation has awarded three contracts to industry/university teams to explore the feasibility of using solar energy to heat, cool and provide hot water for buildings. Winners are General Electric/University of Pennsylvania; TRW, Inc./Arizona State; Westinghouse Electric/Colorado State University/Carnegie-Mellon University. . . . The Senate Aeronautical and Space Sciences Committee has published a 199-page booklet entitled “Toward a Better Tomorrow With Aeronautical and Space Technology.” It describes applications and potential achievements for technology developed by NASA. The booklet is available from the committee, Room 231, Russell Senate Office Building, Washington, D.C. 20515. . . . Another useful publication available is a “Printer on Government Contract Claims,” by the Senate Small Business Committee. The aim is to aid small-business contractors, who accounted for $12.5-billion in Government procurement in 1972. Copies are available from the committee, Room 424, Russell Senate Office Building, Washington, D.C. 20515. . . . The U.S. Postal Service has asked seven companies to bid on a contract for development of a five-year master plan for using information systems technology throughout the Postal Service. Other requests for proposals have gone to IBM, Holmes and Narver, Inc., and Computer Sciences for a systems analysis of the National Bulk Mail System now being installed in 33 centers. . . . The Defense Dept. has asked Congress for $5.5-million for engineering development of two over-the-horizon backscatter radars—one in Maine facing east and one in the state of Washington facing west. They will be used for aircraft detection.
an unbeatable combination...
350 MHz and 1ns/div in a portable!

Dual trace, 350 MHz bandwidth, high writing speed, 5 mV/div to full bandwidth and 1 ns/div sweep together with many operator conveniences assure fast accurate high-speed oscilloscope measurements. This combination is now available in a portable—the 485 from Tektronix. It weighs just 24 pounds, allowing you to move it in the lab and shop, or you easily take it with you on installation and repair jobs.

HIGH-SPEED MEASUREMENTS WITH SELECTABLE INPUT IMPEDANCE

Full capability 50 Ω and 1 MΩ measurements are available at your fingertips. The 5 mV/div deflection exists to the full bandwidth of 350 MHz in 50 Ω, and 250 MHz in 1 MΩ. The 50 Ω input is protected against the inadvertent application of excessive signal strength. When it happens, you simply press the reset.

SINGLE-SHOT FAST PULSE RECORDING

If your application involves high-speed single shot phenomena, an optional P11 CRT phosphor and the TEKTRONIX C-31 Camera allow you to record on film at 6.0 div/ns. Use of the Writing Speed Enhancer substantially increases this speed.

ACCURATE TIME RESOLUTION MEASUREMENTS

In many of today's pulse applications, accurate time measurements are vital. An unmagnified sweep speed of 1 ns/div permits time resolution measurements in the vicinity of 200 picoseconds. This high-speed accuracy combined with horizontal sweep switching present time measurement capability unheard of in a portable oscilloscope.

BONUS FEATURES

Some of the operator conveniences are: A-external trigger view, delayed sweep, automatic scale factor readout, horizontal sweep switching, A-trigger hold-off, bandwidth limit, beam finder, frequency selectable fast-rise calibrator, automatic focus, and battery operation with the TEKTRONIX 1105.

Full realization of these many ease-of-operation features can only be gained through actual hands-on experience. Your local Tektronix field engineer has a 485. Call him for a personal demonstration.

If you'd like additional literature, write Tektronix, Inc., P.O. Box 500, Beaverton, Oregon 97005. In Europe, write Tektronix Ltd., P.O. Box 36, St. Peter Port, Guernsey, C.I., U.K.

485 Oscilloscope ............ $4200

committed to technical excellence
Our microelectronic business has grown in two directions.

So now we have two divisions:

**Microelectronic Device Division**
If you need help in designing or building microelectronic circuits for your product, read here. We've formed a separate division with separate engineering staff to serve you.

Our product line now includes a family of powerful one-chip calculator and slide rule circuits, a multi-circuit four-bit microprocessor system with software for microprogramming by equipment manufacturers and telephone frequency tone generation circuits—all at more-functions-per-dollar prices.

Future developments: an 8-bit microprocessor; SOS-LSI logic and memory circuits with bipolar speeds at MOS prices; magnetic bubble domain devices for mass data storage; CCD devices for batch storage, scratchpad memories and video systems.

Want to hear more? Write C. V. Kovac, Vice President and General Manager, Microelectronic Device Division, P.O. Box 3669, Anaheim, California 92803.

**Microelectronic Product Division**
Interested in “private label” or custom calculators, or other microelectronic products?

Read here. We've formed a separate division with its own engineering and manufacturing departments to design and produce a broadening line of microelectronic products and subassemblies.

Right now, our biggest market is in calculators for mass merchandisers—hand held, desk top, display, and printing machines . . . all low cost.

Other new products? Microelectronic wrist watches with digital liquid crystal displays. Digital anti-skid systems for hydraulic brakes of automobiles. Subsystems for business and telecommunications terminals, including: our MOS/LSI 4800 b/s modem, the only one working in field equipment to our knowledge, and our embossed credit card reader for P-O-S systems.

Want to hear more? Write H. L. Edge, Vice President and General Manager, Microelectronic Product Division, 3430 Miraloma Avenue, Anaheim, California 92803.
Quick Permanent Repairs with Confidence.

The D67 ends troubleshooting guesswork in complex TV and audio circuits—at a low price.

TV and audio equipment servicing is outdistancing the capabilities of older test instruments. Also, greater use of electronics in consumer products (pocket calculators, microwave ovens, digital clocks, home intruder alarms, etc.) is opening up new service opportunities. Telequipment offers you the high performance you need in a low-cost scope for this new service business.

The D67 combines dual-trace, delayed sweep, and 25 MHz bandwidth, at a very low price. Non-delayed sweep scopes just can’t compete with the D67’s delayed sweep measurement flexibility. It allows quick, accurate troubleshooting of IF tuning and color bandpass problems. You can also see fast circuit conditions after relatively long time delays.

Dual-trace waveforms displayed on a bright CRT are essential for servicing TV and high quality audio systems, where time and phase relationships between signals are critical. Whatever the consumer’s electronic service problem, 25 MHz is probably all the bandwidth you will need.

Telequipment products are marketed and supported in the U.S. through the Tektronix network of 52 Field Offices and 35 Service Centers. Telequipment prices range from $245 to $1495. For a Telequipment catalog, and a reprint of the ET/D review of the D67, write: Tektronix, Inc., Box 500, Beaverton, Oregon 97005

Meet our new series of high-frequency problem solvers . . .

High-Performance VHF/UHF FET Family

Remember the U310? Some people call it the SuperFET. We introduced it a year ago: worst-case 75Ω input match VSWR of 1.25:1. Figure of merit 2.35 x 10⁹ typical. Third order intercept point of +29 dBm.

Now we’ve extended the U310 technology to produce an entire family of high-performance N-channel junction FETs. They’re ideal for VHF/UHF applications such as the two circuits shown below:

U310 family characteristics include:
- High power gain (common gate) — 16 dB at 100 MHz, 11 dB at 450 MHz.
- Noise figure = 3 dB typical at 450 MHz.
- High transconductance = 10,000 to 20,000 μmhos.
Select the right FET for your application from this array:

Get the complete story on this advanced high-frequency FET family.

Can designers be goaded to innovate? Let’s try it

The National Bureau of Standards is about to conduct an unusual experimental program that could have far-reaching effects on the electronics industry. The objective is to spur the pace of technological innovation.

Under the Experimental Technology Incentive Program, the bureau—in conjunction with industry—will issue periodically specifications on consumer products to stimulate companies to introduce product innovations. These specs will not be forced on industry. Instead, the Government—particularly the General Services Administration—hopes to use them to set bidding standards for its equipment purchases. In this way, instead of providing seed money to industry for product development, the Government hopes that the GSA’s $2-billion annual purchasing budget will stimulate manufacturers to innovate. It is also hoped that these improvements will gradually move into the consumer marketplace as well as the export market, thereby helping the balance of payments.

Sometime this month the NBS Institute for Applied Technology, which is overseeing the new program, will release the first series of production specs on air-conditioners and power mowers. The specs will ask that the energy-efficiency ratio for air-conditioners be raised from seven times the cooling power per watt to 11 times. They will also ask that the power-mower noise level be reduced from 72 to 62 decibels. Government scientists believe that both goals are technically feasible in the industry today.

Manufacturers and Government officials have some valid fears about the program: Will the innovations make the products too expensive and thereby noncompetitive? Will the specs be so tight that one company could become the sole source of supply to the Government? How can the technical requirements be set so that equal competition is maintained among companies?

Since the program is still experimental, the real answers to questions like these may not be clear for three or four years. Meanwhile why anticipate abuses? Although we don’t believe it’s possible to legislate innovation, we do applaud the Government’s attempt to speed technological improvements. In the long run we’ll all benefit, if it’s done right. The designer will be challenged to come up with new ideas, the public will get a better product and industry will profit.

decoding the codes
With ever-changing technology and increasing demands for innovative products, more precise safety guidelines are a must.

Belden knows the codes, standards, requirements and limits of acceptability in the wide world of industrial wire, cable and cord. As supplier of thousands of standard items for electrical, electronic and automotive needs we can readily help you select the right product for the job. Belden products meet or exceed industry code needs. And we can custom design and manufacture complex cable configurations to meet the most demanding specifications. If a code is puzzling you, or you have an application where you’re not sure what the standards are, check with Belden. We cope with codes every day.

If you want answers right now, phone:
(312) 887-1800, Transportation Division
(312) 681-8920, Electrical Division
(317) 966-6681, Electronic Division
Or write Belden Corporation, 2000 South Batavia Avenue, Geneva, Illinois 60134.
How do you know when to choose a power transistor and when to choose a thyristor? In many applications the choice is easy. For low power dc you usually choose transistors, while for very-high-power applications, thyristors are most commonly selected. There is, however, an increasing grey area between these two extremes where the newer high power transistors and Darlington are replacing thyristors. At the same time low-current thyristors are being used instead of power transistors in many applications.

Choosing between power transistors and thyristors is only part of the problem. Once you've decided on one, you must select a specific device to use. This is not always easy, especially if you rely heavily on the data sheets for help. They don't always give the full story of device capabilities, and often they are deceptive, misleading or ambiguous.

JEDEC devices have problems, too

Pay particular attention to devices registered by the Electronic Industries Association's Joint Electron Device Engineering Council (JEDEC). Such devices are assigned 2N numbers and must meet a JEDEC spec, but the specs don't always give enough information.

Since JEDEC is composed of representatives of the different semiconductor manufacturers and must be approved by them, its specs are necessarily broad. The result is that two transistors from different manufacturers can have the same number and quite different characteristics. One reason for this is that the manufacturing process is not specified.

And in the last few years, notes Herbert Roth, president of Power Designs, a power-supply manufacturer in Westbury, N.Y., semiconductor manufacturers have found a new game: Find a home for the overrun device. It is not unusual for a manufacturer to ship you, under the same part number, devices with chip size, geometry and electrical characteristics that are substantially different from those of the basic device. A good example is the 2N3055, one of the most widely used power transistors.

"It is common knowledge among semiconductor manufacturers," says Roth, "that the 2N3055 is the garbage dump for everything that falls off of every other line. It is not the least bit unusual to get chip sizes ranging from 65 mils to 240 mils."

Since ft is always specified as a minimum and never as a maximum, it can vary so widely that devices with the same JEDEC number will have completely different high-frequency characteristics, even though they will be similar for low frequencies.

Differences in the device characteristics are related to the different processes used in production. The 2N3055 has been produced by at least three different methods; single-diffused, triple-diffused and epi-base.

The single-diffused technique was used on the original 2N3055 registered by RCA. It led to a rugged device with an excellent safe operating area—a measure of its power handling capability. Then a triple-diffused version came out, with a decreased safe operating area. An epi-base version followed, and while smaller and therefore cheaper than the two other versions, it had a different high-frequency characteristic.

Is anything being done about improving power-transistor spec sheets. Yes, but progress

Jules H. Gilder
Associate Editor
is slow. After the introduction of the 2N3055, RCA attempted to improve the device's JEDEC specs by adding a spec for safe operating area. But there was intense resistance from other manufacturers and the attempt to update the data sheets failed. For new devices, however, improvements are being made. Devices now being registered have spec sheets that are much better than those of the older devices. These devices, in the 2N5000 and 2N6000 series, have safe-operating-area specs, data for switching applications, fewer typical specs and more min/max.

If you must use the older, inadequately specified devices, evaluate your application and the devices thoroughly.

**Look out for those deceptive specs!**

Deceptive specs often found on power semiconductor data sheets include unrealistic operating conditions. For example, a current or power rating for a device is generally given at a case temperature of 25°C. This is an unrealistic rating; as one user put it, the only way you can hold the device at that temperature is to mount it on the side of a battleship in the Arctic Ocean.

Adding to the problem of semiconductor-device power ratings is the practice of rating diodes and thyristors by both average and rms current. A so-called 1800-A rating for such a device is meaningless. A device can be rated 1800 A rms and have only a 1100-A average rating.

Assuming you know if the rating is average or rms, you've still got trouble. You will never be able to get the full rated current out of the device.

Engineers often forget that the maximum current, voltage and dissipation ratings may not correspond. Some manufacturers list these parameters separately, and when you multiply the maximum voltage drop by the maximum load that you know how these devices are processed and packaged as well as how they are going to be used.
High power thyristors, like this one from Westinghouse, are finding increasing use in transportation systems.

current, you may find that the maximum allowable dissipation has been exceeded. The solution is to do some cross-checking to find out the allowable load current.

Realizing that current ratings are confusing to the designer, at least one manufacturer, Power Semiconductors, Inc., of Devon, Conn., has added to the traditional average and rms ratings a third value—usable current. This tells the engineer how much current he can expect under typical conditions of ambient temperature, coolant flow, practical heat sinks, conduction angles, etc.

If you take a device with an average rating of 1100 A and an rms rating of 1800 A, you’ll find that the usable current is only 450 A when forced-air cooling is used and the air is at 50 C. That’s a far cry from 1800 A.

Another thing to watch out for is a spec that gives the operating current capability for an inverter device at a very low frequency—say, 60 Hz—while at the same time the device is advertised as operating at 5 to 10 kHz. The current looks terrific at low frequency, but wait until you get to the higher region.

An ambiguity found with many power semis is that devices are specified at current levels that require larger wire sizes than the device terminals can accommodate. For example, many devices are rated at currents that require a No. 8 wire or larger. The terminal eyelets, however, can only accept No. 12 or 14 wires.

Typical specs are anything but

Data sheets, particularly the older ones, contain typical parameter values in addition to some min/max values. The designer’s assumption—and one that many manufacturers try to foster—is that “typical” means that a majority of devices in the shipment will approximate the typical value.

The assumption may be true at times for one of many specific parameters, but it is decidedly not true for all parameters all of the time. Typical values will fluctuate with the variation in the intrinsic characteristics of the raw silicon wafer, with the thickness and parallelism of the wafer, and with different diffusion runs—which themselves depend on temperature, gas density contamination level, cooling slope, etc. Another factor affecting typical values is that manufacturers screen out various device types from a single wafer diffusion. This causes a highly skewed distribution that will vary from one side of the norm to the other as different types are drawn from the over-all yield. It is for this reason that manufacturers do not guarantee that some specified percentage of the yield will be within, say, 10% of the so-called typical value.

It’s unwise to design for volume production using typical values of power semiconductors without allowance for the worst worst-case conditions—minimum and maximum values at temperature extremes. There is a serious risk of receiving devices that meet the letter of the specification but do not function in the system.

Surface contamination can cause failures

Often unexplained device failures can be attributed to surface contamination. Most power semiconductors are made in open air instead of clean rooms, thus the junction is exposed to all sorts of dirt. Though manufacturers clean and passivate the chips, there is always the danger that passivation will seal in contaminants. The contaminants can degrade or even destroy the junction in time.

A controversy exists as to the affect, if any, of surface contamination. Vendors claim that while contamination often occurs, it is non-destructive. Some users, however, disagree.

One method suggested for detecting the presence of surface contamination in a power transistor is to test the device on a curve tracer and bring either the base-emitter or base-collector junction to the point of avalanche. At that point the junction is stressed to its maximum potential,
and any stray materials or contaminants will tend to ionize and form leakage paths, which will make the avalanche breakdown characteristic unstable, soft or even resistive.

Once the contaminated devices have been detected, it may be wise to store them for one to three years. Where contamination degrades the junction, one user—Roth of Power Designs—has found, it will destroy 20% of the junctions after the first year and 10 to 15% more in the second and third years. After storage, the devices should be inspected and the bad ones pulled out. Those that show no change can be used, the assumption being that if the junctions haven't degraded by then, they're okay.

What are the tradeoffs?

There are numerous tradeoffs an engineer must make when choosing a power semiconductor. Just how the tradeoffs are made depends on the application. One fundamental one is price vs performance. You cannot expect to pay 50 cents for a high-reliability power device with burn-in and data logging. Other economic tradeoffs include reliability vs cost and size and weight vs cost.

On the technical side there are more tradeoffs. Generally larger chips can handle higher maximum currents and provide greater pulse-power capability, but these are at the expense of larger capacitance and slower switching speeds.

For thyristors, there is a tradeoff between the current rating, the turn-off time and the blocking voltage. For example, if the turn-off time of a thyristor is reduced from 40 $\mu$s to 10 $\mu$s either the blocking voltage rating must be decreased from 1200 V to 600 V for the same current or the current rating must be substantially reduced to maintain the 1200-V blocking voltage.

A tradeoff frequently encountered in high-power rectifiers involves junction temperature, current rating and the voltage rating. If the voltage rating is to be increased, the junction temperature must be derated and the current rating must decrease.

Power transistor vs thyristor

One of the big advantages of power transistors is that their switching characteristics are easy to control. Since transistor switching is controlled by base current, a transistor can be turned off simply by removal of its base current. Silicon-controlled rectifiers, on the other hand, require more complex circuitry to turn off the device.

Another advantage of the transistor is that it operates at much higher frequencies than the thyristor and thus can provide quieter operation, higher efficiency and lower output ripple. In ad-

Silicon power transistors from Unitrode come in a variety of current ratings ranging from 0.5 A to 20 A.

Disc packages, like the one used for Power Semiconductors' 6000-A diode, permit double-sided cooling.
Thyristors that operate at 25 kHz and at a di/dt as high as 2000 A/µs, are the result of recent advances in technology.

Bipolar transistors have superior operating temperatures and, unlike thyristors, are not subject to accidental turn-on by a high dv/dt.

Power transistors are the best choice for dc circuits that require precise control, for self-oscillating low-power inverters and for high-frequency pulse shapers. Also, the new high-voltage devices are especially suitable for automobile ignition systems, TV deflection circuits, choppers and medium-power, high-frequency regulator and inverter circuits.

Thyristors are generally chosen when ac phase-control systems or control of high-power systems are needed. They have a much higher control gain than power transistors and are generally less susceptible to overvoltage transients. Also, because of the latching capability of thyristors, they don’t require a constant gate current—unlike transistors which require constant base current. In general, thyristors are superior to power transistors in ac applications.

**Understanding the safe operating area**

Quite often one of the most significant specs for power transistors—the safe operating area—is completely ignored. This is a family of curves that indicate the peak watts, at a given collector-to-emitter voltage, that the device can dissipate for some specific time, ranging from seconds to microseconds.

The safe-operating-area spec is important because no matter how uniformly the junction is manufactured, it is possible to get nonhomogeneity of collector current. This lack of uniformity causes the collector current to flow through only a portion of the junction, thus creating local overheating. Since the thermal time constant for the junction is slow and the peak wattage is very high, one area of the junction can actually explode, thus destroying the device.

Sometimes the peak power conditions don’t destroy the junction; they just damage it surreptitiously. This damage can be cumulative, and you wind up unexpectedly with reduced life for the device.

Mistakes commonly made in specifying power semiconductors run a wide gamut. Perhaps the...
Power modules that contain several thyristors and diodes in various circuit configurations are available from International Rectifier.

Most common is overreliance on the spec sheets, making assumptions about parameter distributions and limits that may not be valid and failing to employ the product and application services of the manufacturer.

Another common mistake engineers make is using a manufacturer's data sheet as a specification rather than the actual operating conditions imposed upon the device by the circuit.

Sometimes a designer severely limits his sources of supply by marking up a manufacturer's data sheet rather than starting from the external constraints placed on the device. The remedy: Talk to the manufacturer about your application and let him suggest the best device.

Overspecification is another big problem. Engineers often add too much of a voltage safety factor without informing the manufacturer. Consequently they pay dearly for an overrated device that isn't really needed.

Suppression of voltage spikes and current surges is all too often neglected by designers. Device breakdown caused by these surges must be prevented to achieve reliable operation.

The increasing demand for power commonly results in a need to connect devices in series and parallel. This calls for special device testing and matching to ensure proper blocking-voltage division, and matching of turn-on delays, forward voltage drops, etc.

The latest trends in power semiconductors are toward devices that can handle larger powers. These newer devices simplify circuit design and eliminate the need to connect devices in parallel for higher current or in series for higher voltage.

The transistor with highest current capability will be announced this month. PowerTech, Inc., of Clifton, N.J., is introducing a 500-A, single-diffused transistor intended for application in high-current inverters, switching regulators and motor controllers. The device is fabricated on a 0.825-inch chip and has a voltage rating of 500 A at 80 V.

In thyristors, the device with the highest current appears to be one developed by Power Semiconductors, Inc., of Devon, Conn. It is a 4000-A device fabricated on a 102-mm chip. Since the newer thyristors are handling larger power loads, their packages must be designed for good thermal dissipation. Nearly all employ the flatpack, or
disc, pressure package, which allows more efficient double-side cooling, as contrasted with the single-side cooling of threaded stud packages.

The disc package also lends itself well to a variety of assemblies—series or parallel arrays and water or vapor-cooling techniques.

Another trend in power devices is toward faster-switching and higher-voltage monolithic Darlington transistors. Four terminal Darlington devices are being developed. They would enable the designer to customize the Darlington device to his needs.

Type W variable resistors feature a solid hot molded resistance track for long operating life. Tests show less than 10% resistance change after 50,000 complete rotations. The noise level is low and the resolution is virtually infinite. Low inductance permits operation at high frequencies where wirewound variable resistors are useless. A lot of variable resistor for less than a dollar. ½ inch diameter, ½ watt rating at $70^\circ$C. Can be operated at $120^\circ$C ambient. The entire unit is immersion sealed. Available in resistance values from 100 ohms to 5 megohms. Available through your appointed Allen-Bradley Electronic Distributor, or write Allen-Bradley Electronics Division, 1201 S. Second St., Milwaukee, WI 53204. Export: Bloomfield, NJ 07003. Canada Allen-Bradley Canada Limited, Cambridge, Ontario. United Kingdom: Jarrow, County Durham NE32 3EN.

If you're really serious about cost, be serious about quality.

*Standard unit with plain bushing and hardware, 20% tolerance in 1,000 piece quantities. Prices subject to change without notice.
THE QUADS THAT CONQUERED THE WORLD.

You saw the first exciting saga.
The 7400 series and multiple devices gobbled up the digital planet.
Now comes a brand new epic adventure.
National quads are taking over the linear world. And who can stop them?
Low cost and greater reliability make the quads invincible.
Don’t miss the thrills. Don’t settle for imitators. See the original, dynamic performers from National.

**LM 3900: Tap dancing its way into your heart.**
Yesterday a nobody. Today a star.
An inexpensive general purpose amp whose performance is different from the standard op amp because it makes use of a current mirror at input stage. Designed to operate off a single power supply and provide a large output voltage swing.
All America is cheering.

**LM 324: For mature audiences only.**
A new and inexpensive quad. Bold. Daring. The most complex product in the line. Sophisticated enough to be used with a low voltage power supply and still eliminate the need for dual supplies. It is compatible with all forms of logic and can operate over wide voltage supplies.
Amazing performance.

**LM 339: The comparator they said could never be made.**
Unbelievable, but true. The new comparator that’s compatible with all forms of logic and is the only device suitable for interfacing with CMOS logic. More kudos. It’s the only comparator that can be supplied with two millivolts guaranteed. It operates from a single supply which means it may be powered by batteries.
The most versatile, high-class device ever to hit the big time.

**Hold over for second smash month.**
You’ve read the ad, now see the applications book that inspired the quad success (the uncut version) and enter our super-colossal applications design contest—anytime before November 30th.
You could win a 4-channel sound system.
Or a Zenith color television set.
Or the Incredible Time Machine—digital clock/calculator.
For the book and contest particulars, send to National Semiconductor Corporation, 2900 Semiconductor Drive, Santa Clara, California 95051.

**Please don’t reveal the ending of this ad.**

National wants you to be ready for the quads.
So our new Seminar on Quads and Other Linear Devices is coming soon.
Watch for it at your neighborhood National distributor.
No one seated during the last ten minutes.
Calculate large-signal behavior of rf power transistors using an equivalent circuit and equations that provide more information than can be obtained from Y or S parameters.

A complete analysis of rf-transistor performance requires a comprehensive equivalent circuit and formulas for large-signal behavior. In addition to large-signal applications, the circuit and formulas permit calculations to determine a variety of functions, ranging from precise, narrowband performance to a check on the accuracy of test measurements.

The usual approach—calculating S parameters—can be used only for small-signal applications. And while wideband information can be obtained, the use of S parameters isn't suitable for the investigation of such problems as unwanted resonances. The comprehensive equivalent circuit can handle all such cases.

Most spec sheets don't list all the characteristics for the equivalent circuit, but the information can be obtained from the device manufacturer or by making your own simple measurements (see box “Transistor Parameters”). One bonus with the equivalent-circuit approach: The formulas are easily handled by a computer.

The equivalent circuit

The equivalent circuit (Fig. 1) includes three external components—$R_{be}$, $R_{bc}$ and $C_0$—that allow for a wide variety of applications.

The external base-emitter, $R_{be}$, provides stabilization in Class C amplifiers at relatively low frequencies. Without this resistor, drive power and input resistance of the transistor may become negative, which would lead to instability.

In wideband amplifiers for ssb operation, the collector-base feedback resistor, $R_{bc}$, reduces the variation in gain and the input impedance.

Cross-neutralization is accomplished in push-pull amplifiers by two capacitors, $C_n$ (for which an approximate value is $C_{ohe} + C_{oee}$). At high frequencies this gives an increase of power gain and input impedance.

The analysis is entirely ac, and the amplitude of the fundamental component is always used. The calculation begins with voltage and current between the internal collector and emitter points A and 5 in Fig. 1. From there, the calculation is made outward in both directions until voltage and current are known at both input and output.

When making a choice of voltage and current between points 4 and 5 you must distinguish between linear operation—as in a Class AB amplifier—or nonlinear—as in Class B or C.

The linear Class AB amplifier

In the Class AB amplifier the collector current source, $i_c$, is loaded with a real impedance. This means that the shift between the internal collector-emitter voltage, $v_{ce}$, and $i_c$ can be equal to $180^\circ$. For linear operation $\phi$ is $0^\circ$. The amplitude of $v_{gs}$ is approximately 10 to 20% below the collector-emitter dc voltage, based on linearity considerations.

The following problem exists when the output power is calculated: In general, power is specified between points 8 and 0, not between 4 and 5. But you need the 4-to-5 power for the calculation.

To get around this problem, begin by choosing the power between points 4 and 5 so that it is equal to the specified power. Account for the difference by a ratio of the two powers. In a suc-
ceeding calculation use the ratio as a correction factor for the power between points 4 and 5. Generally only one iteration is sufficient to approach the desired output power to within 1%.

In a Class AB amplifier a positive-bias voltage of approximately 0.6 to 0.7 V is applied between base and emitter. This voltage source has, of course, an internal resistance also (Fig. 2). Both are important for the required ac voltage between points 3 and 5.

The Class B/C amplifier

Most Class B/C amplifiers are of the narrow-band, tuned type. The matching network at the output is chosen so that the output power, and consequently the gain, is maximum. The phase angle $\phi$, as previously defined, will certainly not be equal to zero.

In this type of amplifier $v_{15}$ takes the highest possible amplitude. This value depends on the ratio of the operating frequency and the maximum frequency that can be handled by the transistor with reasonable gain. However $v_{15}$ is always higher than the collector-emitter dc voltage.

This seems to be unlikely, but it isn't if we consider the following phenomena:

First, at high frequencies the harmonic content of the collector current is small. This is not so for the collector voltage, because of the nonlinear behavior of the collector capacitance. The phase of the second harmonic is such in this case that the amplitude of the fundamental component will rise approximately 10 to 20% above the collector supply voltage (Fig. 3).

Secondly, at low frequencies the influence of the nonlinear collector capacitance is relatively small, because rather big external capacitors are used from collector to ground. The Class C adjustment applied in this case is, however, responsible for a strong harmonic content of the collector current. Since the reactance of the collector-ground capacitance for the second harmonic can certainly not be neglected, a large second-harmonic component in the collector voltage can be expected. In practice it appears that the phase angle preferred by the transistor for maximum gain, together with the present second harmonic voltage, make possible a strong increase of the fundamental voltage. have shown increases of over 50%.

Since the analysis is exclusively based on fundamental components, an approximate value of $v_{ab}$ must be introduced.

In a Class C amplifier negative-bias voltage between base and emitter is often applied by a base resistor. This, of course, influences the required ac voltage between the internal base and emitter points 3 and 5.

### Calculate power and impedance

The final equations for the calculation of power and impedance at both the input and output of the transistor seem straightforward, but many other calculations must be made first to determine the input voltages and currents (see box "Required Equations").

Note the use of the subscripts $r$ and $i$ to designate the real and imaginary parts of the currents and voltages. This breakdown is useful if the calculations are performed by a computer with a language that cannot handle complex numbers.

With $i_1$ as the total current flowing out of the transistor at point 1, the drive power is equal to

$$ P_i = \frac{v_{10r} i_{1r} + v_{10i} i_{1i}}{2} $$

The input impedance is represented by resistance $R_i$ in series with reactance $X_i$:

$$ R_i = \frac{v_{10r} i_{1r} + v_{10i} i_{1i}}{i_{1r}^2 + i_{1i}^2}, $$

$$ X_i = \frac{v_{10r} i_{1r} - v_{10i} i_{1i}}{i_{1r}^2 + i_{1i}^2}. $$

### Required Equations

The equations for calculating input and output power and impedance are derived from the known data between the internal collector and emitter points 4 and 5.

If between points 4 and 5, $P_{oi}$, $V_c$ and $\phi$ are known, the amplitude of the collector current source can be determined with the formula

$$ i_c = \frac{2 P_{oi}}{V_c \cos \phi}. $$

The voltage required between the internal base and emitter points 3 and 5, $V_{35}$, is approximately 0.8 to 0.9 V for all transistors in the vicinity of their maximum power level. This holds when there is no external or internal dc bias voltage between base and emitter. However, if a bias voltage is present, this voltage has to be subtracted from the 0.9 V. Assuming an external voltage source $V_{bo}$, an external base resistance $R_{bo}$ (only active for dc) and the internal emitter resistor $R_e$, we get:

$$ V_{35} = 0.9 - V_{bo} + I_e R_e + I_e \left( R_{bo} + R_e \right) = O. $$

The parts of the collector capacitance—$C_{cb}$, $C_{bo}$, and $C_{ce}$—are voltage-dependent. Consequently, these capacitances will increase when there is an ac voltage across them in addition to the collector supply voltage. Theoretically the maximum increase for a pure abrupt junction is equal to $\sqrt{1.5} = 1.225$. As practical junctions are between abrupt and graded ones, a factor of 1.15 is used.

Then we get

$$ C_{cb} = 1.15 C_{cb1}, $$

$$ C_{bo} = 1.15 C_{bo1}, $$

$$ C_{ce} = 1.15 C_{ce1}. $$

Capacitance $C_{be}$ is also voltage-dependent. However, with a negative bias voltage across $R_e$, this capacitance will decrease approximately as much as it is increased by an ac voltage. Therefore no correction factor is applied in this case.

Voltage $v_{35}$ has been chosen as a phase reference in this system. This means that the phase angle of this voltage is 0. The same holds for the collector current source $i_c$ when it takes the direction indicated in Fig. 1.
With $I_s$ as the total current flowing out of the transistor at point 8, the output power is equal to
\[ P_o = \frac{v_{so1} i_{sr} + v_{so1} i_{sl}}{2} . \]

The load impedance is presented by the parallel connection of a resistance $R_L$ and capacitance $C_L$, which will be negative in most cases:
\[ R_L = \frac{v_{so1}^2 + v_{so1}^2}{v_{so1} i_{sr} + v_{so1} i_{sl}} , \]
\[ C_L = \frac{v_{so1} i_{sl} - v_{so1} i_{sr}}{\omega (v_{so1}^2 + v_{so1}^2)} . \]

To calculate the effect of external feedback networks, it is necessary to know, also, the phase difference between the collector voltage and the base voltage, $\phi_{vcb}$:
\[ \phi_{vcb} = \arctan \frac{v_{so1}}{v_{so1}} - \arctan \frac{v_{101}}{v_{so1}} . \]

For verification of calculations by measurements, it is sometimes useful to know the amplitude of the output voltage:
\[ v_o = \sqrt{v_{so1}^2 + v_{so1}^2} . \]

**How well do the equations work?**

Two examples, one linear and one Class C, show that the calculated values are in a close agreement with measured values. A BLX14 vhf power transistor is used for both examples. The transistor data follow:
- $f_T = 300$ MHz, $L_n = 2$ nH, $C_{ebo} = 31.9$ pF,
- $h_FE = 50$, $L_e = 1$ nH, $C_{be} = 26.3$ pF,
- $R_b = 0.4$ $\Omega$, $L_e = 0$, $C_s = 3.5$ pF,
- $R_e = 0.33$ $\Omega$, $C_{be} = 2300$ pF,
- $R_c = 0.165$ $\Omega$, $C_{cb} = 61.9$ pF,

Inductance $L_n$ has been set equal to zero because its influence at 7 MHz can be neglected.

Operating data for a linear amplifier are $f = 7$ MHz, $V_{bo} = 0.72$ V, $R_{bc} = \infty$, $P_o = 50$ W, $R_{bo} = 2.8$ $\Omega$, $\phi = 0$, $v_o = 27$ V, $R_{bo} = \infty$, $C_n = 0$.

Voltage $v_o$ has been chosen so that the load resistance becomes 6.25 $\Omega$. This results in a $v_o$ of 25 V. Accordingly the load resistance in the test circuit has been adjusted to 6.25 $\Omega$. The collector supply voltage is 28 V. The base-bias voltage is delivered by a resistor-diode potentiometer and adjusted for a collector quiescent current (collector dc current without drive power) of 100 mA. These adjustments yield the required $V_{bo}$ and $R_{bo}$ values.

Calculations produce the following results:
- $R_L = 6.25$ $\Omega$, $R_c = 2.59$ $\Omega$, $P_i = 0.173$ W,
- $C_L = -124$ pF, $X_i = 6.76$ $\Omega$, $G = 24.6$ dB.
Now, that's sales appeal!

The ILLIAC IV, one of the world's largest computers, is another masterpiece of electronic engineering... and it looks it. Even sophisticated equipment such as this requires housing design that says beauty, purpose and durability. And nothing says it better than unique MET-L-WOOD® panels.

Met-L-Wood is a structural laminate combining the best qualities of wood and metal. It features high rigidity, strength, durability and lightweight. It has the solid feel and characteristics of steel plate without the weight, and a beautiful, smooth surface for immediate and lasting eye appeal.

First impressions often influence final decisions and acceptance. Met-L-Wood panels add more sales appeal than any other material you can use. Send for complete information today. Write: MET-L-WOOD CORPORATION, 6755 West 65th Street, Chicago, Illinois 60638.

The measured values are

\[ R_L = 6.25 \, \Omega, \quad R_i = 2.61 \, \Omega, \quad P_i = 0.178 \, W, \]
\[ C_L = 0, \quad X_i = -6.86 \, \Omega, \quad G = 24.5 \, dB. \]

The differences in complex quantities can be evaluated from absolute values and phase angles. For the load impedance, this becomes

\[ \Delta |Z_L| = 0.06\% , \quad \Delta \phi_L = 1.9^\circ. \]

And for the input impedance:

\[ \Delta |Z_i| = 1.4\% , \quad \Delta \phi_i = 0.13^\circ. \]

The deviation of drive power is \( \Delta P_i = 2.8\% \), corresponding to \( \Delta G \approx 0.1 \, dB \).

For this example, the agreement between calculation and measurement is extremely good. For Class C amplifier operation, the transistor data are, of course, the same as in the previous example. The operating data become

\[ f = 7 \, MHz, \quad V_{bc} = 0, \quad R_{bc} = \infty, \]
\[ P_0 = 50 \, W, \quad R_{bc} = 0, \quad \phi = \text{optimum}, \]
\[ v_c = 43.4 \, V, \quad R_{bc} = 27 \, \Omega, \quad C_a = 0. \]

The value of \( v_c \) is chosen to equal the measured value of the output voltage. The value of \( R_{bc} = 27 \, \Omega \) is chosen to achieve stable operation. With this resistor value, we avoid a negative drive power and a negative real part of the input impedance.

Calculations yield the following results:

\[ R_i = 17.7 \, \Omega, \quad R_i = 1.29 \, \Omega, \quad P_i = 0.114 \, W, \]
\[ C_L = -1303 \, pF, \quad X_i = -6.29 \, \Omega, \quad G = 26.4 \, dB. \]

The results for these two examples cannot be obtained using S-parameter techniques. **
WORLD'S FIRST PRODUCTION CCD AREA IMAGE SENSOR
New 100 x 100 CCD solid state area image sensor for low resolution applications.

THE CCD201 solid state 2-phase self-scanning device is the first CCD area imager in production. The device uses charge-coupled and buried N-channel implanted barrier technology to create an electronic image. It's the second Fairchild CCD device to go into production (our 500-element linear image sensor was introduced earlier this year).

CCD advantages over vacuum tube imaging devices
- smaller size
- longer life
- lower power (50mw typically)
- lower operating voltages (20V max)
- solid state ruggedness and reliability
- on-chip video preamp and compensating circuit
- inherent spatial accuracy to 1 part in 10,000
- low impedance output
- excellent dynamic range
- highly sensitive to both visible and near-infra-red radiation

CCD201 format size is compatible with low cost lenses, which represents considerably lower system cost. This makes the device attractive in existing low-resolution CCTV applications for example, where there can be a dramatic reduction in camera size and voltage requirements (20V instead of 2KV). Plus the elimination of sensor replacement because of tube aging.

The availability of both our linear and our area image sensors takes CCD out of the R&D lab and into a proven Fairchild production technology. (Example: the CCD101 linear image sensor has already been reduced from $1200 to $800).

For more information ask for data sheets and technical papers on the physics and applications of charge coupled devices. Call our Hot Line: (415) 962-3333
The CCD201, because of its small size, lower power consumption, and reliable operation over a broad range of conditions, is ideal for surveillance, medical instrumentation, and process control. This CCD image sensor opens up a world of new applications, particularly where extremely precise image analysis is important.

The sensor region consists of 100 columns of 100 1.2 mil x 0.8 mil light-sensitive elements, on 1.2 x 1.6 mil centers, arranged in a standard 4 x 3 aspect ratio. The entire device is contained in a 24-lead, dual-inline package with an optical glass window.
Multiple-output NAND networks
synthesized in seconds with computer program that accounts for fan-in and fan-out limits.

NAND and NOR gates find wide use in logic design. Yet, despite the availability of computer-aided circuit-design techniques, much of the logic design used continues to be performed by hand. Recently, however, Su and Nam\(^1\) presented an efficient computer algorithm for the synthesis of multiple-output, multiple-level NAND (NOR) combinational networks that accounts for the practical fan-in and fan-out limits of these logic gates.

The algorithm, programmed in Fortran on the CDC-6400 computer, provides efficient logic design for truth tables or function-arrays that have up to 75 variables (the sum of the input and output variables). Requirements of time and storage are moderate—several seconds and 51.2 kbytes of main memory.

The program's ability to handle many variables and to realize solutions with near minimum numbers of gates makes it ideally suited for practical computer designs. Other benefits derived from use of the program include:
- Output of detailed logic diagram; each gate satisfies the fan-in and fan-out limitations.
- Ability of the designer to tackle problems beyond the scope of hand methods.
- Program can be used as a subroutine in a general logic-design program (logic-synthesizer) or as a hardware compiler.

Program execution
The programs accept truth-table inputs in cubic notation\(^2\)—a compact notation for Boolean products (see Box 1)—along with specifications for the following integer variables:
- NC — no. of cubes (rows)
- NV — no. of input variables
- NVO — no. of output variables
- IFI — NAND gate fan-in limit
- IFO — NAND gate fan-out limit
- IWFI — fan-in weight
- IFWFO — fan-out weight

Matrix representation of the truth table
Cubic notation permits compact matrix representation of a given truth table. To convert to this type of notation, express each output as the sum of Boolean products, then reserve a matrix in which the number of rows equals the total number of products—one row (cube) for each distinct product. Reserve one column for each input variable \(X_i\) and one column for each output \(Z_j\).

Proceed column-by-column with each row; place a 1 if \(X_i\) appears in the product; a 0 if the complement appears, or an X if the literal does not appear in the product.

In the output columns, use 0 and 1 to represent on and off, respectively; use D to indicate a “don’t care” condition. For example, the logic equations

\[
Z_1 = X_1X_2X_3 + X_4X_5X_6 + (X_7X_8X_9 + X_1X_2X_3)
\]

where the parenthesized terms are “don’t cares,” are represented as shown in the table. The input combinations \(X_1, X_2, X_3, X_4, X_5, X_6\) correspond to \(Z_1 = 0\) and \(Z_2 = 0\) and needn’t be shown in the array.

Array representation for \(Z_1\) and \(Z_2\) outputs

<table>

</tbody>
</table>

\(^\ast\)Not part of array representation
where the fan-in and fan-out weights determine the relative importance of fan-in and fan-out reduction. For example,

\[ IWFI = 2 \text{ and } IWFO = 1 \]

mean that it is twice as important to solve fan-in than fan-out problems.

Data inputs for a job consist of a card in 715 format that contains the seven integer variables, followed by cards for the truth table or function-array. Array data are in row-by-row order; each array element occupies one space on the card. One space is to be left between input and output variables, and each row of the matrix begins on a new card. A given row may occupy a total of 75 card-columns—on successive cards.

More than one problem can be done at each execution of the program, provided the data cards for each problem are placed behind one another. A blank card placed after one or more data decks terminates the run. Computer output for each problem consists of a recapitulation of the input data (Fig. 1a) and a cryptic description of the detailed logic diagram (Fig. 1b).

The example shown has 10 inputs, six outputs, and the truth table contains 13 rows. The print-out of the truth table follows the format described in the box.

The solution to the problem contains 44 NAND gates (Fig. 1b). Six gates, numbered 39 through 44, respectively, generate the six output-variables, \( Z_i \) through \( Z_6 \). Inputs to the gates are defined as follows: a number signifies input from a like-numbered gate; symbols such as \( X_1 \), \( X_9 \), \( X_{10} \) denote input literals \( X, X \) and \( X \); a \( \Gamma \)-like symbol preceding the \( X \) indicates use of the complement of variable \( X \). Commas separate the individual inputs.

Other than elimination of rows for which there are no ONEs in the output columns, the eighth row in the sample case, the program does not simplify the given truth table or function-array. But the NAND-gate count is often less if such a reduction or simplification is made before this program is run. Programs that reduce the truth table may be found in appendices I and II of Ref. 3. These use the reduction algorithms of Su and Dietmeyer.\(^3\) \(^4\) \(^5\)

---

1. Program output consists of a recapitulation of input data as well as the completed NAND network design. The program accepts truth-table inputs in the form of matrix notation (a) along with fan-in and fan-out limits. Symbols containing \( X \)'s indicate input variables or their complement (b); numbers refer to inputs from other NAND gates.

</tbody>
</table>

LOGIC, the main program, controls the flow of operations (Fig. 2). The program’s functions are to read and to print input data, to encode the incoming arrays, to prepare them then for processing by the subroutines and to call these subroutines.

Procedural subdivisions

Functionally, LOGIC is divided into eight sections, which perform eight tasks (Table 1). Processing begins with section 1. All input information is printed out as a check to the programmer. Array rows are read with a DO loop. The input information is encoded to occupy two bits of the CDC-6400, 60-bit word. Input characters are checked against IRCL for error. IRCL contains only five elements: 0, 1, 2, X and D. If the input contains any other elements there is an error and an error message is printed. The program continues to check the remaining rows for errors, then terminates. At the end of this section the output array (the Z's) are stored in ICUBE and ISTORE; the input array in IM.

Then program execution proceeds to section 2 to count 0's and 1's in the output array—contained in ICUBE—and continues to the third section. The third section is used only once. At completion of section 3, the input array is stored in ICUBE; the output array remains in ISTORE.

2. Over-all program flow. The mainline program controls the operations, reads input data, encodes the arrays and then forwards them for processing by subroutines.

This completes preliminary processing.

Processing of the input array according to the algorithm begins. The program returns to section 2, then to sections 5, 6 and 7. LOGIC calls subroutines IFACT and CUBE in section 7. The program keeps cycling—section 2, 5, 6 and 7—until no additional factors can be found in section 6. At this point, section 7 is entered and subroutine OUTPUT is called to produce the necessary gate connections for the input array.

When processing of the input array is completed, control goes to section 8, where the variables necessary to process the output array are set.
The output array previously stored in ISTORE is placed in ICUBE.

A cycle similar to the one used to process the input array occurs that involves sections 2, 4, 6 and 7. Once again, when no additional factors are found in section 6, subroutine OUTPUT is called to post the output-array information. The program is now completed, so it terminates. A number of important functions are performed by subroutines (Fig. 3). LOGIC, the mainline program, calls the three major subroutines—IFACT, CUBE and OUTPUT. In turn, OUTPUT calls on five minor subroutines—OUT1, OUT2, FANSUB, FANOUT and ORDER.

Subroutine IFACT finds the common factor with the largest figure-of-merit that can reduce fan-in or fan-out problems. The program consists of three sections as follows:

<table>
<thead>
<tr>
<th>Major subroutine</th>
<th>Function</th>
<th>Minor subroutine</th>
<th>Subtask performed</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOGIC (MAINLINE)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>IFACT</td>
<td>Finds factor in ICUBE with greatest figure-of-merit.</td>
<td>OUT1</td>
<td>Pads characters for gate connections in IOUT with 6-bit BCD code.</td>
</tr>
<tr>
<td>CUBE</td>
<td>Adds auxiliary row and variable for each factor found in ICUBE. Deletes elements in ICUBE covered by that factor and replaces them with “don’t care” elements for the output array and X’s for the input array.</td>
<td>OUT2</td>
<td>Prints gate connections formed in other subroutines.</td>
</tr>
<tr>
<td>OUTPUT</td>
<td>Generates gate connections for input or output arrays. Calls on five additional subroutines for selected sub-tasks.</td>
<td>FANSUB</td>
<td>Stores pertinent information on fan-out problems in any row or variable.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FANOUT</td>
<td>Determines if fan-out problem exists and if so, which gate should receive the connection. Uses mostly information processed in FANSUB.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ORDER</td>
<td>Assures proper processing sequence of auxiliary terms or variables to avoid use of undefined variables in the algorithm.</td>
</tr>
</tbody>
</table>

3. **Subroutines play an important role** in the execution of the algorithm. IFACT and CUBE embody the iterative portions of the algorithm. Once processing by LOGIC, IFACT and CUBE is completed, OUTPUT generates gate connections, keeps track of gate numbers and locates fan-in and fan-out problems.

out selected tasks that include printout of the final results—from OUT2 (Fig. 3).

Program limitations and modifications

As written (in Fortran V) the program can accept input arrays with a maximum limit of 50 rows and 75 variables—input and output. Word usage is minimized when each entry occupies only two bits of the 60-bit CDC-6400 word. Each CDC-6400 word contains 60 bits, and therefore stores 30 variables. The five words allocated to each row of the truth table permit the handling of up to 150 variables. More words can be allocated—to handle more variables—but the number of allowable rows is reduced. Each matrix row is stored in successive elements of array ICUBE, such as ICUBE (I, 1), ICUBE (I, 2), etc.

Variables in labelled-common occupy about 50% of the total memory space used. Consider the following dimensioned variables in COMMON: ICUBE (100, 5) IM (50, 200) ISTORE (50, 5) and IW (100, 5). To reduce memory requirements—as well as the capacity of the program—certain relations must be maintained between the size parameters, that are defined by writing ICUBE (I, J), IM (L, M), ISTORE (K, J) and IW (I, J). The meaning of the dimensional parameters I, J, K, L and M is as follows:

I — total number of rows which the program can process;

J — varies with I, increases by one for every 30 variables or part thereof processed;

K — maximum number of variables or part thereof processed;

L — largest number of elements in a column;

M — largest number of right-hand or left-hand elements of the same column.

And the following relationships must be satisfied:

K ≤ I
L ≤ K
M ≤ K and ≤ 2 · Max (I, J).

To have the program occupy more or less memory space, modify the dimension statements for ICO (I), IC1 (I), ICC1 (I), ICC (I), IM (L, M), IMU (L), IORDER (K), ISA (KE) (K), IKE (KE) (I), IKEPI (K, J) and IW (I, J). Use of larger arrays necessitates program changes along with changes to the field lengths specified to the program.

Users of ANS Fortran IV will have to replace the ENCODE and DECODE statements—which are part of Fortran V—with equivalent character manipulations and input/output statements. The ENCODE statement converts the data items specified in the list following the parenthesis to a character string according to a specified Format-statement number. The characters are placed in consecutive locations of the array, array element or variable named as the starting location for the character string. The items within the parenthesis following the ENCODE verb specify the length of record, the number of the Format statement used, the name of the array to receive the characters and the name of a variable to receive the count of the number of characters generated by execution of the statement.

The DECODE statement corresponds roughly to the standard READ statement. Use of the statement causes characters in internal records to be converted to data items. The list portion specifies the items to be decoded as in the READ statement. The items in the parenthesis specify the number of characters to generate per record, the Format statement used, the name of an array, array element or variable that is the starting location for data and the name of a variable to receive a count of the number of characters scanned during the execution of the statement.

In all cases the following Fortran statements in the program listing must be changed to conform to the values selected for these dimensional parameters: Line nos. 24, 26, 214, 450, 523, 524, 532 and 804.

Certain changes must also be made in the program depending on the computer you are using. These changes depend on the number of bits in a

(continued from page 102)

computer word and the number of output characters that can be stored in a word. The changes are as follows:

1. In the main program the user must supply the initial value for IBIT in the DATA statement. This value is the number of bits per word in the computer being used.

2. The output routines, OUT1 and OUT2, must be changed, as shown in Table 2, to reflect the different internal codes used to represent characters and also the number of characters that can be stored in a word.

New reduced price on
the popular HP-35 ... $295

The HP-35—the original scientific pocket calculator that's now the standard of the industry—is available at a new, reduced price ... $295. It has all the trigonometric, logarithmic, arithmetic and data manipulation capabilities that have made it the indispensable tool of more than 75,000 scientists and engineers.

The HP-45 and HP-35 come complete with: Battery pack • AC adapter/recharger • Leather carrying case • Safety travel case • Illustrated owner's handbook • Self-adhesive owner's name tags. The HP-45 also includes a Quick Reference Guide.
Compare the HP-45's advanced features with those of any other scientific calculator!

Gold "shift" key doubles the function of 24 keys... helps give the HP-45 increased capability with no increase in size! Primary functions are labeled on the keys, alternate functions above. Gold key lets you shift from one to the other.

Display formatting in fixed decimal or scientific notation... at the press of a key. And you can round off answers to any number of digits (0 to 9) displayed after the decimal point in either mode. Full accuracy is always maintained internally.

Operational stack has 4 registers... for automatic storage and retrieval of intermediate solutions. The stack design permits review of stored data at any time.

9 additional memory registers are addressable... can be used for storage and retrieval of data, or to perform register arithmetic. A 10th ("Last X") register lets you recall last input argument for error correction or for multiple functions of same argument.

Trig functions may be performed in any of 3 selectable angular modes... degrees, radians or grads. Decimal angles are calculated in whichever mode is specified. The HP-45 also computes natural and common logarithms, as well as antilogarithms.

Instant conversion from polar to rectangular coordinates... or vice-versa. And vector calculations are simple when you also use the Σ+ key to simultaneously accumulate two coordinates.

Factorial function allows rapid calculations of combinations and permutations... to reduce problem-solving time to seconds. You can quickly find the factorial of positive integers.

Statistical analysis is easier... because the Σ+ key provides a running total when summing numbers, keeps track of the number of entries, and automatically computes the sum of the squares. The Σ- key calculates the arithmetic mean and the standard deviation.

Hewlett-Packard pocket calculators...

If you work with numbers, you can't afford to be without one!

Beyond the basic four functions (+ x - ÷), the HP-45 is pre-programmed to:

Perform trigonometric functions:
- Sine
- Arc sine
- Cosine
- Arc cosine
- Tangent
- Arc tangent

Perform logarithmic functions:
- Common logarithm
- Natural logarithm
- Common antilogarithm
- Natural antilogarithm

And perform:
- Serial calculations
- Mixed serial calculations
- Chain calculations
- Mixed chain calculations

Calculate:
- The square root of the number displayed
- The square of the number displayed
- The reciprocal of the number displayed
- The raising of any positive number to any power
- The factorial of positive integers
- Percentage and percent differences
- Sum of the squares
- The mean of entries made with the "Σ+" key
- The standard deviation of entries with the "Σ−" key

Automatically convert:
- The decimal angle in any of the angular modes in the display to degrees/minutes/seconds
- The degrees/minutes/seconds angle in the display to a decimal angle
- Polar coordinates to rectangular coordinates
- Rectangular coordinates to polar coordinates
- Centimeters to inches
- Inches to centimeters
- Kilograms to pounds
- Pounds to kilograms
- Liters to gallons
- Gallons to liters

And the HP-45 will also:
- Simultaneously accumulate two sets of entries for statistical and vector calculations
- Allow for deletion of erroneous entries
- Recall the last argument of a calculation to check for accuracy
- Display the constant π at the touch of a key
- Permit selective data storage and retrieval in up to 9 registers
- Operate in any of three trigonometric modes—degrees, radians or grads
- Perform register arithmetic
- Perform vector arithmetic
- Fit in your shirt pocket
- Operate on rechargeable batteries or AC

Dust filters can block cooling air and overheat electronic equipment. Here’s data on how to select them, how they affect airflow and when to change them.

Dust destroys electronic components, upsets calibrations and wears out bearings and other sliding surfaces. Dust also hinders the transfer of heat from components to cooling air, and the result is premature failure. So it’s important, obviously, to filter the cooling air before it enters the electronic equipment. But surprisingly little has been published about the effects of filters on cooling capacity and filter life. The filter should match the environment. However, the filter you choose is, at best, a compromise between the filter’s efficiency and its life or air-pressure loss.

Dust comes in all sizes. The average size of particles in the atmosphere is about 3 µm in diameter. For test purposes, the AFI-USA (Air Filter Institute) code provides a standard dust-composition atmosphere as follows:

<table>

The amount and composition of the dirt in your equipment’s environment is the first factor you must estimate before you choose a filter material. A working estimate of the weight of dust per cubic meter that can be expected in various environments is:

- Zone 1: Heavy industrial — 0.0030 g/m³
- Zone 2: Average industrial — 0.0008 g/m³
- Zone 3: Average residential — 0.0003 g/m³
- Zone 4: Relatively clean room — 0.00014 g/m³

Woven fiberglass is probably the most widely used filter material. It can trap particles in sizes from 3 µ up; it provides good efficiencies that range from 68 to 98%, which depends on weave and thickness; and it holds large quantities of dirt. However, plastic foam is best for very small particles. It can trap 1-µ particles, has a very high efficiency—roughly 98 to 99%—but it clogs rapidly and requires frequent cleaning or changing. For large-particle filtering—or merely as a fan guard—wire mesh is often used. Its particle-trapping capability and efficiency are very poor initially, but this tends to improve as lint accumulates.

Slitted, expanded aluminum foil is a filter material particularly advantageous to electronic applications. It traps fine particles, as does plastic foam, and it is more easily washed for reuse. A spray coating of adhesive restores its ability to capture fine dust particles. Of special value to electronic equipment is its RFI and EMI attenuation capability. And since it is metal and non-flammable, UL approval is more easily obtained.

Calculating filter life

Fig. 1 shows how the efficiency (% dust removed) of a typical woven fiberglass filter pad for a 4-11/16-in. fan varies with dust accumulation. The efficiency remains constant at about 75% for most of the operating life of the pad, and it increases rapidly when the trapped dust finally prevents proper “breathing.” At this point the pressure drop caused by the clogged pad produces an unacceptable loss in cooling capacity, and the pad must be replaced or cleaned.

To determine how frequently a filter should be changed, use the simple equation

$$T = \frac{C}{W},$$

where $T$ = filter operating life in hours (h), $C$ = filter capacity in grams (g), $W$ = weight of dust deposited in one hour (g/h).

To find $W$:

$$W = F \times D \times 3.6,$$

where $F$ = air flow in liters/sec (l/s), $D$ = dust density of environment in g/m³.

For example, from the efficiency plot of the fiberglass filter in Fig. 1, we see that the filter’s maximum trapping capacity is 14 g. However, the final filter capacity could be less if, instead of by efficiency, the capacity was determined by

Lawrence F. Edwards, Product Manager, Amphenol Sales Div., Component Marketing Service, Broadview, Ill. 60153.
Filter efficiency remains nearly constant until accumulated trapped dust causes it to suddenly increase—a signal that the filter should be cleaned or replaced. While this is the ultimate filter life, allowable pressure-loss may be a prior criterion and thus require earlier replacement or cleaning of the filter.
maximum allowable air-pressure drop.

For a filter of this size a typical airflow rate is 40 l/s. Let's assume a relatively clean-room environment (Zone 4). With a value of 0.00014 g/m² of dust, we get

\[ W = 40 \times 0.00014 \times 3.6 \]

\[ = 0.02 \text{ g/h} \]

and

\[ T = \frac{14}{0.02} = 700 \text{ h}. \]

On the other hand, suppose periodic maintenance is done every 500 hours. The filter capacity is then

\[ C = 0.02 \text{ g/h} \times 500 \text{ h} \]

\[ = 10 \text{ g}. \]

Both dust-trapping capacity and filter efficiency are specifications that can be obtained from the filter-material manufacturer.

**Designing around the pressure drop**

Two approaches can be used to offset the air-pressure loss in a filter as it clogs up:

1. Pick a suitable fan; determine maximum tolerable pressure drop for the required airflow; and specify a filter that will not exceed this loss within a reasonable replacement time.

2. Pick the filter first and then calculate the worst-case pressure loss. Choose a fan large enough to overcome the loss.

For the fiber filter considered thus far, curve C in Fig. 2 shows the variation of pressure drop with airflow for a clean filter, and curve B, the pressure drop build-up as dirt accumulates.

To apply either approach in filter selection, you start with curve C and determine the clean-filter pressure drop at the required rate of flow. For instance, a 40 l/s flow causes a drop of 3.5 mm H₂O in a clean filter.

In the first approach, deduct the clean-filter loss from the maximum tolerable pressure drop. Then find the weight of trapped dust that will cause this loss on curve B. If, say, the maximum tolerable drop is 10 mm H₂O, then 10 - 3.5 = 6.5. At 6.5 mm H₂O, the weight of dust trapped is 5 g. The filter would have to be changed at intervals of

\[ T = \frac{5}{0.02} = 250 \text{ h} \]

for a flow of 40 l/s and Zone 4 dust conditions.

In the second approach, if you had selected the 4-11/16-in. fiber filter, the maximum filter capacity would then be 14 g (from Fig. 1). On curve B of Fig. 2, 14 g of trapped dirt yields a pressure drop of 16.5 mm H₂O. Add 16.5 to the clean filter drop of 3.5 mm H₂O to get a total pressure drop of 20 mm H₂O. The fan must be able to overcome this pressure drop and still deliver the required flow.

Typical fiber-filter characteristics curves, as might be supplied by a filter manufacturer, are shown in Fig. 3. • •

ELECTRONIC DESIGN 23, November 8, 1973
The market is ripe for product breakthroughs. Just look, for example, at the growth of such items as the hand-held calculator, small camera flashguns, ultra-mini portable radios and recorders. The key to these tremendous sales successes is high frequency power conversion circuits.

And the key to still more efficient, high-frequency power conversion is Ferroxcube's new 3C8!

This important new ferrite material gives significantly higher flux densities at higher temperatures, and lower losses at high excitation levels than any other magnetic core material. It is available in practical size cores for use up to kilowatt power levels.

3C8 is already being used with great success in: inverters, battery chargers, fluorescent lamp ballasts, strobe light devices for highway markers and harbor buoys, power oscillators, power amplifiers, ultrasonic generators.

In all of these circuits Ferroxcube's 3C8 material has led to greater efficiency, lower cost, less weight, and smaller sized units. In one power supply, for example, the size of the core was reduced from 13 lbs. at 60Hz to 4 lbs. at 20,000 Hz and the volume from 35 to 9 cu. inches—savings of 70 to 75%!

Can 3C8 improve your present products or suggest new products and markets for your company? If you've got the imagination, we've got the core! Call 914-246-2811, TWX 510-247-5410 or write today.

Ferroxcube linear ferrites—made in Saugerties, N.Y. and stocked in seven U.S. locations.
Linearize your v/f converter. By adding a constant-current source to the usual feedback arrangement, you can cover five decades with 0.0005% linearity.

You can design a voltage-to-frequency (v/f) converter that covers five decades with exceptional linearity and with a minimum of trimming. The secret lies in precise control of the discharge of a capacitor used as an op-amp feedback element. Here’s how the circuit works.

Most v/f converters depend upon the charging of a capacitor in the feedback loop of an op amp; the capacitor is discharged when a certain output level is reached. With this arrangement it turns out that nonlinearity is almost strictly a function of the discharge circuit.

The usual way to improve linearity is with compensating circuits or some form of feedback correction. For example, to control the discharge, a reference capacitor, $C_1$, can be charged to a defined level, then switched into the charging circuit with a comparator (Fig. 1). The charge of $C_1$ then flows into $C$ and the charging is repeated.

In the ideal case, the switching time can be neglected and the frequency is then:

$$ f = \frac{1}{V_{ref}C_1} \cdot \text{constant} \times V_1. $$

However, with the conventional scheme, the op amp will overload momentarily during the discharge, which will result in a change in current, $I$, and—consequently—in frequency, $f$.

But the discharge process can be controlled better if the discharge current is taken from a controlled-current source (Fig. 2).

Current source improves linearity

In Fig. 2 the op amp operates normally even during the discharge of $C$, and there’s no interruption in the integration.

When $V_2$ reaches $V_{ref}$ in value, a circuit is triggered, that delivers a pulse of length, $T_d$. This pulse activates the current generator through which $C$ is discharged. During the cycling time, $T$, a charge, $I_c \times T_c$, is removed from, and an equal amount $I \times T$ is transferred to $C$. Thus:

$$ IT - I_cT_d = 0 $$

and

$$ f = \frac{1}{T} = \frac{I}{I_cT_d}. $$

The stability of the v/f conversion depends now on that of the current generator and the timing circuit. A high degree of stability is achieved by using a crystal-controlled clock oscillator as the timing element (Fig. 3).

Again, the purpose of the timing circuit is to deliver a pulse with a well-defined length. The

---

Bengt Alvsten, University of Lund, Sölvegatan 14, S-223 Gz, Lund, Sweden

1. Linearity is improved in feedback-type v/f converter (a) by discharging feedback capacitor through $C_1$ at the right moment during the cycle (b).

2. Best linearity is obtained by discharging $C$ through a constant-current generator (a). Improved output occurs during $T_d$ (b).
3. Using a crystal oscillator as the timing control device ensures high stability.

4. Complete v/f converter (a) combines FETs, ICs and bipolar transistors to achieve high linearity over a wide span. Waveforms are shown in (b). Linearity can be further increased by modifications—see text.
pulse starts when the integrator output signal passes a certain level. Since the length of the pulse is determined by a free-running clock, synchronization is needed between the signals from the integrator and the clock.

To synchronize, a comparator senses the integrator signal and sets a flip-flop in a state such that the flip-flop is triggered by the next clock pulse. The flip-flop's output pulse then activates the current generator.

Since the comparator signal changes during discharge, and the next clock pulse resets the flip-flop, the discharge time, \( T_d \), is thus determined by the clock frequency.

Note that the comparator pulse appears arbitrarily in the time interval between two clock pulses. This causes the integrator output level to be modulated and the time interval between two discharge pulses to oscillate around the shown value for \( 1/f \). However, these don't affect the \( v/f \) accuracy in the steady state.

Circuit verifies theory

A practical design for a complete converter is shown in Fig. 4. The integrator is a \( \mu A 715 \) op amp equipped with FET inputs to minimize input-bias currents. The voltage-to-current converter consists of two resistors, with one resistor variable for calibration. The \( \mu A 734 \) comparator couples directly to the output of the integrator; the signal at this point is shown in Fig. 4.

The \( \mu A 734 \) comparator signal is fed into the D-input of a 7474, D-type, edge-triggered flip-flop. With a clock-oscillator frequency of 100 kHz, a 10-\( \mu s \) pulse will be produced at Q. This pulse controls the path of the discharge current.

The current generator is designed in a conventional way. A \( \mu A 741 \) controls the current in a BC107 transistor. Two FETs in the collector circuit of the BC107 shift the current to capacitor C or to ground. Thus, the current through the BC107 stays constant; this increases the accuracy of the current generator.

The FETs are controlled by a Schmitt-trigger activated by the pulse at the Q output. Active FET resistors are used in the trigger circuit to improve the pulse shape. An emitter follower, together with a zener diode, matches the flip-flop and the Schmitt. The output can be taken from the pulse at Q or directly at the integrator output.

Output frequency as a function of input voltage, and the percentage deviations from a straight line, are listed in the table.

Linearity can be increased by: 1. increasing integrator gain; 2. driving the input of the integrator symmetrically relative to ground; 3. replacing the input resistor with an active voltage-to-current converter; and 4. including a feedback loop. ■

This switch does everything from mother baby chicks to brew fresh coffee.

You’ve probably used our versatile V3 snap-action switch a thousand times and didn’t know it. Since 1947, it’s been standard equipment on applications ranging from incubators to vending machines.

It offers thousands of variations in circuitry, electrical capacity, actuators and terminals.

For example, various contact designs provide switching capacities that range from milliamps to a ½ hp rating. A choice of integral or auxiliary actuators turns difficult jobs into routine ones. While a selection of terminals, including screw and quick-connect, further uncomplicates your application.

For special jobs, there are special versions. Some can handle temperatures down to −100°F. Others with hi-temp construction can operate at up to +600°F. And still other specials meet UL standards for TV ratings.

The V3 offers this versatility without sacrificing quality or low price.

Use thyristor switches for proportional temperature control. These zero-switching circuits provide rapid but smooth control.

Proportional temperature control offers major advantages in applications that require fast warm-up. This type of circuit controls power smoothly and rapidly. By contrast “burst” controllers tend to cause temperature fluctuations due to their intermittent extremes of power.

In the proportional system of Fig. 1, an error signal can control a thyristor switch. The switch, in turn, applies the line voltage to the load. To avoid generation of any electrical interference, the thyristor switch is always either ON or OFF for one or more complete cycles.

The proportional controller has several advantages.
- The average power delivered to the load is directly proportional to the input current.
- At all power levels, the particular ac line cycles selected for application to the load give the smoothest supply of power.
- A step change of input current results in a step change of output power within a maximum delay time of one cycle.

Figure 2 shows a practical version of the system outlined in Fig. 1. The input error current charges the timing capacitor, C,, of unijunction-relaxation oscillator, Q . The oscillator output pulses vary in frequency from zero to 60 Hz, and the frequency is linearly related to the input current. These pulses are then applied to the set terminal while the reset terminal of the bistable element receives 60 Hz pulses each time the ac lines change polarity. However, the bistable output can only change from the SET to RESET state if an oscillator pulse has occurred during the previous cycle.

Whenever the bistable changes between the SET and RESET states, it triggers a pulse generator and, thus, the full wave thyristor switch. Each oscillator output pulse causes one full cycle of line power to be applied to the load. Also, the bistable element “remembers” the output pulse and won’t change state until the next positive-going zero crossing of the line.

If, for example, the oscillator frequency is 20 Hz, every third cycle is applied to the load. If the frequency is 40 Hz, two successive full cycles, followed by one OFF cycle, are applied to the load. If we use a “1” to represent a cycle applied to the load and a “0” to represent a missing cycle, some typical load patterns are:

- 20 Hz: 1101101110110110110110110110110
- 30 Hz: 1101101110110110110110110110110
- 36 Hz: 1111101110110110110110110110110
- 40 Hz: 1111101110110110110110110110110
- 42 Hz: 111110111011011011101101101110
- 50 Hz: 11111011101101101111101111110
- Step change: 11111111111111111111111111111111

This system guarantees that the ON and OFF cycles are uniformly spaced throughout any time period.

Building a practical circuit

Following the schematic through, we see that the zero detector consists of a tunnel diode, CR , feeding the base-emitter junction of Q . To eliminate false outputs caused by transients on the ac power lines, an RC filter precedes the zero detector. The same filter gives sufficient phase advance to ensure that the tunnel diode switches from its low impedance to high impedance condition about 1 ms before the ac lines pass
2. The circuit uses a full-wave thyristor switch and a UJT oscillator to control the heater current and thus the temperature. This stable, closed-loop system also uses a neon lamp as a telltale indicator.

Through zero – to + (positive going).

The pulse generator output pulse has a duration of 3 ms. This ensures that the thyristor switch is gated to conduct as the ac line voltage passes through zero. To avoid the loss of a selected cycle due to the coincidence of the oscillator and line trigger pulses, the bistable design should guarantee that:

- All trigger pulses have short duration.
- The oscillator SET pulse has a shorter duration than the zero RESET pulse—say 20 µs and 60 µs, respectively.
- If both output pulses are present simultaneously, the bistable output should depend on the oscillator pulse. Thus, for coincident pulses, the bistable output will be in its SET condition for at least 20 µs and in its RESET condition for at least 40 µs (this being the time difference when the zero pulse only is applied).
- The bistable output time constant of 8 µs is short enough to differentiate a 20 µs output pulse and ensure triggering of the pulse generator.

The pulse generator gates SCR, for the positive half-cycle. During this half-cycle, the load voltage charges \( C_0 \) to provide gate current for \( \text{SCR}_2 \) when the ac lines change polarity. Thus, a full cycle is applied to the load.

Controlling furnace temperature for a furnace temperature-control application, the output voltage of a thermocouple and a reference voltage feed the input terminals of a difference amplifier. The amplifier output feeds a current to the oscillator circuit in Fig. 2. During the initial furnace warm-up, the reference voltage exceeds the thermocouple voltage and the amplifier is saturated, giving a maximum output current. This output current, from the collector of a pnp transistor, operates the oscillator at a frequency just over 60 Hz (for a 60-Hz line frequency). Thus, there is at least one SET pulse during each cycle and the heater is fully energized. The amplifier gain is such that the amplifier stays in saturation until the furnace temperature is within about 3% (30°C for control at 1000°C) of the required temperature. Further increases in temperature cause a drop in oscillator frequency.

Once the frequency falls below 60 Hz, heater power drops. Because the controller is a closed loop system, aging and variations in ambient temperature have little effect on the furnace temperature control.

A neon lamp in parallel with the heater forms a useful indicator since:

- A continuous glow confirms that both SCRs are conducting during the initial warm-up.
- Once the furnace temperature stabilizes the lamp flickers steadily.
- If the glow around each electrode is different, there is a fault in the circuit (usually an SCR failure).
The Avantek Fundamentals.

Only Avantek, among all YIG oscillator suppliers, offers fundamental YIG-tuned oscillators covering 2 GHz to 10 GHz. What's more, we back our statement with the thousands of Avantek oscillators currently operating in our customers' spectrum analyzers, sweepers, synthesizers and tuners. Our YIG's have met the rigid requirements of E.Wsystem manufacturers to whom maximizing sweep rates and high reliability are paramount.

And now you can leave the driving to us, since we have just introduced YIG-drivers to complement these YIG oscillators and ease the design burden of the system engineer.

Avantek's leadership in transistor design and manufacture, coupled with total mastery of thin film circuit techniques, has spearheaded these wideband oscillator breakthroughs and set the stage for developments into even higher frequencies.

LOW COST IC D/A'S... made easy!

8 & 10-bit Models
Internal Reference
100% Power Burn-In
Specs guaranteed 0° to 70°C
Available From Stock
From $9.95*

COMPLETE FAST CURRENT OUTPUT DAC IN A 16-PIN DIP!

At last — an I.C. D/A converter that's easy to apply! The aimDAC 100 series provides its own internal reference voltage for low full-scale tempco and high supply rejection without complex external circuitry — and the fast current output settles in 250ns for use directly in high-speed A/D converters. Need a voltage output? Just add an op-amp — the tracking feedback resistor's already in the package! (Use our monoOP-01 High Speed Op Amp for total settling in less than 1.0μsec!)

Every aimDAC 100 guarantees its critical linearity and tempco over the entire 0° to 70°C temp range — and all devices are 100% burned-in for maximum stability and reliability. Military temperature range models and MIL-38510 processing are available, too.

Best of all, aimDAC 100's are available from stock — try one and see how easy I.C. D/A conversion can be!

Giving engineers the ‘business’

via vertical organization, says this division head, has improved both our project success and the company’s ability to manage.

Once upon a time there was a company that maintained more engineering talent than the average company its size did. It felt that if it could create technically superior products, it could gain the No. 1 spot in the marketplace. But, alas, it didn’t work. While the company recognized the importance of its products, it didn’t appreciate what the market really wanted. It didn’t, that is, until it tried vertical management and used engineers as program managers under that system.

The company is my employer, Instrument Systems Div., Gould, Inc., and the reason no one successfully determined what the customer would buy was that each program was managed horizontally: Each department head interpreted a defined marketing need in his own way; only the general manager knew what the grand business plan was for the product.

Under vertical management, which was started at Gould a few months ago, the directors of marketing, engineering, operations, quality control, and probably a sales manager, formulate a business plan together around a new product or idea. A business plan recognizes all aspects of what has to go into this product. The plan says: This is what the market wants; this is what the product must look like; this is how we’re going to produce it; this is the investment we’re going to make in it; and this is the profit we expect on it.

Engineers learn the business

The job of the program manager is to see to it that this business plan is met. I pick engineers for this job because they have excellent educational backgrounds and the technical expertise to make those tough initial design decisions. We have outstanding technical men who may never become program managers; they’re looked on favorably for their innovative ability, and they’re not expected to carry an idea all the way through to a product.

But there are other engineers here who are more geared to the business world. They’re dy-no-mamic, and although they may well be as innovative as the others, their motivation is that one day they want to be president of Gould and they recognize that they’re not going to get there by sitting on a bench in a corner and inventing things. That’s the class of engineer I want to talk about, along with an example of how vertical management is working for us.

The advantage in use of a vertical management concept over a horizontal concept are dramatized in the handling of our data-acquisition system project. We decided that the best way to make that system was to formulate a business plan in which all of the department heads discuss the problems from the beginning. What are the limitations of the engineering group, for example, and can they meet these specs? What are the reliability requirements on the product? Do we have the kind of equipment that will allow us to make our design; and if we don’t, can the equipment be procured in time to allow us to get the kind of factory cost we need to make the kind of return on investment we must have?

In the past, the engineer that we chose to manage this project would not have been exposed to the business plan and, in all probability, would not have related to the customers’ needs. In most cases he would not have known how the quality-control people were going to measure the product against the market. He would not have talked with the manufacturing people, and in many cases, his limited understanding of our manufacturing capability would have dictated his design. He might not have created a design that he believed was perfect if he thought it meant committing the company to buying a $50,000 piece of test equipment. And that may be a wrong decision. To remain competitive we may be forced to make an investment of $50,000 or even $500,000 to help us to design the right products, and it’s important to know what our investments are going to be as early as possible.

The need to invest in more automated assembly equipment and automated circuit-board test equipment for our data-acquisition system project was recognized from the first day. I have to believe that these changes would not have been made if we had managed horizontally where

Joseph J. Sacco, Vice President and General Manager, Instrument Systems Div., Gould, Inc., Cleveland, Ohio 44114.
Joseph J. Sacco

Education: B.S., Chemistry, Northeastern University.

Experience: President of Ferroxcube Corporation, a subsidiary of North American Philips Corporation; managed memory products in the Electronics Instrument Division of Burroughs Corp. and was general manager of the Electronic Memory Systems Division; directed product development at Memory Products Division, RCA, and memory core manufacturing and test operations were established under his management; conducted research in ferrite materials for digital applications at the MIT Lincoln Laboratory—helped develop the pilot production facility for the SAGE Air Defense Program and the first transistorized computer.

Employer: Following World War I, Charles Brush, Jr., Theodore C. Browne and R. C. Baldwin Sawyer founded the Brush Laboratories Company, which engaged in diversified industrial research. In the late 1920’s, Bengt Kjellgren joined the firm and developed a technique for growing synthetic piezoelectric crystals for use in a variety of acoustic applications. The resulting expansion into sales of microphones, loudspeakers and phonograph pickups was largely responsible for the organization of the Brush Development Company. The magnetic pen motor and wire-tape recorder, among other instruments, were introduced and marketed by Brush following World War II.

In 1952, Brush merged with the Cleveland Graphite Bronze Company and formed Cleve Corporation. Brush continued as a major innovator and manufacturer of direct writing recorders and expanded into experimental work in piezoelectric ceramic materials and the development of underwater acoustic sending and receiving devices. Dix Brown's patents for pressure ink recording (1962) and improved pen linkage, coupled with other improvements in pens and pen motors in the late 1960’s, were the catalysts for Instrument Systems Division's present leadership position in the industry. Present developments include the X-Y printer/plotter, digital recording devices and new O.E.M. recorders.
everyone was concerned only with his own little piece of the action.

The engineer-in-charge now realizes that his sole responsibility is to make this project go. He has assets available to him that he never had before, and he begins to understand things like gross margin and expense levels. He learns about cash flow and profit before tax and what that means to the division. In fact he's running his own business—with all the tools he needs to do it—and he's relating to the two major goals in business: to make a profit and to satisfy the customer.

**Cultivating the business engineer**

Fifteen years ago an engineer was happy to sit on the bench; there was status in being a Ph.D. But engineers have gone through a frustrating time because their ultimate promotion was to chief engineer and, in this division, that's a thankless job. He's not supposed to do the engineering, and he's hung with a budget and the assignment of people to projects. I can get a clerk to do that job. That's not managing anything. It's overseeing a budget and a distribution of manpower and you can't afford a $30,000-a-year technical man doing something like that.

In most cases you know pretty early in the game who of your engineering people is motivated in the management direction. You find out in simple ways—the guy who likes to go to a trade show, who likes to talk to people, who likes to demonstrate the product, who likes to go on calls with the field engineers and the marketing people. He really has an appreciation of the business world in general and he's motivated to create something to which he can tie his name.

That's a different motivation from the guy who's satisfied with his name on as many patents and technical papers as possible. There's nothing wrong with that either. The business-oriented engineers could innovate, too, but we found that many of them saw that all they were doing was overseeing the budget and they were worried about where they were going from there. The business engineer wants to be able to do his own thing; and his job satisfaction comes from relating to how many units are sold, seeing how much profit the company makes on them and speculating on the next great thing he can do for the world.

**The bouquets and the brickbats**

One tremendous side-effect benefit we've gotten from the vertical management concept is that it develops our management ability. In the final analysis, a lack of good managers can really slow down a company's growth and can affect its profits. But when you hire someone from the outside you're buying an unknown quantity. Gould believes in hiring from within. Of course, one of the pitfalls is the syndrome: "He's a nice guy and he's been around for a long time, so let's give him a shot at it." That doesn't happen here.

We have a philosophy in the company: Nobody gets anything by divine right, by right of accession, or because he's been around a long time. For our engineers this is a tremendous opportunity. If we gave a man a small plant to run and he couldn't handle the first big problem that came along, it could destroy him. But if we bring a man along slowly, let him make his mistakes where they can be controlled so that no mistake becomes a disaster, he's allowed to do his own thing and to implement it.

He works with the accounting department to pick up a fair amount of factory cost accounting, and with the purchasing department to understand purchase-price variance. It's great to say that if we're going to build ten-million components, we can buy these transistors for half a buck apiece. But he has to be realistic enough to know what he's doing during the two years before he reaches that ten-million-dollar level. And who's going to absorb those losses? You don't say, "If volume is there, the price ought to be all right." So people are very sensitive about what can and cannot be done in a factory.

Vertical management also allows people to work as a team. They work from a total problem point of view, with a recognition that, to be responsive, things have to occur that are going to be somewhat different from the setup of the old system. All become much better planners. They can adjust schedules and can adapt them to any problem they may have. That was never going to happen with the old system because everybody said, "This is my responsibility and this must happen this way because I have no authority to do it any other way."

The only serious drawback of the vertical system is that if the entire project is not successful, for whatever reason, it can have a tremendous negative impact on the fellow who's managing it. My job is tougher now because I have to manage people who have more authority than they once had. There's a higher risk, too, because we're not documenting as much as with the old system; but the schedule has certainly been maintained.

You had to be very lucky to satisfy the customer and to make a profit under the old system. With the new it's a real-time situation on a continuing basis with a total involvement on the part of a group of people who have the best feel for what they're doing and where they stand on it. If I suspect that something is wrong, I demand a meeting—just to give me a nice warm feeling. The way it should work is that these people should call a meeting whenever they hit upon a problem. •••
For built-in reliability, design with "Scotchflex" Flat Cable/Connector Systems.

"Scotchflex" Flat Cable and Connectors can offer you trouble-free packaging for your next generation equipment.

There's built-in reliability for your circuit inter-connects. Our flat, flexible PVC Cable has up to 50 precisely spaced conductors. The gold plated U-contacts are set into a plastic body to provide positive alignment. They strip through the insulation, capture the conductor, and provide a gas-tight pressure connection.

Assembly cost reductions are built-in, too. "Scotchflex" Connectors make up to 50 simultaneous connections without stripping or soldering. No special training or costly assembly equipment is needed.

Off-the-shelf stock offers you flat cable in a choice of lengths and number of conductors from 14 to 50. Connector models interface with standard DIP sockets, wrap posts on .100 x .100 in. grid, or printed circuit boards. Headers are available to provide a de-pluggable inter-connection between cable jumpers and printed circuit boards (as shown). Custom assemblies are also available on request.

For full information on the "Scotchflex" systems approach to circuitry, write to Dept. EAH-1, 3M Center, St. Paul, Minn. 55101.
The custom MOS.

If you haven't been able to turn up an off-the-shelf MOS device for a high volume application from us—or anybody else—come back to us. Because you could be in a good position to take advantage of custom MOS.

We'd like to point out a couple of things. First, custom design doesn't have to cost you an arm and a leg. That may be true at some companies, but not at AMI. As long as your volume requirements are high enough, we'll bring in your custom circuit at a competitive price. We've designed more than a thousand in the past seven years, so we know how to get where you want to be in the fastest, most economical way possible.

And second, designing a custom MOS doesn't take forever. At AMI, it's normally less than a year from start to full production.

And production is where dealing with AMI really pays off. As the world's largest producer of MOS, we're way ahead of the others, with a monthly volume in excess of one million LSI devices—and climbing.

We're the only company to design in seven MOS processes—from P Channel to N Channel, P, Si Gate and CMOS. So we can choose the design that fits your application exactly—whether it's a calculator, dishwasher, musical instrument, car dashboard control, watch, clock or whatever.

Although we're a large supplier of standard MOS products, we got our start as a custom MOS company and we're not about to forget it. That's worth remembering when you're looking for a proprietary circuit that will give you the jump on your competitors.

We've just published a brochure that outlines our custom capabilities. It's yours for the asking. And if you want to get right down to business, why don't you tell us your MOS problems at the same time? That way, you'll be another lap ahead.

Phone or write our Custom Marketing Department.

American Microsystems, Inc., 3800 Homestead Road, Santa Clara, Ca. 95051. Phone: (408) 246-0330.

New PM motors/gearmotors

The people at Bodine have a new permanent magnet field D-C motor line: The 42A. But, there's a lot more to it than meets the eye. High quality barium ferrite magnet material, magnetized and stabilized by Bodine gives you consistent output capabilities. Day to day. Over the long haul. From motor to motor, lot to lot. The 42A delivers more power from a smaller, lighter package. It runs cool. Quiet. Has surprising control capabilities. Other design benefits include: High-starting torque, low-speed operation and self-braking. Brush life is outstanding: A unique thermoplastic end-shield assembly has precision metal brush boxes and constant force roll-type springs that continuously maintain even brush pressure. Bodine application engineers are ready to help you apply the 42A. Bodine Electric Company, 2500 W. Bradley Place, Chicago, Ill. 60618.

42A Motor Line: Diameter is 4.3 inches. Standard continuous duty ratings are 1/4, 1/3 and 1/4 hp at 2500 rpm, 115V D-C. Available with or without NEMA Type C face mounting shield.

Modified current-limiter circuit ensures turn-on of power supply with constant-current loads

Short-circuit protection of series-regulated power supplies usually includes current limiting plus foldback. Foldback is desirable since it limits the short-circuit dissipation of the pass transistors. However, if the load characteristics approximate those of a current sink, the power supply—during turn-on time—will settle at the first stable point and not reach the expected output voltage.

The turn-on problem can be solved and the foldback feature retained in the series-regulated supply (Fig. 1) by addition of the components shown in Fig. 2b. As long as

\[(V_{IN} - V_{OUT}) < (V_Z + V_{CR2} + V_{BE(Q3)})\],

CR1 remains reverse biased and the current limiter has the characteristics shown in Fig. 1. If the output terminals are shorted, then

\[(V_{IN} - V_{OUT}) > (V_Z + V_{CR2} + V_{BE(Q3)})\],

and the current flowing through CR1, CR2 and R2 forces Q3 into saturation. Since Q3 does not rely on I_L to stay in saturation, I_L drops to a few milliamps. With the short removed, the output voltage increases again to its nominal value.

Representative values are shown on the schematic. The technique described can be used with any series-regulated power supply.

CIRCLE NO. 311

1. Transistor Q1 limits the load current I_L, even if the output is shorted, but it does not provide foldback for the series-regulated supply.

2. Addition of a single resistor (a) gives the foldback characteristic (b). Use of the two diodes (c) modifies the VI characteristic to ensure full output with current-sink loads.

Each GE Planar Ceramic Triode Delivers Acknowledged* Excellence...

And You’ll Find The Same Quality in Every GE Microwave Circuit Module (MCM)!

GE Planar Ceramic Triodes deliver acknowledged state-of-the-art performance: thirty years' GE tube research with triodes has resulted in exceptional tolerance to the most adverse thermal, shock and vibration environments; very high ratio of power, efficiency, reliability and gain bandwidth to product size and weight; fast warmup; lower noise levels; and more efficient operation at higher frequencies.

And we've put our extensive knowledge of triode technology to work developing a family of pre-packaged microwave circuits called General Electric MCM's (Microwave Circuit Modules) each built around a GE triode or solid-state diode. And each MCM is built with such care and precision that it, too, is fast becoming a recognized standard of excellence.

Functioning as an oscillator, an amplifier, or as a complete assembly (with a power supply, and/or integrated isolator/circulator, and/or modulator), GE MCM's solve five of your toughest problems:

- circuit-active component interfaces
- reproducibility
- on-time delivery
- in-line rejects
- field failures

Chances are there's a GE MCM already available for your microwave system. If not, we'll design and build the exact module you need. And we'll get it to you fast.

Contact: Microwave Devices, General Electric Company, 316 East 9th Street, Owensboro, Kentucky 42301. Or use the reader service card.

*In a recent Brand Recognition Study by a leading business publication, more designers expressed a preference for General Electric Planar Ceramic Triodes...11% more chose GE over the next leading brand. (Copies of the Study are available upon request.)
Circuit based on four-bit addition finds average value of BCD numbers

In certain monitoring applications, the parameter of interest is the average value of an analog quantity taken over the sampling period. As is often the case, the average value and inputs must be expressed in BCD format.

The expression

\[ C = \frac{A + B}{2} \]

gives the average value of two numbers A and B. The computation involves two algorithms—addition and division-by-two.

The algorithm for BCD addition is well-known: Add individual digits together as in binary addition; if the sum exceeds nine, add six to it and output a "carry" bit to the next higher decade.

Division by two requires the following steps: Shift each digit to the right by one bit position; add five to the next lowest digit if the bit shifted

1. Average-value circuit uses two levels of full-adder logic. BCD adder blocks perform BCD addition of numbers A and B. The second logic level performs a divided-by-two algorithm.

2. Addition of BCD digits is done on a digit-by-digit basis. If a given sum exceeds nine, a six is added thereto and a carry to the next higher decade is generated.
All in the family.

Three new dual-gates join TI's ever-growing number of MOS FETs.

TI's new N-Channel dual-gate MOS FETs are a family of real performers. The 3N211, 3N212 and the 3N213 deliver 6dB more gain than our 3N204 family. And up to 8dB more gain than any other MOS FET you may presently be using.

You also get high output impedance, low noise figure, high forward transconductance.

TI builds this dual-gate family with monolithic, back-to-back diode protection that blocks out troublesome transients. Nitride passivation is also used for better reliability. This eliminates time-consuming precautionary assembly steps and means lower production costs, fewer wasted devices.

This all new dual-gate family gives you the competitive edge you'd expect from the people who offer the industry's broadest line of N- and P-Channel J-FETs and MOS FETs. And more are coming. UHF and new VHF dual-gate MOS FETs will be arriving soon.

Prices for the 3N211 and 3N312 are 70¢ in 1,000-piece quantities. And 75¢ for the 3N213.

For data sheets, indicate by type number and write: Texas Instruments Incorporated, P. O. Box 5012, M/S 308, Dallas, Texas 75222.
out is a ONE; add zero if a ZERO is shifted out. In the example, A = 53 and B = 76. With the implied decimal point included, the output is the average value 64.5.

Two levels of full-adder logic implement the average-value circuit (Fig. 1). BCD adders—in the first level—perform the addition of numbers A and B, two four-bit adders in the second level implement the divide-by-two algorithm.

The right-shift operation is achieved by connecting the \( S_8, S_4 \), and \( S_2 \) outputs of the BCD adders to the \( a_4, a_2 \), and \( a_1 \) inputs of the second-level adders; and by wiring the \( a_8 \) inputs to logic ZERO.

The following connections implement the additive portion of the averaging algorithm: \( S_1 \) outputs are connected to the \( b_3 \) and \( b_2 \) inputs of the next lowest output stage; the carryout of the last BCD stage is connected to \( b_1 \) and \( b_0 \) of the highest output digits; the \( b_3 \) and \( b_2 \) inputs of the second level are connected to logic ZERO.

Two stages of logic are needed to implement the BCD full adders shown in Fig. 2. If the sum of the digits exceeds nine, it is corrected by adding six to it in the second stage. Note that only single 4-bit adders are required in the averaging stage since the sum never exceeds nine. The circuit has the following features:

- The BCD nature of the inputs is preserved, which minimizes hardware costs.
- Circuit operation is static, which allows high-speed operation.
- Longer numbers can be handled simply by cascading ICs.

V. R. Godbole, Systems Design Engineer, North Electric Co., P.O. Box 688, Galion, Ohio 44833.

CIRCLE No. 312

Temporal-priority circuit latches after receipt of first input signal

Certain data-processing applications require identification of which of several signals arrives first. The circuit shown latches the first pulse received and inhibits further change until it receives an external reset command.

Initially, all six signal inputs are at logic ZERO; the reset line is at logic ONE. Consequently, all eight inputs to the 8-input NAND gate are ONES, which makes the clock input to the flip-flop a ZERO.

A pulse that occurs on one of the input lines makes the corresponding input to \( G_1 \), a ZERO, which changes the output of \( G_1 \) to a ONE. This has two consequences: First, the output transition causes the data at the flip-flop's input to be transferred to the output. Second, the output of \( G_2 \) becomes a ZERO, which thereby latches \( G_2 \). Pulses that occur on any of the other lines will not be transferred since the output of \( G_2 \) remains a ONE.

When the reset line is set to ZERO, the output of the flip-flop is cleared and the latching condition is removed because \( G_1 \) becomes a ONE. The circuit is reinitialized when the reset line returns to ONE.

Propagation delays in the inverters and \( G_1 \) limit the circuit's ability to discriminate between nearly coincident inputs. The minimum delay is 17 ns—based on the maximum delays specified by the manufacturer.

Fred E. Hicks, Junior Engineer, General Electric Co., 831 Broad St., Utica, N.Y. 13503.

The CRT display isn't really obsolete. DIGIVUE® just makes it look that way.

And Rear Projection Capability Is One Reason Why...

Digivue is the plasma display device from Owens-Illinois that delivers computer-generated alphanumeric and graphic displays at microsecond speeds. Digivue provides drift-free images, selective write/erase, inherent memory, hard copy printout potential. And rear-projection capability.

You get coordinated computer-driven displays and optically projected images. Rear project a blank graph, chart, table, blueprint or cutaway drawing, for example, while computer-generated data fills in the blanks. Theoretically, anything that can be photographed can be rear-projected through a Digivue screen. From maps to the Mona Lisa.

Try that with a CRT.

If you'd like to know more about the next generation in display systems, take a look at tomorrow—take a look at Digivue.

Simulation of rear projection on screen.
Feedback circuit improves electron-gun aim by limiting acceleration-voltage changes

Many devices, such as spot welders, gas ionizers and gamma-ray spectrometers, use an electron gun that is operated under pulsed conditions. The drop in accelerating potential during pulsing often causes unacceptable aiming accuracy of the electron beam. The use of additional capacitors across the high-voltage supply is often unacceptable—because of excessive currents that may develop in case of a short-circuit or arcing.

But an inexpensive feedback circuit that keeps the voltage drop of the accelerating potential within prescribed limits provides a reliable and safe way to reduce beam wander.

The accelerating potential, the cathode voltage in Fig. 1, is attenuated 1000 times and is ac-coupled to the input of the feedback circuit (Fig. 2). This blocks the dc component, but allows the circuit to sense the ac variations.

The ac variations are amplified, then applied to the input of a Schmitt trigger, which has an adjustable threshold. Monostable multivibrator MM, normally provides a logic ONE output to the gate. A logic ONE from the external pulser passes through the gate, is inverted, and produces a pulse at the output of A2—which turns on the electron beam.

When the input voltage to the Schmitt trigger falls below the level set by R1, the trigger fires, the cathode voltage changes by a preset amount. Potentiometer R1 determines the cut-off point.

1. Poor voltage regulation causes focus change and beam deflection in pulsed operation of an electron gun.

2. Feedback circuit minimizes effect of accelerating-voltage changes by cutting the beam off when the cathode voltage changes by a preset amount. Potentiometer R1 determines the cut-off point.
If all calculators are the same, why buy a Panasonic?

Simple. Because all calculators are not the same. And we’re not just talking about how great Panasonic calculators look. Or the quality you can expect from the Panasonic name. Panasonic hand-held electronic calculators have great features too. Features like large, easily-read numerals in bright, easy-to-take green. Instead of small, eye-tiring red. Panasonic calculators are simple to operate. Because you calculate the same way you think. They’ve got three-way power: AC, battery, or optional rechargeable Ni-Cads*. They’ve got underflow that extends the capacity of the display register. Automatic repeated*, constant, and integral-exponent calculations. Continuous and mixed calculations. Suppressed zeros. Sign-correct answers. Battery life indicators. And they’re reasonably priced.

Then there are the extras. JE-855 has a memory. That remembers any entry or display. Or sums the results of successive calculations. And recalls it for use in a calculation at the press of a button. JE-860 has automatic pi-entry and automatic square root. Perfect for students and engineers, among others. JE-883 is a little winner. Fits in a shirt pocket. And gives you more than twenty hours continuous operation with four Panasonic “AA” size alkaline batteries. Works many times longer with intermittent use. It’s also got an extended display capacity of $10^{16}$ with eight significant digits.

Why buy a Panasonic electronic calculator? See why today wherever fine electronic calculators are sold.

*Not available on JE-863.
Two resistors remove limiting effects of input voltages on current-mode amplifiers

When designing with current-mode amplifiers, you must also consider input voltages. The base-emitter voltages of the input transistors can limit the reproducibility of a circuit. But by adding just two resistors, you can eliminate their influence and simplify circuit calculations as well.

The output voltage of the simple stage is shown by the expression

\[ e_o = r \left[ \left( \frac{e_i}{R_1} - \frac{e_f}{R_2} \right) + V_{BE} \left( \frac{1}{R_3} - \frac{1}{R_2} + \frac{1}{R_4} - \frac{1}{R_1} \right) \right]. \]  

The addition of two extra resistors, \( R_z \) and \( R_s \), eliminates the influence of \( V_{BE} \) if you choose \( R_s = R_1 \) and \( R_z = R_3 \). This reduces Eq. 1 to

\[ e_o = r \left( \frac{e_i}{R_1} - \frac{e_f}{R_2} \right), \]  

in which \( V_{BE} \) no longer appears. You can now compute the current difference as if \( V_{BE} \) were zero and the extra resistors were not present.

With more complex input arrangements, you must use equivalent source resistances—Thevenin equivalents. Then the diagram applies, where \( R_s \) and \( R_z \) are the equivalent source resistances.

The 5 fastest ways to make better inverters.

1. The new 81RM — fastest 125 Amp inverter SCR around.
   It has 20μS turn-off, through 1000V, with efficiency that cuts filtering, commutating and snubbing costs up to 30% in new designs. Plugged into existing circuits, it can increase overload capability or power rating by 50%. Its 30% lower switching losses let you operate efficiently at 10kHz. And for today's circuits, a guaranteed turn-off time of 25μS with an antiparallel diode gives unequaled speed. The best "soft recovery" in the business assures the lowest RFI generation, minimizes false triggering and improves reliability. Voltage ratings from 100-1000V. dv/dt is 200V/μS, and di/dt is 800A/μS.

   At 15μS and 10μS turn-off, there are no faster SCRs in their range. But what really sets them apart is the 30% lower switching loss for unequaled efficiency at high frequencies. No derating to 4KHz, and 50% of the rated current at 20KHz. Excellent as commutating SCRs. Conforms to JEDEC 2N3649-58. Reapplied dv/dt is 200V/μS, and di/dt is 400A/μS. Voltage ratings: 50-400V.

New — The fastest Turn-Off (10μS) high-current inverter SCRs available!
These low-frequency inverter SCRs turn off four times faster than others at their power level. You can reduce commutating component size and cost ½ and still increase inverter ratings with greater reliability. Higher surge ratings give you bigger safety margins, easier fuse selection. To top it off, you can choose from three package types in 50-600V ratings to optimize your design.

3. New 430 Amp (RMS), 275RF Series. The only stud-mounted 430 Amp (RMS) inverter SCR available. 7000 Amp surge rating. 200,000A/Sec. It rating.

4. New 710 Amp (RMS), 450PF Series. Rated 710 Amp (RMS), this ceramic "Hockey Puk" has a surge rating of 9000 Amps and It of 340,000A/Sec.

5. New 710 Amp (RMS), 451PF Series. For maximum economy, the first and only plastic encapsulated 710 Amp (RMS) "Hockey Puk" SCR. Surge rating: 9000 Amps. It is 340,000A/Sec.

IDEAS FOR DESIGN

Line-voltage control technique improves resolution, lowers parts cost

The classic method of varying the power-line voltage for design or production testing is to connect the load to the power source through a variable autotransformer (a). But there are three shortcomings.

First, the 105-to-125-V range over which most equipment is tested uses only a small percentage of the total rotation of the autotransformer's control knob. This may make it difficult to set the desired output voltage precisely. Second, controlling a large amount of power requires a large, and therefore expensive, variable autotransformer. Third, variable autotransformers have poor load regulation. This may necessitate continual readjustment.

The voltage-control method in the diagram (b) overcomes these problems. A low-power—and low-cost—variable autotransformer controls the primary current of a filament transformer whose high-current secondary winding is connected in series with the load and power source. The DPDT switch in the filament transformer primary circuit allows the secondary winding's output voltage either to aid or to oppose the power-source voltage. Since a full revolution of the autotransformer's control knob will either increase or decrease the line voltage by an amount equal to the filament transformer's rated output voltage, very precise control is achieved easily. Moreover, use of the comparatively low impedance of the secondary winding results in excellent load regulation (compared with that of an autotransformer alone).

The secondary winding of the filament transformer must be rated to handle the maximum expected load current. The current rating of the variable autotransformer must equal the maximum expected load current divided by the voltage step-down ratio of the filament transformer.

The technique is especially attractive, from both a control and monetary standpoint, when the desired output-voltage range is small.

Michael J. Salvati, Staff Engineer, Sony Corp. of America, 47-47 Van Dam St., Long Island City, N. Y. 11101.

IFD Winner of July 5, 1973

Walter Jung, 1946 Pleasantville Rd., Forrest Hill, Md. 21050. His idea “Simple dc current controller adapts easily to any supply voltage and load current” has been voted the Most Valuable of Issue Award.

Vote for the Best Idea in this issue by circling the number for your selection on the Information Retrieval Card at the back of this issue.

SEND US YOUR IDEAS FOR DESIGN. You may win a grand total of $1050 (cash)! Here's how. Submit your IFD describing a new or important circuit or design technique, the clever use of a new component or test equipment, packaging tips, cost-saving ideas to our Ideas for Design editor. Ideas can only be considered for publication if they are submitted exclusively to ELECTRONIC DESIGN. You will receive $20 for each published idea, $30 more if it is voted best of issue by our readers. The best-of-issue winners become eligible for the Idea of the Year award of $1000.

ELECTRONIC DESIGN cannot assume responsibility for circuits shown nor represent freedom from patent infringement.

INFORMATION RETRIEVAL NUMBER 54
Our Supersonic Printer can speed up your next design.

If your next design requires a narrow print-out, consider Victor's high-speed matrix printer.

Why?
Because it's outstandingly reliable. Reliable enough to print 35 million characters without periodic maintenance.
Because its 5 x 7 dot matrix head can form alphabetical, numeric, and symbolic characters. 34 per line. 110 per second. In two colors.
Because it's a compact unit—8½" wide, 5" high, 12" long—that accepts adding machine tapes up to 3¾" wide.
And because it utilizes all technology and expertise that Victor's design engineers and factory personnel can build into a machine.
That's why we use it in our own top-line electronic calculators. Victor's Supersonic Matrix printer. It can speed up your next design.
Computer graphics prepare numerical control tapes

A system that prepares numerical-control (N-C) tapes with the aid of a low-cost computer-graphics terminal has been developed by the Computer-Aided Design Centre in Cambridge, England. Advantages over other methods include simplified parts-programming procedures, less opportunity for parts-programming errors, easier and cheaper correction of errors and considerable reduction in the lead time needed to reproduce control tapes.

The terminal used is a Tektronix storage tube, which is connected to a computer system via the switched public telephone network. The system can be run on a range of different computers.

The basic structure differs from other systems because component-geometry definition is divorced for cutter-path definition. The three stages of N-C processing are kept separate and are dealt with by three different programs—bounded-geometry definition, machining-sequence definition and post-processing. The user calls them up as required.

The definition of bounded geometry is carried out by a program that processes descriptions of 2-D composite curves. Alternatively the definition may be the output of a CAD process. The geometry data are inputted to the computer, and the program is executed from a terminal.

Diagnostic messages can be inspected at the terminal, and the geometry data file can be amended as necessary. Users can also inspect the successfully processed geometry graphically, to check for shape errors not indicated by normal-error diagnostics. The cycle may be repeated until the user is satisfied that the geometry is correct.

The second program is an interactive one that accepts the geometric description of the curves outputted from the first program. Sequences of cutter movements may be specified in relation to this predefined geometry by a simple command language and by use of the graphical facilities of the terminal.

Users need not refer directly to component coordinates or to geometry parts that are less-than-complete composite curves. All supplementary information required on the final control tape can also be specified and finally processed with cutter-path information to produce an APT-compatible CLF-ILE.

Post-processing and tape production can be carried out with post-processors that are written for the APT or 2CL system. The first two programs may be re-entered and new control tapes may be produced if the simple intermediate data files are kept in readable character form. In this way error-free production tapes can be produced in hours—rather than days—with a minimum of computer processing.

CIRCLE NO. 202

Sea mines destroyed by remote vehicle

A remotely controlled vehicle for destroying sea mines has been developed by a British division of Sperry at Bracknell, England. Known as the Sperry Cat system, the vehicle is designed to operate in conjunction with a mine-hunting vessel, which acts as the mother ship. The system consists of a small, low-profile, unmanned surface catamaran known as the mine-disposal vehicle (MDV), a submersible weapon carrier and a radio-control console aboard the mine hunter. The object is to place a charge close enough to a mine to destroy it.

When a mine-like echo is detected by the sonar and the target range and bearing are identified, the MDV and an armed-weapon carrier are sent to the area. The weapon carrier is lowered, allowed to flood and sink, and is maintained at a controlled height from the sea bed by use of a drag rope.

A sonar transponder mounted in the tail of the weapon carrier assists the mine-hunting control officer to identify the carrier and steer it remotely along the sonar beam. When the slant range of the target and the weapon carrier are the same, the officer releases the charge from the carrier so it drops adjacent to the mine. The drag rope is jettisoned and the carrier, now buoyant, rises to the surface and is winched in aboard the MDV. The latter retires to a distance while the mine is exploded.

Signal processing uses thin-film waveguides

Acoustic surface-wave, thin-film waveguides have been used for a variety of nonlinear signal-processing techniques by researchers at University College in London. By use of nonlinear effects, thin-film waveguides are used to receive a surface-wave beam that travels at right angles to the waveguide axis. Tapered funnels have been used to solve the problem of coupling a transducer structure that is tens of wavelengths wide to a waveguide that is typically one wavelength wide. The functions of convolution and imaging have been carried out, but other forms of signal processing are possible with the basic system.
Improve your hybrid yields with

**SINGLE-CHIP TC ZENER CHIPS**

from DICKSON

You can now design temperature compensated voltage reference diodes in your hybrid circuits with assurance that temperature coefficients will meet your design requirements. Dickson provides them on a single-chip, 100% tested, to help save time, simplify circuit fabrication and improve your yields.

Each 37 mil square Dickson chip contains two totally passivated junctions with a 6.2 Volt or 6.4 Volt temperature compensated reference. Temperature coefficients to 0.0005%/°C are available. The chips are electrically equivalent to the JEDEC 1N821-829 and 1N4565A-4584A series.

The Dickson chips have gold metalization on the back, compatible with all common die bonding and soldering techniques. Aluminum metalization on upper surface is compatible with ultrasonic and thermocompression wire bonding.

FOR COMPLETE TECHNICAL INFORMATION contact your local Dickson Sales Representative, or write to Dickson.

**AVAILABLE IN ASSEMBLIES, TOO!**

Dickson "single-chip" TC diodes are also available bonded in a ceramic channel for ease of handling and testing. These LID's are available with solder coated runners for reflow mounting or with gold runners for wire bonding. In addition, Dickson supplies a wide variety of components in chip assembly form to hybrid manufacturers. Ask for details.

"Where Quality Makes the Difference"
Uninterruptible power source delivers 3 kVA

Topaz Electronics, 3855 Ruffin Rd., San Diego, Calif. 92123. (714) 279-0111. $4400.

The “Mini-UPS” uninterruptible power system can deliver 3 kVA. It will operate on power lines of 95 to 130 V ac and provide excellent attenuation of power-line noise spikes. Each unit comes complete with battery charger, inverter and choice of either relay or solid-state transfer switch. Integral meters show battery voltage and output voltage. The operation mode is indicated by panel lights. A wide choice of full load back-up time is available through battery selection.

CIRCLE NO. 250

Single output supplies deliver 0.1% regulation

ACDC Electronics, Oceanside Industrial Center, Oceanside, Calif. 92054. (714) 757-1880. From $32; stock.

Series OEM5N low current power supplies offer five more models ranging from 5 V at 3 A to 24 V at 1 A. These units deliver 0.1% regulation and have protection against overload and short-circuit. Provisions are made for overvoltage protection, remote sensing, remote programming and rack mounting.

CIRCLE NO. 252

High voltage sputtering supply has 60 kW output

Spellman High Voltage Electronics Corp., 1930 Adee Ave., Bronx, N.Y. 10469. (212) 671-0300. $16,000; 10 to 12 wk.

The Model HP6-10,000RX high-voltage sputtering power supply has been designed for a 60 kW continuous dc output (0 to 6 kW at 10 A) with a 90 kW short term capability. It is servo regulated against ±5% line voltage variations and uses primary reactors to limit short-circuit output current to 30 A and maintain constant output power for load variations in the 4.5 to 60 kW output voltage range. Input power requirements are 480 V/60 Hz, three phase at 100 kVA. The main power cabinet measures 52 by 53 by 58 in. including casters, and weighs approximately 3000 lb. The remote control panel measures 8-3/4 by 24 by 7 in. and weighs 30 lb.

CIRCLE NO. 253

Lone output dc supplies require no blower

The LX-E series of single output power supplies is convection cooled and requires no blowers. The 5-V models have built-in, fixed, over-voltage protection at 6.8 V ±10%. These supplies use power hybrid voltage regulators and are available in seven single voltage output models: 5, 6, 12, 15, 20, 24 and 28 V, all adjustable ±5%. Currents at 40 C for these voltages are 35, 34, 21, 19, 15, 13 and 11 A, respectively. Package size for all units is about 5 by 7-1/2 by 11-3/4.

CIRCLE NO. 254

Get three-phase power from single-phase lines

Ronk Electrical Ind., 106 E. State St., Nokomis, Ill. 62075. (217) 563-8333.

The Roto-Con rotary phase converter transforms single-phase power to three-phase. It gives up to 150% breakdown torque. It can be used with variable-speed, instant-reverse, frequently-started and continuous-duty motors. It can also provide power to several motors separately or simultaneously. Roto-Con models are available for multimotor installations up to 100 hp total load, with any individual motor not exceeding 50 hp.

CIRCLE NO. 255
NEW 63A SCRs FROM GENERAL ELECTRIC

**C147-FOR PHASE CONTROL**

- 63A RMS @ 95° C Case
- Up to 1,200V AC
- 200A/µsec. di/dt
- 1,000A Peak One-Cycle Surge
- Priced as low as *$9.25*

**C149-FOR INVERTERS**

- 63A RMS @ 95° C Case
- Up to 600V AC/DC
- 10 µsec. t off
- 1,000A Peak One-Cycle Surge
- Priced as low as *$12.75*

*Suggested resale prices, 10-99 quantities*

These two new SCRs have low power dissipation, providing an added measure of reliability... run at 15° C cooler case temperature than their competitive counterparts. Hermetically sealed in a ¼"-28 stud mount package, their more compact size and more efficient operation allows the use of smaller, lower cost heatsinks.

The C147 and C149 are available from any authorized GE semiconductor distributor. For further information contact either your authorized GE semiconductor distributor or any GE Electronic Components Sales Office or write on company letterhead to General Electric Semiconductor, Building 7-49, Electronics Park, Syracuse, N.Y., 13201, U.S.A.
Our congratulations and FIVE $50 U.S. Savings Bonds from the Struthers-Dunn 50th Anniversary Relay Contest are awarded to:

Dr. M. Sayar
Rehovot, Israel

for this solution to a relay problem, independently judged the third most imaginative entry of wide interest to users of relays.

LIGHT DEFLECTION BY RELAYS

Relays not only trigger but actually deflect a laser beam in this extraordinary application. Following delays of 0, 30, 10, and 70mS after control command, four dye cells are illuminated by a pulsed nitrogen laser according to a sequence programmed by control logic.

Deflection of the laser is done as shown in Fig. 1 using relays with polished and coated armatures which act as front surface mirrors. Relays are also adjusted for the required delays: 10mS for A, 30mS for B, 70mS for C. Except for the first control logic input, the NO relay contacts trigger the laser as shown in Fig. 2 assuring that the reflective armatures are properly positioned to deflect the beam before the laser is triggered.

Believe it or not Struthers-Dunn can furnish relays for such a specialized application. For relay A we suggest an open-type 219 Frame modified to have a mirrored armature extension. Similar armature modifications can be furnished on our A112 Frame sensitive relays which will serve for B and C since operate time can be closely adjusted.

STRUTHERS-DUNN, INC.
PITMAN, NEW JERSEY 08071
Canada: Struthers-Dunn Relay Div., Rentrew Electric Co., Ltd.

INFORMATION RETRIEVAL NUMBER 57

1 vs. 4 WIRE REMOTE MOTOR CONTROL

Two relays and a few inexpensive electronics allow remote control of any size motor with just one wire plus a common as shown in Fig. 3. By contrast, 4 wires plus a common are needed in the conventional circuit of Fig 4. The diagrams are arranged to separate the components at the control area from those at the remote area.

Key to this cable saver is the use of diodes D1 through D4 to provide a one-way path for the Start signal and indicator while using the same path, but with reversed polarity, for the Stop signal and indicator. Resistors R1 through R4 merely reduce any series interaction between relay coils and indicator lights, while capacitors C1 through C4 block dc components introduced by the diodes. Any Struthers-Dunn dc relay could be used in this 'line-saving' circuit by properly matching capacitors, lamps, and relay coils. Specifically recommended is the 283 Frame, 10 amp, general purpose relay. The 283 offers quick-connect terminals spaced for standard plug-in mounting and pierced to accommodate solder-wiring. Congratulations and $50 to A. C. M., Dumas, Texas for calling this suggestion to our attention.
Optimum Q/C relationship is only one reason for choosing the 283 Frame family over other 10-amp control relays. Few GP relays have such excellent packaging density capabilities, or are so readily available in so many enclosed and open styles, with ac & dc coils, 1-3 pole contact arrangements, 3-way terminals for solder, quick-connect, or plug-in, to matching sockets, and so on. Popular styles are stocked by S-D distributors. All are quickly available from the factory.

To learn more, ask for a copy of our latest Relay Catalog.

Sierra Systems, Inc., 650 Vaqueros, Sunnyvale, Calif. 94086. (415) 969-3656. $1050 (10-up); 4 to 6 wk.

Model 752 CRT power supply delivers four output voltages, three of which are adjustable. The adjustable ranges are: accelerator voltage, 24 kV to 28 kV at 25 μA, focus voltage, 7 kV to 9 kV at 10 μA and intensity control voltage, 500 V to 700 V at 10 μA. The fourth output is a photomultiplier supply voltage that is factory set at -1.5 kV at 2 mA. The regulation and ripple specifications for all voltages are ±0.5% and 0.1% pk-pk, respectively. The output voltages can also be monitored at externally accessible test points with a microammeter. The input supply voltage for the 752 is 28 V dc. The unit is fully shielded and filtered for both radiated and conducted RFI.

CIRCLE NO. 256

Current supply can be pulsed to give 200 A

Merrick Engineering Inc., 725 Melpark Dr., Nashville, Tenn. 37204. (615) 383-0502.

The TXR-200 pulsed current supply can be used to deliver straight dc or pulsed dc over the range of 0.25 to 200 A, with a pulse repetition rate of 2000 to 25,000 pulses/s. Welding current consists of two separate components, background and pulsed current. Background current (nonpulsating dc) 0.2 to 99.9 A is controlled by a direct reading digital dial. Pulse peak is indirectly adjustable up to 500 A. Speed of regulator response is 4 μs and corrections are made instantaneously for changes in either arc length or line voltage.

CIRCLE NO. 257

Dual tracking supply tracks to within 0.1%

Power-One, 10526 Jordan, Chatsworth, Calif. 91311. (213) 887-5730. $31.95 (100-up).

Dual tracking power supply Model AA15-0.8 delivers +15 V at 800 mA or ±12 V at 1 A. Some of its other features are: tracking accuracy of 0.1%, line regulation of 0.01%, load regulation of 0.02% and ripple content of 1.5 mV pk-pk.

CIRCLE NO. 258

Series of drive controls handles motors to 700 hp

The Electrostat 600 Series is a six-SCR drive control designed for single motor or system applications. Options can be added for multimotor drive, torque, followers, field regulator control or field regeneration applications. The same regulator control is used for all motor horsepower ratings. Drives to 150 hp are supplied in a NEMA I 24 by 30 by 12 in. enclosure or on a 21 by 21 in. panel. Larger drives, from 200 to 700 hp, are supplied in NEMA I 30 by 36 by 14 in. wall mounted enclosure or on a 27 by 33 in. panel. Standard features include an up-front drive monitor test meter, an adjustable current limit with light indicator, ac line reactors with dc circuits, instantaneous fault trip, line and armature current limiting fusing, phase loss and low voltage protection and adjustable acceleration/deceleration and jog.

POWER SOURCES

Modular dc supplies have dual regulated outputs

Ac line conditioner delivers up to 5000 VA
It's our latest monolithic analog multiplexer with internal overvoltage protection--the HI-507A Dual 8 Multiplexer. And it's pin for pin interchangeable with the DG-507.

Just recently we introduced the first monolithic multiplexer with internal overvoltage protection--our HI-506A 16-channel multiplexer, featuring performance characteristics previously unavailable. Now we offer a dual 8-channel unit incorporating all the advantages of the 16-channel unit.

As with the HI-506A, this new device combines our DI/CMOS (dielectric isolation) process with a unique circuit design to provide on-board protection against analog input overvoltage. In the event of overvoltage in one channel there is no output error when other channels are being addressed. This same protection circuit also eliminates latch-up, as well as unpredictable operational characteristics that could result from transient voltages originating in either the signal or supply. A second similar circuit provides the necessary safeguards against static charges. Additionally, break-before-make switching eliminates undesirable channel interaction.

Applications for the new device include data acquisition, telemetry systems, process control and general analog switching. The device is available in volume now for off-the-shelf delivery. For details see your Harris distributor or representative.

Features:
- Internal overvoltage protection, both analog and digital
- No channel interaction with power loss
- Break-before-make switching
- TTL and CMOS compatibility
- Supply current 4mA at 1 MHz toggle rate
- Power requirement 7.5mW disabled
- Power requirement 7.5mW enabled
- Access time 500 ns
- Power supply ±15V
- Signal range ±15Vdc
- Supplied 28-pin DIP

Decade inductors are accurate to ±1%  

Type 4W precision decade inductors for design and experimental work in the frequency range of 150 to 20,000 Hz, are available in units with 0.001, 0.01, 0.1, and 1.0 H steps. Each unit has 10 steps. With four decades inductors in series, any inductance from 0 to 11.11 H can be selected in 0.001 H steps with a guaranteed accuracy of ±1% at 1 kHz and 25°C.

Heat-actuated flow switch responds in 2 sec  

Fluid Components, Inc., P.O. Box 1165, Canoga Park, Calif. 91304. (213) 883-0806.

A new fast-acting thermal flow switch, Model FR-72-FS, provides a response in the neighborhood of two seconds in either liquids or gases. The switch will operate in any size line and makes use of a conventional mounting port. Versions are available for liquid flow rates from 0.01 to 2 ft/s, and gas flow rates from 0.1 to 15 ft/s. Operating temperatures range from 100 to 300°F. All surfaces in contact with the medium are of stainless steel. The switch is heat actuated, has no moving parts and is field adjustable. Electrical circuitry is all solid state, modular construction and enclosed in an explosion proof housing. An external circuit may be connected to either the normally-open or normally-closed contacts of the output relay.

Screwdriver sets rotary PC-board switch  

Electronic Engineering Company of California, 1441 E. Chestnut Ave., Santa Ana, Calif. 92701. (714) 835-6000. $1 per station (OEM qty); stock to 6 wks.

EECO 21-S switches are single-piece, multistation units with one to 11 separate switch stations. Solder pins provide both input and output interconnections as well as a firm mount to either or both sides of a PC board. Code circuitry is integral and no rivets, stator pattern or special board platings are required. The switches are 0.44 deep × 0.775 high × 0.80 wide in per switch station.

Light sensor measures with built-in electronics  

Photon Products, Inc., P.O. Box 1230, Cupertino, Calif. 95014. (408) 296-5226. $35 (unit qty).

A new series of light sensors comes complete with a silicon detector, filter, amplifier and microcircuitry in a single compact unit. Three models cover the complete visible and near-visible photometric range: ISP-610; 610-740 nm; ISP-55; 380-740 nm; and ISR-590; 410 nm to 1.0 µm. Dark-current noise is as low as 10 pA with zero bias. All models feature binary programmable range selection for automatic or manual ranging. Adjustable gain and ambient offset controls permit interfacing to microscopes, probe stations or other production facilities. The units are powered by 18 V dc.
Meet the linear IC with the advantages of COS/MOS. The new RCA CA3600E Transistor Array... three pairs of complementary enhancement-type MOS (p-channel/n-channel) transistors on a single chip. The CA3600E is designed for a great variety of applications requiring virtually infinite input impedance, wide bandwidth, matched characteristics, lower power consumption and general purpose circuitry.

And that’s not all. With the new CA3600E you get performance advantages that include square-law characteristics, superior cross-modulation performance, and a greater dynamic range than bipolar transistors.

Whether you’re working in timing, sensing and measuring or any other applications, or if you’re tired of fighting beta variation in your bipolar circuit, let your “linear” imagination run wild. The features offered in the new CA3600E COS/MOS Linear IC are too good to pass up.

- Virtually infinite input resistance/100 gigohms
- Each transistor rated for operation up to 15V and 10 mA
- Low gate-terminal current/10 picoamps
- No “popcorn” (burst) noise
- Matched p-channel pair/gate-voltage differential (I0 = -100uA) ...±20mV (max)
- Stable transfer characteristics over a temperature range of -55°C to +125°C
- High voltage gain/up to 53dB per COS/MOS pair.

Supplied in the 14-lead dual-in-line plastic package, the CA3600E is available in production quantities from your local distributor or direct from RCA.

THE SMALLEST LED SWITCH/INDICATOR ON THE MARKET

ACTUAL SIZE

NOW AVAILABLE IN RED, GREEN, YELLOW AND REDUCED 10%!

ONLY $3.70 Each in 100 Qts.

Subminiature SSBL Series combines long life LED and SPST-NO-OB switch in a low cost, highly reliable unit that fills a variety of display and control functions — especially where space is limited. Projects only 3/8" behind panel with turret lug terminals (as shown) or 1" with .025" square Wire-Wrap terminals. Mounts in 1.4" hole on % " centers.

Bright indication, low power consumption and resistance to shock, vibration and extreme temperature changes make this LED the perfect replacement for incandescent or neon lamps in low current, solid-state applications. Lens has Fresnel rings that distribute light for maximum visibility.

Momentary contact pushbutton switch has rating of 100 mA @ 115 VAC and life exceeding 1 million operations at rated current. The SSBL operates from a 5 VDC supply; however, can accommodate up to 28 VDC by adding an external series resistor.

MATCHING LED INDICATOR

Only $2.70 Each in 100 Qts.

The SSIL Series has all the outstanding features of the SSBL, but is an indicator only. Built-in resistor adapts unit for 5 to 28 VDC operation. TEC also has a matching switch only — the SBS — plus subminiature indicators and switch/indicators with neon and incandescent lamps.

NOTE: Green and yellow LED's are available only with 5V rating.

ILC Data Device Corp., 100 Tec St., Hicksville, N.Y. 11801. (516) 433-5330. $10 to $25 (OEM qty).

DDC's Series 811 Ladder Networks are miniature, 12-bit binary ladder networks for use in digital-to-analog conversion. These cermet thick-film units are available in eight standard models with resistance values of 5 k, 10 k or 20 kΩ. The networks are directly interchangeable with like units of Beckman Instruments Co. Maximum voltage ratio errors are as low as 122 ppm over a -55 to 125 C or -20 to 80 C operating temperature range.

CIRCLE NO. 268

General-purpose relay has built-in amplifier

Class 388 amplifier-driven, general-purpose relay allows 10-A switching with extremely low power control. The amplifier circuit presents a very-high impedance to the control circuit. This makes it especially suited for IC low-power signal levels. A control voltage as small as 2.4 V dc will energize the relay via its 24-V-dc supply voltage. Polarity and transient protection are standard. The relay has either plug-in or surface mounting.

CIRCLE NO. 269

Timing motor made with barium-ferrite rotor

The Cramer 105 motor is a high-torque, permanent-magnet synchronous motor with both mechanical and electrical direction control. It has a barium-ferrite rotor, and stator poles of different widths to provide high starting and running torque under all load conditions. The power input is 2.7 W at 115 V and 60 Hz. Starting and running torque for this permanently lubricated motor is 300 oz-in. at 1 rpm and 60 Hz. Motor output speeds range from 1 to 60 rpm. This motor is particularly suited to timing applications.

CIRCLE NO. 270

Pushbutton tests plug-in relay

Deltrol Controls, 2745 S. 19th St., Milwaukee, Wis. 53215. (414) 671-6800.

A test button in the cover of Series 165B/166B plug-in relay enables maintenance personnel to manually check circuit functions without energizing the relay coil. The relay is available in SPDT, DPDT and 3PDT contact configurations with contact ratings of 5 and 10 A. Terminals are a 3/16-in. quick-connect type that are spaced for a standard plug-in receptacle or for single-lead quick-connect lugs or solder connections. The series comes in a large selection of ac or dc coil voltages.

CIRCLE NO. 271
RCA COS/MOS in low cost ceramic.

RCA now offers COS/MOS in a new low cost ceramic package. So you can select, from our complete line of COS/MOS circuits, an IC package to meet your exact needs for performance and price.

Compare the prices of our new ceramic IC's. If you've needed the temperature range and hermetic features of ceramic, but couldn't afford the price, now you can discover the digital world of COS/MOS in RCA's new low cost ceramic package.

Our new CD4000AF Ceramic IC's feature electrical characteristics identical to the present AD and AK series weld seal ceramic COS/MOS circuits. You get a completely hermetic package designed to operate over the full military temperature range of -55°C to +125°C...at a commercial price.

COMPONENTS

**Tach generator output rate is selectable**

*Avtron Manufacturing, Inc., 10409 Meech Ave., Cleveland, Ohio 44105. (216) 641-8310.*

Super Tach generates a choice of 15, 30, 60, 120, 150, 300, 600, or 1200 pulses per revolution by just setting the internal switch. The unit uses a LED source, has zero-speed direction sensing, and a NEMA-56C face. Output is a 15-V square wave. An analog dc output that is proportional to speed is also available.

---

**Cassette tape transport uses one reel motor**

*The Amilon Corp., 49-12 30th Ave., Woodside, N.Y. 11377. (212) 274-1794. From $125 (1000 up).*

Designated the A7 system, Amilon's one-reel-motor and one-capstan-motor tape transport is functionally superior to two or three motor mechanisms for cassette applications, according to the company. Two or three motor systems are better suited to the stronger tape of reel-to-reel devices, which require the tape to pull the rotor of the unused motor. Additional features include front loading, separate BOT and EOT sensors and single or dual direction read/write.

---

**Incremental encoder has metric or English output**

*Trump-Ross Industrial Controls, Div. of Datametrics, 265 Boston Post Rd., North Billerica, Mass. 01862. (617) 663-3451.*

Tru-Rota is a dual-count, optical, rotary, incremental encoder that is compatible for use in English or metric systems. Resolution in English units is as high as 2000 lines and in metric up to 2540 lines.
THE NEW SHARP PC-1001.

For fast, accurate answers to complex everyday scientific and engineering problems—count on Sharp's new PC-1001. Because not only is the PC-1001 ideal as a desktop, scratch pad, scientific, programmable calculator....it also features a 10-digit display that automatically operates in scientific notation. Results of the functions can be computed in degrees or radians at the touch of a switch.

With the PC-1001, difficult programming of functions is already incorporated. So you compute instantly with just a one-touch key operation. A total of "15" different scientific functions are hardwired in, including trigonometrical, inverse trigonometrical, hyperbolic, exponential, and logarithmic. In addition, 64 steps of programming or 8 registers are available for formula and equation evaluation.

And you can use both decimal point positioning systems. Both the floating decimal point and the exponential system—with exponential display capacity from $10^{-99}$ to $10^{100}-1$ and 0.

The PC-1001 also features a new simplified keyboard operation.

Get the full information on Sharp's PC-1001—the desktop, scientific programmable scratch pad calculator. Just plug in its AC cord and try it. You'll find it indispensable. Phone toll-free (800) 447-4700 for your nearest Sharp Dealer. In Illinois (800) 322-4400. Or just mail the coupon today.

Better yet, what you set is what you get!
When you set a DIGIVIDER voltage divider or DIGIDECADE resistance decade at a value, you get only that value (within 1/10 of 1% accuracy). We make them with more liberal tolerances, too. But, regardless of your accuracy requirements, (1.0%, 0.5%, 0.25% or 0.1%) you get...

- In-line readout
- Positive detent action
- Absolute repeatability (no hysteresis)
...in less space and for less money per digit than a 10 turn precision potentiometer.

We make DIGIVIDERS or DIGIDECADE assemblies in any of our modular switch lines.

Send for our DIGIVIDER, DIGIDECADE Catalog today and see what you get.

There is a Digitran authorized distributor and a sales engineering group in your area.

COMPONENTS

Precision linear pots measure to 5 ft long

Conductive-plastic and wirewound, precision, linear-motion potentiometers in 1/2, 3/4 and 1-1/4-in. D models have lengths from 0.125 to 12 in. in conductive-plastic types and 0.25 to 5 ft in wirewound. Resistance ranges cover 50Ω to 100kΩ with linearities as low as 0.1%. Single and dual elements are available with both linear and nonlinear functions. Taps and switches can be installed to order. Dissipation is 1.5 W/in.

CIRCLE NO. 275

Precision wirewound resistor replaces film

Kelvin, 5919 Noble Ave., Van Nuys, Calif. 91401. (213) 782-6682. As quickly as 4 days (additional charge).

Designed to interchange with Vishay 5102 bulk metal-film resistors, the K747 resistor is claimed to have a wider resistance range, a lower temperature coefficient and better tracking. The K747 is available with resistance tolerances to ±0.005% and TCs to 1 ppm. Cost savings of up to 50% can be realized over bulk metal-film resistors.

CIRCLE NO. 276

PM gearmotors meet military specifications

Wertronix Corp., 2673 Culver Ave., Dayton, Ohio 45429. (513) 299-5596. $35 typical (OEM qty); 4 to 6 wks.

The type DMR gearmotor is designed for compact-size and high-torque applications. Diameters range from 1-1/4 to 3.53 in. There are a total of 21 different standard gear-box ratios available—from 3.81:1 through 19,841:1—with maximum torque capacities to 1250 oz-in. for continuous duty. Voltages range from 3 to 50 V dc. Both 1-1/4 and 1-7/16-in. square mounting flanges are available with a choice of either a 1/4 or 5/16-in. diameter output shaft. Both commercial and MIL-M-8609 versions are available.

CIRCLE NO. 277

Rotary switch handles 900 circuits

Cole Instrument Corp., 2034 Placentia Ave., Costa Mesa, Calif. 92627. (714) 642-8080.

A specialized precision rotary switch with nine decks and 900 usable circuits has static shields between decks and a removable cover to protect the switch from dust and outside interference. All connections are brought out to prewired terminal boards for fast and easy wiring. Ball bearings are provided in both end plates to keep the rotational torque at a minimum and to allow the use of solenoid or motor drive for remote or automatic operation. Each deck is individually adjustable to ensure deck-to-deck alignment. An important feature is the switch’s constant contact resistance and lack of thermal or contact potentials. Fully bifurcated brushes maintain contact and prevent open circuits while switching.

Singer is here to Servo you.

SERVO MOTORS.
Kearfott offers you a complete line to fit just about any application. From a \( \frac{3}{4} \) " diameter motor with an acceleration of 150,300 rad/sec\(^2\) to units such as the 7" diameter 1 HP Servo Motor shown above.

SERVO AMPLIFIERS.
Choose from 1.4 watt output amplifiers to the new 2200 watt unit above. Only 10" long and weighing just 7 lbs., the XA-2200 is a highly-efficient solid-state amplifier that furnishes output required by 1 HP motors.

PRECISION POWER SERVO DRIVES.
Our broad line of Servo Motors (to 1 HP) are the primary drive source for our Power Servo Drives. Typical units give you: accurate positional feedback information; low backlash; highest performance/pound.

SERVO PACKAGES.
We can give you the "tightest" job, the lowest price and meet your delivery dates. How? We make thousands of Servo components, from motors to clutches. We design and build all associated electronics, from Servo amplifiers to switching networks.

We can meet almost any Servo requirement you may have from a single source—Singer's Kearfott Division.
For nearly 30 years Kearfott has been a pacesetter in the development of small motors and their associated electronics. Today we can offer you a wider variety of Servo components than any other single supplier.
All components are built to the highest order of precision, both in concept and construction. In addition, we'll design and produce units to your special requirements.
To learn more about Kearfott Servos and capabilities, mail the coupon now, for our information-packed 24-page brochure "Servo Motors". We'll rush it to you.

Portable 3-digit DMM costs under $200

Ballantine Labs, P.O. Box 97, Boonton, N.J. 07005. (201) 335-0900. $195.

Model 3/24 digital multimeter offers a full three digits (1000 counts) for just $195. The unit weighs two pounds, complete with internal battery. Dimensions are 5 x 2-1/2 x 7 in. Model 3/24 has five functions with 24 ranges: four of ac and dc voltage; five of ac and dc current, and six of resistance. On the dc voltage ranges, accuracy is typically 0.2% ± 1 digit.

CIRCLE NO. 279

Test system handles both MOS and bipolar

Western Digital, 19242 Red Hill Ave., Newport Beach, Calif. 92663. (714) 557-3550. $55,500.

SPARTAN 780 MOS and Bipolar tester is a successor to the SPARTAN 770 and features functional and dc parametric testing of all bipolar, p-channel and n-channel MOS and CMOS LSI devices including random and sequential logic, as well as RAMs, ROMs and shift registers. The basic unit features a mainframe to which memory channels, test heads and other options may be added for specific test requirements. The unit can be easily expanded to three 48-pin, 40-channel test stations.

CIRCLE NO. 280

50-MHz, portable scope sells for $1375

Tektronix, P.O. Box 500, Beaverton, Ore. 97005. (503) 644-0161. $1375; 2 wk.

TELEQUIPMENT D75 is said to be one of the lowest priced dual-trace, 50-MHz, portable, delayed sweep scopes on the market. Portability is optimized in the horizontal-configured package—size is 5.4 x 15 x 18.6 in. and weight is 25 lb. For low-amplitude measurements, the 50-MHz dual-channel, vertical amplifiers have deflection factors starting at 5 mV/div, accurate within 3%. For measuring even lower amplitude signals, a gain control (X5) extends the minimum deflection factor to 1 mV/div with 16-MHz bandpass.

CIRCLE NO. 281

Radiometer/photometer gives absolute readings

Model 550 Radiometer/Photometer System provides automated operation with direct, absolute readings in any of 10 distinct optical units and two electrical units. The instrument contains a 3-1/2-digit panel meter and a digital display of the decade exponent. Auto-ranging is included over seven full decades. Provision is also available for compensation of unwanted ambient light and analog output for a recorder.

CIRCLE NO. 282
Recorder meets AHA and UL requirements

Gulton Industries, Gulton Industrial Park, East Greenwich, R.I., 02818. (401) 884-6800. $300 (100); 4 wk.

MED 100, an EKG recorder building block, comes in a unitized "U" frame construction. Frequency response is 140 Hz at 5 divisions pk-pk. An important feature of the new recorder is that it is designed specifically to meet UL 544 leakage-current requirements for Type A grounded equipment. It also conforms to AHA frequency and voltage specifications, which are 95 to 155 V ac, dc to 100 Hz (−3 dB).

CIRCLE NO. 283

18-GHz counter offered for systems use

EIP Inc., 3130 Alfred St., Santa Clara, Calif. 95050. (408) 244-7975. $5100; 2 wk.

The EIP 351C offers automatic frequency measurement from 20 Hz to 18 GHz using an electronically tuned YIG comb generator. Under remote control, microwave measurements to 100-Hz resolution can be made at a 30 per second rate. Four system-oriented, TTL-compatible options are available: BCD output ($100), remote programming of range ($350), i-f offset ($400), and YIG-filter tuning ($200). To simplify the data presentation, an 11-digit display, with constant decimal placement, is used.

CIRCLE NO. 284

Who said you can't beat the option game when buying a true-rms voltmeter?

At $1,200, our Model 93AD gives you the best price and the best performance. It's not just priced 20 to 32 percent under competition. It's complete with standard performance and convenience features that the other manufacturer tags on as costly options ... or can't give you at all.

Take remote programming and BCD outputs. They are a necessity for any kind of test automation. We don't ask you to pay an extra $450 ... we've made them standard.

If you're doing low-frequency work, spurious high-frequency signals are always a problem ... but not with Boonton's selectable bandwidth. On the 100 kHz setting, you get immunity from spurious pickup; on the 20 MHz position, you get twice the full-performance bandwidth of the older designs at lower cost.

We've even removed the conflicting advantages of digital and analog readouts. We give you both — a 3½ digit LED display for absolute readings, and a special analog dB meter for easy peak/ null adjustments ... as standard.

Our dB option is not only $100 less than the higher-priced spread but also gives you an extra digit for a constant 0.01 dB resolution ... available in your choice of 50 Ω, 75 Ω, 600 Ω, or 1 V references.

And we have a low-cost 10 MΩ, low-capacitance probe for negligible circuit loading at high frequencies — not available from the competition.

What don't we do?

Well, our autoranging option costs $25 more than the competition and we don't go down to 2 Hz or up to 100 MHz. But unlike some, we don't pretend to "cover" a frequency range beyond our capability. Their advertised 100 MHz bandwidth is usable on only the 0.1 and 1 volt ranges. On all other ranges, their upper frequency is 10 MHz or less. The 93AD has a 10 Hz to 20 MHz bandwidth specified down to 300 µV with full calibrated accuracy.

But see for yourself. Before you pay more for less, write or call for the full specs or a demonstration: Boonton Electronics Corporation, Rt. 287 at Smith Road, Parsippany, New Jersey 07054; (201) 887-5110.

DON'T NEED DIGITAL?
OUR FULLY-PROGRAMMABLE ANALOG MODEL 93A GOES FOR A LOW $600.

BOONTON
use pressure sensitive TEMP-R-TAPE of fiberglass for quick relief.

Excellent electrical properties plus most anything else you want in fiberglass tapes like high tensile and tear strength, dimensional stability, good conformability, thermal endurance, abrasion resistance, non-corrosiveness, Temperature to 180°C. Available with several adhesive systems. Low unit cost.

INFORMATION RETRIEVAL NUMBER 71
Clamp-on V/I/Ω meter also traces conductors

Amprobe Instrument, 630 Merrick Rd., Lynbrook, N.Y. 11563. (516) 593-5600. $49.50; stock.

This clamp-on volt/amp/ohmmeter, the LINE-PROBE ALP501, performs five important testing functions. It measures current on a 0 to 100-A ac scale, measures voltage on either of two ranges, 0 to 150/600 V ac; measures resistance on a 1000-Ω midscale range; checks continuity; traces and identifies up to 10 pairs of conductors at one time.

CIRCLE NO. 290

Portable instrument tests a/d converters

C-O Manufacturing Co., 646 Summer St., Brockton, Mass. 02108. (617) 584-4710. $4500; stock.

Model ADT-1A tests analog-to-digital and digital-to-analog converters. The unit measures and displays both converter accuracy, monotonicity and noise. Analog inputs and outputs are displayed on a precision zero-centered meter. Direct error readings are also displayed with a 2-bit full-scale sensitivity. A set of LED indicators provides a digital display of inputs and outputs. Dynamic operation may be displayed as a two-dimensional CRT presentation of input vs output or input vs error.

CIRCLE NO. 291
Greater reliability from HUTSON'S advanced thyristor technology

ISOTAB* Electrically Isolated

TRIACS & SCR'S

TRIAC's
6A, 8A, 10A, 15A (I_{RMS})
50 to 600 V (V_{DRM})

SCR's
8A, 10A, 20A (I_{RMS})
50 to 600 V (V_{DRM})

For greater operational reliability, Hutson Isotab thyristors feature an improved electrical isolation technique. They have a low thermal impedance and center gate design for high di/dt capability and improved dv/dt ratings with very low switching losses. Void free glass passivated chips are hermetically sealed in the package. All Hutson thyristors also available in chip form.

INSTRUMENTATION

Spectrum analyzer tests communication signals

Nelson-Ross, 5 Delaware Dr., Lake Success, N.Y. 11040. (516) 328-1100. $4950.

Model CSA-290 Communications Spectrum Analyzer System provides graphic, quantitative analysis of SSB, AM, FM, baseband and other communications signals from audio through rf, 10 Hz to 40 MHz. Analysis at higher frequencies is also feasible, with somewhat degraded specifications. A built-in frequency counter provides highly accurate center frequency calibration and can be used for measurement of other inputs from 0.5 to 100 MHz.

CIRCLE NO. 292

Unit generates precise time codes

Datametrics, 340 Fordham Rd., Wilmington, Mass. 01887. (617) 658-5410. $2595; 60 days.

Model SP-125 Universal Time Code Generator serves as a Master Time Reference for distributing precision time code indices to index recording mediums such as magnetic tape, camera film and oscillographs. The unit can also be slave synchronized to within ±20 µs of an external received IRIG-B time code that is derived from another Master Time Code Generator. The unit has an internal time base oscillator to assure continuous operation in the event of input code drop-out during slave sync operation, as well as a fail-safe power supply.

CIRCLE NO. 293

RF test set synthesizes, measures frequencies

Cuahman Electronics, 830 Stewart Dr., Sunnyvale, Calif. 94086. (408) 739-6760. Basic Unit: $5100.

A portable, rf test set, Model CE-6, combines synthesized signal generation with precise frequency measurement. The new instrument generates signals from 10 kHz to 1000 MHz, with cw, AM and FM, and measures frequency from 20 to 1000 MHz. Through the use of optional plug-in modules, the CE-6 can also be used as a sensitive AM and FM receiver; an FM peak-deviation meter; and AM modulation meter; and/or an audio oscilloscope and waveform monitor. Weight is 40 lb., without plug-ins, and the unit takes up only one square foot of bench space.

CIRCLE NO. 294

Angle position indicator is ruggedized

Transmagnetics, Inc., 210 Adams Blvd., Farmingdale, N.Y. 11735. (516) 293-3100. $895; stock to 5 wk.

These rugged, industrial Absolute-Angle Position Indicators consist of a transducer and a digital readout receiver having an accuracy of 0.1 degree. The receiver converts the transducer information into digital form and presents a digital display that is readable in direct sunlight conditions. Simultaneously, BCD outputs are available at the rear of the receiver. Output formats of ±179.9°, 0 to 360° or 0 to 9999, with floating decimal point, are available.

CIRCLE NO. 295
Your A/D or D/A application can win the GRAND CONTEST [ $1000 ]

Never before an application contest like this.

GRAND PRIZE...
A $1000 GOVERNMENT BOND.

A design contest like this may be an industry "first." But then, firsts are a way of life at Micro Networks Corporation... first 12 bit dip package D to A... first 8 bit dip package A to D... first 12 bit MIL range D to A in a dip package and in a miniature module... plus over 12 more firsts in the last 3 years alone!

MNC offers the broadest selection of dip package standards D to A and A to D's for the avionics, instrumentation, computer and military Hi-Rel markets.

HERE'S HOW.
Send in your application that includes one or more A/D or D/A converters.
Win the $1,000 Grand Prize or one of the many second prizes of valuable Bowmar Calculators. Handy technical pocket calendars given to all entries.

The rules are simple...
1. Your design application must include one or more A/D or D/A converters. Need not be Micro Networks converters.
2. Entries will be judged on originality, completeness, and usefulness of application.
3. Entries become property of Micro Networks Corporation, which reserves right to publish, in whole or in part, any entry at its discretion. An honorarium will be given for those entries published by MNC.
4. MNC personnel, their families, and personnel and families of affiliates are ineligible.
5. Entries judged by 5 impartial judges, whose decisions are final. For anonymity entries will be coded for judging.
7. Each entry must include circuit diagram with description of circuit operation. Include if possible a statement of the significance of the application.

4 k n-channel RAM introduced

A 4096-word-by-1-bit n-channel silicon-gate RAM, called the 2107, comes with all decoding on the chip, a single high-level clock and is TTL compatible. The dynamic RAM dissipates power only during chip enable. Refresh of all the bits is done in 64 read cycles. Presently priced at $64 (100-999), the company projects an eventual price of 0.1¢ per bit for the 2107.

CIRCLE NO. 296

Stud mounted SCRs can handle 1000 A peak

General Electric, Bldg. F. Mail Drop 49, Electronics Park, Syracuse, N.Y. 13201. (315) 456-2021. For 10 up: $9.25 (147), $12.75 (149); stock.

The C147 and C149 SCRs can handle 63 A rms. The C147 is rated at 63 A rms max and up to 1200 V. Its dv/dt is 200 V/μs and can withstand a 1000 A peak one-cycle on current. Applications include dc motor control, power supplies, and ac motor, temperature and lighting controls. The C149 is a high speed version for inverter applications. It has a 10 μs turn-off time and is rated at 63 A rms max at 95 C case temperature, and up to 600 V. It can also handle a 1000 A peak one cycle on current. Both the C147 and C149 are available in a 1/4-28 stud mount package.

CIRCLE NO. 297

Schottky decoders feature 9-ns delay

Signetics, 811 E. Arques Ave., Sunnyvale, Calif. 94086. (408) 739-7700. $5.40 (100).

A binary-to-octal decoder, the 82S50, and a BCD-to-decimal decoder, the 82S52, both use Schottky-clamped TTL for a typical propagation delay of 9 ns. Maximum input load currents for the gate arrays are 400 μA (logic ZERO) and 25 μA (logic ONE). Minimum output currents are 20 mA at 0.5 V (ZERO) and 1 mA at 2.7 V (ONE).

INQUIRE DIRECT

SOS multiplexer switches in 75 ns

Inselel, Inc., 743 Alexander Rd., Princeton, N.J. 08540. (609) 452-2222. $19.50 (100-999); stock.

An 8-channel TTL-compatible multiplexer switch uses SOS technology for a 75-ns channel-to-channel switching time. Called the L05, the multiplexer features a low data-channel ON resistance of 15 Ω and a 150-mW power dissipation level. The L05 comes in a 16-pin DIP.

CIRCLE NO. 298

IC multiplier holds errors to 0.5%

Analog Devices, Route 1 Industrial Park, Norwood, Mass. 02062. (617) 329-4700. AD533JH: $5.95; stock.

A family of IC multipliers guarantees 0.5% maximum multiplying errors. Called the AD533, it provides a ±10 V, 5 mA output without the need for an external op amp. The AD533 multiplies in four quadrants with a transfer function of XY/10. It also divides in two quadrants with 10Z/X transfer function, and square roots in one quadrant with a transfer function of -√10Z. The devices provide typical small signal bandwidth of 1.0 MHz, full power bandwidth of 750 kHz and slew rate of 45 V/μs.

CIRCLE NO. 299
Quad comparator uses one supply

Motorola, P.O. Box 20912, Phoenix, Ariz. 85086. (602) 244-3466. $1.50 (100 up); stock.

The MC3302 IC packs four independent voltage comparators into a single plastic DIP package. The comparators can operate from a single power supply ranging anywhere from 2 to 28 V dc. Total current drain is only 1.5 mA max at voltages of 5 to 28 V. The comparators feature a voltage gain of 30,000, an input bias current of about 30 nA and an input offset voltage of 3 mV. The outputs are TTL compatible and can sink 2 mA minimum at $V_{OL} = 0.8$ V.

CIRCLE NO. 300

IC diode arrays offer design flexibility

National Semiconductor, 2900 Semiconductor Dr., Santa Clara, Calif. 95051. (408) 732-5000. LM3019: $1.18; LM3039: $1.17 (100); stock.

Two monolithic ICs—the LM3019 and LM3039—contain diode arrays that are grouped for convenient use. The LM3019 contains six diodes; four are connected in a full-wave bridge configuration and two are completely uncommitted. Each diode has a 20-mW power dissipation. Typical reverse breakdown voltage is 6 V per diode and 80 V between any diode and the substrate. The LM3039 contains six fast, low capacitance diodes. Five are independently accessible, and the sixth shares a common terminal with the substrate. Reverse recovery time is typically 1 ns, and the dc forward voltage of the diodes is matched within 5 mV. Power dissipation is 100 mW each, and the diodes have a typical reverse breakdown voltage of 7 V.

INQUIRE DIRECT

How can you resist a 400% improvement in feedback stability?

So beautifully done!

With DIVIDER-MOX resistors, the effects of T-C matching, V-C, self-generated heat, and other control variables are minimized by a unique manufacturing process.

Precision is % allowable change over operating temperature range; DIVIDER-MOX resistors give 0.5% stability at 10% power dissipation over a temperature range of $-55^\circ$ to $125^\circ$C.

And, along with precision and stability you also get size advantages as well. DIVIDER-MOX resistors are about ½ as large as the equivalent resistance carbon film.

Resistance ranges available from 25K to 2000 Megs with maximum power ratings up to 10W at 30kV. Customers may specify divider ratios in the range of 300:1 to 10,000:1.

Victoreen...where else can you get so many accurate ohms for your money:

ICs & SEMICONDUCTORS

Gas-display drivers simplify interfacing

Two series of monolithic high-voltage display drivers interface MOS or other low-voltage circuitry and high-voltage gas discharge displays. The Series 480 and 481 drivers feature 130-V breakdown and can be used as cathode drivers for both Burroughs Planaplex and Sperry SP300 displays. The Series 480 ICs have five switches per DIP while the Series 481 contain seven switches in each DIP. The Series 490 and 491 anode drivers can also replace most of the discrete components usually required for interfacing. Series 490 devices have five drivers per DIP while the Series 491 contain six drivers per package.

Thyristors rated for 80-A operation

Motorola, P.O. Box 20924, Phoenix, Ariz. 85086. (602) 244-3485. $8.95 to $31.75 (10-99); stock.

A line of 80-A rms isolated-stud thyristors—called MCR82—include nine repetitive peak-reverse blocking voltage ratings from 50 to 800 V. Peak nonrepetitive surge current for all ratings is 1000 A. The units use glass-passivated junctions with center-gate firing for uniformity and stability.

INFORMATION RETRIEVAL NUMBER 80

EMC's Pin-in-Board

Still best! EMC's high density Wire-Wrap® non-warping epoxy panels assure accurate true position, especially on ¾" boards. Edgeboard finger patterns, power and ground planes, and new TIP-DIPTM for double density! Funnel-Entry design simplifies lead insertion; Nurl-Loc® terminals prevent twist during wrap. Standard and Custom panels for every requirement, too.

128-bit static register guarantees 2-MHz speed

A dual 128-bit static shift register offers guaranteed speeds of 2 MHz over the full MIL temperature range. The p-channel silicon-gate IC, the first in a series of such circuits, is a high-speed, pin-for-pin replacement for Mostek's 1002P. Other static shift registers to follow in the series include quad 128-bit, dual 256-bit, 512-bit and 1024-bit devices.

CIRCLE NO. 303

Static shift register buffers card images

Texas Instruments, P.O. Box 5012, M/S 308, Dallas, Tex. 75222. (214) 238-3741. $3.68, plastic; $6.16, ceramic (100); stock.

A 4 x 80 MOS/LSI static shift register—the TMS3120—can be used as a read or punch buffer for 80-column-card applications. Three TMS3120s can buffer one standard IBM card image. The TMS3120 features dc-to-2.5-MHz operation, recirculate logic and feedback path on the chip, a single TTL-compatible clock and TTL-compatible inputs and outputs.

CIRCLE NO. 304

Precision timer avoids triggering problems

National Semiconductor, 2900 Semiconductor Dr., Santa Clara, Calif. 95051. (408) 732-5000. $2.50 (100); stock.

The LM122 IC timer provides accurate, repeatable timing without concern for input trigger conditions. The input circuitry reacts only to the rising edge of the trigger signal. Thus, it is immune to any trigger voltage that might occur during the timing period. The input has a threshold of 1.6 V independent of power supply voltage and it is fully protected from inputs as high as ±40 V, even when using a 5-V supply. The output of the LM122, a floating transistor with built-in current limiting, can drive either ground referred or supply referred loads up to 40 V at 50 mA.

INQUIRE DIRECT

Electronic Design 23, November 8, 1973
the standard power supply is a minor consideration... until it fails!

OEM's are getting a little tired of 'power failures'. And many have decided it's better to pay the difference to be sure their products are powered reliably. The cost isn't that much more... and it may save some valuable reputations.

This concept puts North Electric squarely in the picture, because reliability is our stock in trade.

We've been the leading custom power producer for more than 40 years... and our modular power supplies follow the same quality standards... including rugged Life Tests, EMI analysis, shock, vibration, humidity and temperature tests... and most are UL recognized.

Another point - if you are presently making your own power, let us show you (through a make or buy analysis) why it might be to your advantage to have North handle this specialized area of production.

When you buy power supplies, standard or custom, buy from the one big name that makes both.

now...you can test digital IC's... economically... to manufacturer's specs

New Kurz-Kasch Model IC-590 is the first economically priced digital IC analyzer for accurate testing in the lab, shop, inspection, production, field or any other location.

The Model IC-590 is a completely portable, battery powered digital IC tester for use in conjunction with published IC specification sheets for static and dynamic testing of all 14 and 16 pin dual in-line IC modules of the DTL and TTL, 5 and 15 volt families. Flat pack and TO-5 modules may also be tested by using appropriate adapters. Price $169.95.

A unique sister Model IC-591 is also available. It comes complete, as IC-590 above, internal power supply for highly regulated 5 volt, 1 amp operation and adapter cable for firing-up complete card units containing as many as 15 or more mounted IC's. Price $295.00.

For complete technical data, write or call now: Tom Barth, Marketing Manager

Audio amp IC handles wide voltage spread

The LM354A is a monolithic IC designed for use as an audio amplifier. Special features of the circuit include self-centering bias for operation from 6 to 24 V, direct-coupled input, high input impedance (> 100 kΩ) and high supply voltage rejection ratio (52 dB). It is assembled in a 14-pin plastic split-DIP with a shaped heat-sink soldered onto a copper bar inserted in the plastic.

EEP Corp., 10180 W. Jefferson Blvd., Culver City, Calif. 90230.

CIRCLE NO. 305

Phototransistors have light currents to 25 mA

Sensor Technology, 21012 Lassen St., Chatsworth, Calif. 91311. (213) 882-4100.

The STPT 100, 110, 120 and 130 series of npn silicon photodetectors offers a total of 12 models. Series 100/110 have light-current ranges from 0.2 to 4 mA and the 120/130 series covers 2 to 25 mA. The designer can specify either a convex lens for wide angular response, or a flat lens suitable for flush mounting. The units are packaged in a three lead plastic transistor case.

CIRCLE NO. 306

Npn transistor boasts 3.5 dB noise figure

The Type TN-3200 silicon npn planar transistor has a typical noise figure of 3.5 dB at 45 MHz. Power gain is 22.5 dB min at 45 MHz. The max BV is 40 V and the total power dissipation is 150 mW max. The unit is in a hermetic TO-72 case.

CIRCLE NO. 307

N-channel MOSFET becomes smoke detector

Motorola, P.O. Box 20924, Phoenix, Ariz. 85036. (602) 244-3465. $1.85 (100 up); stock.

The MFE824 depletion-enhancement mode (Type B) n-channel MOSFET can be used for smoke detection applications. The reverse gate current, Igs, is 1 pA max at VGS of 10 V. Typical operating temp range is -65 to +200 C. The unit is available in the TO-18 package and can dissipate 300 mW of power at 25 C. Max drain current I is 30 mA with a max VDS of 20 V.

CIRCLE NO. 308

Our angle: More Synchro Conversion For Less Cost

How does a choice of 14-bit resolution (greater for 2-speed S/D), 60 or 400 Hz data frequency, high accuracy, 11.8V to 90V line-line voltages and all kinds of self-protection circuitry - look from your angle? Not to mention that as few as 5 modules make up a complete S/D or D/S converter, or that all modules are replaceable one-for-one without trimming? And, economically too!

New 2-speed S/D sets are now available with accuracies typically better than 20 seconds from all error sources including resolution. D/S specifications include 4 minute accuracy, 1.25 VA output with optional 20 VA output for torque receiver applications.

Key performance specifications for both converters include 14-bit (0.022°) resolution over 360°, 4000°/sec analog data rates and 0-70°C operation. Some units available for operation from -55°C to +105°C. All units are DTL and TTL compatible.

Prices start at $650.00 for a set of modules. Delivery from stock. Call toll-free (800) 645-9200 for the name and address of your local sales engineering representative.

THE BROAD-LINE PRODUCER OF ELECTRONIC PARTS

Information Retrieval Number 85
**Packaging & Materials**

**Flat cables offered in width to 100 wires**

Hughes Aircraft Co., 500 Superior Ave., Newport Beach, Calif. 92663.

Hughes new ribbon cable is offered in widths from two to 100 conductors. Conductors are round and either solid or stranded with color-coded PVC insulation and in sizes 22-28 AWG. Multiple twisted-pair conductors are also available.

**Tiny connectors fit small PC boards**

Microtech, Inc., 777 Henderson Blvd., Folcroft, Pa. 19032. (215) 532-3388. $2.25 (unit qty); stock.

Miniature PC-board connectors allow you to construct a small instrument with small removable PC boards rather than with captive ones. The old problem of having no choice but to use connectors larger than the PC board itself is now solved. The standard board-connector line consists of 10 and 20 feed-through contacts with 0.075-in. spacing in phenolic strips of 1/8 H x 1/8 W x 3/4 L in. for wave soldering to the board. The mating connectors are only 1/4 H x 1/8 W x 3/4 L in. The pins and sockets are made of gold-plated brass. Units with up to 50 contacts are available on special order.

**Conductive paint metalizes insulators**

Tecknit, 129 Dermody St., Cranford, N.J. 07016. (201) 272-5500. $0.01/in²/mil; 1 wk.

Electrically conductive silver/acrylic paint is a one-component, air drying, electrically conductive coating that may be applied by conventional spray, brush or dip method. It can be used in many areas including: EMI shielding, to coat nonconductive enclosures, flanges or seams; for reflection, to paint plastic antenna forms, non-conductive surfaces and inflatables; for grounding, to spray ground planes or grounding surfaces on insulating materials; as a preplate, to accept electroplating; and for static prevention.

**New solder-gun element can desolder**

Gunmaster Universal Industries, P.O. Box 743, Kings Park, N.Y. 11754. (516) 269-0797.

A new solder-gun element which accommodates interchangeable soldering tips and solder removers should restore the popularity of the solder gun. A basic receptacle element, which will fit most of the popular solder guns, is permanently installed. Then either a unit, called the Slug, fits the receptacle element for general soldering or another unit called the Dum-Dum removes solder by capillary action. For heavy solder deposits, a solder sucker may be attached to the back end of the Dum-Dum.
NOW... a self-programming wiring analyzer system

for under $12,000

Plexus now offers the WA2K Self-Programming Wiring Analyzer System for testing backplanes, printed circuit cards, and cable harnesses. There are no sophisticated computer programs to establish or debug. And, the system can be operated by non-technical personnel after only a few minutes of instruction. All that is needed is a network that is known to be good, some simple fixturing and connector information, and the WA2K does the rest. It programs itself in minutes and stores the program on reliable cassette tape. A paper tape printer output clearly identifies network errors and simplifies subsequent repairs.

The compact WA2K System can test up to 1,024 points and is easily expandable to 2,048 points by plugging in an expander card for each additional 128 points needed. The 1,024 point WA2K System is priced at $11,900, a price well below comparable systems. Expander cards are priced at just $320.00 each.

Other quality Plexus Wiring Analyzer Systems are available for testing networks of from 4,000 to over 65,000 points. For further information, circle this publications reader service card or phone Plexus to discuss your particular requirements.

Packaging & Materials
Mag recording tape withstands —65 to 400 F
Thermo-465 is claimed to be the first magnetic recording tape which retains high-performance properties in the extremes of heat and cold that range from 400 to —65 F. Graham Magnetics says that the new tape has performed after exposure to 800 ° F with no loss of operability or signals recorded on the tape prior to exposure. Thermo-465 will record in either a digital or analog format. The tape is now offered in 1/4 and 5/8-in. widths and 1000-foot lengths. Other sizes are available upon request.

Flexible-shaft coupling reduces side loads
Metal Bellows Co., 1075 Providence Hwy., Sharon, Mass. 02067. (617) 668-3050.
These flexible-shaft couplings for low torque applications have extremely soft side rates. This reduces side loads on bearings. Other features include low wind-up, zero backlash, high torque carrying capability and a long axial stroke. Five basic models can meet most requirements.

High-speed air-driven tool cuts PC layouts
Electro-Dent, Inc., 120 Haddon-towne Ct., Cherry Hill, N.J. 08034. (609) 429-1256.
ED-1000 is a high-speed, ball-bearing, air-turbine tool that rotates in excess of 300,000 rpm. It enables you to directly produce a PC board layout from a pencil sketch on copper clad material. You simply remove the undesired copper with an appropriate burring bit. The same tool can be used to cut mounting and throughholes. Also odd holes, rectangles and keyways are easily produced. In addition, this instrument readily lends itself to cutting and drilling in tight places that are inaccessible to other tools. Materials that can be cut include plastics, glass epoxy and most metals. A wide assortment of differently shaped burrs are available.

Formula kills static and bacteria
Analytical Chemical Laboratories, 6270 Evenhouse, Rosemont, Ill. 60018. (312) 696-3244.
A new antistatic formula, Staticide, eliminates all static on clear plastic, film, records and all other materials. It is easy to apply and safe to use in regular and FDA approved formulas. Staticide is invisible, long lasting, and doesn't deteriorate for long periods.

Handy spacers stack circuit boards

Ricochet Plastic Co., 5825 N. Tripp Ave., Chicago, Ill. 60646. (312) 539-4060. $0.02 to $0.04 each (OEM qty).

The Model CBSS spacer system can be used to stack circuit boards in any number of vertical tiers or side-by-side rows. The system has only two simple parts—a locking spacer for each tier and a capping button to top-off and lock the stack. The spacers are available in 1/2, 5/8, 3/4 and 7/8-in. heights. A barbed-arrow locking tip snaps through a 0.156-in. D. hole in the board and into the top of the adjacent spacer. The system is completed by inserting a capping button through the top board. The capping button protrudes only 0.18 in. above the top board for a compact assembly. The spacers and capping button are made of rigid natural nylon. Free samples are available.

CIRCLE NO. 329

Cut and peel this PC board to your needs

Circuit-Stik Inc., 24015 Garnier St., P.O. Box 3396, Torrance, Calif.

Cut & Peel circuit boards are a new idea in keeping with Circuit-Stik's adhesive backed subelements. The boards consist of electro-deposited copper foil laminated to epoxy-glass with a pressure-sensitive adhesive. This allows engineers and technicians to cut breadboard circuits and ground planes and peel away the unwanted copper foil. Off-the-shelf boards are offered in 38 combinations of sizes and styles.

CIRLE NO. 330

WHEN YOU MAKE THE BEST CMOS IC'S IN THE BUSINESS, IT'S HARD TO BE MODEST.

Who says we make the best? We do and our customers do. What's more, we can prove it. Only Inselek offers you C/MOS with the most optimum combination of higher speed (3 times faster than monolithic C/MOS) and lower power dissipation (typically less than 10 mW) than any other logic family. Pin-for-pin compatible with the CD4000 series too!

You can select from over 25 standard circuits and our own INS4021S - 4x4 cross point switch, or, INS4200S - 256x1 C/MOS RAM. We'll even custom fabricate an IC for your own LSI application in production quantities.

Get the density and power of MOS with the speed of bipolar in a package designed to meet your most critical military and commercial requirements. In addition, Inselek's cost/performance ratio is one of the best around.

Modesty forbids us from discussing high noise immunity, temperature ranges, etc. but you can contact us for the latest technical specs. If you do, we'll include a "It's Hard To Be Modest" button.

For detailed information on C/MOS, RAM's or other Inselek IC's, or, our new do-it-yourself SOS wafer kit, call or write Inselek, Inc., 743 Alexander Road, Princeton, N.J. 08540 (609) 452-2222.
Thermalloy offers the most complete line of heat sinks in the industry: over 100 designs for cooling all types of packages including DIP's, plastics, TO-3's, TO-66's, and power transistors.

Popular, easy-to-use economy coolers for PC board components.

INFORMATION RETRIEVAL NUMBER 92

The single station, diffusion type TOX-EX 017D-CGA operates from a 20 to 35 V dc line or battery. It can detect concentrations of carbon monoxide, acetylene, hydrogen, hydrogen-sulfide, hydrocarbons or mono-halogenated compounds. The units use MIL-grade components and have a two year warranty. Each module has its own constant voltage control, relay circuits, automatic or manual reset, single or dual set points and lower flammable limit meter. Set point(s) may be adjusted on the scale between 5% and 100% of lower flammable limit. Channels may be added without affecting operation of adjacent modules within the chassis and control console. Detection sensitivity is maintained in ambient temperatures from -40 to 200 F and humidity levels of 100% RH. The TOX-EX 017D-CGA system can meet or exceed the requirements of Factory Mutual and Canadian Standard Association. MIL-grade components meet hazardous area requirements of Class 1, Division 2, Groups C and D. The explosion-proof sensor meets Class 1, Division 1, Group A, B, C and D requirements. Size of plug-in modules is 2-7/8 by 8-3/4 by 14-11/16 in.

CIRCLE NO. 331

Pacific Photometric Instruments, 5745 Peladeau St., Emeryville, Calif. 94608. (415) 653-6585.

Model 50B photomultiplier tube housing is designed to accommodate side-window tubes such as RCA 1P21, Hamamatsu R-446 and EMI 9781. Model 50B comes ready for use. It contains a low-loss socket with precision voltage divider built from 1% metal-film resistors. A mu-metal cylinder with side port encases the photomultiplier tube and shields it from magnetic and electrostatic fields. A series of mechanical options (circular and square filter holders, optical bench mount, etc.) makes the Model 50B adaptable to a variety of systems and applications.

CIRCLE NO. 332

True Time Instrument Co., 2255 Melbrook Way, Santa Rosa, Calif. 95405. (707) 528-1230. $390 (T), $490 (TR).

Designed to recover the WWVB timing code, the Model 60-T receiver measures only 1-3/4 by 6-1/2 in. All IC construction gives the unit a high sensitivity of 0.5 µV. It is guaranteed to operate anywhere within 1800 miles of WWVB. A rack-mounted version, Model 60-TR, is mounted on a standard 1-3/4 in. rack panel, and utilizes the same circuitry and features, and includes a regulated power supply.

CIRCLE NO. 333
a new choice in Plug-In Rotaries

Start with Stackpole’s exclusive environment proof rotary. Then add terminal pins facing front or rear, ready to plug in instantly to your PC board. Or design in a Stackpole PC board rotary switch with 12 terminals ending at a common junction point for vertical or horizontal mounting or mating to an edge-board connector.

Eliminate wiring harnesses, hand wiring errors, costly intermediate assembly. Pin termination switches are available as standard off-the-shelf switches as well as with binary codes and special switching sequences. Yet they cost less than $2.00.

Call Stackpole. They’re plugged in to your needs. Stackpole Components Company, P.O. Box 14466, Raleigh, N.C. 27610. Phone: 919-828-6201.
General Electric’s New PowerUp-15* Battery

RECHARGES IN 15 MINUTES

THINK OF THE POSSIBILITIES

When charged at room temperature for 15 minutes with an approved charger, General Electric’s new PowerUp-15* battery delivers 90 percent of its rated capacity.

The battery is charged with a unique Voltage/Temperature Cutoff system which features straightforward charger control circuitry. Ideal for portable industrial power tools, photographic equipment, portable communications devices... anywhere portable electric power is needed fast.

And you get all the advantages of time-proved GE nickel-cadmium rechargeable batteries.

For more information, write General Electric Company, Section 452-04, Schenectady, N.Y. 12345, or circle reader service card.

MODULES & SUBASSEMBLIES

Driver cards offer versatile motor control

The MCS-1800 series of solid-state driver cards converts serial command pulses into sequenced high-current motor excitation signals for both open and closed-loop variable-reluctance step motor control systems. They are designed for either three or four phase motors that draw a maximum current per phase of 1.5, 3 or 8 A. The printed-circuit board drivers fire either one or two motor phases at a time. User-supplied pulse source, logic power (5 V dc) and motor power supply complete the basic control system. Six of the 18 cards operate with an additional overexcitation power supply. All have DTL/TTL compatible input logic which accepts separate clockwise and counter-clockwise pulse trains or a single step pulse source and separate direction signals. Fly-back diode suppression with provisions for additional suppression resistors is standard. Driver cards mate with 22-pin, 0.156-in. center edge connectors.

CIRCLE NO. 334

V/f converters span 0 through 100 kHz

The DF-20 Series of voltage-to-frequency converters are printed-circuit plug-in modules. The seven standard models cover output frequency ranges from 0 to 1 kHz through 0 to 100 kHz. Linearity for all models is specified as ±0.02% maximum and power requirement is 10 mA from ±15 V regulated dc.

CIRCLE NO. 335

Telephone tone decoder performs 15 functions

Speedcall, 2020 National Ave., Hayward, Calif. 94545. (415) 783-5811.

The Speedcall 527 tone decoder allows specific sites to be individually addressed and up to 15 functions performed at any fixed or mobile site. This unit is offered with momentary, latched and interlocking outputs and is addressable with up to four digits. It has an operating temp range of -35 to +85 C and a power supply requirement of 16.3 V ±20%. The input range is 20 mV to 6 V (each tone) and -32 to +18 dBm. Outputs are open collectors capable of sinking 50 mA at 24 V dc.

CIRCLE NO. 337

Trigger generator gives 50 kV fast-rise pulses

The Condenser Products Corp., P.O. Box 997, Brooksville, Fla. 33512. (904) 796-3562. $395.

The CP-50 fast-rise, low jitter, 50 kV pulse generator delivers long duration pulses. Almost no protective isolation is required for the trigger device (only 100 Ω up to 25 kV and only 4 Ω per kV thereafter) allowing positive, low-jitter performance.

CIRCLE NO. 336
Tone repeater panel can handle 18 separate tones

Alpha Electronic Services Inc.,
8431 Monroe Ave., Stanton, Calif.
90680. (714) 821-4400.

The RCP-780 is a multifrequency repeater tone panel. The unit is capable of handling up to 18 separate tone-controlled functions utilizing a modular plug-in card for each function. System “A” will respond to a received tone, either sub-audible or pulse tone, by keying and modulating the transmitter with the same tone, filtered and regenerated. System “B” removes the received tone from the audio and keys and modulates the transmitter with the received signal minus the tone. A new tone is generated for the transmit carrier which can be the same tone frequency as the received tone or may be a different frequency if desired. System “C” utilizes any number of pulse-tone combinations to accomplish the same action as System “B.” Plug-in cards are also available for any of the following special tone combinations: pulse-tone decode with sub-audible encode, sub-audible decode with pulse-tone encode, pulse-tone decode of one tone frequency with pulse-tone encode of another or any combination of sub-audible and audible tone can be employed simultaneously.

CIRCLE NO. 338

Lamp flasher handles inrush currents of 120 A

SSAC Precision Products, P.O. Box 395, Liverpool, N.Y. 13088. (315) 699-2551. $25.33.

The Model FS154 Flasher measures 2 by 2 by 3/4 in. and operates on 120 V ac, ±15%. Maximum voltage drop is 1.5 V and the 90 per minute flash rate is consistent within ±15 flashes, from unit to unit. Added features of the FS154 are full-wave ac power circuitry, zero voltage switching for minimum radio frequency interference, longer lamp life, capability of 120 A inrush current and a steady state current of 12 A.

ELMWOOD SENSORS
INFORMATION RETRIEVAL NUMBER 98

MODULES & SUBASSEMBLIES

Multichannel oscillator switches in under 10 μs

The Model M-398 multiple-channel oscillator can switch between four customer specified channels in the 20 to 125 MHz range in less than 10 μs. Frequencies are remotely selected by a standard TTL code. Intermodulation between channels is down at least 40 dB. The M-398 has a frequency stability of ±0.005% over the temperature range of 0 to +50 C. Output power is 10 mW with an input supply voltage of 28 V dc.

CIRCLE NO. 340

Voltage/current alarm has 100% deadband

Model ET-1218, solid-state alarm, accepts current or voltage inputs and provides a DPDT relay output. The unit has a deadband adjustability of 0 to 100% via a multiturn potentiometer. The 1218 accepts all standard process inputs: 1 to 5, 4 to 20, 10 to 50 mA dc, or 1 to 5 V dc. External shunt resistors are used to convert the voltage range for current activation on any of the milliamp ranges, with an input resistance of 5 MΩ minimum at 5 V dc. The basic range of the unit is 0 to 5 V dc, but the input stage is fully surge-protected against potentials as high as 115 V ac to guard against wiring errors. Three standard power supplies are available with the ET-1218—117 V ac, 24 V dc, or 48 V dc—with ±20% voltage regulation furnished as standard with any supply. The output of the sensor is a DPDT relay rated at 10 A, 117 V ac resistive. Trip set adjustability is by means of a multiturn potentiometer and accuracy is 0.1%. Response time is less than 30 ms. Trip point stability and drift is ±0.5% of span for a 50 °F change in ambient temperature maximum, with a drift of ±0.2% typical.

CIRCLE NO. 341

A/d converter resolves 15 bits in 4 μs

The ADC1215F a/d converter resolves 15 binary bits and has a total conversion time of 4 μs. It uses a fold-back conversion technique in which two 9-bit successive approximation conversions are combined with a high-speed, high accuracy DAC and a fast settling differential amplifier. Accuracy is 0.005% of full scale ±1 LSB and resolution is 0.003%, both guaranteed along with monotonicity. The analog dynamic range of the ADC-1215F is in excess of 86 dB. It also offers an overrange bit, an output buffer register and a high impedance input buffer amplifier or an optional differential input buffer amplifier. Mechanically, the ADC1215F measures 4.5 by 5 by 1.5 in. Power requirements are ±15 V at 150 mA and +5 V at 1 A maximum.

CIRCLE NO. 342

Three-axis rate sensor resolves 0.01°/sec

Model RT02-0201-1 is a solid-state three-axis angular rate sensor. It provides ±60°/sec range for pitch and yaw, ±360°/sec range for roll and operates on 28 V dc using less than 10 W. This hermetically sealed unit has no moving parts and comes in a package capable of withstanding 100 g shock and 10 g vibration. Input resolution is 0.01°/sec., and output impedance is 2 kΩ. The ruggedized unit has a 200 ms startup and is guaranteed for 10,000 hours. It weighs less than two pounds and is 3.75 by 4.62 by 3 in.

Phoenix Data's 7000 Series Automatic Gain Ranging Data Acquisition System has the **HIGHEST DYNAMIC RANGE IN ITS CLASS**

Dynamic Range input: 112 db
Thruput Rate: 50 KHz

The 7000 Series of High-Speed, Automatic/Programmable, Gain-Ranging Data Acquisition Systems offer maximum flexibility in Input Levels, Scanning Rates, and Resolution at minimum cost per channel.

**FEATURES:**
- Dynamic Range input of 112db
- Five Customer-Selectable gains from 1 to 100.
- ADC resolution thru 15 Binary Bits.
- Full Scale Input Ranges from ±100 millivolts to ±10.24 volts.
- Automatic or programmed Gain Ranging thruput rate to 50 KHz.
- Thruput rate to 100 KHz at Unity Gain.
- CMRR of 94db.
- Thruput accuracy to 0.01%.
- Up to 128 differential input channels with expansion capability.

**MODULES & SUBASSEMBLIES**

**Hybrid s/d and d/s converters consume 1 W**

**ILC Data Device Corp., 100 Tec St., Hicksville, N.Y. 11801. (516) 433-5530. $1800 to $2000; 6 wk.**

The synchro tracking converters of the H-Series are thick-film hybrid devices. A 16-bit s/d converter can be assembled with as few as five double dual-in-line modules. CMOS logic reduces power consumption to less than 1 W. Single or multispeed, high (90 V L-L) or low level (11.8 V L-L), synchro or resolver, and wideband systems are available. Processing to MIL-STD-883 level C is standard procedure with processing to level B available. These devices use the Type II servo loop approach and have high resolution (up to 16 bits), high accuracy (up to ±2'), and fast tracking (0 to 1440°/sec, full accuracy. They also have small size (six DIPs for a s/d, four DIPs for a d/s).

**BCD coded keyboards include encoder IC**

**Key Tronic Corp., Bldg. 14—Spokane Industrial Pk., Spokane, Wash. 99216. (509) 924-9151.**

A 16-key BCD encoded keyboard includes the 20-0165 keyboard encoder—a 16-line to four-bit parallel encoder in a 24-pin hermetic DIP. The keyboard operates over the temperature range of 0 to +75 C. The encoder provides strobe and two-key rollover protection as well as BCD encoded data. Full typewriter keyboard encoding up to eight bits can be accomplished using two encoder packages. Outputs of the package interface readily with all popular DTL and TTL logic families. The 16-key keyboard requires only +5 V input and prior to shipment is cycled 50,000 times and undergoes a minimum 24 hour burn-in.

**Proportional servo speed control has many uses**

**Automated Servo Control, Lindenwood, Ill. 61049. (815) 339-4471.**

A proportional servo speed control system can interface with mobile or industrial hydraulic drive systems. This closed-loop control consists of a solid-state comparator-amplifier, rotary control actuator and photoelectric speed detector. The basic control function is speed synchronization of two rotating devices. However, the design flexibility offers automatic control relative to pressure, G.P.M., temperature, torque, position and ac/dc voltage or current, etc.

**Phase shifter controlled by a six-bit signal**

**Merrimac Industries, Inc., 41 Fairfield Pk., West Caldwell, N.J. 07006. (201) 228-3890. $525.**

The PSD Series of digital phase shifters is available for center frequencies from 21.4 to 160 MHz. Phase can be shifted in binary increments using a six-bit binary word. The least-significant bit is 3 degrees for Model PSD-63-30 and 5.75 degrees for Model PSD-64-30, while the most-significant bit for these two models is 96° and 354.25°, respectively. Other specifications include a center frequency of 30 MHz, a bandwidth of 5%, a 50 Ω impedance, a VSWR of 1.5:1, an insertion loss of 3 to 4 dB, a maximum input power of -10 dBm and phase shift accuracy from 2.7 to 5.2 degrees. Model PSD-63-30 has a nominal phase shift range of 0 to 180 degrees; the model PSD-64-30 covers a nominal 0 to 360 degrees. Model PSD-63-30 has a nominal phase shift range of 0 to 180 degrees; the model PSD-64-30 covers a nominal 0 to 360 degrees. BNC female connectors are used for the rf ports, and solder pins are used for control terminals. Both models weigh 10 oz.
Four-quadrant multiplier offers high accuracy

Teledyne Philbrick, Allied Dr. at Route 128, Dedham, Mass. 02026; (617) 329-1600. Model 4454: $85; Model 4455: $125; stock.

Models 4455 and 4454 modular four quadrant multipliers deliver pretrimmed accuracies of 0.25% and 0.5%, respectively. Temperature drifts are 0.01%/°C for the 4454 and 0.02%/°C for the 4455. Small signal bandwidth for both units is 600 kHz. Both units are housed in 1.5 by 1.5 by 0.6 in. encapsulated modules and are rated for operation from 0 to 70°C.

CIRCLE NO. 348

A/d converter offers 10-MHz throughput

Datel Systems, Inc., 1020 Turnpike St., Canton, Mass. 02021; (617) 828-6395. $1295.

The ADC-VH video a/d converter uses a parallel/serial conversion scheme. It can deliver a 5-MHz throughput rate for eight-bit words or 10 MHz for four-bit words. First the four most-significant bits are determined through a four-bit parallel converter. These four bits in turn control an ultra-high speed d/a converter whose output is subtracted from the input signal and the remainder is fed to a second four-bit parallel converter which determines the four least-significant bits. The total propagation delays and settling times involved are less than 200 ns. The eight digital outputs can each drive up to four TTL loads. The converter will operate within specifications from 0 to +70°C. Long term stability is specified at ±0.25%/year and the temperature coefficient is +50 ppm/°C. Power requirement is ±15 V dc at 75 mA, +5 V dc at 1.2 A and -5 V dc at 225 mA.

CIRCLE NO. 349

General Electric has all the Solid State Lamps (LED's) you may need, ready for off-shelf delivery.

GE has a complete line of competitively priced infrared and visible SSL's now available for immediate delivery from your GE distributor or your local GE representative. We have a new plant on-stream ready to serve you, devoted exclusively to manufacturing solid state lamps.

New small infrared SSL.

With the addition of our new SSL-65, GE can now offer an infrared SSL as small as .050". It's the ideal lamp to specify where package size is critical. With GE's line of infrared SSL's, you can now choose lamps from .25" to .050" in diameter; select beam distance up to 1 mile with proper external optics and specify power output from a maximum of 7.5 mW @ 100 mA down to .1 mW.

Bright visible SSL's.

You'll have to see our visible SSL's to appreciate their brightness. They feature high efficiency GaP pellet material and the GE-patented light reflector. GE's GaP pellet gives you bright uniform light.

Exclusive GE guarantees.

As a result of GE's design and construction features, we can offer these exclusive guarantees: Power output to be within published min-max range. 100% lamp inspection at rated current for power output and forward voltage; reverse current @ 10mA is 2 volts or greater.

In addition to this blanket guarantee, GE also guarantees every SSL-55B, SSL-55C, and SSL-56 infrared lamp for precision beam alignment to within 3 degrees of the mechanical axis of the lamp. Power output of each of these lamps is within the less than 2 to 1 range, as published. GE will refund your purchase price or provide replacements for returned lamps not meeting published specifications.

Send today for information.

For a free copy of our Solid State Lamps catalog (3-3358), prices and delivery details, write or phone your GE electronic distributor today.

Or call GE collect. Ask for John Hall at (216) 266-2400 for further details and technical information. General Electric, Miniature Lamp Products Department, Nela Park, Cleveland, Ohio 44112.

GENERAL ELECTRIC

Modular mini handles up to 255 devices

Interdata, 2 Crescent Pl., Oceanport, N. J. 07757. (201) 229-3040. See text; Feb.

Model 7/16, a microprogrammed minicomputer, consists of a two-board CPU packaged in an eight-slot RETMA chassis. A CPU plus 8-k bytes of core costs $3200 in single units. The computer provides 16 general registers, a set of 100 instructions and provides for 255 I/O interrupts with automatic vectoring to service routines. Data-word length is 8, 16 or 32 bits; instruction-word length is 16 or 32 bits. Typical time for a 16-bit register-to-register add is 1.5 μs. The computer handles up to 255 devices at rates up to 2-M byte/s—with an optional selector channel. Core modules, mounted on 15-in. PC boards, are available in capacities 8, 16 or 32 k bytes with 1 μs cycle time. The 32-k boards are also available with 750 ns cycle times.

CIRCLE NO. 350

Punched-tape emulator requires no interface

Remex, 1733 Alton St., Santa Ana, Calif. 92705. (714) 557-6860. From $2395; stock.

The punched tape emulator (PTE) converts equipment that uses paper tape to digital-cassette operation without the need for interface devices or software modifications. The unit provides asynchronous operation at speeds from zero to 300 char/s. A single cassette stores the equivalent of ten 130-foot punched tapes. A dial-controlled file search allows access to 10 or more programs on a single cassette. A single PTE handles two independent cassette drives.

CIRCLE NO. 351

Portable video recorder has 3.5-MHz bandwidth

Ampex Corp., 401 Broadway, Redwood City, Calif. 94063. (415) 367-4515. MS-1: $39,000; MX-1: $120,000.

A portable video recorder, the MS-1, weighs less than eight pounds with battery pack attached. The recorder has a 3.5-MHz bandwidth and a dynamic range of 32 dB. Recording time is 20 min. with the 1-in. wide tape and helical-scan wrap used. A companion unit, the MX-1, provides for playback of the recorded data.

CIRCLE NO. 352

Manual programmer can handle 1000×8 pROMs

Spectrum Dynamics, 1320 W. McNab Rd., Fort Lauderdale, Fla. 33309. (305) 974-9500. $900; 90 days.

According to the manufacturer Model 310 pROM programmer handles any field-programmable ROM. The unit, intended for manual use, programs and verifies both bipolar and MOS pROMs—including fusible-link, MOS erasable and avalanche migration types. A single plug-in card adapts the unit to any manufacturer's pROM. Operation is simple: pROM words are addressed decimally with a three-digit thumbwheel switch. Depressing any one of eight switches programs the corresponding bit. And the buttons light up to verify the programmed bit. pROMs up to (1000×8) can be handled by the basic unit; an available option allows expansion to a 10,000 × 8 capacity.

Data Processing

Industry’s first 32-bit mini heads product list

Time-code generator has decimal readout

Thiem Industries, 1918 N. Artesia Blvd., Torrance, Calif. 90504. (213) 321-9111. $690.

Output of the series M time code generator is in IRIG B serial format. The display—either Nixie or Sperry seven-segment—shows decimal digits representing seconds, minutes and hours from 00:00:00 to 23:59:59. The time base, a crystal-controlled oscillator, is available with accuracies up to 25 ppm. Stand pulse rates include 1000, 100, 10 and 1 Hz as well as 1 or 6 pulse/hr.

CIRCLE NO. 356

Modular terminal system includes diagnostics

Teletype Corp., 5555 Touhy Ave., Skokie, Ill. 60076. (312) 982-2500.

The Model 40 terminal system includes a CRT display, ASCII keyboard and medium speed impact printer. The display screen has a capacity of 1920 characters (24 lines × 80 characters); the display memory accommodates 24 lines, expandable to 48 or 72 lines. All data can be entered on the screen, edited and corrected if necessary then transmitted at speeds up to 1200 baud (other speeds optional). The printer speed is 80 cols. at 314 lines/min—with a single-case character set. The system is modular—the user can chose the desired combinations of keyboards, printer and CRT. To minimize downtime, self-contained diagnostic circuits provide display patterns and activate lights on individual circuit cards.

CIRCLE NO. 357
Terminal handles ASCII or APL character set

Anderson Jacobson, Inc., 1065 Morse Ave., Sunnyvale, Calif. 94086. (408) 734-4020. $4250; Nov.

A printer-keyboard terminal, the AJ630 A, can be switched locally or remotely between the standard ASCII character set and the APL-ASCII system. The terminal operates at the rate of 10, 15 or 30 char/s and provides a 140-column thermal printout. The character set consists of APL, plus standard upper and lower case characters. Options include an internal modem or an acoustic coupler.

CIRCLE NO. 358

Low-cost calculator has 8-LED display

Three penlight batteries power the Litronix 1100, a four-function calculator, that can perform chain computation. The calculator uses a single MOS/LSI circuit and an 8-LED display. A switch selects two- or four-decimal place operation; the “clear-entry” key permits erasure of the last-entered number without erasing the results of previous calculations. An optional AC adaptor is available at a suggested retail price of $4.95.

CIRCLE NO. 359

Control Meter Relay Systems

Servo-Tek’s NEW Control Meter Relay Speed Indicating System is designed for accurate speed monitoring and speed limit control in process and control machinery. Adjustable single and double set point systems, accuracy ±2% full scale, repeatability 0.5%, speed ranges from 0-10 rpm to 0-12,000 rpm. Double set points adjust 0° of each other. The system’s permanent magnet dc generator can also provide a signal to auxiliary equipment.

FREE CATALOG of rotating components available.

INFORMATION RETRIEVAL NUMBER 109

New Series

EPOXY BRIDGE RECTIFIERS

- Low cost, high reliability
- 10 Amp (Io)
- Electrically isolated case
- Low thermal impedance for longer life and greater operational reliability

A bonded metal-to-ceramic substrate achieves electrical isolation with an exposed copper mounting pad resulting in low circuit-junction-to-heat-sink thermal impedance.

The VJ series is available in 200 V, 400 V, 600 V, and 800 V PRV ratings in controlled avalanche series. Non-controlled avalanche series also available.

VJ248, $1.65 ea., 200 V, 1000 qty.

Design us in; we’ll stay there

In Canada:

SOLID RELIABILITY

Micropackaged pulse transformers with outstanding performance.

Toko pulse transformers are proven performers in the electronics world, and are known for compactness, reliability and product quality which are hard to beat. Make your selection from our list of standard types or let us design a unit specifically for your application.

Technical Data
- Operating temperature range: 0~70°C
- Storage temperature range: -40~+100°C
- Insulation resistance: (At 250 VDC) More than 10³ MΩ
- Package: Transfer molding (epoxy)
- Environmental test: Units satisfy MIL-STD-202D

For detailed information, please contact our sales department.

LESS THAN 1µV OFFSET!

New Ultra-Low Thermal emf Reed Relays!

- Unique new method (pat. pend.) virtually eliminates thermal offsets, permits use of almost any type reed switch...fg wet, dry, high voltage.
- Remarkably independent of ambient temperature, environment.
- Many contact forms, pin configurations available.
- Units also available at less than 500 nanovolts per switch, or less than 1µV differentially between switches.
- Greater than 10¹ ohms isolation resistance.
- Rugged molded package. Moderate price.

MICROWAVES & LASERS

Mm-wave sources deliver up to 50 mW

Hughes Aircraft, P.O. Box 90515, Los Angeles, Calif. 90009. (213) 670-1515. $1050 to $2950; 90 days.

A series of solid-state millimeter-wave power sources are tunable over broad frequency bandwidths by means of a built-in micrometer. The new oscillators—Models 44101H through 44103H—are offered in three models: two have center frequencies from 33 to 40 GHz, while the third spans the 50-to-75-GHz band. Minimum output powers range from 10 to 50 mW, and minimum bandwidths are 4 to 5 GHz. The sources consist of Impatt diodes mounted in special high-Q cavities.

CIRCLE NO. 360

MEASURE TIME DELAYS FROM 20 MHZ TO 18 GHz

The ET-300 series of time-delay instruments permits tests over the frequency range of 20 MHz to 18 GHz by the use of interchangeable modulators and detectors. The ET-300 can resolve delay changes as small as 0.1 ns, and the rf and output signals may be in different frequency bands. Ten linear delay scales provide readability from 0.1 to 5000 ns. Selectable 200-kHz and 1-MHz modulation frequencies allow indicator optimization with respect to the bandwidth of the device under test.

CIRCLE NO. 361
Power attenuators handle 10 kW

Radiall, 101 rue Philibert Hoffmann, Zone Industrielle Ouest, 93116-Rosny S/Bois, France.

Coaxial fixed power attenuators, type ACO, offer attenuation values of 3, 6, 10 and 20 dB over a 2-to-18-GHz frequency range. Average power handling is 50 W and peak power handling is 10 kW. VSWR is less than 1.3 from 2 to 10 GHz and less than 1.2 from 10 to 18 GHz. Also available are type AFP waveguide attenuators that provide attenuation values of 3 to 6 and 10 dB, from 3.3 to 18 GHz over seven bands. Average power handling is 50 W and peak power is 10 kW. Max VSWR is 1.10.

CIRCLE NO. 362

Thermistor heads measure mm power

Variable and fixed tuned thermistor heads, series MMC, measure mean power output from 20 to 110 GHz. Each waveguide unit consists of a mount containing a tunable short-circuit and a plug-in waveguide wafer in which the thermistor is mounted. The tunable head offers an instantaneous bandwidth of 10%. Power handling of all units in the series is typically 14 mW at 200 Ω with a 2.3 VSWR. Heads are self-heating from the rf power. At room temperature, their resistance falls by approximately 4% for every degree C increase in temperature. Each thermistor head is supplied with an individual calibration certificate specifying minimum and typical efficiency within each band.

CIRCLE NO. 363

Why pay more for square wire terminals just because they’re made on screw machines?

Screw machined parts are expensive. If you’re using a square wire terminal (or even round wire parts) made on screw machines, we can save you money. Our equipment can upset, head, point, cut radii, knurl, flatten and form square wire to your specifications... and at far less cost. If you require, we’ll supply the parts plated to suit your specifications.

Send us a sample or a print.

We may be able to save you a lot more money than you realize.

**Film resistors**

A bulletin describes the use of Bulk Metal-film resistors in TV color encoders to eliminate the basic problem of drift and instability in TV color transmission. Schematics and descriptions of the matrix and modulator circuits are included. Vishay Intertechnology, Malvern, Pa.

**CIRCLE NO. 364**

**Tests for plastics**

“Standard Tests on Plastics,” a 32-page brochure, contains over 30 ASTM tests commonly used to describe the characteristics of plastics. The illustrated brochure separates tests into six categories: mechanical, thermal, optical, permanence, analytical and electrical. Also included are conditioning procedures and 11 conversion charts and reference tables. Celanese Plastics Co., Newark, N.J.

**CIRCLE NO. 365**

**Low-noise preamplifiers**

A 16-page brochure entitled “Low-Noise Preamplifiers” provides information on weak-signal amplification in the 0.01-Hz to 1-MHz range. Included is information on 30 preamplifiers and notes on noise and other factors affecting preamplifier selection and use. Ithaco, Ithaca, N.Y.

**CIRCLE NO. 366**

**Programmed logic systems**

**CIRCLE NO. 367**

**Dual-gate MOSFETs**

Details on the performance of dual-gate MOSFETs in rf and i-f amplifiers are provided in a four-page brochure. Special consideration is given to age functions, biasing, distortion and stability. General Instrument Corp., Semiconductor Components Div., Hicksville, N.Y.

**CIRCLE NO. 368**

**Linear motion sliders**

A family of linear slide controls, the 1-1/4-in. slim-line series 440, complements the existing line of 1-3/4-in. and 2-in. potentiometers. The new series features smooth resistance adjustment over the full 1-1/4 in. of mechanical travel, a power rating of 1/4 W at 55 C, and resistance values from 200 Ω through 5 Mn. Top, side or bottom twist tab mountings are provided with straight PC, snap-in PC or solder-lug terminals. Operating force in either direction is 5 to 15 oz. CTS of Elkhart Div.

**CIRCLE NO. 370**

**Stacking spacer system**

The CBSS spacer system is comprised of two simple nylon components, which can be used to stack circuit boards in any number of vertical tiers or side-by-side rows. The spacers are available in 1/2, 5/8, 3/4 and 7/8 in. heights. The system is completed by inserting a capping button through the top board to secure it to the spacer below. The capping button protrudes 0.18 in. above the top board for a compact assembly. Richco Plastics.

**CIRCLE NO. 371**

**PC card ejectors**

Electro-Flex card ejectors are molded of UL-approved, 20V nylon. The ejectors attach to cards of 1/16, 3/32 and 1/8 in. thickness. Drive pins are included. Standard colors are white and red; other colors are available. Electro-Space Fabricators.

**CIRCLE NO. 372**

**Thin-line bushing**

A thin-line strain-relief bushing for chassis thicknesses of 1/16 in. and less accommodates SJT, SJ0 and SJ 18/2 cable. It securely anchors, insulates and protects cables at chassis point-of-entry and is approved for high-temperature applications. Heyman Manufacturing.

**CIRCLE NO. 373**

**IR-emitting diode chart**

A brochure/wall chart compares solid-state GaAs infrared emitting diodes and GaAs and GaAlAs laser diodes. RCA.

**CIRCLE NO. 374**

**Slide rule**

A pocket-size platinum resistance vs temperature slide rule enables users to convert platinum resistance to degrees celsius or fahrenheit and to determine the non-linearity error when using platinum, nickel or balco resistance temperature transducers. Genisco Technology Corp., Instruments Div.

**CIRCLE NO. 375**

**Capacitor kits**

“ATC UHF/Microwave Capacitor Kits,” a four-page folder, describes six kits (55 mil cube) with capacitance values ranging from 0.3 through 91 pF and 10 kits (110 mil cube) with capacitance values ranging from 0.3 through 620 pF. American Technical Ceramics.

**CIRCLE NO. 376**

**Resistor selector guide**

The fired resistor properties, sensitivity to processing variables and effects of subsequent processing steps on the company’s thick-film resistor compositions are described in a selector guide. Resistance, thermal coefficient of resistance, noise, stability and fired print definition are among the properties delineated by the pamphlet. Du Pont.

**CIRCLE NO. 377**

**Mercury switch kit**

A 19-piece design kit permits engineers to investigate a new family of rugged all-position mercury switches, series LC2. Self-healing mercury film contacts provide over 250-million bounce-free operations switching contact loads to 2 A. The design kit lists for $45. Fifth Dimension, Box 483, Princeton, N.J. 08450.

'74 Heathkit catalog
... fully describes the new Heathkit IB-1103 Counter featuring phase-locked multiplier, extremely high resolution with 6½-digit readout and 100 MHz capability. Pushbuttons permit multiplication by 1 (direct), 10, 100 or 1000. Also, it has temperature compensated crystal oscillator (TCXO) and pushbutton selection of 1 msec, 100 msec and 1 sec gate times. Input sensitivity is 50 mV to 120 MHz and 100 mV to 100 MHz. Includes lighted indicators for MHz, kHz, Hz, Gate, Overrange and unlocked conditions. Kit utilizes plug-in circuit boards for fast assembly. Mail order price, 379.95*. Shipping weight, 12 lbs.
... there are more than 350 other Heathkit products for '74, including assembled and kit-form automotive and lab test instruments. Kits for every interest - marine, ham, color TV, stereo hi-fi, automotive, home appliances, educational, etc.

Noise measurements

Instruments described in the Sound Measurement and Analysis brochure are all easy to operate and use. As an aid to the correct selection of instruments for a certain noise reduction problem, the brochure summarizes what noise is and how it can be measured. B & K Instruments, Cleveland, Ohio.

CIRCLE NO. 378

Low-frequency oscillators

Low-frequency oscillators spanning from less than 1 Hz to 100 kHz are described in a series of technical bulletins. Bulova Watch Co., Woodside, N.Y.

CIRCLE NO. 379

Wafer dicing saw

Features, specifications and capabilities of the model 602 dicing saw are contained in a brochure. Tempress, Div. of Sola Basic, Los Gatos, Calif.

CIRCLE NO. 449

EMI ceramic filters

A "how-to-select" section in catalog FC-73 helps specifiers to narrow the choice of the right ceramic filter for the job. Charts show typical full load attenuation vs temperature and insertion loss vs frequency. Part numbers of filters and their AVX equivalents are listed. AVX Ceramics, Braintree, Mass.

CIRCLE NO. 450

Measurement instruments

A two-color, six-page brochure describes products for measurement, signal conditioning and control. Moxon/SRC Div., Irvine, Calif.

CIRCLE NO. 451

Power supplies

A 120-page dc power supply catalog makes it easy for the user to find exactly what he wants without having to interpret pages of complicated tables. First, this catalog lists all of its power supplies in order of ascending voltage. Then, within each voltage rating, current ratings are listed in ascending order. The catalog is divided into five categories: low-cost lab supplies, general-purpose, special-purpose, modular and digitally programmable power supplies. Hewlett-Packard, Palo Alto, Calif.

CIRCLE NO. 452

Interconnectors

A data sheet describes conductive elastomeric liquid crystal interconnectors and carbon-filled or silver-filled elastomeric materials. Technical Wire Products, Cranford, N.J.

CIRCLE NO. 453

Dc testers

Four series of portable high-voltage dc insulation testers and four types of fault locators are illustrated and described in a 12-page catalog. Design and safety features, specifications, instrumentation data and optional equipment are included. Hipotronics, Brewster, N.Y.

CIRCLE NO. 454

Telecommunications LSI

A four-page, full-color brochure introduces the company's LSI test system, the MD-154, and goes into detail explaining how to use the system to test complex LSI telecommunications devices. The brochure is complete with specifications, photos and block diagrams. Macrodata, Woodland Hills, Calif.

CIRCLE NO. 455

Precision potentiometers

Six 2-page, two-color data sheets describe low-cost, single-turn, conductive plastic precision potentiometers. Photographs, dimensional drawings, specifications and ordering information are given. Spectrol Electronics Corp., City of Industry, Calif.

CIRCLE NO. 456

Thermocouples

A 16-page brochure of Enclad sheathed thermocouples describes the use of precious metal and selected base metal sheaths and thermocouple wires. Engelhard Industries, Murray Hill, N.J.

CIRCLE NO. 457

Computer peripherals

An OEM product sheet lists computer peripheral product lines and describes typical models, including chain and drum printers, reel-to-reel and cartridge tape transports, disc drives, card readers, digital lister printers and paper-tape equipment. Mohawk Data Sciences, King of Prussia, Pa.

CIRCLE NO. 458

Modems

Modem 4600/48, a 4800 bps data set featuring a simplified type of manual equalization, is described in an eight-page catalog. The illustrated data sheet includes a description of the unit's remote control test feature and other functional and interface data. International Communication Corp., Miami, Fla.

CIRCLE NO. 459

High-purity materials

A 116-page catalog contains complete product information, including available forms of analytical data, prices, ordering information and definitions of commercial and technical terminology dealing with high-purity metals, alloys and ceramics. Also included are coated and uncoated filaments, evaporation boat sources, coated and uncoated Superstrate and ceramic substrates and opto-electronic materials such as gallium arsenide and gallium phosphide for LEDs and microwave devices. Materials Research Corp., Orangeburg, N.Y.

What you should know about

Reconstituted Mica... Capacitors

A recent survey of 10,000 EEs indicated only 10% demonstrated a working knowledge of reconstituted mica as a capacitor dielectric.

Reconstituted mica is not "recycled" or "second-hand" mica. It is natural capacitor grade mica formulated into continuous sheets of uniform thickness. After removal of soluble contaminants, this "paper like" structure is maintained by the natural cohesive forces characteristic of natural mica itself. The reconstituted mica "paper" dielectric is then capable of being wound on conventional capacitor winding machines in conjunction with purified aluminum foil as the conducting media. Flag leads are inserted during the winding process to serve as the terminations.

Upon completion of impregnation, the winding is compressed while the impregnant is in an unpolymerized state. Pressure is maintained during curing until polymerization is complete. Whereupon, a totally solid capacitor section is now ready for packaging to customer requirements.

Excellent performance under environmental extremes is a prime advantage of reconstituted mica capacitors. At Custom each step of production begins and ends with Quality Control because we know our customers can not afford failures.

Now that you know what reconstituted mica capacitors are, let us show how we can meet your requirements. See our page in EEM and write for FREE product sheets today.

NEW LITERATURE

High-voltage transistors

A 24-page book provides a condensed listing guide to more than 160 high-voltage power transistors. Device series numbers, breakdown voltages, current gains, saturation voltages, leakages, and thermo resistance as well as JEDEC package types are included. Solitron Devices, Riviera Beach, Fla.

Logarithmic amplifiers

A brochure describes characteristics of logarithmic amplifiers and includes features of ac and dc-coupled logarithmic video amplifiers and rf log detectors. American Astronics, Costa Mesa, Calif.

Integrated circuits

Advanced linear integrated circuits for industrial and communications equipment are described in a short-form catalog. It includes ICs originally developed and introduced by the company as well as second-source devices. Exar Integrated Systems, Sunnyvale, Calif.

Fasteners

High-performance, quarter-turn fasteners are described in a 12-page catalog. In addition to specifications, performance data and ordering information, the catalog gives instructions on installation and field adjustments. The Paneloc Corp., Colinsville, Conn.

VCOs

Varactor-tuned solid-state sources for applications from 0.2 to 20 GHz are described in a 12-page brochure. Curves depicting typical power output/tuning voltage characteristics, package outline drawings and specifications are included. Watkins-Johnson, Palo Alto, Calif.

Permanent magnets

Characteristics of ceramic permanent magnets and specific features and applications for nonoriented, fully oriented and partially oriented magnets are given in a four-page brochure, Stackpole Carbon Co., Kane, Pa.

Thermometers

Specifications, prices and ordering data for thermistor thermometers and temperature controllers for precise measurement and control through -80 to +150 C are described in a four-page catalog. Yellow Springs Instrument Co., Yellow Springs, Ohio.

Rf semiconductors

A 16-page catalog and selection guide on rf semiconductors describes hyperabrupt tuning diodes, chips for hybrid circuits and LIDs for hybrid circuits. The catalog contains a description of all type numbers and is illustrated with electrical characteristics and application information. A complete cross-reference chart is included. KSW Electronics, Burlington, Mass.

Sockets and connectors

A four-page short-form catalog features key socket and connection products and comes complete with technical data and pricing. Robinson-Nugent, New Albany, Ind.

Carbon-film resistors

Performance characteristics of carbon-film resistors are described in a data sheet. A wide range of resistance values are available and standard EIA color coding is used. Sakata International, Elk Grove Village, Ill.
Power systems

Static uninterruptible power systems (UPS) and sine-wave static inverters are described in a brochure. Schematics illustrate four types of UPS available: basic continuous, manual transfer, automatic transfer and redundant parallel systems. NIFE, Copiague, N.Y.

CIRCLE NO. 472

Transformers

A 24-page brochure provides information for the specification and selection of dry-type transformers. The bulletin includes a question-and-answer section, proper transformer sizing and problem applications. Acme Electric, Cuba, N.Y.

CIRCLE NO. 473

Hybrid components

Standard and custom hybrid components including oscillators, comb generators, bite modules, i-f amplifiers and i-f systems are featured in an eight-page catalog. Specifications are given on each model with curves where necessary. Trak Microwave Corp., Tampa, Fla.

CIRCLE NO. 474

Digital timers

Programming instruments and controls, timers, clocks, counting and measuring devices are featured in a six-page catalog. Also included is a list of modular display units for custom digital instrumentation and a section outlining digital clocks, multimeter and frequency counter kits. E S Enterprises, Inglewood, Calif.

CIRCLE NO. 475

Service monitor

A six-page color brochure describes many features that make the Model S-1327A series service monitor the answer to FM servicing needs. Motorola, Schaumburg, Ill.

CIRCLE NO. 476

Male/female standoffs

A selection of precision male-to-female standoffs is found in a 12-page catalog. Tables, illustrations and schematics give details on metal and plastic materials, platings and finishes, standard lengths, diameters and thread sizes. Unicorp, Orange, N.J.

CIRCLE NO. 477
NEW LITERATURE

Circuit assemblies

A four-page rectifier bridge cross-reference shows replacement capability of a line of molded low power circuit assemblies. The cross-reference lists over 250 devices including the competitive part number, the IR part number and the IR case style. Also shown is a photograph of the various devices. International Rectifier, El Segundo, Calif.

CIRCLE NO. 478

Half-dip reed relays

A two-page illustrated bulletin gives design information on a half-dip reed relay. The bulletin tabulates coil characteristics, contact ratings and life expectancy. It gives socket diagrams as well as full dimension drawings. Options, including clamp diodes, are discussed. Struthers-Dunn, Pitman, N.J.

CIRCLE NO. 479

Die cutting

Custom die cutting of films and pressure sensitive materials for use in a broad range of applications is described in a six-page brochure. Webtek Corp., Los Angeles, Calif.

CIRCLE NO. 480

Indicators

LED indicators, lamps, switches and panel displays; incandescent, neon and LED digital readouts in heights from 0.27 to 3 inches; conventional and transistorized switch-es and indicators; plus lamps and displays are featured in eight-page brochure. TEC, Tucson, Ariz.

CIRCLE NO. 481

Industrial adhesives

Typical end uses of 11 versatile industrial adhesives are described in a two-color, two-page bulletin. Overlap shear strengths, T-peel strengths and 180° peel strengths at various operating temperatures and cure times are listed for the adhesives in easy-to-read table form. Another table lists application methods, color, solids content, consistency, coverage and bonding range. 3M Co., St. Paul, Minn.

CIRCLE NO. 482

Data sets

An eight-page short-form catalog describes 300, 1200, 2400 and 4800 bps data sets that are compatible with Bell models, and includes other specialized data-communications products. Tele-Dynamics, Fort Washington, Pa.

CIRCLE NO. 483

Data-conversion equipment

A 12-page short-form catalog covers data conversion and high-speed signal conditioning equipment. Included are specifications for d/a and a/d converters, syn- chro converters, hybrid synchro converters, instruments, operation-al amplifiers and an outline of the company's total data conversion systems capability in commercial and MIL-grade specifications. ILC Data Device Corp., Hicksville, N.Y.

CIRCLE NO. 484

Position transducers

Linear variable differential transformer precision gauge heads for position transducers are described in a catalog. Outline draw- ings and specifications for over 30 different models are shown. Tabu- lar data, cutaway sketches and wiring diagrams are used to de- scribe the theory of operation and typical gauging systems. Schaevitz Engineering, Camden, N.J.

CIRCLE NO. 485

Dc control motors

Five 4-page illustrated publications include features and applications of dc control motors. Modular selection guides with characteristics as well as intrinsic and derived parameters, listings of analog and digital tachometer characteristics, frequency response charts, thermal data graphs, mounting dimensions and suggestions on se- curing application assistance are included. Micro Switch, Freeport, Ill.

CIRCLE NO. 486

Electronic calculator

The 1145 compact electronic printing calculator is detailed in a four-page brochure. A detailed step-by-step diagram gives examples of calculations that can be performed on the machine. Facit-Addo, Secaucus, N.J.

DECITEK'S NEW
UNIVERSAL READER

cuts inventory costs
saves on spare parts
speeds servicing
simplifies your designs
reduces documentation,
software and training

Think of the money, time and trouble you can save by standardizing on one, proven-reliable punched-tape reader for all your applications. Decitek's evolutionary new "Universal Reader" reads to 300 CPS step-at-a-time truly asynchronously . . . to 600 CPS stop-on-character.

Combines refined electromechanical design and improved electronics with all original Decitek advantages that avoid edge guides, capstans, pinch rolls, brakes, lenses . . . stepping motor/dual sprocket bi-directional drive . . . interchangeable reading of 5, 6, 7 or 8-level paper, metalized polyester or paper-polyester tapes having up to 70% transmissivity. Basic reader with or without electronics, fanfold or spooler. Call or write DECITEK, 16 Sagamore Rd., Worcester, Mass. 01605. Tel. (617) 757-4577.

DECITEK
A DIVISION OF JAMESBURY CORP.

INFORMATION RETRIEVAL NUMBER 124
Heat pipes

"Heat Pipe Technology for Industry" explains what a heat pipe is, different types of heat pipes, and how they may be applied to a variety of industrial uses. Numerous illustrations show applications in which heat pipes are already proven useful. Hughes Electron Dynamics Div., Torrance, Calif.

CIRCLE NO. 488

Portable recorders

Features, photos and specifications on portable recorders are given in a 12-page catalog. Full specifications are provided on all plug-in preamps presently available, and a general discussion of the company’s concept of recorder design is included. Gulton Industrial Systems Div., East Greenwich, R.I.

CIRCLE NO. 489

Feed-thru filters

Updated to include new configurations and improved performance, data sheet 73-133 describes the physical and electrical characteristics of series 55 miniature feed-thru filters. Capitron Div. of AMP, Elizabethtown, Pa.

CIRCLE NO. 490

Rf capacitors

The Rf Capacitor Handbook details specific design considerations and criteria to further knowledge in the field of circuit design. The handbook is divided into four main categories: topic locators, design equations and explanatory text, test data for circuit design and additional design aids. American Technical Ceramics, Huntington Station, N.Y.

CIRCLE NO. 491

Instrumentation head

A specification sheet describes a 2-MHz 14-channel wideband head assembly. Infomag, Pomona, Calif.

CIRCLE NO. 492

Pushbutton switches

The series D200 heavy duty momentary switches is described in a two-page catalog. Dimensional diagrams, schematics and pertinent data are contained in easy-to-follow tabular form. Control Switch, Folcroft, Pa.

CIRCLE NO. 493
**Bulletin Board**

A computer system for scientific calculations, having twice the speed of systems costing five times as much, has been announced by Digital Equipment Corp.'s Education Products Group. FORTRAN ENGINE is based on the company's EduSystem-25 configuration, with a floating point processor, OS/8 FORTRAN IV software and a R8-E disk cartridge system. System prices begin at $37,085.

CIRCLE NO. 494

A software program, DATA COM, enabling computer-output-microfilm users to convert print tapes or raw data files to microfilm or microfiche without any programming effort or post-processing of computer-generated tapes, has been announced by the Business Systems Div. of Pertec Corp. Designed for use with the Pertec 3700 COM system, DATA COM is a fully programmed software program for IBM 360/370 systems that use parameter cards. The cards define formatting requirements for an application including report page layout and film format.

CIRCLE NO. 495

Eight CMOS ICs for military applications have been introduced by Texas Instruments. Six of these circuits are pin-for-pin replacements for Series 4000 and 14000 equivalents. Offered in hermetic dual-inline packages, these circuits feature low-power dissipation of 50 nW typ, 3 to 15 V operation, noise immunity of approximately 45% of the supply voltage, high-input impedance, and up to 10 MHz operation.

CIRCLE NO. 496

The E series of miniaturized power modules manufactured by Acopian Corp. has been expanded to provide outputs ranging from 1.5 to 28 V at current ratings of 1.5 A. Duals offer ±12 or ±15 V outputs at current ratings of 300 and 350 mA.

CIRCLE NO. 497

Bowar Instrument Corp., has introduced a line of calculator keyboards in new colors and new sizes for manufacturers of handheld calculators.

CIRCLE NO. 498

Motorola Semiconductor Products is supplying 13 MECL 10,000 integrated circuits in small flat packs. These devices have high packaging density, meet MIL-temp range of -55 to +125 C, are hermetically sealed and weigh less than previously available packages.

CIRCLE NO. 499

Two new transistor arrays, the SG3081 and SG3082, from Silicon General are suited for driving all types of seven-segment displays. The devices are electrical and pin-for-pin equivalents to the RCA CA3081 and CA3082.

CIRCLE NO. 500

Fairchild Camera & Instrument Corp. has announced it is raising distributor cost on TTL and DTL SSI products by an average of about 15% across SSI product lines.

CIRCLE NO. 501

Ionemc has announced the first deliveries of its Iodisc Series 3000 minicomputer cartridge disc drive with 200 track-per-inch recording capability. The 200 tpi technology allows the user to effectively double the storage capacity of a cartridge disc drive from 48 to 96 megabits, using four disc surfaces.

CIRCLE NO. 502

An integrated-circuit timer with an output capable of sourcing or sinking up to 200 mA is available from National Semiconductor Corp., 2900 Semiconductor Dr., Santa Clara, Calif. 95051. Called the LM555, the monolithic integrated circuit may be employed as a monostable one-shot time delay or as an astable oscillator.

CIRCLE NO. 503

Carter Semiconductor has entered the LED market with a new gallium-phosphide red diffused LED in a molded-plastic package. It is a direct replacement in applications where Monsanto, Littronics and Fairchild LEDs are now used.

CIRCLE NO. 504

Ferrite cores from Magnetics have made it possible to reduce the size of oscilloscopes. The cores are used in two circuits in the Tektronix Model 212—a gapped ferrite pot core is used in the dc-dc inverter main power transformer and an ungapped ferrite pot core is used in a rejection transformer for a two-way line filter.

CIRCLE NO. 505

ITT Semiconductor has introduced 12 LED display drivers—six segment drivers and six digit drivers—designed to interface between MOS and LED displays. The segment/digit drivers range from 9 to 18 V and 3.8 to 250 mA operation.

CIRCLE NO. 506

TEL-1, a software package that allows an 810 programmable terminal processor controlling up to four of the company's printers to operate with Bell's BISCOM system, has been announced by Sanders Data Systems.

CIRCLE NO. 507

A family of junction field-effect transistor high-speed switches from Intersil has been qualified to JAN-TX specifications. The JAN-TX 2N4091, 2N4092 and 2N4093 are n-channel FETs with maximum ON resistances from 30 to 100 Ω, leakage current of 200 pA and switching speeds of 40, 60 and 80 ns, respectively.

CIRCLE NO. 508

American Electronic Laboratories, Inc., Product Assurance Div. has announced a service that provides functional and parametric testing of all families of digital integrated circuits.

CIRCLE NO. 509

Omnitec Corp. has announced a coupler subassembly to meet terminal manufacturers' circuit specifications and PC-board configurations.
Mirco, Inc. has announced that its FLASH II software package, used in the generation of test programs to determine and identify faulty components on printed-circuit boards, is now available for the first time on a lease, purchase or lease-buy basis.

CIRCLE NO. 510

Improved materials and processes allow Sprague to offer a new series of extended capacitance ratings in its type 150D hermetically sealed solid-electrolyte Tantalex capacitor lines. These capacitors meet MIL-C-39003C.

CIRCLE NO. 511

Price reductions

Inter-Computer Electronics Inc., a subsidiary of American Electronic Laboratories, Inc., has reduced the price of its pulse transient recorder, model PTR 9200, to $9300 from $9850.

CIRCLE NO. 512

RCA Solid State Div. has added a new series to its sensitive-gate SCRs. The 4-A SCRs have types with voltage ratings of 15, 30, 50, 100, 200, 300, 400, 500 and 600 V and use the standard JEDEC TO220AB package. The dc gate-trigger current for this series is 2000 µA, maximum, at a case temperature of 25 C.

CIRCLE NO. 513

Berkey Photo, Inc., Keystone Div. has reduced prices on its electronic pocket calculators. The Model 350 has been reduced to $94.95 from $119.95; Model 370 reduced to $99.95 from $139.95 and Model 390 reduced to $119.95 from $159.95.

CIRCLE NO. 514

Burr-Brown has cut prices 20% on its 16-bit/4-digit integrating a/d converter. Prices for the ADC100 now start at $175.

CIRCLE NO. 515

Litronix has announced price reductions ranging up to 23% for six IL-series opto-isolators. The IL-1 has been reduced to $1.20 from $1.55; IL-5 reduced to $1.40 from $1.75; IL-12 reduced to 95¢ from $1.19; IL-15 reduced to $1.05 from $1.25; IL-16 reduced to $1.25 from $1.50; IL-74 reduced to 90¢ from $1.

INFORMATION RETRIEVAL NUMBER 128
Annual and interim reports can provide much more than financial-position information. They often include the first public disclosure of new products, new techniques and new directions of our vendors and customers. Further, they often contain superb analyses of segments of industry that a company serves.

Selected companies with recent reports are listed here with their main electronic products or services. For a copy, circle the indicated number.

Spar Aerospace Products Ltd. Mechanical subsystems and ground-support equipment, hf and vhf antennas, and gearbox dual-propeller transmission systems.

ARINC Research Corp. Design and analysis.

Solid State Scientific Inc. CMOS, semiconductors, oscillators, counters, shift registers, static CMOS memories, rf transistors and displays.

Burroughs. Business machines, computers, terminal systems, data storage and peripherals and components.

Storage Technology Corp. Tape and disc drives and semiconductor memory systems.

Western Union International. International communications, radio paging and mobile radio services.

Systems Engineering Laboratories. Computer systems, automotive electronics, telemetry, simulators and defense support equipment.

Universal Instruments Corp. Components, electronic assemblies, contract instrumentation and metalworking.

Mohawk Data Sciences Corp. Data-entry and dedicated data-processing systems.

Advanced Micro Devices, Inc. Monolithic integrated circuits, linear ICs, MSI, computer-interface circuits, MOS/LSI and bipolar memories.

On-Line Systems Inc. Computer time-sharing services.

Gates Learjet Corp. Aircraft electronics and aircraft.

ARi Industries, Inc. Cable, heaters and antipollution products.

Ampex. Computer peripheral equipment, magnetic tape, professional video products, on-line tape mass-memory storage systems and instrumentation recorders.

North American Philips Corp. High-intensity discharge lighting, components, motors, switches, keyboards, LEDs, information and data systems, electro-optics, medical electronics, instrumentation, materials and consumer products.

Sperry Rand Corp. Aerospace, semiconductor wafer processing, laser holography, planar gas-discharge displays, computers and consumer products.

Morse Electro Products Corp. Stereo and quadraphonic systems, switches and cabinets.

Informatics. Computer systems and software.

Computer Sciences Corp. Nationwide remote data-processing network and computer systems.

Aeronautical Radio, Inc. (ARINC). Air-ground-air communication service, electronic switching systems, intercity communications and weather wire service.
OmniScribe™ Strip Chart Recorder provides low cost, high quality for industrial, chemical, medical, biochemical, physiological and university laboratories. Prices start at $395 which is half of competition. Features include multi-speed chart drive, sprocketless paper feed and a re-balance element to replace the potentiometer. Houston Instrument, 3950 Terminal Ave., Bellaire, Texas 77401. (713) 667-7403

INFORMATION RETRIEVAL NUMBER 151

5 watt regulated power supplies. Low cost power supplies designed around 7800 series of voltage regulators, these units are available in 5, 6, 8, 12, 15, 18, and 24 volts with a 5 watt output rating. Short circuit protected. $9.75 in unit quantity. ELCOM Industries, Inc., Civil Air Terminal, Bedford, Ma. (617) 274-6656.

INFORMATION RETRIEVAL NUMBER 154

Spade-Sert by Sems simplifies electrical connections with 2 washers which automatically space themselves for easiest insertion of spade connector or wire. Close tolerance eliminates troublesome wire cutting. Washer surfaces are precision beveled, free from rough edges and burrs. Sems Div. Camcar Srew & Mfg. 1818 Christina, Rockford, Ill. 815-226-2400

*INFORMATION RETRIEVAL NUMBER 157

New free catalog containing specifications for over 60 models of single, dual and triple output AC to DC power modules. MIL Electronics, Inc., Lowell, Mass. 01854. (617) 453-4142.

INFORMATION RETRIEVAL NUMBER 152

400 Ideas for Design, Vol. 2. Edited by Frank Egan. Ready to borrow, modify, or adapt, the top recent contributions to Electronic Design's popular "Ideas for Design" column range from amplifiers to switching circuits. 288 pp., illus., cloth, $11.95. Circle below for 15-day examination copy. Hayden Book Co., New York, N.Y. 10011.

INFORMATION RETRIEVAL NUMBER 155

INFORMATION RETRIEVAL NUMBER 158

Thin-Trim variable capacitors provide a reliable means of adjusting capacitance without abrasive trimming or interchange of fixed capacitors. Series 9401 has high Q's and a range of capacitance values from 0.2-0.6 pf to 3.0-12.0 pf and 250 VDC working voltage. Johanson Manufacturing Corporation, Boonton, New Jersey (201) 334-2676.

INFORMATION RETRIEVAL NUMBER 153

The Pulsecom Model 461-6 Automatic Message Numbering Device electronically inserts station identification and message numbers. This device saves operator time, and prevents mistakes. The 461-6 operates at 45-1200 Baud with most terminals. PULSECOM, 5714 Columbia Pike, Falls Church, Va. 22014. 703-820-0652.

INFORMATION RETRIEVAL NUMBER 156

30 watt DC/DC converter. +15 vdc output at 1 amp load with external heat sink. Short circuit protected. 10 mv line/load regulation. Filtered input and output. 12 V to 28V input models. Protected against input over-voltage. Size 2.7 x 5.8 x 1.2 inches. $119 ea (1 to 9). B. H. INDUSTRIES, Los Angeles, CA, 213-479-8278.

INFORMATION RETRIEVAL NUMBER 159
Electronic Design

Electronic Design’s function is:

- To aid progress in the electronics manufacturing industry by promoting good design.
- To give the electronic design engineer concepts and ideas that make his job easier and more productive.
- To provide a central source of timely electronics information.
- To promote communication among members of the electronics engineering community.

Want a subscription? ELECTRONIC DESIGN is sent free to qualified engineers and engineering managers doing design work, supervising design or setting standards in the United States and Western Europe. For a free subscription, use the application form bound in the magazine. If none is included, write to us direct for an application form.

If you change your address, send us an old mailing label and your new address; there is generally a postcard for this bound in the magazine. You will have to requalify to continue receiving ELECTRONIC DESIGN free.

The accuracy policy of ELECTRONIC DESIGN is:

- To make diligent efforts to ensure the accuracy of editorial matter.
- To publish prompt corrections whenever inaccuracies are brought to our attention. Corrections appear in “Across the Desk.”
- To encourage our readers as responsible members of our business community to report to us misleading or fraudulent advertising.
- To refuse any advertisement deemed to be misleading or fraudulent.

Microfilm copies are available of complete volumes of ELECTRONIC DESIGN at $10.00 per volume, beginning with Volume 9, 1961. Work is now in process to complete the microfilm edition of Volumes 1-8. Reprints of individual articles may be obtained for $2.00 each, prepaid ($5.00 for each additional copy of the same article) no matter how long the article. For further details and to place orders, contact the Customer Services Department, University Microfilms, 300 North Zeeb Road, Ann Arbor, Michigan 48106 telephone (313) 761-4700.

Want to contact us? If you have any comments or wish to submit a manuscript or article outline, address your correspondence to:

Design Data from

Noise/Vibration Diagnosis: Real-Time Analysis Explained

Informative booklet answers the 11 most-asked questions on what a real-time analyzer is, and how it can be used to diagnose complex machinery and trace sources of noise. It answers such questions as:

- Why do I need real time?
- How much resolution do I really need?
- Can I calibrate frequency and amplitude quickly and accurately?
- Do I need spectrum averaging?
- How can I compare past data with new data?
- How do I know I am analyzing (or averaging) valid data?
- Can I interface to my computer?

Federal Scientific Corp.
An affil. of Nicolet Instrument
615 West 131st St., New York, N.Y. 10027 (212) 286-4400

ABSOLUTE TIMING DISTRIBUTION HANDBOOK

Datametrics is pleased to offer our new valuable handbook on the theory and application of absolute timing systems. The handbook outlines techniques on how to synchronize to within microseconds to Universal Time (UTC), as well as describing redundancy techniques to obtain overall system reliability of better than 100,000 hours.

This handbook should serve as a valuable guide for the instrumentation engineer engaged in real time data indexing, as well as serve as a primary standard for the Public Utilities and Metrology Standard Laboratories for time and frequency calibration.

Copies of Technical Bulletin ATD are available upon request by contacting

400 IDEAS FOR DESIGN Volume 2

Edited by Frank Egan

A unique sourcebook of practical design techniques and approaches using the latest components, representing the best contributions to Electronic Design’s “Ideas for Design” column. All selected for their practical value in solving the design engineer’s most common, everyday problems. They have proved useful as parts of larger designs or as aids in measuring the parameters and testing the effectiveness of existing designs. 288 pp., 7½ x 9¼, illus., cloth, $11.95. Circle the reader-service number to order a 15-day examination copy.

Measure Vector Angle, Magnitude And Components

The new P.A.R. Corp. Model 129A Two Phase Lock-In/Vector Voltmeter, enables you to simultaneously measure the magnitude and phase angle with respect to a reference signal of virtually any low-level signal within its range of 0.5 Hz to 100 kHz—even if the signal is buried 60 dB beneath background noise. At the flip of a switch, you can also measure the in-phase and quadrature components of the vector. The Model 129A features fully automatic reference tracking, independent output expansion and filtering for each channel. Complete specifications are contained in bulletin T-314, available on request.

PRACTICAL RELAY CIRCUITS
By Frank J. Oliver

Uniquely groups various relay circuits according to the functions they perform, enabling the systems designer to quickly select the best circuit for his specific purposes. Includes arc and RFI suppression systems; time delay function; audio tone control and resonant-reed relays; sequential relays; protective functions of relays against overload overvoltage, and overcurrent, pulse generation and detection; logic circuits; and more. Particulary important is coverage of pulse-operated relay systems now extensively used with automated control systems. Illustrated with many circuit diagrams using the latest American National Standard graphical symbols. 363 pp., 6 x 9½, illus., cloth, $14.95. Circle the reader-service number to order a 15-day examination copy.

NEW, GENERAL PURPOSE, LOW-NOISE AMPLIFIER

The Model 206 C, Quan-Tech’s latest version of its highly regarded general purpose, low noise amplifier, offers significant features at the low price of $290.
• Selectable gains of 20, 40 and 60 dB, ±0.5 dB.
• Frequency response is flat from 1 Hz to 100 kHz
• Noise less than 10 µV.
• 1 V RMS at 1 ma.
• Less than 0.1% distortion.
• Dimensions: 3"H x 4½"W x 7" Deep, 2½ lbs.

ENGINEERS

Have you heard about NCR's new organization?

We've changed! And in that change there could be opportunity for greater professional involvement for you!

We've changed many of our products from mechanical free-standing equipment to complete electronic systems for business, industry, and diverse government functions. Among other things, they include:

- Accounting Computer Systems
- Data Entry Systems
- Data Processors
- Electronic Communication Systems
- Financial Systems
- Postal Systems
- Retail Systems

And we've changed our location! NCR Engineering was once basically in Dayton, Ohio. Now it is California, Ohio, New York, Florida, Kansas and Delaware — wherever the product itself is made!

Now we must staff to meet our goals. Developing the many current products (as well as those yet to come) for complete systems require professionals with advanced understanding of applied electronics and innovative minds in people who think fresh and new. Business systems is the fastest growing segment of the electronic industry, and our invitation to you is come, grow with us!

If you have experience in digital logic and circuit design for business systems, or if you are software-oriented and knowledgeable with the firmware and hardware that goes into computerized systems, terminals, or mini-computers, contact us now!

Let us know your product interest, your geographic preference and your professional credentials. One of our many divisions will be happy to explore employment with you.

WIDE BAND RF TRANSFORMERS

Great Value at

$295

10 piece quantities

0.1 - 500 MHz
50 Ohm impedance
1:1 to 16:1
impedance ratio
micro-miniature case

Some Models $3.45

A breakthrough in technology and high production volume enables Mini-Circuits Laboratory to offer these new products at an unprecedented low price.

In today's tough competitive market can you afford not to use these remarkably low priced and high performance units?

Ruggedness and durability are built in the T-series transformers. These new units are packaged within a 1/3 D.I.P. package. They use uniquely designed transmission line transformers for extra wide bandwidth.

We invite you to convince yourself. Place your order now and check our delivery, product performance and reliability.

When it comes to a wire bundle . . .

Gudebrod's harness room accessories can tie it up, hold it down or cut it off.

Choose the items you need and call now.

Gudebrod Lacing Tape
Gudebrod's complete line of lacing tapes is backed by over 100 years of manufacturing know-how. Many types and styles meet or exceed military specifications and are guaranteed the finest quality available.
Gudebrod makes tapes from nylon, dacron*, nomex*, glass, teflon* and other fibers that cover all harness lacing requirements, plus a research and development department that is continually working to improve or develop new tapes.

Gudebrod Wire Holding Pins
No need to use nails, cotter pins, etc. and gamble on cutting the harness wire or maybe your hand. Gude-pins are made of case hardened blued steel with rounded heads. They resist bending and can be used over and over again. Gude-pins are available in seven sizes ranging from 1.18 to 4.0 inches in length and various diameters.

Gudebrod Swivel-Tilt Harness Board Mount
Gudebrod Swivel-Tilt mounts reduce fatigue, eliminate stretching and bending and increase production.
Portable mount swivels and locks securely in any position with a single lever. Handles boards up to 3 ft. by 3 ft. and clamps to any sturdy table or bench. Larger sizes also available.

Gudebrod Cable-Lacer
The Cable-Lacer is precision made and designed to speed many production jobs. Light in weight and handy to use, the Cable-Lacer produces tighter knots and makes lacing easier.
Self-contained bobbin holds and feeds tape as required to increase worker efficiency and reduces the strain to the worker's hands.

Gude-cutters
Heavy Duty all-purpose tape and wire cutters. Compact in size - easy to use. Drop forged construction with special serrated cutting edge prevents wire from slipping during cut.

Gudebrod Wire Holding Objects
Branch-off wires can be held in place with lightweight, inexpensive WHO™ clips. Only one pin is required to securely hold 3 to 5 wires in place, either stripped or insulation covered. WHO™ clips are made from steel, are reusable and have low initial cost.

Gudebrod Swivel-Tilt Harness Board Mount
Gudebrod Swivel-Tilt mounts reduce fatigue, eliminate stretching and bending and increase production.
Portable mount swivels and locks securely in any position with a single lever. Handles boards up to 3 ft. by 3 ft. and clamps to any sturdy table or bench. Larger sizes also available.

ELECTRONIC DESIGN 23, November 8, 1973
Just watch our action when you call for service! The old-fashioned, dependable kind that just could be brand new to you. With fast application help, fast action on prototypes, and delivery dates you can count on.

Fact is, we have snapped into action in a big way. Coming up with new lines of precision snap-action switches, designed and manufactured in the Cutler-Hammer quality tradition. We have samples in stock for immediate inspection.

But remember. If we don’t have exactly what you want already, tell us and we’ll snap into action to get you a prototype promptly.

Call your Cutler-Hammer Sales Engineer or Switch Distributor and ask him how our snap-action switches (and service) can help you meet your product development schedules on time.

Action you want.
Action you’ll get!

Miniature—Five different types with U.L. rating up to 15 amps. Four terminal styles. Choice of actuators—straight lever, roller lever, simulated roller lever.

Sub-miniature—Four basic types with U.L. rating up to 10 amps. Four terminal styles. Same actuator choice as above.

Sub-subminiature—Four basic types with U.L. rating up to 7 amps. Four terminal types. Actuators—a variety of lever, leaf and roller lever types.
Thanks to large, sharp, clear characters, and uniform brightness, the PANAPLEX™ II panel display is the first choice of calculator users. The soft, orange-red neon glow is easy on the eyes, yet bright enough to be viewed comfortably in brightly lit offices. Manufacturers find that calculators using PANAPLEX II panel displays sell better; and at the same time, PANAPLEX II panels offer low cost drive circuitry and low-power consumption.

Most significant, the uniquely simple single envelope construction of PANAPLEX II panel displays offers premium reliability at the best price per digit now and in the future!

For additional information about PANAPLEX II panels and how to solve your readout problems, write to Burroughs Corporation, Electronic Components Division, P.O. Box 1226, Plainfield, New Jersey 07061; or call our special sales/application assistance number, (201) 757-3400. Our representative will show you why...
