Bipolar bit-slice microprocessors replace scores of conventional logic circuits at reduced power. Through microprogramming, you can achieve a precise emulation of existing equipment without the need to change system software. The result: minis and high-speed controllers can be made smaller and more versatile. See p. 34.
... here today at no extra cost in every Trimpot® Potentiometer

Historically, pin-to-element termination problems have been one of the primary causes of trimmer failure... especially during handling and PC board process operations. Bourns exclusive Swage-Bond™ process virtually eliminates pin termination failure... truly a revolution in trimmer reliability. Furthermore, Swage-Bonding results in a marked improvement in temperature coefficient consistency.

Other trimmer manufacturers utilize a simple clip-on termination. Some solder this connection, some rely on tension pressure alone. In the Swage-Bond process, the P.C. pins are secured through the substrate, with a high-pressure compression swage on both top and bottom sides. The pressure of the swage locks the pin solidly into the element, and thoroughly bonds it to the thick-film termination material.

The seal that seals... without springback
Bourns trimmers stay sealed when others fail. We know. We've tested them all. Bourns uses a chevron-type sealing technique, that seals without O-rings... eliminating the windup and springback that frequently occurs with such seals. The result is faster and more precise adjustability... with a seal that really works.

Wrap-around wiper for better setting stability
Bourns multi-fingered, wrap-around wiper delivers more consistent, more reliable performance. The unique design significantly reduces CRV fluctuations and open circuit problems due to thermal and mechanical shock... by maintaining a constant wiper pressure on the element. Compare the ruggedness of Bourns design with the common "heat-staked" wiper designs. Compare performance. Specify Bourns.

HERE'S PROOF:
Send for a copy of our new engineering report on TRIMMER PERFORMANCE. Tell us about your application, and we'll provide qualification samples that best suit your needs.

Bourns reliability is available at ordinary prices... off-the-shelf from nearly 100 local distributor inventories... plus our largest-ever factory stock. TRIMMER PRODUCTS, TRIMPOT PRODUCTS DIVISION, BOURNS, INC., 1200 Columbia Avenue, Riverside, California 92507. Telephone 714 781-5320 — TWX 910 332-1252.
There's a whole lot more to the Model 186 than just pretty pictures. Like its calibrated phase lock and built-in oscillator for 1 kHz AM/FM capabilities. It also has 30 v p-p output plus continuous, triggered and gated modes. And it's the only generator that gives you the combination of AM and phase lock.

The Model 186 has a frequency range of 0.0001 Hz to 5 MHz and sells for just $795. Just circle our bingo number and we'll send you the complete picture.
The only Double-Balanced Mixers
with a 2-YEAR GUARANTEE

featuring Hi-Rel tested diodes-

still only

$7.95
(500 pieces)
$9.95 (1-49)

*including diodes!

Yes, a two-year guarantee for DBM's is now a reality... made possible by an accelerated-life diode screening program adopted at Mini-Circuits.

Each Schottky diode used in Mini-Circuits' SRA-1 mixers is now preconditioned by the HTRB (High Temperature Reverse Bias) technique, previously reserved almost exclusively for semiconductors assigned to space applications. With HTRB testing, each diode is operated for 168 hours at 150°C with one volt reverse bias applied.

To screen out "infant mortality", the diodes are deliberately stressed to accelerate aging and to force time-related failure modes to take their toll. In conventional testing or "baking", the diode does not experience anywhere near the stress encountered with the HTRB program. Hence, the ability at Mini-Circuits to locate the potentially-unreliable diodes before they are assembled into SRA-1 units And, with double-balanced mixers, the overall reliability hinges almost entirely on the diodes used.

Yes, the HTRB procedure costs us more and screens out more devices. But our goal is to improve reliability to a level unmatched for off-the-shelf DBM's at no increase in cost to our customers. You — our customers by your overwhelming confidence in our product line have made us the number one supplier of DBM's in the world.

To earn your continuing support, we are now employing HTRB Hi-Rel testing for every diode used in the SRA-1, at no increase in cost to you. So, for the same low price of $7.95, you can purchase our SRA-1, with a two-year guarantee, including diodes.

To ensure highest system reliability demand highest quality diodes on your source-control drawings and purchase orders. Specify SRA-1 mixers, with HTRB tested diodes from Mini-Circuits... where low price now goes hand-in-hand with unmatched quality.

TEKTRONIX logic analyzers
New Plug-ins with
Expanded Capabilities

For digital design and testing applications, you'll find that Tektronix Logic Analyzers and Oscilloscopes are literally made for each other. To expand your digital analysis capabilities, choose either the 7D01 Logic Analyzer (a new plug-in for our 7000-Series laboratory oscilloscope family) or the LA 501 Logic Analyzer and its new companion plug-in, the WR501 Word Recognizer (these two are packaged as modular TM 500-Series instruments to work with almost any oscilloscope).

Features these analyzers have in common include:
- 16 Channel Operation
- 15-ns Asynchronous Timing Resolution
- 4k Memory to Store Pretrigger Data
- Word Recognition
- High Z Probes

For versatile data acquisition, these logic analyzers let you select the number of channels and the resolution best suited to specific applications:
- 16 Channels, 20 MHz, 256 Memory Bits
- 8 Channels, 50 MHz, 512 Memory Bits
- 4 Channels, 100 MHz, 1024 Memory Bits

You'll like what we've done to reduce circuit loading problems associated with testing high-speed and high-impedance logic families. With our new P6451 active probes, which have an input impedance of 1 MΩ paralleled by 5 pF at the probe head, you'll be able to test virtually any logic family.

LA501/WR501, Members of the TM 500 Series

Take your logic analyzer right to the problem with the LA 501 Logic Analyzer and its new companion word recognizer, the WR 501. Packaged as modular TM 500 test instruments, this pair works with any oscilloscope or X-Y monitor. Now you've got versatile logic analysis capabilities to complement the oscilloscope you probably already own.

Word recognition with digital delay gives you fast access to almost any location in the data stream. For channel-to-channel timing comparisons, you can select any trace and position it next to any other. And timing tic marks on each channel enhance visual analysis.

No matter what your application—design, production testing, or service—we've got a TM 500 logic analysis configuration for you.

On the bench, power the LA 501 and WR 501 with the TM 503 mainframe or the TM 504 mainframe (now you've got room for another TM 500 module like the DMM 502 Digital Multimeter).

In a rack, use the RTM 506—there's room enough for the LA 501, the WR 501, the SC 502 Oscilloscope, and one more module. Or you can mount the LA 501 and WR 501 in a TM 503 side by side with a 604 Monitor. The 6½-in. display is easy to read.

For field portability, try the TM 515 Traveler Mainframe. It's rugged and durable, yet as attractive as carry-on luggage. You can pack the LA 501, the WR 501, and the SC 502 and have a complete logic analysis system in a suitcase.

7D01, A Member of the 7000 Series

Turn any 7000-Series laboratory oscilloscope into a versatile 16-channel logic analyzer with the new 7D01 dual-wide plug-in. Now, gaining logic analysis capability is as simple as adding a plug-in.

With a four-compartment 7000-Series mainframe and plug-ins, you get a truly powerful logic design tool: a logic analyzer and a real-time oscilloscope in one unit. Use the 7D01 Logic Analyzer to locate a digital domain problem, then zero in for detailed analysis by using the 7D01's word recognizer to trigger the analog portion of your oscilloscope. Now you can do it with one instrument and display your digital and analog information on the same crt.

With the 7D01 you also get timing and binary information displayed simultaneously on the crt. You do it with a cursor. And because the cursor can be moved in single clock intervals, timing comparisons are faster, easier and more error-free than visual estimates. When the cursor is moved to a given clock position, the binary word at that point is read out across the bottom of the display.

The LA 501/WR 501 and the 7D01 Logic Analyzers will be on display at ELECTRO76. Stop by our booth for all the details and a hands-on demonstration. If you can't make it to the show, call your nearby Tektronix Field Engineer or write Tektronix, Inc., P.O. Box 500, Beaverton OR 97077.

New at ELECTRO76
Thin-Trim® capacitors

Tucked in the corner of this Pulsar Watch is a miniature capacitor which is used to trim the crystal. This Thin-Trim capacitor is one of our 9410 series, has an adjustable range of 7 to 45 pf, and is .200" x .200" x .050" thick.

The Thin-Trim concept provides a variable device to replace fixed tuning techniques and cut-and-try methods of adjustment. Thin-Trim capacitors are available in a variety of lead configurations making them easy to mount.

A smaller version of the 9410 is the 9402 series with a maximum capacitance value of 25 pf. These are perfect for applications in sub-miniature circuits such as ladies’ electronic wrist watches and phased array MIC’s.
Bicentennial issue praised

Look ahead

Congratulations on your "200 Years of Progress" issue (ED No. 4, Feb. 16, 1976) and the letter from President Ford. The Bicentennial makes me a little worried, unfortunately, that we may become so lost in retrospection that we may overlook what needs to be done in the future.

William N. Bushey
5002 N. 78th Street
Scottsdale, AZ 85253

Required reading

Last night I couldn’t put down the ED Bicentennial Issue! Reads better than fiction—absolutely fascinating! My copy is already circulating around San Antonio to selected friends who would appreciate your efforts.

I can remember lamenting the meager (or nonexistent) historical data grudgingly given by EE profs during school. Your special issue should be required reading material for students of the industry.

Leroy H. Becker
Union Instrument Corp.

'Absolutely great'

Electronic Design has done it again! Your special Bicentennial issue was absolutely great! Dr. Dibner was especially pleased with your article.

Please extend our congratulations to all who participated.

Therese Michalic
Burndy Corp.
Norwalk, CT 06856

An early phonograph

Your account of "200 Years of Progress" was great—really great! It was all succinctly stated and the manner in which concurrent events from other fields were woven in put your account of electrical history into refreshing perspective.

One addendum may be of interest: you mentioned (p. 102) Bell’s licensing the Orthophonic phonograph system to Victor. As I recall, this system was a high-fidelity acoustic phonograph of remarkable tonal quality. According to information I recently stumbled across, the design of the acoustic pick-up head for that system was among the first applications of network theory to mechanical problems.

By manipulating the values of electrical analogs of the mechanical parts of the system, including a specially contoured aluminum diaphragm that functioned as the sound transducer, Bell engineers arrived at a design that had flat, broadband response—and it really delivered clean sound. Unfortunately, it didn’t compete in the marketplace against the then-emerging, more powerful vacuum-tube systems.

(continued on page 10)

Electronic Design welcomes the opinions of its readers on the issues raised in the magazine’s editorial columns. Address letters to Managing Editor, Electronic Design, 50 Essex St. Rochelle Park, N.J. 07662. Try to keep letters under 200 words. Letters must be signed. Names will be withheld on request.
We started by redesigning a CRT. And ended with the fastest, easiest way to build microcomputer systems.

The AMI 6800 MDC architecture is so far ahead of the competition they'll have to change their whole development philosophy to catch up.

Unlike their multiple box approach, with lights and switches, our grand plan is centered around a very smart CRT, with full debug software.

There's a 6800 system in the terminal, so the processor you're working with is the same one you're developing. That cuts your learning time in half.

And you can forget about those long hassles with paper tape, front panels, teletype or cassettes. Put your hands on our keyboard and you never have to let go. You modify information instantaneously. Interrupt a program after every instruction, and get a complete snapshot of the state of the machine. Look at all the registers and change their values, simply by pressing a key. And you never have to translate addresses into binary to get information.

Our 6800 MDC not only cuts programming time in some cases from hours to minutes, it can also be configured as a test center for incoming 6800 parts. And it adapts easily to a powerful, one megabyte microcomputer for a variety of uses, such as inventory control.

The standard AMI Microcomputer Development Center consists of the 80 char. x 25 line CRT, the dual floppy disk with disk operating system, S6834 EPROM programmer,
RS232 interface and 16K words of RAM memory. The many options will include a character printer, an in-circuit emulator so you can use the CRT like a front panel, EPROM and RAM memory modules.

So now the most flexible, easiest-to-use microprocessor family, the AMI 6800, has taken another giant step ahead of the others. The AMI 6800 Microcomputer Development Center can get you to the market faster, with a better product. Ask your AMI sales office, distributor or representative for our brochure. Or write to AMI, 3800 Homestead Road, Santa Clara, CA 95051. Then see how fast things develop.

This is the way to the Center:

CA1RL08E NUMBER 12

Electronic Design 10, May 10, 1976
You'll like what printer designers like about the 82900 logic stepper motor.

Take low price...top quality...compactness and 23 oz-in torque as starters.

The new 82900 stepper motor is built to do yeoman's service not only in impact and non-impact printers, but in small X-Y plotters, chart drives and computer peripherals. Yes, even medical instrumentation, where its reliability really pays off. Compact size, efficiency, low cost and 23 oz-in torque @ 200 PPS all combine to offer design advantages unobtainable in larger, bulkier and more expensive steppers.

A case in point. A high-speed impact terminal printer. Initially a mechanical linkage, actuated by a solenoid, was used to advance the carriage platen and paper automatically on command. This design proved to be somewhat cumbersome in making adjustments during assembly and required excessive downtime during servicing. After careful investigation, the 82900 stepper was adopted as a more viable alternative. In addition to meeting the load requirements of the application, the 82900 proved capable of providing the necessary torque output, the required step angle and a minimum of 5000 hours operating time. Equally important, the motor met price parameters.

Consider the 82900 stepper in your own design. It's bidirectional. It has a nominal power rating of 12.38 w@ 5 vdc. And it is efficient, operating at lower than average temperatures. Standard construction provides 2-phase operation (requiring simplified drive circuitry) a 7.5° step angle and roller bearings. A 15° step angle, 4-phase operation or sleeve bearings in any combination desired can also be provided as options.

OSCAR was earlier

Your Bicentennial edition was well done. I would like to add that on Dec. 12, 1961, the OSCAR I satellite was orbited (Orbiting Satellite Carrying Amateur Radio), built entirely by radio amateurs. Is it then not the first privately owned satellite—contrary to a statement on p. 120 accompanying the picture of the Telstar satellite?

Thomas E. Wulling
1723 Terrace Dr.
St. Paul, MN 55113

Early terminology

On page 62 introducing your Bicentennial issue it is stated that Franklin "...was first to propose the theory that there are two kinds of electricity—positive and negative." Actually, this is incorrect, and Franklin's contribution of the one-electricity theory is duly noted later (p. 68) in Stanley Runyon's article.

However, earlier (p. 67), Runyon makes another small error. He writes, "It was Gilbert ... who distinguished between electrics (conductors) and nonelectrics (insulators) ..." The pre-19th century electricians referred to substances which could easily acquire a static charge by friction as "electrics" and those which could not (unless insulated) as "nonelectrics." Electrics today would be generally referred to as insulators and nonelectrics as conductors.

The polarity of electricity produced by rubbing electrics depended on their position in an empirical triboelectric series, ranging from glassy substances or "vitreous" (acquiring positive charge) to "resinous" like amber (acquiring negative charge), leading many of the ancients to adopt those terms for supposedly two types of electricity. Many of the phenomena associated with frictional electricity are still under investigation to this day.

David Ecklein

(continued on page 18)
Who provides the industry's broadest line of electronic packaging hardware ... including Card Files?

SAE does! In either kit form or fully assembled, VARIFILE's® exclusive snap-together construction lets you assemble a card file in just minutes—without tedious component stringing.

Designed on a modular basis, SAE card files contain only five basic parts: end plates; support bars; card guides; nylon snap locking tabs; and connector mounting feet. Also available is a complete line of accessories including identification tabs, card pullers, circuit card ejectors, circuit card ejector/retainers, printed circuit board edge connectors, and cable connector hoods.

Stanford Applied Engineering has the complete capability for the design and production of special card files in both New York and California that will accommodate mixed cards and connectors with such features as front/rear panels, divider plates, front panel hinges, chassis slides, etc. Your request for quotation will receive immediate attention!

Our new 128 page packaging handbook gives complete details, and also describes our entire line of electronic packaging and interconnection hardware.

* Stanford Applied Engineering, Inc.
Your next digital logic analyzer.

Biomation's new 851-D
8-channel, 50 MHz logic analyzer.
Digital logic analyzers are revolutionizing the solutions of design and trouble-shooting problems. Biomation, building on our early waveform recording technology, has created the tools you need for your fast new digital world. We offer the most complete line of logic analyzers anywhere. And our thousand-plus customers have helped us develop the most useful features for real-world problems of digital system design and test. Our new 851-D catches, records and displays 8 channels of high speed logic. It is the slickest handling, most cost-effective logic analyzer we've seen yet. But don't take our word for it. Check over the features for yourself.

- Ideal companion for your 2-trace portable scope • Portable and self-contained • 8 channel • 50 MHz • Digital delay for precise trigger control • Accepts synchronous clock input (0° or 180° phase) • Provides internal clocking • Catches glitches as narrow as 5 ns • Pre-trigger recording • 512 bit per channel memory • Captures 512 words before, after, or around the trigger • Expanded and mixed display • Constant brightness expand to X20 • Combinational "true" trigger • 'Any-change' trigger • Built-in delay (4 digit) • Latch mode (catches single pulses) • Adjustable threshold levels for channels 1-4 and 5-8 • Step-and-wait cursor control • Steps through data one bit at a time

What next?
If you want to see a demo, right now, of our new 851-D or any of our digital logic analyzers (we have both less expensive and more powerful models), pick up the phone and call (408) 255-9500. Ask for Roy Tottingham at ext. 851.D. Or circle the reader service number and we'll send data. Biomation, 10411 Bubb Road, Cupertino, CA 95014.
Sprague puts more passive component families into dual in-line packages than any other manufacturer.

Call Sprague First!

DIP MULTIPLE TANTALUM CAPACITORS

Solid-electrolyte tantalum capacitors with 2 or 4 sections per package. 8- or 16-pin configurations. Standard ratings are 6.8 µF @ 35V, 15 µF @ 20V, 22 µF @ 15V, 33 µF @ 10V. Capacitance tolerance, ±20%. Operating temperature range, -55°C to +85°C. Write for Bulletin 3542 or circle 151 on reader service card.

DIP MULTIPLE METAL-FILM RESISTORS

Noble metal film resistors encased in protective glass. Choice of 7 or 8 resistors per 14- or 16-pin package. Resistance values, 50Ω to 100,000Ω. Power dissipation, 125 mW. Standard resistance tolerance, ±5%. Operating temperature range, -55°C to +70°C. Write for Bulletin 7042 or circle 155 on reader service card.

DIP PRECISION RESISTOR NETWORKS

Noble metal film resistors in pull-up, pull-down, interfacing, and terminating configurations, for applications requiring repetitive resistance patterns. 14- or 16-pins. Up to 28 resistors per package. Individual resistors from 50Ω to 100,000Ω. Dissipation, 125 mW. Write for Bulletin 7042 or circle 156 on reader service card.

DIP MULTIPLE PULSE TRANSFORMERS

Four transformers in 16-pin package. All cores have exclusive protective coating. Inductance values from 10 to 1000µH. ET product values of 5 volt-µsec. Choice of four turns ratios . . . 1:1, 2:1, 3:1, 4:1. Operating temperature range, 0°C to +70°C. Write for Engineering Bulletin 40400 or circle 157 on reader service card.

DIP TAPPED DELAY LINES

Lumped constant delay lines . . . ideal for timing and pulse synchronization circuits. 14- or 16-pin packages with delays of 50, 100, or 150 nanoseconds at a characteristic impedance of 50Ω. Working voltage, 50 VDC. Operating temperature range, 0°C to +70°C. Write for Bulletin 45004 or circle 158 on reader service card.

THE BROAD-LINE PRODUCER OF ELECTRONIC PARTS
CELCO makes "Above-Average" YOKES for "Above-Average" CRT Displays

Need a deflected CRT spot as small as 0.00065"?

The CELCO HDQ High-Resolution Deflectron for Satellite Photography Read-out was the choice of one of our customers for their "Above-Average" display requirements.

You can get performance like that with a CELCO YOKE optimized on your CRT for your "Above-Average" display, (measured with a CELCO CRT Spot Analyzer.)

Or YOUR "Above-Average" display may require fast Zero-approach settling time, as required in a Fingerprint Scanning job where CELCO HDN Deflectrons are specified to recover to 0.01% in 25μs.

Precision Linearity on the final film plane or work surface, in Integrated Circuit Mask-Generator Displays enables producers of LSI technology to make low-cost computers for all of us. CELCO Special Deflectrons and Linearity Correctors LC123 are being used by several equipment builders for their "Above-Average" displays.

For PEPR, a system for reading Bubble Chamber photographs, developed by a few individuals at MIT and refined and expanded by others at leading universities throughout the world, CELCO was asked to provide special Low Residual Yokes for their project. CELCO produced their HD Deflectron with special 0.003% residual, and GFJ irrotational Focus Coils to help achieve the performance of these "Above-Average" displays. CELCO DAPP2N-7 Amplifiers drive the Dynamic Focus Coil; a CELCO DAPP2N-5 Amplifier was selected by another PEPR group to drive the CELCO B1700 Di-Quadrapole which produced the rotating high-resolution scanning line!

"Above-Average" Recording Storage Tube displays with 1½" neck scan converters and storage tubes need CELCO QY and QD Recording Storage Tube Yokes.

CELCO electronics and magnets were integrated into a CELCO "DS" Special Display System for Oil Exploration and Data Reduction where "Above-Average" Linearity, Spot Growth, Zero-approach, Bandwidth, and Residual performances were required. Our customer decided to use CELCO's unique display experience to achieve his "Above-Average" display.

CELCO "Above-Average" deflection yokes, focus coils, beam-centering and aligners, astigmatic correctors, and pincushion correctors applied to your specific requirement will help you produce YOUR "Above-Average" Direct-View Display.

REMEMBER CELCO YOKES, whether you want to send a man to the moon, a probe to Jupiter or Mars, investigate chromosomes or trophoblast for cancer research, or build a large format scanner to generate typesetting masters, X-Ray enhancement, or data digitization.

• CELCO CRT Mounts, coil positioners, holders and magnetic shields will enable you to get everything together to achieve your "Above-Average" display.

• Write for CELCO YOKE BROCHURE and your FREE CELCO CRT Display Computer Slide Rule to compute the CELCO YOKE you need for your "Above-Average" CRT Display.

(average is so... ho-hum to us.)
Now There's A Better Choice

10 millivolt sensitivity, AGC inputs, bright LED displays, automatic ranging...

DATA TECH
DIGITAL FREQUENCY COUNTERS

Model 111 ........ 120 MHz ........ 7 Digit
Model 113 ........ 200 MHz ........ 8 Digit
Model 115 ........ 520 MHz ........ 8 Digit
Model 117 ........ 560 MHz ........ 9 Digit

Standard features include: Overload protection • Burst operation • Serial BCD • Options include: Battery operation • 0.1 Hz resolution in 1 sec • BCD or IEEE bus • Much more.

Priced from $350

DATA TECH
UNIVERSAL COUNTER TIMERS

Model 101 ........ 50 MHz ........ 6 Digit
Model 103 ........ 50 MHz ........ 7 Digit
Model 105 ........ 200 MHz ........ 8 Digit

Standard features include: 10 mV sensitivity • Overload protected to 250V rms • Variable DC offset • Full complement of triggering controls including scope monitors • 100 psi TI average resolution • Auto bandwidth reduction on period • Contact or pulse measurement operation including fixed or variable delay • RFI shielded case • ±3x10^-7 month time base • BCD output • Many options.

Priced from $675
Before you decide on another counter... get the full details on this all new family from

DATA TECH

Data Tech (formerly Data Technology) introduces an all new family of frequency counters and universal counter/timers, plus an automatic modulation meter utilizing an entirely new concept in modulation measurement.

Now you have a better choice. Data Tech has a counter for every need. LSI technology significantly reduces the number of components so prices are remarkably low—and reliability is remarkably high! Each counter carries a two year full warranty.

Every conceivable function has been included in these precision instruments. All counters have a $\pm 3 \times 10^{-7}$ crystal. Optional oven crystals, including $\pm 3 \times 10^{-9}$/day and $\pm 1.5 \times 10^{-9}$/mo., are available. All feature a rugged metal, RFI shielded case, and are immediately available from stock.

Before you decide on your next counter, get the full story from Data Tech. Circle the appropriate number for literature, or call for a demonstration.

Completely automatic AM and FM modulation measurements to better than 3% accuracy.

DATA TECH

AUTOMATIC MODULATION METER

Model 209 . . . . . 1.5 GHz Frequency Range
Standard features include: Eight FM and six AM ranges • Automatically adjusts input level • One-second automatic operation • Audio filter • Up to 100 KHz positive or negative peak FM deviation • Up to 100% AM modulation depth • Selection of peak or trough on AM measurements • I.F. and A.F. outputs • Compact and lightweight • Rugged metal case • Battery option and much more.

(Filter article ‘ideal’)

Congratulations on your Feb. 16 issue! Not only did you give an exhilarating dissertation on two hundred years of progress, but the technical articles rated among the best I have ever seen.

The one article I found to be most interesting was Dr. Delagrange’s “ideal” translating filter. The technique is something I was until now unfamiliar with (and I am sure this is true of many others). Although I am not usually called upon to create such a filter, the realization of the possibility of such a filter has added a new dimension to my knowledge. This is what a technical journal is supposed to do!

And you did it!—Keep it up.

Rudy Schneider

Misplaced Caption Dept.

There’s something about the service in our company cafeteria.

Sorry. That’s Pieter Brueghel the Elder’s “A Country Wedding,” which hangs in the Kunsthistorisches Museum in Vienna.

A LED lament

The News Scope item, “Color LEDs Gain in Brightness, Reliability,” (ED No. 9, Apr. 26, 1976, p. 15) mistakenly said that the reliability of Monsanto’s nitrogen-doped multi-colored LEDs has more than doubled in the last year. In reality, the reliability has been improved from 10 to 100 times.
Analog Devices introduces less of a DPM.

When we designed our new line of second generation digital panel meters, we had a clear objective in mind.
Give our customers less of everything. Less of everything they don’t want in DPMs, and more of what they need.

**Less confusion.**
Like less confusion finding the exact DPM they require. With six different second generation DPMs (three +SVDC logic-powered and three AC line-powered) we have the biggest selection available. And each of them benefits from advanced MOS/LSI circuitry, 3½, 4½ or 4¾ digit large LED displays, a full week of failure-free, power cycled burn-in, lower power consumption and lower cost.

**Less components:**
But let’s not talk in generalities. Let’s talk specific Analog Devices DPMs where less is a plus. Take our 3½ digit SVDC Model AD2021 for example. Through the use of MOS/LSI circuitry, we’ve been able to cut the number of components in it by 42%. And in doing so, chopped power consumption by 42%. Decreased the number of interconnections adding to reliability. Reduced its size to 3”W x 1.8”H x 1.25”D. And dropped its weight to 4 ounces. That’s why logic power is your logical choice for compact instrumentation. Our line-powered version, AD2016, offers similar advantages, in its industry-accepted AC-powered package.

**Less difficult to read.**
Digital panel meters should be easy to read. Get a glimpse of our logic-powered 4¾ digit AD2028 and line-powered AD2025. Like our other second generation Analog Devices DPMs, they have displays featuring big, high-intensity “light pipe” LEDs almost twice the size of earlier ones.

**Less cost.**
With so much that’s improved, you’d expect to pay more for our latest DPMs. Surprisingly, that’s not the case. Our logic-powered 4½ digit Model AD2027 and line-powered Model AD2024, for instance, are priced 40% lower than their first generation predecessors.

Less is more.
When is less more? When you specify Analog Devices new line of second generation digital panel meters. The real company for precision measurement and control. For complete facts, get the Designers Guide to DPMs. Analog Devices, P.O. Box 280, Norwood, Mass. 02062.

Analog Devices
The real DPM company.

You can turn to AMP for thumbwheel switches that'll snap, plug or wire in place.

Or you can go on soldering.
Maybe you're used to connecting or terminating your thumbwheel switches the traditional way—with solder.

Fine.

You can solder an AMP switch, if you want to. But if you're more inclined to break tradition in the interest of saving time and money, then innovate with AMP: take your choice of wrap-type, snap-in, posted or plug-in interconnections plus a variety of thumbwheel switches (including .500" and .350" wide), message wheel, enclosed and sealed configurations, and BCD and BCO codes.

When you turn to AMP for thumbwheels—or any other type of switch—you can expect the type of backup for which AMP is famous.

With professionally concerned sales engineers who want to know about your switching problems. And help you solve them.

And twelve district sales offices across the country—to help them help you.

After all, if you're going to innovate, it pays to have a stable company backing your design.

Why not take time out from soldering. Ask for our thumbwheel switch catalog. Today.

Call Customer Service at (717) 564-0100, or write: AMP Incorporated, Harrisburg, Pa. 17105.
Here's the key. HP's new 8-bit 1230A Logic Trigger—a handy scope accessory that simplifies data-domain measurements two ways. It gives you an easy way to trigger on digital events. And it gives you a stable display—even with long delays between word recognition and the trigger point.

**Word recognition** simplifies the task of triggering your scope from digital data. Simply connect the eight parallel inputs to the desired points in your circuit and set the level switches to HI, LO, or OFF (don't care). When the operating logic states agree with the selected input levels, the unit indicates word recognition. And, after the preset delay, sends the trigger signal to your scope. It's just that simple.

**Digital delay** is the key to stable traces. Trigger delay is based on clock pulses—not time. So you can window on an event occurring up to 9999 clock pulses from the point of word recognition and obtain a jitter-free trace every time.

To set the delay, you simply tap a pushbutton switch to increment or decrement the delay count a digit at a time. Or hold the switch down to slew to a higher or lower number quickly.

**Sync/Async operation** allows you to be dependent on or independent of clock pulses. A gate input provides a qualifier for word recognition, or, if you need additional parallel inputs, the gate input can be the ninth bit for the word recognizer.

You get the 1230A, a handy carrying case with input cables and probes, scope trigger input cable, and a carrying strap... all for only $495*. Optional accessory kit (15268A, $100*) includes an external power supply (the 1230A normally operates from your own +5V to +15V logic supply) and a variety of adapters. To get a logic trigger for your scope, and simplify your data domain measurements, just contact your local HP field engineer.

For 4-bit word recognition, ask him about the models 10250A (TTL), 10251A (MOS), and 10252A (ECL) priced at $95* each. If you need 16-bit serial or parallel word recognition, he'll tell you about the 1620A priced at $1,750*.

*Domestic U.S.A. prices only.
Whenever a product-preference study is conducted, GR is always voted #1 for RLC bridges. And by a wide margin. Perhaps it is because we've been in the business for so long (over 50 years at making bridges). Or maybe our reputation for building in high quality is a factor. Or our engineering savvy. Or whatever. We think it is all these things plus a lot more that keep us in the top spot as a supplier of bridges and RLC standards.

Today, you'll find GR bridges and/or standards in laboratories, at QC and incoming-inspection stations, and in production environments throughout the world wherever R, L, or C measurements are made.

For complete information on GR's broad line of manual, automatic, and precision bridges, as well as RLC standards, request copies of our 40-page Impedance Measuring Instruments brochure plus the 36-page brochure on Impedance Standards and Precision Bridges.

Precision Bridges

This line of products typically find their greatest use in standards labs, where scientists and engineers push the state-of-the-art in measuring electrical parameters. The 1621 Precision Capacitance-Measurement System shown here is capable of measuring capacitance in increments as small as 0.1 attofarads (10^-18 pF).

Manual Bridges

Shown here is the 1650-B Impedance Bridge, probably the most popular bridge in use today.

RLC Standards

No bridge is complete without a standard and the GR 1408 Reference Standard Capacitor shown here is just one of dozens available from GR.

Automatic Bridges

GR introduced its first automatic bridge at the WESCON show in 1964. Several other models have followed since, with the 1686 Digital Capacitance Meter shown here being the latest addition to the product line.
The **100 NSEC fully static 4K RAM** is here now

100 nsec, access time. The SEMI 4402B is the fastest 4K RAM available today. Now you can build a 150 nsec. access memory system with 4K chip density, and minimum worry about soft bit errors.

Fully static. You can design systems without losing valuable time for refresh, or wasting board space with costly refresh circuitry. The simpler timing requirements mean an easy interface design.

Data protection. Brownout protection or battery backup features can be added to your memory, since the 4402B retains data at low voltage and power levels.

The SEMI 4402B, at 100 nsec. access and 300 nsec. cycle time is available now for immediate delivery. Contact your local EMM SEMI sales office, representative or distributor today.

A new and better way to get crisp, clear facsimile-type records of sonar, radar, or IR thermography.

Honeywell's new 1856A linescan recorder.

The Model 1856A from Honeywell reflects a real advancement in fiber-optic CRT technology. Offers high resolution recordings (greater than 100 line pairs/inch), a broad gray scale capability, intensity modulation to 8 MHz, variable sweep range of 2μsec to 1 sec/cm and 1 cm pk-pk vertical recordings from dc to 75 kHz, with a choice of recording media.

In addition to print-out papers, the 1856A offers even greater flexibility through your choice of two accessory magazine assemblies. The Model 1218A, light-tight and self-contained, permits the use of recording papers and films for wet chemical photoprocessing to obtain an even greater resolution, and optimum reproducibility. When high writing and record speeds are not required, the Model 1219 Processor provides dry-processed high contrast or gray scale recordings on paper or film.

For complete technical specifications, call or write Bob Shipman, Honeywell Test Instruments Division, P.O. Box 5227, Denver, Colorado 80217. (303) 771-4700.
Every day, more and more companies are making plans to.

Because since the introduction of the new Harris GENERIC PROM family, stand alone PROM designs are steadily losing their popularity.

Now the diverse requirements for density, modularity, and performance within a system can be totally satisfied by this one generic family.

Once you're at the Harris PROM, you'll enjoy many of the advantages of this GENERIC concept.

For instance, each device within a series features compatible DC electrical specifications plus common programming requirements, permitting easy use of other family elements.

The Harris GENERIC PROMs also feature fast programming speeds (guaranteed 1 ms per bit, max.). Equivalent I/O characteristics for easy upgrading. Fast access time, guaranteed to meet worst case NF sequencing over temperature and voltage. And improved testability.

Right now, our entire family of GENERIC PROMs is in volume production. With 100 up pricing below $2.95 per bit on the popular 1K, 2K, and 4K configurations.

So make a date to come to the Harris family GENERIC PROM.

Just about everyone will be there.

For details, see your Harris distributor or representative.

HARRIS SEMICONDUCTOR
A DIVISION OF HARRIS CORPORATION

P.O. Box 883, Melbourne, Florida 32901 (305) 724-7412

For the first time, an interactive graphics system combines the two leading techniques of computer-controlled displays—storage tube and refresh.

Designed by Tektronix, the industry leader in computer-graphics sales, the 4081 uses two computers to offer the memory and detailed pictures possible with a direct-view storage tube (DVST) and, simultaneously, the animation and selective updating capabilities of a refreshed system.

The Tektronix system costs $27,000 and includes a 19-in. display, a tape-cartridge drive, an ASCII keyboard, 12 function keys, a joystic and an RS032-3 communications interface.

In the past, a user of graphics bought an expensive (up to $200,000) refreshed system if he needed selective erase or picture dynamics; motion, three-dimensional perspective, complex rotations and translations. Other features, such as zoom and scaling, also require a refreshed system.

If the price of refresh was too steep, or such elaborate performance wasn’t needed, the user could select a graphics systems based on a DVST display. Since the tube itself captures and holds the display, no refresh is necessary, and expensive internal memories and other circuitry can be eliminated.

Although the price of storage-tube systems is accordingly slashed—to $10,000, or less—so is the performance. Thus a user must give up the important capability of selective erase. If one character in a line has to be changed—to enter new information or because of a mistake in data entry—the entire picture must be updated.

Updating takes up both the user’s and the computer’s valuable time. If the graphics system is remotely operated, then fast opera-
cost 12 to 24% less than those using the earlier 8-k modules.

"HP's decision to design the TI 18-pin configuration into its 21MX minicomputer is an important boost for us," said Charles Clough, of TI. "The market for high-density RAMs is a young and growing one."

"The new 18-pin RAMs, while improving compactness and reducing costs are demonstrating a reliability equal to that achieved by the 22-pin RAMs as well as a greater reliability than that of magnetic-core memory systems of equivalent capacity," says HP's William Senske.

"Selection of the TI part was preceded by extensive qualification tests involving over 10,000 parts, through several million hours of accumulated reliability and life testing."

"In addition to our agreement with TI, we are evaluating 18-pin parts from RCA and Advanced Micro Devices for second-source purposes," Senske says.

"Building minicomputers that deliver the reliability promised by 4-k RAMs has turned out to be tougher than anyone expected," reports Richard Anderson, general manager of the HP Data Systems Division in Cupertino, CA, where the 21MX computers are produced.

"In a rush to get 4-k RAMs to the marketplace, many of the semiconductor vendors experienced process problems and included serious design flaws in their parts.

"Some of the major problems solved includes improved temperature-sensitive refresh requirements, oxide-layer breakdown under elevated temperature and voltage stress, and crosstalk internal to the chip that led to pattern sensitivities when the chips were imbedded in memory systems."

High voltage encapsulant triples voltage ratings

The voltage rating of several transformers has been more than tripled compared with materials previously thought of as best, by use of a long-polymer modified-polyurethane encapsulant.

"The voltage rating primarily increases because the encapsulant flows readily into all voids. The polymer cures into a flexible material, without air gaps, that is highly resistant to corona breakdown," says Lynn Whitaker of Hughes Aircraft, Culver City, CA.

"With the new material, we can go to 300 to 500 V/mm with no problem. It also allows transformer size to be reduced by 3 to 6 times that of earlier epoxy-filled designs," he continues.

The material is stable from -65 to +95 C and has a dielectric constant of about 3.0. The dissipation factor is 0.02. Hughes sometimes fills the material with aluminum oxide, or with glass bubbles, to tailor its characteristics. The nominal specific gravity of the material when filled with aluminum oxide is 1.5; when filled with glass bubbles it is 0.8.

It has been used in space applications with little or no outgassing.

The material, still in a developmental stage, has already been used for spaceborne transformers on the MARISAT program. It is also being proposed for use on the Atlas II Radar high-voltage-power transformer. Whitaker says that the material is also being used to pot high voltage power supplies.

LSI family reduces size of high-speed systems

Designers of minicomputers and high-speed controllers can now build systems with far fewer components than has been possible, thank to an upcoming LSI family from Signetics.

Called System Logic, the 10-MHz family will use both low-power Schottky TTL and F-L to replace bipolar MSI in μP support, communications and peripheral I/O applications.

Initial offerings of the series will be the 8X01 Cyclic Redundancy Character Generator/Checker, 8X02 Control Store Sequencer, 8X03 and 8X04 16 × 2 FIFOs, 8X06 and 8X07 64 × 8/64 × 9 FIFOs, and the 8X300 eight-bit microcontroller—originally introduced by Scientific Micro Systems.

Signetics, of Sunnyvale, CA, is developing the System Logic family to supplement its existing 3000 series bipolar bit-slice microprogrammed μP. (see "Bipolar Bit-
aspect bipolar bit-slice microprogrammed μP. (see "Bipolar Bit-

Air Force forms library of software abstracts

The Air Force has compiled more than 8000 abstracts of computer programs for design and analysis into a software library that enables users to avoid reinventing the wheel. The system allows rapid checking to determine whether or not software has already been generated for a similar problem.

During the past two years information from more than 40 government agencies has been supplied to the library, which is located at Hanscom Air Force Base, MA. M/ Sgt. Patrick O'Brien, who is responsible for development of the library, says he expects the number of program abstracts in the library to reach 90,000 within the next few years.

The main data base containing the resident programs is located at the IBM 370/155 installation at Wright Patterson Air Force Base, Dayton, OH. At present the central computer-software repository is open only to government agencies.

NASA tests solar cell for home and industry

A program to test solar cells and solar-cell systems for commercial and residential use has begun at NASA's Lewis Research Center, Cleveland, OH. Individuals and organizations can submit their photovoltaic-energy-conversion designs for testing and evaluation under controlled conditions.

The center provides a facility at which basic photovoltaic systems may be easily assembled, and their performance evaluated. A facility designed to accommodate arrays of up to 10 kW peak power is already under construction, and a 100 kW capability is planned.

To reveal problems, that might arise when solar-cell arrays are interfaced with typical home wiring systems, a residence will be constructed that incorporates a solar-cell power system to supply a major portion of the building's power.

High voltage encapsulant triples voltage ratings

The voltage rating of several transformers has been more than tripled compared with materials previously thought of as best, by use of a long-polymer modified-polyurethane encapsulant.

"The voltage rating primarily increases because the encapsulant flows readily into all voids. The polymer cures into a flexible material, without air gaps, that is highly resistant to corona breakdown," says Lynn Whitaker of Hughes Aircraft, Culver City, CA.

The main data base containing the resident programs is located at the IBM 370/155 installation at Wright Patterson Air Force Base, Dayton, OH. At present the central computer-software repository is open only to government agencies.

NASA tests solar cell for home and industry

A program to test solar cells and solar-cell systems for commercial and residential use has begun at NASA's Lewis Research Center, Cleveland, OH. Individuals and organizations can submit their photovoltaic-energy-conversion designs for testing and evaluation under controlled conditions.

The center provides a facility at which basic photovoltaic systems may be easily assembled, and their performance evaluated. A facility designed to accommodate arrays of up to 10 kW peak power is already under construction, and a 100 kW capability is planned.

To reveal problems, that might arise when solar-cell arrays are interfaced with typical home wiring systems, a residence will be constructed that incorporates a solar-cell power system to supply a major portion of the building's power.
We saw your microprocessor coming. So we designed an entire family of socket homes for it. Socket cards for card file mounting, and we've even got the card files. Socket boards for LSI mounting in frames, drawers, and racks, and we've even got the frames, drawers, and racks. Our socket cards, the 3D Series, come with built-in test points, a ceramic monolithic bypass capacitor at each socket, and solder tab connection to pins on LSI chips. Our socket boards, the 2D Series, offer a good selection of socket complements, and are compatible with other boards for hybrid installations. We also offer automated wiring service. We're ready for you.
Spend less and get a PROM Programer you can talk to.

Using plug-in personality modules, the inexpensive Series 90 can program almost any AMD, Harris, Fairchild, Intel, Intersil, Monolithic Memories, Motorola, National, Signetics or Texas Instrument bipolar or MOS PROM made. Contact us for information on the specific module you need. Series 90 shown with personality module installed and with optional MOS PROM erase light.

Pro-Log’s Series 90 simplifies the interface between man and machine.

Pro-Log’s Series 90 PROM programmer gives you a simple, straightforward method of programming, duplicating or verifying MOS or bipolar PROMs. You program straight from a hexadecimal keyboard so there’s no need to learn computer talk. The Series 90 interacts with you and leads you through the programming process so there’s less chance for error. Addresses and data appear on a six digit hexadecimal display. Thanks to our plug-in personality modules, display and formatting adjust automatically to accommodate PROM type or size.

The Series 90 can also duplicate PROMs directly from pre-programed master PROMs, with corrections if necessary. It has a light indicator to tell you whether or not a PROM is completely blank and will automatically indicate an unprogramable PROM.

It weighs less than 15 pounds and comes in an attache case. An optional bench top model is available.

Guards against MOS PROM data loss.

Pro-Log’s field-proven programming technology protects against MOS PROM data dropout caused by improper or inadequate programming pulses.

Tailor it to your needs.

We have standard options to interface it with TTY, paper tape readers and punches, or computers.

Low-priced.

A Series 90 control unit costs $1,800. Personality modules range from $350 to $550.

We have other microprocessor-based instruments and microprocessor subsystems, too.

Our instruments include analyzers for systems using 4004, 4040, 8008, 8080 and 6800 microprocessors.

Our microprocessor subsystems include 4004 and 4040 logic processors and 8008, 8080, and 6800 microcomputers.

For more information on the Series 90, including a complete list of the many personality modules currently available, send for a copy of our PROM User’s Guide.

What spec do you hate to trade-off when selecting switching power transistors?

With TRW's new NPN Switching Power Transistors you trade off nothing. You don't have to check a box. You don't have to give up superior performance in one area to get it in the others. These new parts deliver:

- Operation up to 450 Volts sustaining
- Operation up to 10 Amps continuously
- Fastest Switchtimes available—Tr = 250 nsec
- Typical Saturation Voltages of 1.0V at 7 Amps, B = 5

This no-compromise, no-trade-off, 4-way superiority adds up to the coolest operation and greatest efficiency for high frequency off-line switching regulators, Class D Switching, and any other similar applications in which high voltage and fast switching are essential.

Drop in TRW's new parts and test them yourself. They're competitively priced and available from stock at our distributors.

2N6579, 80, 81 350, 400, 450V 5Amp TO-3
2N6585, 86, 87 350, 400, 450V 5Amp TO61-Isolated
2N6582, 83, 84 350, 400, 450V 7Amp TO-3
2N6588, 89, 90 350, 400, 450V 7Amp TO61-Isolated

If those numbers are not now in your plans—well, the advantage of these new parts is so pronounced, maybe you should design them in!

At any rate, you'll surely want to know more about TRW's new NPN Switching Transistors. For full information call John Power at (213) 679-4561. Or use the coupon.
Logic Probe 1 is a compact, enormously versatile design, test and troubleshooting tool for all types of digital applications. By simply connecting the clip leads to the circuit's power supply, setting a switch to the proper logic family and touching the probe tip to the node under test, you get an instant picture of circuit conditions.

LP-1's unique circuitry—which combines the functions of level detector, pulse detector, pulse stretcher and memory—makes one-shot, low-rep-rate, narrow pulses—nearly impossible to see, even with a fast scope—easily detectable and visible. HI LED indicates logic "1", LO LED, logic "0", and all pulse transitions—positive and negative as narrow as 50 nanoseconds—are stretched to ½ second and displayed on the PULSE LED.

By setting the PULSE/MEMORY switch to MEMORY, single-shot events as well as low-rep-rate events can be stored indefinitely.

While high-frequency (5-10MHz) signals cause the "pulse" LED to blink at a 3Hz rate, there is an additional indication with unsymmetrical pulses: with duty cycles of less than 30%, the LO LED will light, while duty cycles over 70% will light the HI LED.

In all modes, high input impedance (100K) virtually eliminates loading problems, and impedance is constant for all states. LP-1 also features over-voltage and reverse-polarity protection. Housed in a rugged, high-impact plastic case with strain-relieved power cables, it's built to provide reliable day-in, day-out service for years to come.

CSC'S MULTI-FAMILY LOGIC PROBE 1.

AT $44.95, IT DIGS UP A LOT OF INFORMATION WITHOUT BURYING YOUR BUDGET.
USCC/Centralab, the major supplier of monolithic ceramic capacitors to the largest manufacturers of automotive hybrid electronics. The automotive environment can be considered the ultimate proving ground for component reliability. Under-the-hood systems provide a hostile environment where moisture, temperature extremes, shock and vibration are constant. It is a tremendous challenge to supply a component economical enough for an automotive application which can stand up to their rigorous specifications.

And Centralab is there, providing over 3.9 million BME-Chip™ Capacitors which are in 2.25 million domestic cars and light trucks. Over 11 billion unit life hours in ignition systems, voltage regulators and radios, without a single known failure. That's reliability! Compare your requirements with those of the automotive industry. We're sure you'll choose BME™ Capacitors... reliability and availability at a low cost.

Please write on company letterhead for complete technical test reports.
Bipolar microprocessor “slices” have become the hottest new building blocks for minicomputers and high-speed controllers. With these LSI circuits, engineers are reducing the size and cost of their designs, and even increasing system speed.

Unlike most of their MOS counterparts, bipolar slices aren’t complete microprocessors. In essence, the bipolar circuits contain only a section of a conventional processor’s arithmetic-logic unit and register file. Existing slices handle word lengths of 2 or 4 bits, but they can be cascaded to accommodate any multiple of the basic word length.

Existing minis can be upgraded or replaced without having to discard system software. The bipolar/LSI chips permit dramatic reductions in the number of circuit components, and in the amount of power dissipated. At the same time the high speeds of the slices assure a precise emulation of conventional minicomputers, which employ standard-bipolar circuits.

The benefits possible with a bit-slice approach are exemplified in Interdata’s new Model 6/16, an upgraded emulation of the company’s Model 7/16. Both computers are 16-bit, medium-performance minis. However, the 7/16 takes up two PC boards, each measuring $15 \times 15$ in. The bulk of the 6/16, which uses four Advanced Micro Devices’ 2901 slices, comes on a single board.

The total number of circuits drops from about 300 ICs for the 7/16 to about 180 ICs for the new mini. As a result, the 6/16, complete with 8-k bytes of memory, costs $2900, or $300 less than the original mini.

Further, system speed was increased by about 25% from the 1.5 $\mu$s specified for mini operations like register-to-register additions.

**Slices require microprogramming**

The benefits are no less impressive for controllers and designs begun “from scratch.” In all cases, the key to the slices’ remarkable capabilities is microprogramming, the ability to employ a unit’s fundamental microinstruction set to tailor the system to any appli-

---

**The fastest TTL microprocessor slice**—Advanced Micro Devices’ Am2901 (above)—specifies 100-ns microinstruction cycle over supply and operating temperature ranges. The 4-bit slice contains an eight-function arithmetic logic unit, a two-port scratchpad memory with 16-word capacity and an additional accumulator register (right).
STAR PERFORMERS

api Panel Meters

Get the performance you need - with API panel instruments. Need economy? Small package? Tough case? ½% accuracy? LFE has them all.

VERSATILE: Series 7000 can be panel, lens, or bezel mounted. Slide-out scales facilitate modification.

SAVES SPACE: Series 1000 in 1½", 2½" and 3½" sizes feature rugged polycarbonate case, quick stackable mounting, and famous API quality and styling. Surprisingly economical too.

SUPER-TOUGH: Our new 4½" round Model 454 is an ideal replacement for glass-window instruments in portable, industrial, and plant uses. Its wrap-around polycarbonate case tosses off blows that would destroy lesser meters. Large clear dial for great visibility.

ACCURATE: Nobody makes more precise panel instruments. We start at a standard 2% rating, with 1% tracking for taut-band ranges. We stop at ½% accuracy. You can have anything in between.

There's a LFE distributor or authorized modification center near you to provide quick service on standard or special ranges. Call him. Or call us. We perform. LFE Corporation, Process Control Division, 1601 Trapelo Road, Waltham, Mass., 02154, (617) 890-2000
When applied to minis, a microprogram stored in a control memory defines the computer’s fixed-instruction set. For a controller, however, the microprogram can define the system’s entire operation.

However, microprogramming can also be a designer’s bane. It requires a designer to deal with the specific timing relationships of the chip’s internal architecture. And since each application uses a separate microprogram, each has one that can’t be transferred easily to another application. Nor can design aids, geared toward one slice model, be transferred to another.

Not that many aids are available. At the very least, a designer generally needs a microassembler: a program that lets him microcode without dealing with a processor’s inherent and unwieldy machine language of ONEs and ZEROS. He’ll also want to use a ROM simulator to check out the microprogram. However, few manufacturers offer these essential design aids, or suitable equivalents.

The growing acceptance of bipolar microprocessors has spurred semiconductor manufacturers to develop improved circuits. Efforts are now under way to build enhanced sequencers for presently available slices. Sequencers—companion circuits to the slices—provide the logic needed to operate the microprogram control memory. They also generate next-address instructions, thereby simplifying the microcode.

Also in the wings are other sophisticated support circuits, such as field-programmable logic arrays, 4-k bit RAMs and 16-k ROMs. Employing advanced forms of ECL, Schottky-TTL or I-L (integrated-injection logic), upcoming products may even include complete bipolar microprocessors on a single chip, and increase slice word lengths (presently a maximum of 4 bits) to 8 bits.

I-L slices move up in speed

The first bipolar slice to use I-L technology—Texas Instruments’ 4-bit SBP0400—never caught on. There were several reasons.

Operating at speeds comparable to complete, single-chip MOS microprocessors, the I-L slice required many more circuits to form a working system without offering any real speed advantage.

Moreover, the circuit’s need for microprogramming made it more difficult to design with than MOS µPs.

Still, the SBP0400 did establish TI as the only I-L slice maker. And now the company plans to strengthen that position when it offers, in the third quarter, an upgraded 0400—designated with a suffix A—that uses an advanced I-L technology to achieve Schottky-TTL speeds.

The 0400A’s longest microcycle path takes 150 ns, when it is used in a 4-bit configuration. A comparison based solely on the same speed spec for other 4-bit slices puts the new slice about midway between Advanced Micro Devices’ faster 2901 and Monolithic Memories’ slower 6701.

Another version of the 0400—the 0401—offers speeds and capabilities similar to that of the 0400A. A key difference, though, is that the 401 can work readily with members of a forthcoming family of Schottky-TTL circuits that TI calls, simply enough, the Schottky Microcomputer Chip Set.

“The chips were a computer before they became a chip set,” observes Dick Horton, TI’s manager of bipolar product development, commenting on the use of the Schottky-TTL circuits in his company’s 990 computer family (see “Processor Family Debuts,” ED No. 22, Oct. 25, 1975, p. 137). “They started as the upper end of the family.”

The chip set will mark TI’s long-awaited entry into the TTL-slice sweepstakes. At the heart of the family is the 74S481, a 4-bit circuit that TI plans to introduce in the fall and that is described as the next-generation slice. Its claim is not likely to be refuted.

Inside the S481 is a programmable logic array with “hard-wired” control algorithms that yield a whopping 24,780 set of different microinstructions. No other slice responds to more than about 500.

The algorithms are actually those of the 990 computer, and directly provide for multiply and divide without having to microprogram for those operations. When applied to a 16 × 16-bit multiplication, a series of S481s can produce a 32-bit result in 2-1/2 µs.

For such operations, the S481 employs a kind of trinary logic. Depending on whether one of the input pins is connected to ground, supply or left floating, the circuit becomes the least-significant, most-significant or intermediate-bit slice, respectively. On receiving a multiplication or divide command, the most-significant bit slice takes charge of the other slices and executes the command.

Another distinctive feature is the S481’s so-called memory-to-memory architecture. The chip doesn’t have a dedicated register file. Instead, internal memory-control logic allows the use of all of program memory. A work-space pointer keeps track of the external register space, and a program pointer locates instructions.

As impressive as the new Schottky family promises to be, it might well be dwarfed in comparison with an I-L family that TI only hints at now. Advances in the technology have reportedly reached the point at TI where a single-chip I-L mi-
COULD A $3 RESISTOR SAVE YOU A $300 FIELD SERVICE CALL?

It sure could.
When the equipment you’ve built fails at the worst possible moment in the field, you may suddenly learn just how expensive a mere resistor can be. You may learn the hard way that the dollar or two you saved at the drawing board has cost you hundreds or even thousands in warranty service. And quite possibly even cost you a customer.

Not every resistance application cries out for Vishay quality. You may often do without this quality and still suffer no dire consequences.

But when you need a precision resistor or trimmer for rock-solid stability and reliability, think of this:

Some precision resistors offer you tight tolerance at the expense of poor frequency response. Others offer low inductance and fast rise at the expense of poor temperature characteristics. Only Vishay Bulk Metal® resistors offer you the complete set of top performance characteristics, including TCR as low as $0\pm1$ ppm/$\degree$C, a combination that will most often free your equipment from that tormenting bug.

And now Vishay offers you the chance to make your own custom bulk-metal resistors for breadboard, prototype, or even production use. Call or write for information on the simple calibration and encapsulation of Vishay resistors in your own plant.

Vishay Resistive Systems Group, 63 Lincoln Highway, Malvern, PA 19355; phone (215) 644-1300; TWX 510-688-8944.

Only Vishay resistors give you all six top performance specs.
ECL: still the speed king

For now, though, the fastest speeds are offered by an ECL bit slice from Motorola (see "ECL Bit-Slice Processor Arrives, Setting Top Speeds for Bipolar µPs," this issue, p. 58). Like other manufacturers, Motorola doesn't see the bipolar circuits displacing their MOS cousins for the great bulk of microcomputer applications, although for some uses designers will have to turn to ECL.

"In the controller area, especially, there's no other way to go other than with the ECL M10800 family if you need the highest performance," asserts Jim Loro, Motorola's marketing manager for bipolar memories and LSI. He expects controllers to embrace his product more quickly than any other application area.

Still, the speed benefits of ECL show up dramatically when the bipolar circuits are compared with MOS ones. For the same algorithm (or system program) designers can expect an increase in speed by a factor of 10 because the ECL system's clock rate is that much faster.

And when the slice-based system is tailored to a high-speed application, the speed increase could soar to much more. The tailoring comes about primarily through microprogramming and the use of high-speed bipolar memories.

These facts aren't lost on the many designers who employ popular MOS µPs like the 6800.

"I have had several customers calling to ask how one does a 10800 version of a 6800 system," says Bill Blood, manager of bipolar LSI system development. Blood, though, agrees that the use of slices to emulate MOS µPs will amount to only a small part of their possible applications.

4-bit slices set the standard

Currently the leading slice is generally acknowledged to be Advanced Micro Devices' 2901. Among presently available TTL slices, the 4-bit slice has the shortest microcycle time (see "4-bit Bipolar/LSI Processor Slice Cuts Microcycle Time to 100 ns," ED No. 15, July 19, 1975, p. 77). It has been alternate-sourced by Raytheon and Motorola, and AMD boasts a customer list numbering over 200.

Among designers, one reason for the 2901's popularity is the flexible structure of the slice's microinstruction. The 9-bit word consists of three 3-bit segments that either control or determine the internal arithmetic-logic unit's source operand, function and destination register. The breakup reduces delays; it permits parallel decoding of different segments of the same microinstruction.

In addition, the three-way breakup leads to 512 possible microinstructions. However, not all 512 represent useful instructions.

Another factor in the 2901's success was the early availability of supporting circuits like the 2909 microprogram sequencer. AMD plans to offer a version of the sequencer housed in a smaller package—a board-saving 20-pin DIP vs 28-pin DIP for the 2909. Like the original circuit, the upcoming 2911 will be able to address 4-k words of microprogram memory when three are cascaded together.

Also, the new 2911 won't have an edge-triggered register built into the sequencer's output, as other sequencers do. The register is needed in the path formed by the sequencer, microprogram memory and feedback loop. The latter provides the sequencer with information on the next microinstruction.

"Without that register, you just chase your tail around," says John Springer, AMD's marketing manager for bipolar µPs. "But if it comes at the output of the sequencer, the unit isn't really intended for a pipelined system, implying a longer system cycle." A better spot would be at the output of the microprogram memory.

The internal architecture of Advanced Micro Devices' 2901 so closely resembles Monolithic Memories' earlier 6701 that a system designed for one could be adapted readily for the other.

"If I were a designer out there, I would be frustrated because the two circuits are so similar," observes Clive Ghest, applications systems manager at Monolithic Memories. The two 40-pin parts aren't pin-compatible.

"But if a designer started from scratch, he could more than likely develop an instruction set usable with either circuit. He would need a different PC card and different control memory. However the basic..."
Magnecraft’s line of 1200 stock relays just increased ... by another series.

WHY WAIT FOR SOLID STATE? Our family of 24 solid state relays provides current ratings from 2.5 to 40 amps, with switching capacity up to 480 VAC. All models incorporate opto-isolation between input and output, and zero-voltage switching. Screw type clamps and Faston “Quick-Connect” terminals are available on packages which are interchangeable with others. Output switching reflects the latest state-of-the-art technology. Both the high-reliability dual SCR approach and the more economical triac approach are available.

Magnecraft is committed to providing design engineers with the best solution for their switching applications. It is with a complete understanding of the areas where solid state relays provide the most reliable and economical switching solution, that we’ve included this family in our line of stock relays.

For complete information and specifications, WRITE FOR OUR SOLID STATE RELAY PRODUCT BULLETIN. Magnecraft Electric Co., 5575 N. Lynch Ave., Chicago, IL 60630
NEWS

operations of the two systems—operations like add, shift and compare—could be identical.

More importantly, the highly vaunted speed advantage of AMD's 2901 over MMI's 6701—as high as 2:1 for some operations—shrinks when the two are applied to a 16-bit system, like that common for minicomputers.

Though the 2901 is still the front runner, the winning margin is less. According to Ghest, the AMD circuit has a worst-case delay of 145 ns; that of his product is only 30 ns longer.

Monolithic Memories expects to close the gap and take the lead in speed with a dash-1 version to be offered later in the year. It will have worst-case cycle times of 100 ns in the commercial temperature range and 125 ns over the MIL range, making it, by Ghest's figuring, 40% faster.

2-bit slices available, too

Compared with 4-bit slices, which designers have embraced readily, 2-bit slices have yet to make their mark. These circuits are available in the 3000 series introduced by Intel and alternatesourced by Signetics. Designers typically cite difficulty in using the circuits as the main reason for keeping their distance from the series.

Without minimizing the problems, Intel's Ron Yara, product manager for the 3000, points to the advantages.

The 3002 2-bit slice, for example, requires only seven bits to specify a function's source, destination and operation. That number is less than half the bits typically needed by 4-bit slices.

Also the 3002's multibus structure eliminates the need for external multiplexers. The slice has separate address and data outputs and two independent data inputs. A special "K" bus even permits the masking of unwanted bits, during logic testing, and the generation of constants.

A single 3001 sequencer can address 512 words of microprogram memory—a sufficient amount for many 16-bit minis. And the circuit's unusual row/column addressing scheme can actually be an advantage, according to Yara, since clusters of microcode can be located rather easily.

As for design aids, no manufacturer can match Intel's. The company offers a cross-microassembler (called Cromis) and a prototyping system (MDS) that allows in-circuit emulation, permitting simultaneous hardware and software development.

The 3000 series offered by Signetics provides the same functions and pinouts of Intel's. However, its slice features a 30% faster cycle time. And the company will soon have a version of the 3001 sequencer that will come in a reduced-size package but have twice the addressing range. The new sequencer will also incorporate a four-level stack.

Signetics plans to employ its bit-slice family in upcoming kits that emulate MOS microcomputers. The initial offering, planned for a June introduction, will be a bipolar version of the 8080A system. The kit will have about 60 ICs and include programmed PROMs.

Although two 2-bit slices are needed to obtain most features available from a single 4-bit slice, systems based on either circuits may actually use about the same number of IC packages.

"In the real world, you need additional circuits besides the slices to do the job," comments Steve Lau, a member of Signetics' technical staff.

"You may need additional registers for, say, memory addressing, or multiplexers to overcome bus limitations. For an 8 or 16-bit machine, you can't really say that either slice automatically leads to fewer packages."

However, there is one bipolar/LSI circuit that can lead to fewer packages than are needed for any slice. Scientific Micro Systems' SMS 300, the only bipolar single-chip CPU, isn't a general-purpose microprocessor, but it can simplify control systems.

Equipped with eight 8-bit working registers and a set of eight control-oriented instructions, the SMS 300 has an instruction-execution time of only 250 ns, which includes 85 ns for memory access. The chip will soon be alternatesourced by Signetics.
Not New...Just the Best

ERIE RED CAP

Miniature Ceramic Capacitors

WIDEST SELECTION OF MINIATURIZED CERAMIC CAPACITORS IN THE INDUSTRY!
Erie is in the Red Cap winner’s circle because of a well engineered component that’s backed by a unique process control system. Combine this with talented, motivated people and you have Erie as the leader in its field. These tiny high quality capacitors are not new . . . but they are the best. Our customers attest to it. Our test laboratories prove it.

Red Cap dielectrics are manufactured by Erie’s exclusive Monobloc Process® . . . a modern, time-proven ceramic film technology. And tough environmental extremes routinely are endured by our own Jet-Seal, a hard, bright red polymeric protective coating. (The superior aesthetic appearance of Jet-Seal comes to you at no charge.)

Erie Red Caps have it all 21 temperature characteristics: 1pF to 10µF capacitance range. Ratings from 25 to 500 Vdc. You name the application we’ve got a Red Cap for the job. All this is due to Erie’s total in-house capability from exclusive ceramic formulations to unique packaging. So on your very next buy of ceramic capacitors, do it the easy way . . . specify Erie Red Caps.

Write TODAY for Red Cap brochure 8000 . . .
or call our nearby factory representative.

Transient testing is spreading to systems designers

Transient testing is spreading from the power companies to such fields as computers, instruments and even home entertainment. As a result, the IEEE Surge Withstand Capability (SWC) test is now finding a wide application throughout the electronics industry.

An IEEE group currently is defining SWC specs applicable to the computer industry. The original specs were developed in 1974 for the power distribution industry.

In some cases power-line transients can mean very little, other times they can have disastrous results. A color-TV set need not maintain a flicker-free image, but a hospital X-ray scanner must.

Withstanding the surge

And yet, coping with transients is important in television too.

“You can have a 3000-V surge on the wall outlet for your color-TV set,” warns Franz Martzloff, of General Electric’s R & D facility in Schenectady, NY.

“If you could limit the transient from several thousand volts down to a sure 500-V max, then the TV-set designer could specify the component’s voltage ratings with a reasonable assurance that the components would survive.”

Amdahl Corporation of Sunnyvale, CA, uses a motor-generator system to ensure that line surges do not interfere with its Model 470V/6 supercomputer, but most designers cannot afford the motor-generator approach.

For digital controls, the simplest and most common method of isolating transients is to use relays or opto-isolators. For analog signals, gas discharge arc suppressors with RC or LC filtering are used.

But since relays tend to be slow and unreliable, and logic circuits with relatively low noise immunity are being used, designers are turning to solid-state suppressors. For example, metal-oxide varistors, such as the GE MOV made by General Electric in Syracuse, NY under license from Matsushita of Osaka, Japan, can limit surges to two or three times normal operating voltages. They are used to clamp both ac line inputs and signal lines.

Surge-rated avalanche diodes, such as the TransZorb from General Semiconductor of Tempe, AZ, rated from 5 V to 1 kV, are particularly suited to protecting open-collector TTL outputs because they present no dc-leakage path until they conduct a surge. Bidirectional TransZorbs are notably good for surge-protecting analog inputs and outputs.

Another successful approach to surge protection uses 4 kV capacitors of Mylar or polycarbonate film to absorb the transient energy. This approach would also include a special cable layout and lead dress to prevent low-level signal lines from coupling transients from power lines.

Separate cable harnesses for power and signals are used, with lines running at right angles wherever possible. Doubly shielded coaxial signal lines often are employed too.

Until recently the way to test for transients in electronic systems was to randomly connect inductive loads into the power line in an effort to simulate surges. The simulation might involve turning on electric drills, plugging large power supplies into the same wall outlet as the system being tested, or using more sophisticated impulse tests.

Impulse tests provide a unidirectional pulse input to the system under test, simulating high voltage arcing or other instantaneous phenomena. Typical of the impulse testers on the market is the Model 424 Surge Generator/Monitor by KeyTek Instrument Corporation, Waltham, MA. But most power-line surges are not impulses and there is no absolute standard for impulse testing.

All that is changing since the IEEE adopted surge-testing standard 472-1974. The test surge described in the standard is representative of typical power transients, and is a compromise between two requirements. The 2.5-kV, 1.25-MHz damped-sinewave burst applied to power and signal lines is a voltage high enough that power companies can limit surges to it. And the voltage is also low enough that system designers can build systems to withstand it.

The Velonex Division of Varian Associates, Santa Clara, CA, recently introduced a surge transient generator that meets all of the requirements of IEEE standard 472-1974 and the identical ANSI standard C37.90a-1974. The unit also allows the operator to vary the burst duration, amplitude, source impedance, and phase with respect to the power line.

NPN triple diffused silicon transistors. Packaged in solid copper cases conforming to JEDEC TO-3 outline dimensions.

Our newest high-energy silicon power transistors have increased capabilities over our earlier types in current ratings, gain and switching speeds. These improvements were achieved without sacrificing the useful peak power handling capacity that is characteristic of Delco's transistors.

Fall time of these transistors is typically 0.25 microseconds. Their biggest advantage, however, is their high current gain as shown on the accompanying beta curves.

A new characterization feature offered with the DTS-515 series is a graph of capabilities for reverse bias clamped inductive switching. Parameter variables, dealt with in the graph, are voltage, collector current, temperature, and forward and reverse base current. As can be seen in the "VBE (reverse) ≥ 5V" notation, emitter diode avalanche is recommended under certain conditions.

And, of course, these high-energy silicon power transistors come in Delco's solid copper TO-3 packages to ensure low thermal resistance.

The accompanying curves, charts and circuits tell part of the story. Prices, applications literature and electrical data from your nearest Delco sales office or Delco distributor can supply another part.

But the most important part of the story is how well these new transistors function in your applications.

You can order them today; they're in stock at your Delco distributor's.

LED SUPERSTARS

As bright as many incandescents!

Meet the LED Superstars . . . red, amber and green superbright panel and PCB lights. Their high brightness 50 MCD @ 20 MA (typical clear red) make them the perfect cost and power saving replacements for incandescents. Available with built-in resistors for all popular voltages.

Subminiature Panel LED's (also suitable for PCB mounting)—available in hundreds of sizes, shapes and styles.

PCB LED's—Horizontal or vertical viewing . . . optional built-in resistor for 5V applications.

Bi-Pin (T1-¼) LED's—Ideal for dead front panel applications, e.g. DEC's PDP Series computers.

Midget-Flanged (T1-¾) LED's—Direct replacements for incandescents in panel light and switch applications.

Replacement Lenses—Specifically designed for use with Midget-Flanged LED's.

Slide Base LED's—Direct replacements for incandescent types.

There's lots more too, and they're all Superstars! Send for our Catalog today: Data Display Products, 5428 W. 104th Street, Los Angeles, Ca. 90045, (213) 641-1232.

Produced by the original "little light" people.
Coast Guard gets more sea to patrol

The Coast Guard, which nominally patrols the sea inside the 12-mile limit, is going to have a lot more ocean to cover now that the President has signed a bill to extend the nation's fishing boundaries out to the 200-mile mark.

The relatively tiny service will have to enforce fishing and—possibly—mining bans, so more ships and aircraft will be required. Accordingly, the House of Representatives recently passed a $304-million procurement authorization for Fiscal Year 1977 that included $109 million more than originally asked for by the Administration.

The House added funds for six long-range surveillance aircraft and five shorter-range patrol aircraft, four side-looking radars for the present C-130 patrol planes, and two additional cutters.

Test-before-buy procedures are questioned

The fly-before-buy concept now in favor at the Pentagon may be in for modification because of the growing length of time it takes to get a weapon from the drawing board into the hands of the troops.

Dr. Malcolm Currie, DOD director of defense research and engineering, says that in some cases the acquisition cycle "borders on the absurd" because there is too much emphasis on test and evaluation.

Some of our test programs do require a production run to support them, he says, but some testing goes on just to be able to construct statistical curves rather than because such testing is adequate and reasonable.

Obstacles to big defense budget fade

To the shock and chagrin of liberals in Congress, the Ford Administration's defense budget is sailing along in unexpectedly calm seas. A few months back there was the probability of a $5 to $7-billion cut, but Congress is now convinced there is a serious shift in America's military balance with the Soviets.

The first concrete evidence of the change in opinion came when the House added $700 million in spending authority to the Administration's procurement request, bringing it to a total of $33.4 billion. This was a $1.2-billion increase to the $21.8 billion requested for hardware procurement and a $498-million cut from the $10.8 billion wanted for research, development, test and evaluation. The major beneficiary is the Navy's shipbuilding program, which receives $1.08 billion more than the DOD requested for fiscal year 1977, which begins on Oct. 1.

Unsuccessful efforts were made to trim the B-1 production authoriza-
tion, delete funds for attack submarines, and to cancel a new carrier. Existing cuts were spread over some 1000 programs and few were fatal. The Army lost its aerial scout helicopter program for now, and the Navy its Shipboard Intermediate Range Combat System (SIRCS).

The House agreed to $474.7 million for the purchase of six E-3A airborne-warning-and-control-system (AWACS) aircraft, but the Air Force can't spend the funds until a favorable decision is made by NATO members to buy the system too.

Not only has the President clearly sounded a warning that he will veto any bill that reduces defense expenditures, but the Defense Dept. is reportedly planning a whopping supplemental bill. Some $475 million may be requested to build more Minuteman 3 missiles and upgrade older Minuteman missiles to counter the rising number of Soviet ICBMs.

**FCC allows exhibit of nonapproved products**

The Federal Communications Commission has retreated slightly from its tough rule banning the display or showing of nonapproved electronic products at trade shows.

Now the FCC will allow the display of noncertified devices at industry trade shows not open to the general public if the displays are clearly marked: “This device has not been approved by the Federal Communications Commission. This device is not, and may not be, offered for sale or lease, or sold or leased.”

The Electronic Industries Association, which led the fight for a relaxation of the rule for trade shows, told the FCC in a petition that in the government's zeal to protect the consumer, it is not only cutting industry profits, but is increasing the FCC staff workload and forcing up the price of products.

Prior to this rule change the FCC had cited six manufacturers of home video games for violations. In the future, these products can be shown at industry trade shows not open to the general public.

**Capital Capsules:** Foreign military sales are likely to be in the $8-billion to $10-billion range annually for the next decade, predicts Deputy Secretary of Defense William Clements... The Navy says that New Mexico and Nevada are still in the running for the Seafarer ELF site, although Michigan apparently is considered for the first choice. The system for communication with submarines is far from finding a home. The initial rebuff came from Wisconsin, where the Navy wanted to install Sanguine, the underground version... The Electronic Industries Association has a new two-level, 12-digit designation system for microelectronic devices. The EIA says it is designed to be compatible with the Pro-Electron System that's been in use in Europe for several years. The new system also complements the existing program for registering discrete semiconductor devices that is in universal use today... The Renegotiation Board's plan to close down its two regional boards located in Los Angeles and Washington, DC, supposedly in the interest of economy, has been shelved. An angry letter from Rep. Jack Brooks (D-TX), chairman of the House Government Operations Committee, insisted that any reorganization should await the outcome of legislation now pending that either passes and extends the life of the agency or allows the board to die. Industry, of course, is rooting for the latter. The House has passed a bill that would alter the board slightly, and make it permanent. The board's mandate is to make industry refund “excess” profits from Government contract work.
ANNOUNCING

A 40 MHz function generator you can phase lock, am, fm, log or linear sweep, and more.

The TEKTRONIX FG 504

In its phase lock mode, the new FG 504 Function Generator will capture and track a periodic signal, such as a logic pulse or house standard frequency, letting you synchronize the generator's output or convert from one waveform to another. Its am input circuitry senses the presence of an applied modulating signal and reduces the output amplitude by one-half, allowing 100% upward modulation without adjusting the amplitude control. It can be frequency modulated, and it can be swept with its built-in logarithmic or linear sweep. Concentric knobs set the frequency start and stop points.

Frequency range: 0.001 Hz to 40 MHz • up to 6 ns rise/fall time • 3 basic waveforms • a wide range of pulse shaping with variable rise and fall and symmetry controls • up to 30 V p-p output • built-in attenuator • post-attenuator offset • external and manual trigger or gate.

In the phase lock, trigger, or gate modes, a phase control shifts the output of the FG 504, so that you can create setups such as a bi-phase clock. A capable instrument for driving logic circuits, the FG 504 is a "clean," 50 Ω source of pulses to less than 20 ns wide and up to 30 V p-p. Post-attenuator offset enables use of the full ±7.5 V offset range with small signals.

The FG 504 features independent push-button selection of many of its operating modes, so you are not limited to typical "either-or" decisions. Special modes of operation can be set up through independent or simultaneous use of such functions as AM, VCF (fm), SYMMETRY, VAR RISE and FALL, SWEEP, Waveform HOLD, and TRIGGER or GATE or PHASE LOCK.

Order FG 504T ($1350) for a stand-alone instrument operable from 100-240 Vac, 48-440 Hz.

For example, the FG 504 may be operated as a free-running burst generator by using the LIN SWEEP OUTPUT to gate the main generator. With the generator in the SWEEP mode but the START and STOP frequencies set the same, the actual sweep will be zero. Adjusting the trigger level controls the length of the burst. SWEEP DURATION controls the period between bursts.

A special range allows the audio engineer to sweep from 20 Hz to 20 kHz, or a single internal capacitor may be replaced to change the start and stop points.

And dynamic reaction of AGC, squelch, or amplitude-sensitive circuits such as Dolby systems are easy to test with the FG 504 in a square wave or pulse am mode that varies the output between two different levels.

Order FG 504 ($1200) for a plug-In instrument that operates in any multi-compartment TM 500 mainframe power module.

For further information or a demonstration of the FG 504 and TM 500 Instrumentation, write or phone: Tektronix, Inc., P.O. Box 500, Beaverton, Oregon 97077, (503) 644-0161 ext. 5542. In Europe: Tektronix Limited, P.O. Box 36, St. Peter Port, Guernsey, Channel Islands.

FOR DEMONSTRATION CIRCLE #242
Let's talk about the easy way for you to spot microprocessor hardware problems.

We've probably both spent hours at the simulator to prove we had good software and then discovered the hardware won't play—what do we do? You know the traditional answer. Dig out the scope, get out the program printout, and brace yourself for hours of grinding, point-by-point checks. But I can tell you that doesn't have to be the case. Especially now that HP has introduced some new tools that can really cut down your troubleshooting time.

HP's Logic State Analyzers can really take a lot of pain out of your troubleshooting procedures. You'll find wiring errors, defective components, and even solder splashes; and you'll find them a lot more quickly than ever before.

Let me give you an example. We had an eight-bit microprocessor system with start-up problems. The clocks were running and phased right, and the address lines toggled, but the machine didn't function. So, we set up an HP 1600S Logic State Analyzer to look at both the Address and Data buses. It was then we noticed that only 'zeros' were being fetched from memory. Knowing the ROM was good, we then added several control lines to the display and the problem showed up immediately. The "Enable" line never went high. A quick look at the "Enable" driver showed the input was ok, but no output. Obviously, the gate was defective.

I don't know how long it would have taken to find that one without HP's Logic State Analyzers, but I know it would have taken us a lot longer.

Call your local HP field engineer. He'll give you all the details on the 1600S (priced at $6800*) including spec sheets and application notes detailing the use of mapping for troubleshooting minicomputer and microprocessor systems. He'll tell you about the seminars that HP has arranged around the country and tell you when one will be held in your area and how you can attend. You ought to go to one, because you'll discover an exciting new concept in digital troubleshooting.

*Domestic U.S.A. price only.

CIRCLE NUMBER 35
Now our expandable line offers DC to 4 million bits per second!

We offer PCM capability, in addition to Direct and FM electronics, in three of our recorder/reproducers. There's the 7 to 14 channel Sabre III and the 28/32 channel Sabre V, both IRIG all-band portable recorders; and the Sabre IV, a 7 to 48 channel laboratory recorder/reproducer.

In addition, our line includes the new Sabre VI which offers superior performance plus ultra-portability, and the Tandberg TIR-115, a 4-channel, FM, 25-pound system.

Those basic five recorders are actually an almost unlimited line because each is designed and built to adapt to an amazing variety of functions. Just tell us what you want one to do!

MARK IV
CONNECTION
SYSTEM

It lowers your total installed cost.
Want to save on assembly time? Increase production? Buy in bulk? Reduce inventory? Simplify tooling? They're your system's real costs—your total installed cost—and we can cut them with our new flame-retardant-plastic, UL-recognized Burgun-D Mark IV D Subminiature Connection System. It's a whole, low-cost, reliable production system built around our universal Burgun-D. Crimp, removable contacts • Printed-circuit contacts, straight or 90° • Screw machine or stamped contacts • Semi-automatic strip and crimp—crimp machine: 1500-2000 contacts per hour • 5 different connector sizes • 9, 15, 25, 37, 50 contact arrangements • #20-#30 wire sizes • Rugged metal shells • Complete accessories • Intermateable, interchangeable, intermountable, layout for layout with all D Subminiatures • Available at any authorized Cannon distribution center throughout the world.

Applications: computer peripherals; data machines; telecommunications; machine tools; consumer electronics.

Send for our "Cannon Cost Cutters" brochure today. ITT Cannon Electric, 666 East Dyer Road, Santa Ana, Calif. 92702. Toll-free, 24-hr (800) 854-3573; in Calif., (800) 432-7063.

Six decades on the leading edge of interconnect technology.

CANNON ITT
ECL bit-slice processor arrives, setting top speed for bipolar µPs

The fastest bit-slice microprocessor—Motorola's long-awaited M10800 ECL family—cuts instruction-execution time to as little as half that of other bipolar versions. In a 16-bit system, the MC10800 4-bit slice takes only 62 ns to execute a micro-instruction. Present processor slices employ TTL and require much longer times (see news story this issue, p. 34).

Besides the MC10800 arithmetic-logic unit (ALU), the family consists of the MC10801 microprogram-control function, the MC10802 timing circuit and the MC10803 memory interface. All members of the family are fully compatible with the company's high-speed MECL 10,000 logic line. Hence any circuit in the series—especially memory circuits—can be used in conjunction with the new circuits from Motorola (P.O. Box 20294, Phoenix, AZ 85036. 602-244-3465).

The ALU circuit requires an external register file, in contrast to TTL versions like Advanced Micro Devices' Am2901, which has an internal file. Although the requirement increases package count, the external memory can be built to any size and configuration. Also, unlike the Am2901, the slice performs both BCD and binary arithmetic.

The MC10800 performs all logic operations and does both logic and arithmetic shifting. It contains an accumulator for temporary storage, and a special mask network that allows bit manipulation—an important feature for controller applications. Status bits are provided to allow branching in the main program or in the microprogram.

The MC10801 control circuit provides the addressing and sequencing logic needed to (continued on page 54)

Next in kits: do-it-yourself PROM programmers

Not only do microcomputers come in kit form. Now PROM programmers can be put together from kits offered by Cramer Electronics (85 Wells Ave., Newton, MA 02159. 617-969-7700).

The 2708/2704 EPROM Programmer Cramerkit contains all the components, software and design documentation needed to build a self-contained programmer for the popular 2708 (1 k x 8) and 2704 (512 x 8) erasable EPROMs. All timing requirements of the EPROM are handled by the hardware, minimizing the required software and simplifying connection of the kit to virtually any system.

The kit is available for immediate delivery for only $99.95. With a special customized Augat board, the cost is $129.95. The kit was developed in conjunction with Microcomputer Techniques, Reston, VA.

Booth No. 1510-1530

Electroic Design 10, May 10, 1976
operate the microprogram memory. It also generates a series of next-address instructions, thereby easing the burden of writing the microprogram code. Like the ALU slice, it can be cascaded and as a result, can handle virtually any memory size. A single MC10801 can address 256 words; three of the circuits can handle 4-k words.

Contained within the MC10801 are various registers for status, instruction and address; a last-in first-out stack; and an incrementer. Built-in logic provides 16 instructions, any one of which can generate the next address. These instructions allow direct and conditional jumps and subroutining. One instruction even permits multipath-branching decisions to be made. Such features conserve memory and save on medium-scale-integration circuits.

The MC10803 interface circuit provides a communication link between M10800 ICs and such system components as main memory, peripheral terminals and bulk storage.

The interface circuit contains logic for both data routing and memory-addressing operations. Internal registers are provided for memory address, memory data, program counter, stack pointer and other memory-related functions. Seventeen data-transfer instructions can be used to route information between different registers and I/O ports. The interface circuit may be operated in parallel with the ALU slice to enhance system speed.

The MC10802 circuit handles various timing chores, such as starting and stopping the processor. It has a reset capability and generates up to four clock phases. A larger number can be obtained by cascading several circuits. Also offered in the MC10802 is a diagnostic capability for running through a program one step at a time. Thus the timing circuit offers a means to perform program debugging and even system checkout.

All M10800 circuits operate from MECL 10,000 supplies of $-5.2$ and $-2 \text{ V}$ and over the $-30$-to-$85^\circ \text{C}$ temperature range. Typical operating dissipation for the ALU circuit is $1.4 \text{ W}$. Other circuits in the family need about the same amount of power.

This high dissipation is handled by a special quad in-line (QUIL) package that has a maximum rating of $2 \text{ W}$. Developed especially for the M10800 family, the QUIL package takes up about the same board space as a standard 24-pin DIP, but the QUIL's 48 pins are arranged in four rows of 12 pins each. The package is compact and wire-wrappable.

Initial shipments of the M10800 family will come with sockets for the QUIL packages. The MC10800 slice is available now at a price of $75$ in single-unit quantities and $50$ in hundred-up quantities. Other members of the family are similarly priced. The MC10801 will be available in August, and the MC10802 and MC10803 in October.

Motorola plans to expand the family by introducing special circuits to interface with TTL systems, but the initial offering will be the nucleus of any future system.

CIRCLE NO. 501

$295 \ \mu \text{C-on-board aims to satisfy most requirements}$

A single board measuring just $6.75 \times 12$-in. provides the computing power, memory storage and I/O facilities needed for the bulk of OEM-processing and equipment-control applications. Moreover, the new 8080-based SBC 80/10 from Intel (3065 Bowers Ave., Santa Clara, CA 95051. 408-246-7501) costs only $295 in quantities of 100.

The SBC 80/10's versatility stems from its programmable parallel and serial I/O, which allows designers to use the same single-board \( \mu \text{C} \) in different equipment by simply changing six or less program instructions and plugging in appropriate line drivers and terminators.

The board's central processor subsystem includes an 8080A \( \mu \text{P} \), interrupt control, crystal-stabilized system clock system bus control (intraconnection control logic) and high-current drivers for memory expansion.

Memory consists of 1 kbyte of static RAM and up to 4 kbytes of ROM. Sockets on the board can
Point by point, line by line:

See why our lowest-cost Graphics package has no competition.

Our 1024 X by 780 Y viewable points separate Graphics from mere graphing. The price has never been lower. But Tektronix' new 4006-1 provides the same superior information capacity that has made us the company for all your graphics needs.

We'll throw you a curve. Tektronix will graph circles around the competition. Now, thanks to our new low priced 4006-1, we're in the same ballgame with mere alphanumeric terminals.

Graphics to gain. Nothing to lose. Add the graphics extra at an everyday price: $2995 or $150 a month on a two year lease. Alphanumerics? Up to 2590 on screen characters. Plus a spectacular package that includes confirmed compatibility with most mainframes through proven interfaces and time-tested software packages. And expert maintenance that follows you all over the world.

Plug-in peripherals standing by. Like our 4631 Hard Copy Unit for up to four 4006-1's with 8½"x11" copies, or 4923 Digital Cartridge Tape Recorder for low-cost, off-line storage.

Why wait for graphics? Let graphics wait on you. See what our fine-line, full-line graphics can mean for your applications. Check out the whole story and all the prices right now with your local Tektronix Sales Engineer. Or write: Tektronix, Inc. Information Display Group P.O. Box 500 Beaverton, Oregon 97077
be used to plug in up to four optional 1-kbyte EPROMs, or interchangeable 1-kbyte masked ROMs.

The parallel I/O features 48 lines organized as six programmable, eight-line I/O ports. Sockets for line drivers and terminators provide a means to establish the desired electrical characteristics.

The serial I/O features a programmable USART (universal synchronous/asynchronous receiver/transmitter), standard data-communication interfaces (RS232C and teletypewriter) with built-in drivers and receivers, and a variable baud-rate generator.

**Custom board simplifies assembly of 8080A kit**

With a wire-wrapitable socket board, assembly time for the Intel 8080A Cramerkit can be reduced to a matter of minutes. Offered by Cramer Electronics (85 Wells Ave., Newton, MA 02159. 617-969-7700), the board sells for $275 to $325. The custom board is manufactured exclusively for Cramer by Augat, Attleboro, MA.

**Component tester speeds checkout of 6800 family**

Users of Motorola's Exorciser development system can now employ an external component tester to speed incoming inspection of 6800 circuits.

The MEX68CT tester from Motorola (P.O. Box 20294, Phoenix, AZ 85036. 602-244-3465) consists of a "mother" board and a series of special "personality" boards and test programs that evaluate the following circuits: 6800 µP, 6820 peripheral-interface adapter, 6850 asynchronous communications-interface adapter, and the family's 6810 RAM and 6830 ROM. Moreover, Motorola says that forthcoming boards and programs will be able to test popular microcomputer components now offered by other manufacturers.

To test a circuit, a user first connects the circuit's personality board to the mother board, which is then hooked up to the Exorciser. The circuit's test program is entered in the Exorciser. Next the user simply installs the device to be evaluated in the tester, presses a Test switch and obtains a good/fail indication.

One Exorciser system controls up to eight testers, and power for the testers may be obtained from the development system or from an external source. Optional features include foot-switch control and extender cable for environmental testing in special chambers.

The mother board plus Exorciser-interface card cost $1500. Individual personality boards range in price from $175 to $260. Delivery is from stock.
Six great features these two popular trimmers have in common:

The Model 63 3/8" Singleturn Cermet

1. Soldered terminations for reliability
2. Superior design for excellent setability—virtually no spring-back in the singleturn or backlash in the multiturn.
3. Eight multiturn configurations interchangeable with singleturn pin styles for flexibility.
4. Brush wiper design for low CRV.
5. O-ring seal for board wash.

Available from local distributor stock. Send for a data sheet or call for a quote. Ask about a free sample.
Our incredible "get rich ma
You clever devils:
I think this whole thing is a scheme to get you rich. But here’s my $5.00, anyway.
If the Logic Designer’s Guide is as good as you say, I probably won’t regret it.

It’s the “Logic Designer’s Guide to Programmed Microprocessor Equivalents to TTL Functions Using Pace.” And it’s intended to help system designers make the transition from design in hardware to design in software. Thus saving your company a lot of money, which they will probably turn over to you. Or will they?

National Semiconductor
Ise introduces five new ways to make the competition turn green.

Your competition probably already thinks they're using the perfect display in whatever it is they make. Let them keep thinking it. While you prove them wrong with a new Itron display. They're designed to make the competition turn green. Which also happens to be the color of the segments.

All 17 of them on the 17-digit Itron. All 5 on the FG-512A1.

Next comes an Alfa-Numerical Itron. A Linear-Analog Itron. And a Digital Clock Itron. Five ways to be heartless if you put a little heart into it.

Someday Issaquah will be famous.

Someday, people will say: "Issaquah, Washington, that's the home of Data I/O!"

But that's "someday." Today, more people remember us for our PROM programmers than for our name. We understand. After all, the 1,500 companies who use our machines need programmers—not a name. So here's what's behind "Data I/O."

Our most popular programmer is the Model V. It is already out-selling every other PROM programmer in the world (including the former world champ, the Data I/O Programmer I). It can program all PROMs now available (165 at last count), and it's approved by the PROM manufacturers.

Our Programmer VI lets you program from one to eight MOS PROMs simultaneously with the same, or different, programs. (It can program an entire memory board in less than 30 seconds.)

Our new Programmer VIII is a completely portable, microprocessor based unit. You can take it anywhere and easily update it year after year.

Our Programmer X is for Programmable Logic Arrays (PLA's). It features CRT display, multiple inputs and outputs, and error detection through both logical and array verification. It's also microprocessor based.

Our Romulator lets you emulate any PROM configuration on the market today, develop a complete program and debug it before you ever have to commit it to a PROM.

Data I/O offers a unique calibration standard which lets you calibrate to each PROM manufacturer's specs—before you program—for maximum yields and long term I-C reliability.

Data I/O total three point service
1. Every Data I/O customer receives a quarterly update on currently available PROMs.
2. Through our direct (computerized) mailing program, Data I/O customers are kept constantly up-to-date on PROM specification changes and technological innovations.
3. Eight field offices in the U.S. and 22 distributors worldwide provide our customers with direct sales support, installation, and operator training.

Get the facts

If you would like to know more about our products, or want copies of our quarterly PROM Comparison Chart and PROMNews (our periodic technical bulletin on PROM applications and innovations), mail this coupon or call one of our offices. Data I/O Corporation, P.O. Box 308, Issaquah, Washington 98027.

$795
never bought
a system
DMM
like this...

until now.

- Fully programmable in function, range and even autorange
- Full remote control up to 12 conversions/sec
- Complete interface capability
- 0.007% Basic accuracy for 6 months

Until now, you'd pay $2000 to get what the Model 3400 gives you and even then, you might come up short.

The Data Precision Model 3400, at just $795, is the world's most accurate systems/lab 4½-digit multimeter. It is the only DMM in this price range designed with digital data interface as a true system multimeter as well as a highly versatile stand-alone unit. It is completely and independently programmable from its rear terminal digital interface for both range, function and even autorange.

The Model 3400 features include TRI-PHASIC®, the Data Precision exclusive conversion cycle for drift-free overall system performance; up to 12 complete full-scale conversions per second providing printer-compatible data throughput rates; overload protection to 1000 Volts peak on all Volt and Ratio ranges, plus 270V on all resistance ranges; and optimum utilization of 4½ digit resolution through 100% overrange.

And there is still more. The Model 3400 implements "overlap mode" for interlacing MUX advance and sampling, so that system throughput rate equals instrument conversion rate, without MUX settling errors; BCD output is fully printer-compatible; accurate, stable, repeatable 10 µV resolution DC and AC; and it provides full function versatility: DC Volts; AC Volts; Ohms; DC/DC and AC/DC Ratio. IEEE Standard 488 BUS optional.

In the Model 3400, Data Precision has put complete system-implementing control within reach of many new customers. It's just part of our on-going commitment to provide the most accurate and reliable instrumentation at the lowest possible price.

For complete information or a demonstration, contact your local Data Precision representative or Data Precision Corporation, Audubon Road, Wakefield, MA. 01880, (617) 246-1600. TELEX (0650) 949341.

FOR DEMONSTRATION CIRCLE #273
FOR ADDITIONAL INFORMATION CIRCLE #274
The importance of Jack

Jack was an important executive and everybody knew it. You could tell it right away because Jack was extremely difficult to get to. Even his secretary was difficult. It was clear that her mission was to protect Jack from his subordinates. Following Jack's instructions, she spent most of her time making certain that callers didn't waste her boss' precious working hours.

Jack was always available—instantly—when his boss called. His "Hi, Sally. Can I speak to Jack?" always met a super-prompt, super-enthusiastic, "Certainly, Mr. Jones, right away."

But if one of Jack's engineers called, Sally bristled. "He's very busy. Can it wait until some other time? Can somebody else take care of it? Can you tell me about it so I can discuss it with him when he's free? Can't you take care of it yourself?" And often, Sally would so grind down an engineer that he would give up. He would make a decision that should have been Jack's and risk Jack's wrath—for which there was always time—if Jack's decision would have been different.

But most of the time Jack never knew decisions were being made. He would assemble his engineers occasionally to criticize or give them instructions. But he had little else to do with them or, for that matter, with customers or vendors. Sally warded them off, too. So customers and vendors learned to call Joe, one of Jack's subordinates. With his secretary, he made everybody feel welcome and made everybody's problems important enough to merit attention.

The sequel to this tale is predictable. In the next economy wave, Jack and Sally were let go. It was apparent that their principal activities were pleasing their bosses.

Jack and Sally probably got what they deserved. But there are probably hundreds of other Jacks and Sallies who, alone or together, render frequent disservice to their co-workers, customers, suppliers, employers and, in fact, themselves.

A secretary who derives status from sheltering her boss from the outside world injures him and everybody else. And the boss who, through design or innocence, allows himself to become too "important" to stay in touch with others soon loses touch with everything.

Designing broad band transformers?

Here comes help

DESIGN DIRECTION — Tell us your application for broad band components. We'll send you complete design information on the only ferrites manufactured, tested and guaranteed for bandwidth performance. Your design will be easier and more precise with graphs of $R_p$ and $X_p$ vs. frequency and design examples that work.

COMPONENT SELECTION — Give us your circuit parameters and we will select a Broad Band-Rated® component with 16,000 perm to replace expensive metal laminations. Or give us your bandwidth requirements from 100 Hz to beyond 250 mHz and we'll choose from our complete range of toroids and mated parts in recommending a specific solution.

Call APPLICATIONS ENGINEERING, (201) 826-5100 or write: Indiana General, Keasbey, New Jersey 08832.

Why more engineers than all other microcom

The 8080 system comes with four CPU options, twenty-five performance matched peripheral, I/O and memory components, and the industry's most useful software and hardware development systems. We've had the 8080 in volume production since April 1974 and there are now major second sources. These are just a few of the reasons why more engineers use the Intel 8080 system than all other microcomputers combined. Join them and you'll eliminate complex random logic, save design time, and get your products to market faster and at lower cost.

Start by replacing hundreds of TTL packages with the three LSI circuits in the MCS-80™ CPU Group—the 8080A CPU, 8224 Clock Generator and 8228 System Controller. Built into the Intel 8224 and 8228 are many of the extra functions that most designs require, such as TTL & MOS clocks, auxiliary timing functions and current sinking capability that keeps memory and I/O interfaces simple.

A dozen I/O and peripheral circuits that attach directly to the system bus make it easy to add on peripheral subsystems. Five are programmable LSI devices. These operate under software control in numerous modes and can often replace up to 75—or more—TTL packages each. For example, the Intel 8251 Programmable Communication Interface provides virtually all serial data transmission protocols in use today, including IBM Bi-Sync. Or, for easy interface to printers, keyboards, displays and motor drives, use the 8255 Programmable Peripheral Interface. You can reorganize its 24 I/O lines with software as your needs change.

You have thirteen options in performance matched standard memory circuits, such as 16K ROMs, 8K erasable PROMs and 4K RAMs for high density at low cost, plus CMOS RAMs for lowest power.

You also get four CPU choices, including the M8080A for operation...
use the Intel 8080 system puters combined.

at $-55$ to $+125^\circ C$, and the 8080A-1 with a 1.3 microsecond instruction cycle for higher speed applications.

To help minimize system development time use the third generation Intellec® MDS microcomputer hardware/software development system. This development system with its unique ICE-80 in-circuit emulator lets you simultaneously debug software and hardware, from initial prototyping right through production. The Intellec MDS is supported by six comprehensive software packages including a macro-assembler, ICE-80 interactive software driver and a diskette operating system.

In addition to the software packages in the development system, three cross product software packages are available on magnetic tape and on several time share networks. The Intel 8080 system is also supported by the industry's largest user's library, training courses and field applications assistance.

Start now with the new SDK-80 System Design Kit. It's a complete system for only $350 and includes: An 8080A CPU, Clock Generator, System Controller, Programmable Communications Interface and a Programmable Peripheral Interface. You also get two 1 of 8 binary decoders, 256 bytes of static RAM, two kilobytes of erasable PROM (with the system monitor supplied in one kilobyte), a PC board, clock crystal, connectors, other assembly parts, plus a user's manual and programming manuals.

For your free copy of the new 8080 system brochure and our Intellec MDS brochure, write: Intel Corporation, 3065 Bowers Ave., Santa Clara, Calif. 95051. For $5.00 we'll send you a copy of our new 236 page 8080 Microcomputer Systems User's Manual that includes complete hardware, software and interfacing data for all 8080 systems.

**intel® Microcomputers. First from the beginning.**
If you spend more than 20 minutes picking a P.C. connector

It's your guide to the broadest line of printed circuit connectors made by any single manufacturer. We have just about everything and in more combinations and more depth than anyone — more types of contact terminations, insulator materials, mounting styles, contact designs, types of plating.

Send for our catalog. Browse through it and you'll discover that picking out the right printed circuit connector for your job is as simple as it should be.

Quick delivery.
And you can get your hands on our connectors, too — in a hurry if need be. We keep a large inventory; so do our distributors.

Our "Whatever-you-need-we've-got" department.
As you can guess, we have a lot of tooling filed away. Our production engineers have a unique talent at taking an existing bit of tooling, fiddling with it, and turning out a "custom" connector that's exactly what you need. Your extra cost is only a modest set-up charge... a long way from a full retooling cost. Use the coupon.

...you don't have this catalog.

Ok. Send me: □ Your latest printed circuit connector catalog
□ ...and your nearest rep. I want to talk to him about a particular problem I have.

Smash Production Bottlenecks!

You've never seen a faster, more accurate way of measuring frequency response from 30Hz to 110MHz

Slash your production-test times and divert your skilled engineers to more important work with our TF 2370 Spectrum Analyser. It will reduce to simple operations, complicated measurements such as response, level, gain, signal purity, modulation and many more, with a speed and degree of accuracy that has to be seen to be believed. Forget everything you have heard about spectrum analysers. The TF 2370 is unique. It employs advanced technology to make it reliable and as easy to operate as a multimeter. The facts speak for themselves.

* Flicker-free display of frequency response from 30 Hz to 110 MHz on a high-brightness c.r.t.
* Electronic graticule, with a ± 15% variation of horizontal divisions for pin-point positioning against waveform display.
* Press-button selection of three amplitude scales: one linear and two logarithmic with expansion to 1 dB/div, with an accuracy of ± 0.1 dB/db.
* 9-digit electronic counter automatically gives centre frequency, reads any other frequency corresponding to manually-adjusted 'bright line' position on display, or the difference frequency between the two, at the press of a button. All to an accuracy of ± 2 Hz ± reference frequency accuracy on high resolution and manual. Internal reference frequency provided with setting accuracy of 1 in 10^7.
* Internal generator supplies synchronous signal source for measuring such items as networks and filters.
* For comparative measurements, unique memory storage system will retain one display indefinitely as required, for simultaneous display with waveform produced by items under test.
* Automatic adjustment of amplifier gain to give optimum lowest-noise performance with full protection against input overloading.
* Automatic selection of optimum sweep speed.
* With the 5 Hz filter, signals 100 Hz from a response at 0dB can be measured to -70 dB.

Now ask for a demonstration. It could prove that the TF 2370 is a better cure for your headaches than aspirin. We are standing by for your call.
Electronic Design's GOLD BOOK is very convenient and always on my desk. I don’t have to go somewhere else to use it.

Mr. W. T. Noel is Senior Engineer at the Naval Air Systems Command, Arlington, Virginia. He is involved with infrared avionics development and procurement for the Navy Department. Mr. Noel states:

“I refer to the GOLD BOOK often and find it quite useful in my work. It’s very convenient and always on my desk. I don’t have to go somewhere else to use it.

“Navy avionics procurements are largely to specification. The performance sheets and vendor sources provided by the GOLD BOOK are quite useful in the preparation of these specifications.”

This is the Electronic Design audience working for you. (The GOLD BOOK goes essentially to Electronic Design’s audience of engineers and engineering managers, purchasing agents and distributors throughout the U.S. (plus 13,000 abroad) has his own personal copy of the GOLD BOOK.

The GOLD BOOK is there, at hand, ready when the need arises.

THIS IS THE ELECTRONIC DESIGN AUDIENCE WORKING FOR YOU

Electronic Design / GOLD BOOK

HAYDEN PUBLISHING COMPANY, INC.

50 Essex Street, Rochelle Park, New Jersey 07662 • Tel: 201-843-0550
The programmable frequency synthesizer that lets you get on the bus without being taken for a ride

**low cost**

The Model 802 Frequency Synthesizer takes its place between the highly sophisticated (and highly expensive) synthesizers and the less versatile RC and LC oscillators. Now at a reasonable cost, you can have a signal source with crystal controlled stability, high frequency accuracy and resolution, and the capability of remote control programming, either BCD or ASCII compatible with IEEE STD 488-1975, the standard ASCII "BUS".

**simple**

Simple to operate, simple to calibrate, simple to maintain. Just six plug-in circuit boards plus a plug-in power supply perform all frequency synthesis functions. Convenient test points make location of faulty cards quick and easy. And, in case of trouble, you can substitute a new card without extensive recalibration.

**stable and accurate**

The Model 802 offers frequency stability of 10 ppm/year and accuracy of .001% of setting. Bandswitching by decade ranges maintains a constant 6-digit resolution throughout the frequency range. Outstanding signal purity with low phase noise and low harmonic and non-harmonic spurious outputs permit accurate measurement of narrow band communications circuits. Amplitude is controlled with 0.01 db resolution from -69.99 dbm to +26.99 dbm with 0.05 db flatness.

**versatile**

In one instrument, the Model 802 offers frequency coverage from 1 Hz to 20 MHz, or 0.01 Hz to 20 MHz as an option, for an extremely stable source of signals typically requiring more than one instrument. Frequency accuracy is \( \pm 0.001\% \), or by using the Model 802's phase lock input, it can be slaved to an external frequency standard for even higher accuracy. Options include BCD programming, ASCII programming (compatible with IEEE STD 488-1975), several output impedances, low frequency extenders (to 0.01 Hz), and rack mounting adapters.

Frequency range: 0.01 Hz to 20 MHz plus 30 MHz to 50 MHz offset frequency output

Note: Exact also has a line of ASCII Programmable Function Generators.

The best talents in your business can be bought...

PRACTICAL DESIGN FOR ELECTROMAGNETIC COMPATABILITY
edited by ROCCO FICCHI

A complete guide to electromagnetic compatibility for electronic systems and equipment. Includes the current techniques for analyzing, predicting, controlling and reducing unwanted signals, along with numerous charts, graphs and nomographs. Recent advances in filtering and shielding, and exhaustive treatment of the special problems encountered in computers, semiconductors and solid-state devices. #5685-0, $17.20

PRACTICAL VALUE ANALYSIS METHODS
by JOHN H. FASAL

This step-by-step guide transforms sophisticated VA-VE theory into concrete techniques and methods enabling you to literally take apart and scrutinize every facet of your operation—streamline everything from product costs to worker efficiency. An unlimited planning tool in the hands of today’s ambitious executive or manager. #5845-4, $13.75

MODERN DATA COMMUNICATION
by WILLIAM P. DAVENPORT

An on-the-job handbook mapping out the latest techniques, systems and services for the most efficient data transmission. Includes simplified coding techniques; ways of dealing with distortion, distraction, interference; efficiency and control techniques; modulating and multiplexing methods; and advice on using today’s commercially available services. #5810-1, $10.30

BASIC TELEPHONE SWITCHING SYSTEMS
by DAVID TALLEY

Offers the full array of switching techniques—from the early step-by-step type, through the common electro-mechanical group, to today’s sophisticated electronic system. Special attention given to the No. 1 ESS type being installed by many companies. Here’s a versatile, clearly-written handbook for the engineer, executive, and trainee alike. #5750-4, $6.60

RELIABILITY, MAINTAINABILITY AND AVAILABILITY ASSESSMENT
by MITCHELL O. LOCKS

All the techniques and formulas you need for calculating the reliability, maintainability and availability of your repairable and non-repairable systems and components. You’ll find sample models using point and interval values, and time-to-failure and time-to-repair data; binomial and other bernoulli-type distributions; simplified goodness-to-fit techniques, and much more. #9204, $15.95

VIBRATION AND ACOUSTIC MEASUREMENT HANDBOOK
edited by MICHAEL BLAKE & WILLIAM S. MITCHELL

This giant, field-tested, 680-page manual enables you to master today’s vibration equipment and techniques—shows you how to spot up to 90% of equipment problems months in advance and take corrective action before trouble starts. Uses scores of actual industrial problems and solutions in outlining specific procedures and techniques. #9195, $34.50

The first color-capped industrial toggle.

Introducing our new heavy-duty Designer Line switches with up to 20 amp, 2 hp, A-c and D-c ratings. Now you can color-code almost any function or simply use color to improve overall equipment appearance.

Select from nine distinctive lever styles, nine standard colors, two bushing lengths, as well as eleven color-coordinated decorator facenuts in two types.

You also choose from five switch bases, screw or plug-in terminals, single and double poles, plus a variety of circuit configurations.

The first color-capped industrial toggle switch gives you the new colorful choice for your heavy-duty applications. Contact your Cutler-Hammer Sales Office or Switch Distributor.

Designer Line—the broadest line of commercial toggle switches, ratings up to 8 amps, A-c and D-c, and 15 amps A-c. A rainbow of colors! Virtually unlimited combinations of toggle styles, circuits, colors.
A number of significant firsts mark this year's international IEEE convention and product exposition.

The show is being held in Boston, the first time the annual electronics extravaganza has been held outside of New York City. It's got a new name—Electro 76. And it's being held later than ever—May 11-14 instead of March or April.

The exhibition will take place in Hynes Memorial Auditorium, and according to an IEEE spokesman, has been sold out since early January. American and overseas exhibitors—including major representations from the USSR, Israel, the United Kingdom, West Germany and Japan—will occupy 250 booths. The four-day exhibition is expected to attract some 25,000 visitors.

The technical program will be held in the Sheraton-Boston and will consist of 34 morning and afternoon sessions.

Dr. C. Lester Hogan, vice chairman of Fairchild Camera and Instrument Corp., will give the keynote address during a special session on opening day.

The emphasis in the technical program is on microprocessors, microcomputers and LSI; six sessions are dedicated to applications, testing, languages, and design aids, and the impact of \( \mu \)Ps is seen in many other papers.

"Smart" instrumentation, power semiconductors, trends in communications equipment and modern radar techniques are also strongly represented in the program.

Some of the more important technical papers on microprocessors are offered in Session 8, "Design Aids for \( \mu \)Ps," and Session 23, "High-Level Languages for \( \mu \)Ps."

The papers in Session 8 survey the hardware...
And it opens in Boston

and software tools available for μC system development, including “low-end” inexpensive kits and evaluation boards and “high-end” complete development systems, including high-level languages usable both for MOS processors and bipolar bit-slice micros.

Session 23 papers examine the higher-level vs assembly language controversy and offer guidelines to help users decide which language would be more cost-effective in their applications.

In the test and measurement area, Session 6 covers new uses of signal processing to improve measurements. Papers discuss the use of mini and microcomputers to improve measurements by mathematically processing instrument-output data.

The practical side of designing with power semiconductors is covered in Sessions 5 and 16. Among the topics discussed are trends in Darlington, SCRs and power Schottky diodes, and the application of high-voltage power transistors to efficient switching-power supplies.

Present and future trends in communications equipment design are the theme of Session 20. Papers concentrate on improved receiver dynamic range, low-noise reception and measurement techniques.

The microcomputer systems designer is today faced with a confusing array of hardware and software tools for microprocessor-systems development. They range from small kits and evaluation boards for under a hundred dollars, up to fully developed systems, with sophisticated software and peripherals, costing in the thousands.

Just which type of hardware and software is most cost effective for a given range of applications will be discussed in Session 8, “Microprocessor Design Aids,” organized and chaired by Edward Torrero, an associate editor of ELECTRONIC DESIGN.

Because most system logic is implemented in software rather than hardware, creating and testing the first prototype of a microcomputer system requires tools and techniques that have no parallel in hardwired logic, reports A. Scott McPhillips in his paper: “Hardware-Software Breadboards.”

For microcomputer prototyping the designer must have, as a minimum, a machine that executes the software, shows him what is happening and allows him to make modifications, says McPhillips, vice president of Microcomputer Technique, Inc., Reston, VA.

This prototyping machine can be a simple system assembled from chips or small boards and provided with such bare debugging essentials as a teletypewriter and a ROM to operate it. But the lack of displays, controls and interfaces makes working with this primitive system arduous and time-consuming. At the other prototyping extreme are costly development systems, the expense of which often cannot be justified.

For testing small-volume and medium-volume production designs McPhillips recommends a middle-of-the-road approach that is based on a “standardized breadboard” Microcomputer Technique developed for several of the popular microprocessors. These breadboards, which have a variety of simple debugging controls, as well as displays, peripheral interfaces and supporting software, were developed for Cramer Electronics, a Boston distributor that markets them.

Effective low-cost techniques have been devised in the development of these breadboards. For example, a simple tool to get the hardware working is a plug-in 16-word memory comprised of switches. To use this, all memories are removed from the system and the switch ROM is connected so that it ignores all but the four least-significant address bits. It thus responds to any address the processor may generate.

In most microcomputer systems, the 16-word switch memory and an oscilloscope are all that are needed to test every aspect of hardware behavior, McPhillips says.

Also included, for program entry and display are a “poor man’s terminal” (consisting of 16 additional switches) and a pair of seven-segment LED displays. The supporting software controls each segment of the display so that hexadecimal characters and even a question mark can be shown.

One bank of eight program switches is used to enter addresses and the program. The second bank is used to control and sequence the system software without using a teletypewriter.

“In our breadboard designs,” McPhillips says, “we include LEDs on all system busses and often on inputs and outputs, too. The amount of time required to check the state of 8 or 16 points with conventional instruments is astounding compared with the time required when using LEDs.”
with the time needed for looking at an array of lights."

**Bipolars need special design aids**

Design aids useful for bit-slice bipolar microprocessors are different from those used for the single-chip MOS devices because of two factors, according to David C. Wyland, author of another Session 8 paper, "Design Aids for Bipolar Microprocessors." One factor is architectural flexibility and the other is the existence of a second level of programming called "microprogramming."

"The microprogram design phase can benefit greatly from a general purpose microassembler," reports Wyland, manager of LSI applications and systems design, Raytheon Semiconductor Div., Mountain View, CA. He calls the microassembler "probably the single most important design aid for microprogram-controlled bipolar µPs."

"Unit checkout can benefit from inclusion of checkout features that will interact with a microprogram display panel that allows the designer to step the microprogrammed unit through its various sequences and observe the corresponding activity."

Microprogram design consists of devising a flow chart that specifies the desired sequences. These sequences are then converted into bit patterns for ROMs containing the microprogram control. At this point in design a microcode assembler can greatly reduce the effort and error of translating the flow-chart sequences into ROM code.

Microprograms can be created by hand for a control ROM of up to 2048 bits, consisting of 256 8-bit bytes, Wyland points out. But above this size a number of problems appear that make hand-creation undesirable and the use of the general purpose microassembler almost mandatory.

The general-purpose microassembler is useful for both horizontal and vertical microprogram architectures. The horizontal microcode is characterized by wide microinstruction words of 40 to 80 bits, with many independent functions controlled directly by bits in the microinstruction. The vertical microcode is characterized by 12 to 32-bit words that are decoded to perform one or a few functions per microinstruction.

Horizontal system design results in simple, fast systems, Wyland says, because the system functions are driven directly by the ROM bits. But he cautions that horizontal design is expensive because many microprogram bits require numerous ROMs to drive each of them.

Small, high-speed systems of less than 256 words tend to be horizontal in design because relatively few chips are involved in the control-ROM section. For example, 40 lines can be controlled by five 256 × 8-byte PROM chips.

There is a tendency to add bits to the control ROM rather than to the microprogram, says Wyland, because horizontally organized systems often have up to ten 10-step microroutines. An added microprogram step here may increase operating time by 10 to 50%.

Vertical design is used to minimize the cost of the control ROM. That is, rather than use a large number of control-ROM bits for function control, a few ROM bits are decoded and the decoder outputs are used to control the system's functions.

Reducing the number of bits in the microinstruction reduces the number of chips required for the control ROM. But this reduction is obtained at the expense of speed and complexity.

Large microprogram systems of 1024 words or more tend to be vertically organized, Wyland points out. These systems usually have long microcode sequences. As a result, microprogram steps are added, rather than a change in hardware, to solve design problems.

Several microassemblers have been developed for internal use by a number of companies, Wyland says.

The Rapid assembler developed by Scientific Micro Systems, Mountain View, CA, is available on the National CSS time-sharing network. It is probably the most widely used microassembler at this time. While it is well suited for vertical microprograms, Wyland cautions that it is difficult to use for horizontal microcoding.

**Which high-level language is best?**

The controversy over which high-level language is best to use for microprocessors continues unabated, with several late entries into the field.

"Based on realistic cost and production levels as well as the productivity of programmers, we find that Intel's PL/M is especially good for low volumes and inexperienced programmers," reports Terry Dollhoff, director of engineering at...
Microcomputer Technique and author of a Session 23 paper, "Measuring the Cost Effectiveness of Microprocessor Languages."

When production volumes of 20 units or less are expected, there is little in favor of using assembly language, Dollhoff says. But there is considerable argument for assembly language use with a production volume of over 200 units.

"If future programming costs remain constant, reduced memory costs could drive that 200-unit break point upwards. However, since both of these costs are likely to rise in the future, we feel there is an absolute upper limit of about 250 units below which PL/M is favored.

"If the PL/M compilers become more efficient, the production boundary will shift in favor of that language," Dollhoff notes. "However, because of the way PL/M compilers are constructed, significant gains in efficiency are not in the offing.

"Perhaps five years from now there will be a better suite of compilers, but there will also probably be a better choice of languages."

To study the feasibility of high-level, interactive languages for use with their microcomputers, researchers at Lawrence Livermore Laboratory, Livermore, CA, selected two languages—PL/M and Basic.

"In general, PL/M is a subset of PL-1 written by Intel for its 8-bit microprocessors," says Eugene Fisher, programming supervisor at Livermore, in his Session 23 paper, "High Level Languages in Microcomputer Automation."

"PL/M's major deficiencies for the Livermore Laboratory included the fact that it is not interpretive and therefore there is time lost during debug," Fisher notes. "Also, there is no floating point capability.

"As a result, a subset of Basic called 'LLL Basic,' which could be used in both the interpretive and compile modes, was written for Livermore under contract to Idaho University.

"Both PL/M and Livermore Basic showed significant reductions in programming time and manpower cost," Fisher points out. The benchmark program, which was an actual calculation required for a scientific instrument, showed that the LLL Basic was 16 to 32 times faster to program than either assembly language or PL/M.

"This speed was the direct result of an immediately interactive language," Fisher says. "The benchmark also indicated that compared with assembly language the high-level languages were not particularly efficient in memory use. However," he notes, "with memory costs going down and manpower costs skyrocketing, this may be a very efficient tradeoff."

Newer, high-level languages adapted to microprocessors are appearing. One of these, called FORTH, is discussed by Geoffrey Leach, Sycor, Inc., Ann Arbor, MI, in his Session 3 paper "The
State of the Art in Microprocessor Software.”

“The FORTH language defies categorization,” he reports. “However, its advertised use in the development of application language appears to place it in the system-implementation category.”

“These system-implementation languages,” he explains, “provide the designer with an algorithmic language that is close enough to the architecture of the target machine to permit the generation of reasonably efficient code while still being sufficiently close to the application to permit rapid coding. PL/M is such a language.

“FORTH was originally developed six years ago for minicomputers, and has now been tailored for RCA’s COSMAC and Digital Equipment Corporation’s LSI-11. FORTH programming is described in detail in a Session 23 paper entitled: “FORTH High-Level Programming Technique on Microprocessors,” by Elizabeth D. Rather and Charles H. Moore of Forth, Inc., Manhattan Beach, CA. •

**TEST & MEASUREMENT**

**Microprocessors continue to improve instruments and testing concepts**

Microprocessors, microprocessors, and more microprocessors.

That’s the pervasive theme at Electro this year and the one dominating the sessions on instrumentation, testing and measurements. Papers to be presented at Electro run the gamut from design of equipment with µPs, to use of equipment to test µPs.

Improved measurements are, of course, a standing goal in test equipment and the obvious target of internal intelligence. By mathematically processing data, minicomputers—and µPs—boost instrument power, and also let users make entirely new measurements.

In a Session 6 paper entitled “Microprocessor Controlled Calibration and Diagnostics in a DMM,” Zoltan Tarczy-Hornoch of Systron-Donner, Concord, CA, describes how a µP contributes to a DMM’s accuracy and long-term stability:

“Among its other advantages, the µP permits a self-calibration feature that corrects automatically and periodically for gain and zero-offset errors in all modes and all ranges. Self-calibration can be based on internal references or, for more accuracy, on external sources.”

**Faster than a speeding bullet**

A more exotic application of measurement enhancement through signal processing is outlined in another Session 6 paper by Robert Lederer of Sandia Laboratories, Albuquerque, NM. The problem: to measure with high accuracy the velocity of objects moving at super-high speeds—bullets leaving a gun barrel, for instance, or particles from explosive blasts.

Sandia’s solution: Use laser interferometry to obtain a doppler-shift analog signal, digitize the signal with a fast waveform converter, then process the data with a PDP-11/40 minicomputer.

Monochromatic light detects motion of a specimen in an interferometry technique, and a digitizer/computer processes the data to produce the specimen’s velocity.
to get velocity readings. The technique provides 1% accuracy with particles moving at speeds from 0.1 to 10 mm/µs.

“The analysis process involves quite a bit of software” Lederer says, “but the key is the measurement of velocity with two complex waveforms that are analyzed independently and then compared to dig out the required velocity.”

He continues: “Applications of the technique include seismometers, displacement measuring devices, and the like. Or you can monitor any moving target and get continuous information on its motion.”

Ironically, although the μP allows designers to create instruments that make better tests, how to test the μP itself is a sticky problem yet to be solved. New techniques and new equipment are necessary, whether the aim is production testing, engineering evaluation or field service.

With the proliferation of μPs, testing is of topical and urgent importance. This is reflected by two sessions—18 and 28—at Electro dealing with the problems and solutions of testing μPs and μP/μC-based systems.

The headaches of μP testing, from the semiconductor vendor’s point of view, are outlined by Y. Feng of Intel in his paper “Testing Microprocessors in the Semiconductor Manufacturing Environment.”

You don’t have to be a vendor, however, to benefit from Feng’s information. For example, Feng derives the total number of possible CPU states in the 8080 μP as \(2^{16}\), an absurdly high number. To this number, Feng adds another stratospheric quantity—the possible number of memory-address switchings in a program-counter-generated Galpat test. Putting two and two together, Feng concludes: “There’s no such thing as truly exhaustive testing.”

**Requirements for an ideal system**

Swerling goes on to list 15 general requirements for an ideal test system. Included in the list are such items as hexadecimal or octal display format, rather than binary; efficient means of operator input; ability to take a “snapshot” of a prototype’s dynamic behavior without interfering with the prototype; and sufficient memory, computing ability and peripheral options to execute utility programs.

One person who might take exception to some of Swerling’s conclusions is Hewlett-Packard’s Bruce Farly, another Electro speaker. Farly’s “Troubleshooting Processor Based Designs” details the contributions of logic-state analyzers to μP measurements.

Farly states in summary that the analyzer offers designers “a clear window into the data domain, the ability to record data transactions on either side of the I/O, and the sync signal needed to bridge the two domains of time and data.”

**Innovations abound in amateur radio equipment and techniques**

New hardware and design concepts for both the amateur radio experimenter and the data-systems designer are the focus of the communications papers at Electro ’76.

Three of the four papers of Session 20, “Present and Future Trends in Communications Equipment Design,” describe modern communications techniques as applied to amateur radio.

Radio “hams” are not all amateurs according to design engineer Wes Hayward of Tektronix Inc., Beaverton, OR. Since many are employed in industry, and are in the forefront of communi-

cations design, there often exists a two-way traffic in ideas, Hayward says, with industry benefiting from innovations first thought of for "ham" equipment.

In the opening paper, "Modern Trends in Communications Receiver Design—an Overview," Hayward describes current techniques being applied in the HF and low-VHF radio spectrum to design receivers of wide dynamic range. Dynamic range is a measure of how well the receiver responds to two input signals closely spaced in frequency. The larger the amplitude of these signals—before distortion harmonics set in—the better the dynamic range.

Hayward emphasizes narrow-tuning-range receivers, such as CB and "ham" radios, but says his ideas needn't be restricted to those types. His ideas apply, for example, to the design of spectrum analyzers. There is a continuing trend of sophisticated gear being built by individual experimenters for comparatively low cost, Hayward says.

"I can build a good home-made receiver for much less than I can buy one. Average noise figure in the HF range would be 5 to 6 dB, with a typical two-tone dynamic range of 95 to 100 dB, as compared with 75 to 80 dB for a typical commercial receiver."

**Amateur radio enters a new phase**

Joseph Reisert Jr., in the fourth paper at Session 20, "Low Noise VHF/UHF Receiver Design," describes how radio "hams" have now begun implementing earth-moon-earth communications at frequencies of 144, 432, 1296 and 2304 MHz.

This type of transmission uses the moon as a passive reflector to bounce signals back to distant points on earth, in much the same manner as was done by passive man-made satellites like ECHO-1, in the early days of the space program.

Using a transmitter output of less than the maximum FCC-allowed 1 kW, amateurs can now hear their own reflected signal. Reisert describes a dramatic system test in which he transmits for two seconds, stops, and then listens for his own signal, returned from its half-million-mile journey.

The breakthrough in this process came with the availability of low-cost, low-noise receivers. Although they may not be as sophisticated as those employed in long-range radar or radio astronomy, the receivers are practical and use hardware that is low in cost and easily available. That is their big advantage, Reisert says.

Reisert also describes considerations for designing receivers of minimum noise figure. He examines such basic elements of a receiver as the preamplifier, mixer, and postamplifier, and describes what steps must be taken to achieve low-noise operation of each.

Lowest noise figures in the frequencies of interest are achieved with bipolar transistors and gallium arsenide field-effect transistors, with the FETs outperforming bipolars at frequencies above 500 MHz, Reisert reports. However, because of the high cost (over a hundred dollars each) of GaAs FETs, most high-frequency amateur equipment today uses bipolar transistors. Future cost reductions should spur increased use of GaAs devices.

Below 300 MHz, silicon junction FETs perform very well. For example, a low-cost device such as the U-310 yields noise figures of 1.25 to 1.5 dB at 144 MHz. The U-310 is a silicon JFET costing under a dollar for the epoxy version. It is currently manufactured by Siliconix and National Semiconductor.

Improved techniques for receiver design, in the form of broadband, high-power matching networks, are discussed in the paper "Broadband Transmission Line Matching Networks," by Dr. Jerry Sevick of Bell Laboratories, Murray Hill, NJ.

These networks provide the following characteristics, previously unavailable in a single component:

- Broadband impedance matching over a wide range of frequencies.
- High power-handling capability.
- High efficiency.
- Fractional transformer ratios.

These features result in more flexibility for the design engineer in such situations as matching output stages to an antenna, or matching the interstages of solid-state rf power amplifiers, Sevick says.
Suppose it is necessary to match an output signal from a 50-Ω coaxial cable to a short vertical antenna whose impedance can be somewhere in the 3-to-20-Ω range. Previously, only integral-ratio transformers (4:1 is a typical ratio) were available. Such transformers would restrict the designer to antennas in the 10-to-15-Ω range.

Using a design based on a concept of short, coiled transmission lines, Sevick shows that both integer and noninteger transformers can now be fabricated. These devices also provide the very important advantages of covering a broad bandwidth (for example, 2 to 30 MHz), and of operating at high power levels (up to 1 kW).

The new transformers have efficiencies in excess of 98%. Older designs were only 93% efficient, typically, with “good” units measuring as high as 95%.

A proliferation of data networks

Communications networks that link data-processing systems are the subject of Session 4.

A network that can connect many computers, terminals, and users—all distributed over a wide geographical area—is the subject of a paper by Stuart Wecker, a technical consultant at Digital Equipment Corp., Maynard, MA.

The network, consisting of a set of software tools known as Decnet, permits sharing of computer resources as follows:

1. It allows the terminals of one system access to terminals and peripherals of other systems.
2. It enables remote accessing of data files anywhere in the net. For example, this permits data files to be transferred between systems.
3. It provides program sharing capability. Loadable programs can be sent from one system to another for execution, thus permitting the creation of a central program storage that is accessible by any member of the network.
4. It enables the opening of a data path between programs so that processing can be done on a distributed basis. Different segments of a computing job can then be processed by different network components.

A number of potential markets for such a system are described by Wecker. These include users in industry, business, and research laboratories.

The possibility of using cable-television lines for local data distribution (within a city) is discussed in a paper by a group from Network Analysis Corp., Glen Cove, NY.

Using a data terminal in place of the usual TV set, a system can handle about 100,000 subscribers, each of whom can interact with a computer network, the authors report.

Another topic analyzed in the paper is “packet switching.” This procedure, in effect, chops up a long data message into relatively small segments of from 1000 to 8000 bits in length. The packet-switching process permits transmitting each segment, or packet, separately over the most advantageous route. • •

High efficiency matching transformers, designed by Jerry Sevick of Bell Labs are intended for the mf and hf bands. They can handle power up to 1 kW.

The practical side of designing with power semiconductors, including power Darlingtones, SCRs, gate-turn-off SCRs and power Schottky diodes is emphasized in Sessions 5 and 16.

The practical side of designing with power semiconductors, including power Darlingtones, SCRs, gate-turn-off SCRs and power Schottky diodes is emphasized in Sessions 5 and 16.

Power Darlingtones, for example, appear destined for automobile ignitions. “However, they will have to have high transient tolerance,” says Gerald Owens of Prestolite, Decatur, IL, in his...
The tradeoffs between SCRs and transistors in the design of television horizontal-deflection circuits are evaluated in this test setup at the RCA Solid-State Div., Somerville, NJ.

Session 5 paper entitled "High-Voltage Darlington Power Transistors in Automotive Applications." They will have to stand 400-V transients for 0.1 ms, 150 V for 1.0 ms and -75 V for 38 ms. They will also have to take 8 A of collector current, he continues. For ignition use, the collector-emitter breakdown voltage of a Darlington will have to be at least 400 V. These specs are now possible, Owens notes.

"Selecting Your High Voltage Power Transistor," a Session 5 paper by Bill Mickelopoulos from International Rectifier, El Segundo, CA, offers some guidelines on choosing these power devices.

"Selection," he says, "is complicated by the fact that although a device may be offered under the same basic family number as another device, its characteristics may differ from manufacturer to manufacturer, depending on the particular process used, size of the semiconductor chip, diffusion and passivation techniques, device geometry and other factors."

He concentrates his discussion on proper specification of the breakdown sustaining voltage; dc-current gain and saturation voltage; reverse-biased second-breakdown energy; and unclamped, clamped and forward-biased second-breakdown energy.

"Gate-turn-off SCRs have really come of age," reports Mel Kravitz of Trio Laboratories, Plainview, NY. He describes switching-power-supply designs using GTO/SCRs that switch at 20 kHz and deliver 150 and 300 W. He also shows how to handle up to 800 V at 5 A and switch in less than 1 µs. Kravitz feels that the GTO SCR is unsurpassed for fast switching 400 V and higher. He notes that push-pull supplies can now be built with an input dynamic range of better than 2:1 and a regulation of at least 0.1%.

How to make circuits radiation tolerant

"The best way to design a linear-power-transistor circuit that is radiation-hardened, is to select high $f_T$ transistors operating on the $I_C$ vs $\beta$ curve just beyond where $\beta$ peaks. A high derating factor for $I_C$ should not be used for linear circuits. Conversely, for digital circuits the lower the $I_C$, the harder the circuit," note C. E. O'Neil and A. J. Chesavage in their Session 5 paper,
Diodes and SCRs in 'Hockey-Puck packages' have current ratings into the thousands of amps. Mounting considerations for this type of device are covered in a Session 16 paper.

"Characteristics of Power Transistors in Neutron and Ionizing Radiation and Environments."

"To minimize the probability of damage from high levels of photocurrent generation, external current limiting is effective. The penalties paid for current limiting are usually minor," they point out. Neutrons are the dominant factor of permanent degradation in power transistors. From specified electrical characteristics, the best indicator of neutron tolerance has been shown to be gain-bandwidth product ($f_T$).

Frequently, hardness and the safe-operating region of a power transistor conflict, particularly for inductive loads. One paradox is that neutron hardness requires a thin base, even though a thick base is harder for ionizing radiation.

Fortunately, such other geometry alterations as decreasing the base-sheet; resistivity or the emitter's strip-width can be used, say the authors, to decrease photocurrent generation without sacrificing neutron hardness. Two examples of moderately priced neutron and ionizing radiation hard transistors are the 2N5262 and the 2N5038 families.

Making efficient switching supplies

"Probably the most significant factor in the development of efficient switching-power supplies that are competitively priced, has been the availability of high voltage, fast-switching power transistors such as the 2N6342-45 family," contends Derek Chambers of the Sorensen Co., Manchester, NH, in his Session 16 paper, "Measurement and Efficient Analysis of Losses in Switching Regulators."

The use of these and similar devices has enabled the cost of switching regulators to approach that of series-pass regulators at moderate and high-output power levels (200 W to 1 kW), Chambers says.

He lists the power-transistor characteristics that allow the design of an efficient (better than 75%) switching-power supply:

- fast switching speed (20 kHz or above),
- high collector-voltage ratings,
- large, safe operating area,
- good secondary-breakdown capability,
- low saturation voltage.

To obtain maximum switching speed and efficiency, the collectors of the switching transistors should be kept just out of saturation when conducting, according to Chambers. This mode of operation reduces storage time and minimizes its variation under different load conditions and from one device to another.

The trade-offs between SCRs and transistors in the design of horizontal-deflection circuits is the subject treated by Wally Deitz and Thomas McNulty of the RCA Solid State Div., Somerville, NJ, in their Session 16 paper, "Trade-Offs Between SCRs and Transistors in Horizontal Deflection Circuits." They note that the main difficulty in the design of transistor deflection circuits is the base-drive circuit. In SCR designs, it is the need for commutation circuitry to turn off the SCR. Gate-turn-off SCRs can't handle the required voltages yet for this type of circuit.

Each design has certain advantages, says Deitz. Transistor circuits are easier to design, need less magnetics and take 4 to 5 W less input power. SCR circuits yield better high-voltage regulation, have more current safety margin and have better line isolation. The authors do not recommend one technique over another. They merely detail the trade-offs and leave the decision to the circuit designer.

"Power Schottky diodes are relative newcomers to the power scene," remarks Bryan Bixby of International Rectifier, El Segundo, CA. He discusses reliability problems with these devices in his Session 16 paper.

"Although Schottky diodes are starting to find wide use they still suffer from an unexplained failure mechanism. Occasional collapses in the reverse-voltage characteristic of the devices are yet to be understood."

Because of this phenomenon, Bixby recommends that a 24-hour burn-in be performed to eliminate at least some of the potential failures. If a device doesn't fail in the first 24 hours, there is a good chance that it never will.

If reliability is the key concern, says Bixby, conventional p-n diodes are still better.

"Mounting Considerations for High Current
Hockey-Puk SCRs and Diodes,” the final paper in Session 16, is written by International Rectifier’s Arthur Connolly and Sam Pollack. The paper notes that mounting Hockey-Puk packages has always been troublesome.

“The Hockey-Puk is a pressure-mounted power semiconductor in which an external force is applied to achieve the proper internal and external electrical and thermal contacts,” the authors state. “Superior heat transfer occurs because double-sided cooling results in a very low thermal impedance.

“In addition, elimination of solder joints considerably improves the ability to withstand thermal cycling.” They describe a method of carefully adjusting the pressure applied as the device is mounted between a pair of heat-exchangers.

---

**MICROWAVES**

**U.S. engineers take a second look at European radar and ECCM designs**

You can’t design military radar without providing it with a built-in capability to defend itself from enemy electronic countermeasures. Two sessions will be held to bring you up to date on both radar design and the design of electronic counter-countermeasures: Session 25, “Trends in Modern Radar System Design,” and Session 30, “Radar Electronic Counter-Countermeasures (ECCM).”

Trends in European radar technology are becoming more and more interesting to United States designers, according to Robert Hill, Naval Sea Systems Command, Washington, DC, who leads off Session 25.

“We see a firm base in automation with good 2D, and more recently 3D radar in England and Italy,” he says. “There is a thorough array-technology base in the Netherlands, the recent emergence of whole-system work in West Germany, and an attempt to acquire a working phased-array radar system soon in France. A forecast of similar trends for air traffic systems, including complex adaptive systems with multi-static configurations, was made by Plessey of England.”

There’s been significant work in Great Britain on moving-target indication and low sidelobe antennas, Hill says. Except for Plessey, which has steadily pursued its well-automated AR-3D system, there’s been less emphasis on 3D until recently. High-quality 2D systems, have been more consistent in the U.K., as have back-to-back systems and line feeds for precise control of azimuth sidelobes and stabilization at sea.

The U.S. fleet’s air defense system, Aegis, developed by RCA, includes a phased-array radar, AN/SPY-1, that automatically detects and tracks multiple targets while maintaining surveillance coverage of the air.
Hill points out a number of design approaches that seem more popular in Europe than in the United States: line feeds and singly-curved reflectors (Marconi); Nyquist rate-scanning (RRE, Marconi); stainless-steel construction to prevent corrosion problems at sea (HSA); emphasis on polarization control and circular polarization as desirable features (Plessey, HSA, Telefunken, Selenia); use of hydraulic drive (Telefunken, Philips); multiple antennas on common mounts (Marconi, HSA); and an apparent pride in mechanical work.

Another European trend cited by Hill is the use of surface acoustic-wave devices in signal processing. Europeans are more inclined to incorporate technical advances into established company product lines; in the United States, advances are allowed to accumulate until a new generation radar is built.

As for air traffic control, Hill says there seems to be a closer liaison in Europe than in the United States between what's being done for civil aviation and what's under way for the military.

**Converting solar energy to microwaves**

Larger power aperture is very likely to continue as an important trend in phased-array radar, predicts Peter Kahrilas, consulting scientist at Raytheon's Missile Systems Div., Bedford, MA, in his paper, "Phased-array Radar Trends."

Phased-array technology is particularly applicable to systems requiring very large power aperture with steerable beams—for example, to convert solar energy in space to microwave energy, and then beam it to earth. The high efficiency provided by a phased array is required to make the project economically feasible.

Another trend is multifunction radar applications requiring hemispherical coverage for ground, shipborne and airborne applications, Kahrilas says.

Existing phased-array technology provides hemispherical coverage by using a pencil-beam that is electronically scanned in elevation and mechanically rotated in azimuth. For more demanding applications, by using four-planar arrays, a spherical geodesic lens, or dome-lens technology can be used.

The demand for equipment that can handle steadily increasing target densities, however, is straining the capability of most present-day radars, especially those providing hemispherical coverage.

A technical innovation is required, Kahrilas says, to create a simple and inexpensive electronic-scanning technique for multibeam hemispherical coverage.

The trend toward using solid-state components in transmitter modules has been slow because of the resulting low-power output, the high duty-cycle continuous-wave nature of operation and the poor performance at higher-frequency bands. These undesirable characteristics limit the possible power aperture, peak power, waveform and operation-frequency selection. Technological improvement in these areas is needed, Kahrilas says.

There is a trend toward cutting the cost of all components used in phased-array radar, particularly the cost of phase shifters and their drivers, since they are a large portion of the array cost. Improvements are likely to continue in the material, design and manufacturing processes of phase shifters. One effort is to reduce costs by reducing drive power, insertion loss and size, and by increasing microwave power capacity and reliability.

**Microprocessors are making inroads**

Integrated circuits are becoming widely used in phased-array radars, Kahrilas says. And as denser chips become cheaper, more sophisticated microcomputer architecture can be expected. Larger read/write memories, for example, will be available on microprocessor chips.

In phased-array radar designs, microprocessors are already replacing conventional circuits for control of system self test diagnostics, beam steering units and signal processors. High speed ICs are used to perform the FET function in signal processors.

The increasing use of ICs is shifting a phased-array radar from control by a single computer to a more economical system that contains a main computer and several microprocessors.

Over the past few years inexpensive solid-state components have been introduced to make possible the design and construction of digital signal processors only dreamed of in the past, says Charles E. Muehe, MIT, Lincoln Laboratory, Lexington, MA.

Changes have come especially fast in radar, Muehe says, where doppler filtering was usually limited to analog or digital delay-line cancellers. Now inexpensive components allow the construction in each range-azimuth resolution cell of digital filters that markedly improve the signal-to-ground clutter ratio for each target velocity.

Muehe describes a digital signal processor called the Moving Target Detector (MTD), which is designed to improve the FAA's airport surveillance radars.

In using the MTD the signal to be processed is taken from the output of the intermediate frequency preamplifier and fed through a special linear, wide-dynamic-range amplifier to the quadrature video detectors. The two quadrature video-detector outputs are converted to 10-bit digital
numbers by a-to-d converters and hence into the digital processor. The MTD contains an 8000-word input memory and about 900 ICs. A disc memory is used as a fine-grained ground-clutter map. The parts cost total is approximately $25,000.

The MTD achieves its superior performance principally through fine-resolution linear-filtering and adaptive-thresholding techniques.

The filters have been tailored to reject ground clutter by using wide-dynamic, linear, range processing. The result is much better moving-target indication than achieved by present-day airport surveillance radars.

Phased-array for the range?

Range-instrumentation radars of the future will have to track multiple targets simultaneously and cost less, says Josh T. Nessmith, Systems Manager, RCA Government and Commercial Systems, Missile and Surface Radar Div., Moores- town, N.J.

Phased-array radar, either with a limited scan or a full scan, offers a potential for meeting some of the future requirements of the range, Nessmith says. The phased-array presents an opportunity for direct integration of multiple tracks and the metric data associated with each track.

The question, Nessmith says, is whether a single phased-array radar would be more cost effective than an integrated group of single-target or limited-scan-array radars.

At the very outset of the design phase, the designer faces the fact that the life of the system design is at least 25 years, while the gestation period of a countermeasure is a year or two in peace time and a few weeks during war.

How to live with these conditions is discussed by Matthew F. Radford, Marconi Research Laboratories, Great Baddow, Essex, England, in “Radar ECCM—A European Approach.”

The designer can’t possibly know in advance the precise nature of the threats his system will be called upon to face, Radford emphasizes. He does know, however, that any fundamental weakness in his design is likely to be discovered very quickly and exploited.

The first task then, is to build a system with optimum resistance to ECM and to avoid built-in limitations that could restrict the choice of operational routines or provide openings for future ECM.

Radford cites four other problems the designer faces:

- ECM may affect his own side’s defensive radars;
- Airborne ECM may reduce the sensitivity of homing and warning receivers;
- Responsive jammers may respond to each other; and
- Airborne ECM may interface with terrain-avoidance radar.

The pros and cons of adaptive control

When confronted by jamming or chaff, Radford says, search performance can be improved by adaptive electronic control of the antenna beam. But practical methods of electronic scanning will penalize ECM resistance in other ways. For one thing, the maximum available antenna bandwidth is significantly reduced.

Transmission losses are inevitably increased by electronic scanning. A frequency-scanned antenna uses a dispersive line in which an appreciable amount of energy is stored, and this storage results in a predictable heat loss. Waveguide delay lines are the least subject to loss, according to Radford, but they are bulky. With compact folded lines, it’s unlikely that a minimum additional loss of about 1 dB will be introduced.

Phased arrays have phase-shifter losses that are likely to be around 1.5 dB in a typical antenna of simple design. Losses may be higher if the design incorporates dielectric loading or lossy microstrip dipole radiators.

Taking all of these factors together, a fully adaptive phased-array antenna may have a disadvantage of as much as 10 dB on basic ECCM parameter values. The disadvantage cancels out at least part of the potential advantage of adaptive dwell time.

Radford describes some of the achievements that have been made in European radar:

- Transmitters: To permit the use of advanced, coherent-ECCM processing techniques, transmitters have been designed with unusually clean spectra. A typical high-power transmitter has intra-spectral-line noise 120 dB below the peak pulse output.
- Low-sidelobe antennas: The objective of 35-dB sidelobe protection and 30% bandwidth has been reached. The antenna can handle high power and can be adapted to provide a difference channel for monopulse operation.
- Multiple-beam antennas: A number of ways have been found to generate multiple beams without undue loss of sidelobe protection. Multiple-beam antennas are particularly effective against deception jamming, since they always observe the true jammer position.
- Data handling and control: There are families of modular digital processors that can be reprogrammed or extended during the service life of the radar, thus enabling additional ECCM to be added as required.

Radford concludes that unless the application requires adaptivity for some special task, a relatively simple radar may be as cost-effective in ECM as a more complex adaptive system.
Microcomputers made easy. Easier. And easiest.

Our LSI-11, the machine on the left, makes getting into microcomputers easy.
You start with 16 bits and 4K of RAM, all ready-to-go on an 8½" x 10" board. You pay just $634 in 100's. You solve the tough make-or-buy problem easily. And you can use all the fully-developed software from our famous PDP-11 family.

But if you want things even easier, you can buy your LSI-11 in a box, complete with power supply and fans. It's called the PDP-11/03, it's the one in the middle, and it costs just $2495 in single quantities.

Easiest of all, especially for complex systems development, is the PDP-11V03 on the right. It gives you a roll-around cabinet with an 8K LSI-11 in a box, an RXV-11 Dual Floppy Disc Drive and bootstrap for mass program storage, and our RT11 operating system — plus your choice of video or hard-copy keyboard terminal. It sells for a low package price of just $10,450 in single quantities.

Of course, once you see how much the LSI-11 in these last two models can do, you can go back to the board version for your production run.
And at $634, that's not hard to take either.

Europe: 81 Route de l'Aire, 1211 Geneva 26, Tel. 42 79 50.

*Prices apply to USA only.
Our curve was straight.

Advanced Micro Devices announces the 100-piece price for the Am9080A and Am2901: $21.00. Just like we said.
Last year, we predicted the price would be just over $20.00. We even drew a curve. Now it's happened. And that's only the beginning.

Look:

**Am9080A.** It's built with an advanced ion-implanted, n-channel, silicon-gate process that permits versions with speeds to 250 nanoseconds cycle time (one microsecond instruction time). Our low power (800mW maximum) gives you cooler running systems, less power drain and better reliability. The superior output drive (3.2mA @ 0.4V) gives increased design flexibility and improved margins.

**Am2901.** It's bipolar, for systems that rely on high speed. It can do a 16-bit register-to-register add in just 145 nanoseconds. It has 16 working registers in a cycle-saving, two-address architecture, and is controlled by nine instruction lines that permit it to do almost anything you can think of.

Another thing. Advanced Micro Devices offers a full line of support circuits for either unit-support circuits that optimize your system, not compromise it.

Whether you can best use the MOS Am9080A or the bipolar Am2901, you can now do it for less. $21.00 in 100-piece quantities. Just like the curve said.

Build a compact microcomputer by starting with a µP like the 8080 and surrounding it with peripheral LSI interfaces that can be programmed for specific jobs.

Systems based on the single-chip 8080 µP can be built with far fewer components than has been possible until now. What makes the parts reduction possible is the availability of programmable LSI interface circuits.

These programmable I/O and peripheral devices provide the means to standardize hardware designs for system interfaces. They can be used to upgrade or replace specialized logic assemblies involving scores of conventional digital circuits.

An additional benefit of these peripheral LSI circuits: they simplify microcomputer design. Since the bus standardizes the internal interface structure, a system designer's main task reduces to that of organizing external interface and interrupt structures. The complete 8080 system can be used as an interrupt-driven system in on-line computation and control applications.

Basic system components

The 8080 microcomputer system (MCS-80) consists of a family of n-channel MOS and Schottky-bipolar devices, and development support products (Tables 1 and 2). It is based on the 8080A CPU group, which consists of an 8080A 8-bit central processing unit, an 8224 clock generator and an 8228 system controller. The CPU can directly address up to 65,536 bytes of memory and 512 I/O ports (256 input, 256 output ports).

Bipolar timing, bus control and drive functions normally required to support the CPU are integrated into the 8224 and 8228. Major I/O

and peripheral units are programmable: they are both configured and controlled by software. The I/O units provide serial data and parallel I/O; the peripheral units augment the CPU group's control capability by managing multilevel interrupts, peripheral-service timings, and direct-memory access (DMA). Memory components have industry-standard configurations.

The CPU options provide typical instruction cycle times as low as 1.35 \( \mu s \) in the commercial temperature range and 2 \( \mu s \) in the military range (M8080A). Introduced in 1974 as the first NMOS CPU, the 8080 has become an industry standard. It now accounts for more than half of all microcomputer applications, and components are being widely second-sourced.

### Microcomputer architecture

The 8080-based microcomputer features a modular architecture (Fig. 1). The CPU group represents the only dedicated components in the \( \mu C \) (Fig. 2). The remaining subsystems—memory, I/O and peripheral control—are modular. They are constructed by use of other components in building-block fashion on the bus.

The CPU group standardizes system-bus control logic and ac timing and dc electrical characteristics. Other components interface directly with the group via the bus. Thus, the over-all design is comparable to that of a computer with standardized "mainframe" logic and modular peripherals that plug into the bus.

The system bus consists of three groups of interconnections: \( A_0 \) to \( A_{15} \), a three-state bus used by the CPU to address memory locations and to select ports; \( DB_0 \) to \( DB_7 \), a bidirectional, three-state bus driven by the 8228 and used for all information transfers; and the control bus. The latter includes control lines operated by the 8228, which gates selected devices on and off the data bus.

The bus is TTL compatible and is driven by the CPU group at or above TTL drive levels (1.9 mA on all 8080A outputs and typically 10 mA for the 8228). In general, bus buffers—or bidirectional driver and decoder units—are required only in large systems.

The CPU group performs the following:
- Makes all CPU inputs essentially asynchronous. Selected device operations align with CPU operations regardless of the device's operating times.
- Stabilizes the data bus to ensure the validity of transferred data.
- Sinks and sources the currents required to maintain direct component-to-bus interfacing as the system expands outward from the CPU group.

### Programmable peripherals

The key I/O and peripheral devices are these:
- 8255 programmable peripheral interface, which provides three ports (24 lines) for parallel I/O and control.
- 8251 programmable communications interface, a universal synchronous/asynchronous receiver/transmitter (USART) for serial data I/O.
- 8259 programmable interrupt controller, which allows eight levels of priority-interrupt control, expandable to 64 levels.
- 8233 programmable interval timer, which consists of three 16-bit BCD/binary counters. The circuit may be used to set system-timing delays, replacing software-timing loops.
- 8257 programmable DMA controller, which offers four channels of direct-memory-access control for bulk-data transfers between peripheral equipment and RAM.

A designer seeking to use these devices chooses control words and algorithms from sets supplied for each device. He then adds them to the initialization or service routines of the system-application program. Initialization control words, for example, define communication and control configurations of the 8255's 24 I/O lines. Algorithms govern the priorities of the interrupt levels controlled by the 8259.

Of course, since software defines the devices' functions, it can also be used to change them. One method is to use control words as replace-
Microprocessor architecture

The nucleus of an 8080-based system is, of course, the CPU, a single-chip, 8-bit parallel processor.

In turn, an important part of the CPU is its register section, a static RAM array organized into six 16-bit registers. The array's six 8-bit general-purpose registers (they may be addressed individually or in pairs) provide single or double-precision (16-bit) operators.

Up to 64-kilobytes of memory may be directly addressed. The stack pointer allows any portion of RAM memory to be used as an external stack, so that subroutine nesting is bounded only by memory size. The stack can be used to store the contents of the program counter, flags, accumulator and all six general-purpose registers.

The arithmetic logic unit (ALU) performs arithmetic, logic and shift/rotate operations. Associated with it are an 8-bit accumulator, and 8-bit temporary accumulator, and a 5-bit flag register (zero, carry, sign, parity, auxiliary carry). Testing the auxiliary carry for decimal correction allows decimal arithmetic to be performed.

Accumulator-group instructions include arithmetic and logic operators with direct, register-indirect and immediate-addressing modes. Move, load and store-instruction groups can be used to move either 8 or 16-bits of data between memory, the six general-purpose working registers and the accumulator. In each of these cases, the same addressing mode can be used. Jump, jump conditional and computed jumps provide program branching.

Calls to and returns from subroutines can be made conditionally and unconditionally. RST (restart) provides a single-byte Call instruction for interrupt operation. This Call saves the contents of the program counter upon completion of the current instruction and points to any of eight memory locations usable as the start of an interrupt-service routine. RST is normally initiated by the peripheral logic, which can also generate additional Call instruction bytes for vectoring to more than eight interrupt levels.

A basic instruction cycle is four states long (T1 through T4). For example, adding the contents of an 8-bit general-purpose register to the accumulator (ADD r) requires three states for the instruction fetch and one state for execution. Some instructions take two execution states.

A machine cycle is required for each fetch and for each memory or I/O access. Each instruction cycle must begin with a fetch, but other machine cycles may be used in succession, between the fetch and the execution state or states.

The first machine cycle of an interrupt operation resembles a fetch but does not increment the program counter. Thus, when the peripheral logic generates the Call, the program-counter contents are automatically saved. Other system-status information can also be saved in the RAM stack. The stack pointer automatically provides for retrieval of the interrupted program address upon completion of the interrupt.

A Hold input causes the CPU to complete an instruction's execution, then come to rest. Hold is generally used during DMA operations. In this case, the CPU doesn't use the bus during the last two states (T4 and T5), so DMA operations can overlap instruction cycles.

A Ready input inserts a Wait state (or states) after T2. The Halt instruction stops the CPU in the next machine cycle after T2. A Reset, Hold or Interrupt brings the CPU out of Halt.
Instruction set and programming methods

The basic instruction set of the 8080 can be divided, for convenience, into data-transfer, arithmetic, logic and branch groups. The final division is stack, I/O and machine control (see instruction table).

The first byte of an instruction is an operation code. The op code is supplemented in many cases by one or two address or data bytes. Data stored in memory or registers may be addressed in one of four modes:

- Direct—a memory address of the data is contained in bytes 2 and 3 of the instruction;
- Register—the register or register pair containing the data is specified by the instruction;
- Register indirect—a register pair containing the data's memory address is specified by the instruction;
- Immediate—the instruction contains the data, rather than the data address.

Branch instructions specify the next instruction by containing the next instruction address (direct) or by indicating a register pair containing the next instruction address (register indirect).

Two complete sets of software packages are available to the programmer: those resident in the Intellec MDS system, and cross products (available on both computer tape and time-shared computer networks) written in ANSI-standard Fortran IV.

The cross products and resident software generate completely compatible code. Routines written with either method can be linked, emulated and debugged in the microcomputer environment with the Intellec MDS system, which can also be used to combine the debugging of program and hardware design.

Programs can be written with a macro assembler or PL/M compiler (PL/M is Intel's high-level programming language). The macro assemblers translate mnemonics into machine code. PL/M allows programs to be written in a natural algorithmic language and eliminates the need to allocate memory or manage register usage.

An example of a sorting routine written with PL/M appears in Fig. A. The free-form input shown is translated into 8080 object code by the compiler; the programmer can concentrate on the software design structure and system-logic requirements. Fig. B illustrates a macro-assembly approach to programming one of the peripheral components.

able software modules. One set of basic hardware can then be used with various peripheral equipment in different end-products.

Furthermore, operating modes can be changed “on the fly” during system operation. This feature permits dynamic changes in priority levels, thereby enhancing a system’s real-time response. When the CPU determines that particular types of services become more critical than others, it can rearrange the priorities.

All units contain internal control logic and “housekeeping” functions. These reduce CPU overhead software. They enable the CPU to manage the I/O structure with acknowledgements and operating commands after receiving requests for service (interrupt and DMA). Thus they help the CPU perform an increased number of real-time tasks.

Two ways to handle interrupts

All I/O devices, including the 8253 timer, can generate interrupt requests. The 8080 handles interrupts in one of two ways: vectored interrupts and Call structures. In the first case, a vector instruction (RST) “points” the program counter to the specific memory locations to be used as the starting points of service routines. RST acts as a program Call. The vector instruction is generated by an interrupt-control device, and up to eight branches can occur.

In the second case, the CPU’s regular Call structure may still be used. Thus, any location in memory can be the start of a service routine and the number of interrupt levels is bounded only by memory size. Again, the interrupt-control device generates the Call instruction.

Implementing the interrupt-handling techniques are these circuits:
- 8228 system controller, which generates one vector (RST 7). This provides a single-level interrupt control built into the CPU group.
- 8259 programmable interrupt controller, which generates eight Call vectors and can be cascaded for up to 64 service levels.
- 8214 priority-interrupt control unit, which is similar to the 8259, but has fixed priorities, and can be expanded from 8 to 40 levels.

The interface structure may be isolated from memory or may share the memory-address space. This gives the programmer the option of using either I/O or memory-reference instructions (that read, write or operate on data in memory) for I/O operations. Memory-reference instructions can significantly increase throughput in applications requiring frequent I/O data manipulations. Also, they allow more ports to be addressed without decoding, thereby reducing component count.

When a DMA Request is acknowledged, the 8257 takes control of the system bus. It uses the CPU Hold function to suspend CPU operation and transfer blocks of data. Hold Acknowledge tells the DMA controller to take control of the bus.

Operations of the system bus

During each machine cycle, the CPU first addresses the device to be used in the data transfer. Then it sends to the 8228 system controller a status word defining the operation to be performed, and uses the data bus to make the transfer.

The control lines operated by the 8228 handle device input and output gating. The 8228 controls data-bus flow through its bidirectional driver. The status words are translated into specific gating signals: “write” signals MEMW and I/O W, and “read” signals MEMR, I/OR and INTA (interrupt acknowledge).

Bus timing requires that a specific peripheral device should respond to or be prepared to receive valid data within a specific “window” in the CPU cycle. The window is obtained by giving the device time to settle between addressing and gating. Adjustments for devices that have a relatively long cycle time are made with a function called Wait Request (or Ready).

The function, a special feature of the 8080, allows timing signals to be extended without seriously sacrificing CPU speed. For example, a designer can choose an inexpensive memory, one that has an access time of twice the CPU state time. However, typical instruction-cycle time increases only 25 percent. The Ready function inserts a synchronized Wait state into the cycle between addressing and gating, and increases the
cycle from four states to five. Using other methods, the clock period would be doubled, resulting in a 100% increase in cycle time.

The Ready control can be used to insert one or more Wait states into every machine cycle, or it can be used selectively to accommodate different devices. Ready control also simplifies single-step operations.

During each cycle the CPU also sends to the 8228 various gating commands (Data Bus In, Write, and Hold Acknowledge). Other commands include Interrupt Enable, which is used to permit or inhibit interrupts, and Wait, which signifies that an idling state is in progress.

Memories needn't slow the system

Typical memory organizations and memory-to-bus connections are indicated in Fig. 3. In large memory arrays, drivers and 8205 one-of-eight decoders may be added as bus interfaces.

Access times have no effect on component-to-bus interfaces. The 8111 256 x 4-bit static RAM and 8316A 2048 x 8-bit ROM, for example, have maximum access times of 850 ns while the CPU can operate at a state time of 480 ns or less. A Wait state is simply inserted into the cycle time. If the designer decides to change to faster memory, the logic element used to activate the 8224's Ready Input is simply removed.

Available EPROMS (erasable and electrically reprogrammable PROMS) are interchangeable with the 8316A, mask-programmed ROMs. The EPROMS are 24-pin static devices with three-state, byte-wide outputs. The 8316A 16-kilobits ROM is generally used to double storage density after program development with an 8708 8-k EPROM.

The 8107B 4-k dynamic RAM may be used for large memories. An available 16-kilobyte dynamic-RAM board (Model in-481) matches CPU speed and synchronizes memory-to-CPU operations. Also, Schottky-bipolar PROMs and ROMs are available for very fast program storage.

Organizing the system interface

The organization of I/O and peripheral devices can proceed in one of three ways: isolated or memory-mapped, or a combination of each (Fig. 4). When memory and I/O are controlled separately, up to 65,536 memory bytes and 512 input and output ports can be directly addressed.

With memory mapping, the I/O is controlled by memory-control lines and operated with memory-reference instructions. I/O shares the memory-address space, and a memory-address bit is typically used as a flag to denote that an I/O operation is occurring. A combination of the two techniques is exemplified by a memory-mapped scheme for I/O devices, and isolated I/O for peripheral units.

The memory-mapped approach is often advantageous for complex structures, because memory-reference instructions offer numerous shortcuts in I/O data manipulation. Further, substantial I/O structures can be operated without address decoders.

In either case, two port-selection (or port-addressing) methods apply—linear or decoded select. With linear select, a single address bit forms an exclusive enable for a specific device, and no decoders are used. In decoded select, the address bus is decoded into exclusive enables to maximize the number of directly accessible ports.

Memory-mapped I/O with linear select makes
up to 39 ports (up to 312 I/O lines) available without decoders. If this technique is used for I/O devices, an isolated I/O and linear-select method can still be used for peripheral devices. With decoded select, either method provides a structure of practically unlimited size.

Design and development aids

For design prototyping, Intel supplies the SDK-80 system design kit, which contains the following:
- A basic 8080 system—8080A CPU group, two 8111 static RAMs, two 8708 EPROMs, plus the 8251 and 8255 peripheral circuits. One of the EPROMs is pre-programmed with a system monitor;
- PC board, discrete components, sockets and other hardware. The board is pre-drilled for expansion and has an area for adding wrapped-wire interconnections;
- Design and operating manuals.

Software and hardware development are supported by the Intel MDS (microcomputer development system) and the ICE-80 in-circuit emulator subsystem. The basic MDS contains an 8080 system, with optional peripherals, and resident software.

The MDS can be used for program generation, assembly, emulation, and debugging. It can also be used as a system prototyping tool. Software includes a monitor and a disc-operating system as well as programming packages.

The ICE-80 module and its supporting software offer two unique development features:
1. Debugging in the actual operating environment. Since ICE-80 plugs into the 8080A CPU socket on the microcomputer board, all operations of the system bus can be controlled and analyzed through the MDS console. An auxiliary connector can be used to observe the operations of external devices;
2. Debugging can be done through the console, with readily understandable commands. Also, symbols can be used to refer to critical program labels and parameters, rather than to absolute memory locations.

An example of a system based on the 8080 is the SBC-80/10 Single Board Computer. It contains a general-purpose 8-bit microcomputer designed to be used as a plug-in component. (see “$295 μC-on-board Aims to Satisfy Most Requirements,” this issue, p. 54). **

The first article in the series appeared in the April 26 issue. The next article will discuss the F8 μP.
We've improved our Mini-Mag magnetic circuit breakers.

Broader line. Improved design. Easier to order. And more available.

New code designations, easy to understand and use in specifying and ordering.

New positive latching mechanism, greater repeatability, more positive feeling toggle action.

Mini-Mag yesterday and Mini-Mag today look alike outside. We wouldn't want to change that. Inside is where the big difference is; design changes provide greater dependability and improved performance. Latching, repeatability and toggle action have all been improved for reliable, low cost circuit protection.

And, don't overlook the intriguing possibilities for protecting semiconductor devices. Mini-Mag circuit breakers may be used to protect solid-state switches such as SCRs, triacs, power diodes, power transistors, and solid state relays. Circuit clearing time is as fast as 10 milliseconds.

Did we say the Mini-Mag is more available? You bet! One hundred authorized distributors stock Wood Electric Mini-Mag circuit breakers nationally. Sound good? Works out even better when you set up a local stocking program for delivery of exactly what you need on a pre-arranged schedule.

Mini-Mag circuit breakers, UL and CSA Recognized, can now be specified in 330 standard distributor stock models, thousands more when you order direct from the factory.

Best of all, our new code designators give you an easier-to-use, more error free part numbering system for specifying and ordering improved Mini-Mag circuit breakers.

Log data under $\mu P$ control and enjoy the benefits of software flexibility. Among the advantages: reformattable interfaces and less hardware.

Consider a microprocessor-based data logger before you settle on the usual methods. The $\mu P$ unit offers far more flexibility and less bulk than conventional loggers. With it, you can reduce component count by transferring printer interface and synchronization problems from hardware to software. Such an interface can easily accommodate printer format/font changes or implement new ideas or market trends.

The arithmetic logic unit (ALU) of the processor provides arithmetic functions—a natural addition to an upgraded data logger that, with the addition of memory (RAM), provides the desired data handling.

One intelligent data logger mates a $\mu P$, an a/d converter and a printer (Fig. 1) to provide the following features:

- Autoranging of the a/d converter.
- Printout of days, hours, minutes and seconds along with the a/d reading.
- Direct printer drive.
- Programmable intervals of time between printings.
- Programmable changes of the analog variable between printings.
- Calculation and storage of maximum and time of occurrence.
- Calculation and storage of minimum and time of occurrence.
- Calculation of mean.
- Presettable time.

Which $\mu P$ is best?

Evaluation of $\mu P$s for an intelligent logger centers around two important points. First, man-machine interaction requires the ability to handle BCD easily. This points to decimally based $\mu P$s, often four-bit devices. Second, the time-keeping algorithm of the logger requires a $\mu P$ with an interrupt system.

The BCD coding format is preferred for applications in which numbers are made available for human use at some point. Rather than converting from other coding systems to BCD then back again, it makes more programming sense to stay within a single format like BCD, and use devices that excel in handling this format.

Typical numeric printers work with decimally based characters, a set that often uses the full four-bit capability of BCD to give 16 characters: 10 decimal digits and six other characters.

Several available $\mu P$s have a calculator architecture specifically designed to manipulate and store decimal digits. These $\mu P$s handle decimal arithmetic with special “decimal adjust” instructions that maintain the BCD format. The four-bit $\mu P$ is a natural for all BCD data-handling applications in which low speed is not a problem. An added bonus: four-bit $\mu P$s are inexpensive.

It follows also that the a/d converter used in a $\mu P$-printer application should provide data in BCD—a multiplexed-output format of parallel bits/serial digits provides the easiest interface with the $\mu P$. This allows each four-bit BCD digit to be taken as one nibble (1/2 byte) at a four-bit input port. Digit-select outputs can mark the appropriate digits.

The fundamental blocks of the intelligent data logger are the Siliconix LD110/111 3-1/2-digit a/d converter, the Intel MCS-40 (4040 $\mu P$) system and the Seiko EP-101 printer.

Gary Grandbois, Applications Engineer, Siliconix, Inc., 2201 Laurelwood Rd., Santa Clara, CA 95054.
2. In the complete logger, the input signal is attenuated to 200 mV full scale, then converted to a 3-1/2-digit word for the μP. Program instructions reside in the ROM, and processed data in the RAM.

The two-chip converter offers a number of outstanding features, including autozero and autopolarity, and incorporates all of the necessary precision linear circuitry, digital housekeeping and analog switching.

The output format of the LD110, a multiplexed BCD, is useful for both display and µP applications. Unlike other 3-1/2-digit converters, the MSB (1/2 digit) is not brought out as a static signal on an additional pin, but is multiplexed as though it were an additional digit. This minimizes the input requirements of the µP system by eliminating software and an additional port.

Ideal applications for the logger are those in which slowly varying analog quantities—temperature, pollution, lighting levels, noise—must be monitored. Since high-speed conversion isn’t essential, an integrating a/d is the obvious choice and errors caused by extraneous noise are minimized. In addition, the outstanding stability of the integrating converter makes it especially useful for monitoring analog quantities under adverse environments.

No drift to worry about

The LD110/111 autozeroing system eliminates zero-offset drift over time and temperature, and the low gain tempco of the system (typically 25 ppm/°C) reduces full-scale drift over temperature. The very high input impedance (over 1000 MΩ) of the LD111 eliminates source-loading errors of high-impedance transducers.

Features of the 4040 that make this µP a logical choice for a data logger include: (1) a four-bit decimally based ALU; (2) interrupt capability; (3) 24 working registers; (4) subroutine nesting to 7 levels; and (5) extensive hardware and software backup.

The Seiko EP-101 is representative of the electromechanical “flying” class in which printing occurs when a mechanical hammer is actuated as a character drum rotates under the paper. A history of reliable operation, clean copy and low cost make this unit an attractive choice.

Interface for the hammer drive is readily achieved since the large drive current demanded by electrically driven hammers isn’t needed here. Instead, low-power solenoids release a mechanical hammer driver (a rotating ratchet). Microprocessor interface to the hammer-release solenoids is achieved through standard dual peripheral drivers (75451).

In the complete data logger, the ranging switch attenuates the monitored analog signal according to µP control (Fig. 2). This attenuated (properly
ranged) signal is converted to a 3-1/2-digit word, and the digitized value enters the \( \mu P \) system through the input/output (I/O) ports. An interrupt pulse originating in the a/d converter initiates pick-up of data.

Interrupts occur at precise time intervals because the converter is clocked by the MCS-40's crystal-controlled generator. The interrupts thus provide the means of keeping accurate time.

Also included in the MCS-40 system are RAM, ROM and I/O. Program instructions reside in ROM, and processed data in RAM. The I/O ports provide communication with both the a/d and the printer, which produces hard copy from RAM data.

As shown in Fig. 2, the DG201 CMOS quad switch and the associated resistor ladder comprise the autoranging input circuitry. The autorange switch is driven by a four-bit output port (ROM port 3).

The DG201 switch connects the appropriate range resistor to ground, thereby giving the proper input attenuation—X 10, X 100, X 1000, X 10,000—for the 2, 20, 200 and 1000-V ranges, respectively. The LD110 analog processor is programmed for exactly 200 mV full-scale, and all inputs are attenuated to this level.

**Tempco is kept down**

Reference for the a/d is developed by the 2N4274, configured as a temperature-compensated zener. The CR160 current-regulator diode properly biases this zener to give a very low tempco (typically 20 ppm/°C). Output data from the LD110/111 are applied to input port \( \phi \) of the 4308 ROM.

Port 1 accepts the polarity bit and the digit-1 strobe, used for overrange determination. Note that port 1 is shared with the two printer timing signals. Presetting the time during initialization and programming of print intervals are both accomplished through port 2.

Two-phase clocking functions for both the MCS-40 and the converter are derived from the 4201 crystal-controlled clock generator. This IC provides both MOS (\( \phi_1 \), \( \phi_2 \)) and TTL (\( \phi_{\text{UT}} \), \( \phi_{\text{T}} \)) levels, and its frequency is the basic oscillator rate divided by seven. A power-on reset function is also provided by the 4201.

The MOS outputs drive the MCS-40, while a CD4024 binary counter divides the TTL output frequency of 655.36 kHz by 2\(^5\) to yield an a/d clock frequency of 20.48 kHz. This rate offers many advantages; with it, the a/d provides maximum line-frequency rejection (NMRR) for both 50 and 60 Hz. It is able to do so because the measurement interval is a multiple of both the 50 and 60-Hz periods. Thus:

\[
T_{\text{meas}} = \frac{2048}{f_{\text{clock}}} = \frac{N_1}{60} = \frac{N_2}{50},
\]

where \( f_{\text{clock}} = 20.48 \text{kHz} \), and \( N_1 \) and \( N_2 \) are integers; \( N_1 = 6, N_2 = 5 \).

(Note that the sampling period is split into two intervals: zeroing and measurement; hence the M/Z line.)

Thus only the average value of the line noise contributes errors to the reading. A second significant reason for choosing the 20.48-kHz clock frequency is that it gives 10 conversions every 3 s:

\[
\text{Sampling rate} = \frac{20.48 \text{kHz}}{6144 \text{cycles/sample}} = \frac{10}{3} \text{samples/s}.
\]

With this sample rate—by interruption of the 4040 \( \mu P \) after every sample—a timekeeping system is readily implemented. The \( \mu P \) merely counts each interruption and adds 3 to a counter for every 10 interruptions. The 3-s increment lends itself to easy turnover at 60 s (200 samples).

To interrupt, the M/Z line of the a/d triggers a 74C221 one-shot. The resulting pulse is level shifted by transistor Q\(_2\) and has a pulse width less than the minimum amount of time required to service the interrupt. The \( \mu P \) system also depends on this interrupt for proper synchronization with the a/d (Fig. 3).

With the \( \phi_1 \) and \( \phi_2 \) clock signals, the 4040 generates a signal every machine cycle (8 clock intervals) that synchronizes the RAMs and ROMs to the addresses that subsequently appear on the four-bit data bus (\( D_0, D_1, D_2, D_3 \)). The two 320-bit RAMs each provide a four-bit output port.

Two bits of RAM port \( \phi \) actuate the printer.
4. The logger's program resides in four ROM pages: page 0 stores housekeeping; 1 handles maximum, minimum and mean values; page 2 handles comparisons. Page 3 stores printing and start-up.
ribbon and paper-advance solenoids. Interface to each of the solenoids is implemented with a single power MOSFET, the VMP-1. This recently introduced device is a voltage-activated power transistor that provides 1 A of current sinking with 10 V of enhancement.

Port 1 of the RAM loads and enables the data to the two cascaded 10-bit shift registers (4003s). The outputs of these registers—interfaced to TTL through 5.6-kΩ pull-down resistors—drive the 75471 dual peripheral drivers which, in turn, activate the printer hammers.

The 4002 RAMs have 320 bits (4 × 80) of memory arranged in a calculator format of four sets of 16 four-bit digits. Each four-digit set is called a character, and each set of 16 characters (a column) is called a register. This 16-bit row by 16-bit column is obviously ideal for a 16-column printer with a 16-character wheel.

Four additional status characters, which normally serve as signs and exponents, are used to store decimal points in the logger.

For program memory, a 4308 ROM provides 1024 eight-bit words of μP instruction and four 4-bit I/O ports, three of which act as inputs and one as an output. The 4308 converts the three 4-bit ROM-address nibbles, sent out by the CPU, to a 12-bit address. The eight-bit instruction fetched from ROM is converted into two 4-bit nibbles by the 4308 and is sent to the CPU via the data bus.

The μP must synchronize with the printer's character and ratchet wheels before printing can start. Two magnetic detecting heads provide the proper signals to identify the position of these two wheels. The pulse outputs of the detectors—designated as T for ratchet and R for character wheel—are amplified by Q₃ and Q₄ to the 5-V logic level required at the ROM input port.

Program memory of the data logger is composed of 1024 eight-bit words broken into four sets of 256 words (four pages). All four pages reside in the 4308 ROM (Fig. 4).

Page 0 largely handles timekeeping and datapickup functions; page 1 takes care of minimums, maximums and mean values; and page 2 involves the time and reading examinations leading to printing at appropriate intervals. The printing routine resides on page 3, along with the program-initialization routine.

After the μP interrupt has been enabled, the 4040 acknowledges an interrupt by going to ROM location 003 (instruction 03 on page 0) for instructions. Since the program starts at 000, the first three words serve to branch to the initialization routine on page 3. The routine first establishes the proper printer-interface states, so that all hammers and solenoids are off. Then the routine examines the state of the “test” input of the 4040 CPU.

When the “test” input changes state, the program reads the four bits of ROM port 2 and loads the bits into the time RAM locations. The program reads four sets of four bits representing the present time in hours and minutes (days and seconds are reset to zero).

At the end of the initialization routine, the interrupt capability of the CPU is enabled and

| Table 5. Interrupt timing signals for the μP/converter: The BCD data are read-in at the digit-1 strobe. | Table 6. Output format of the LD110 a/d converter consists of parallel BCD in an interlaced scan (digits 1, 3, 2, 4). |
the program goes into a print-enable examination loop. If a print flag has been set, the program goes into the print mode; otherwise, the program waits for an interrupt.

A complete a/d conversion is signalled by the interrupt pulse. The CPU program counter returns to location 003, where the conversion counter is incremented. If the interrupt doesn’t occur during a printing cycle, the carry bits continue rippling through the seconds, tens of seconds, minutes, tens of minutes, hours, tens of hours, days and tens of days.

If a print cycle is interrupted, the program immediately returns to the next instruction in the printing operation.

With the completion of the time-keeping chores, the instructions lead into the pick-up of the BCD data from the a/d converter. Because of a short override interval, the output of the LD110’s multiplexer may not be valid for the preceding conversion. Consequently, data pick-up is inhibited until the start of the second digit scan.

Since there are four μP machine cycles for every LD110 clock interval, and since the digit scan takes 32 intervals, the program takes 128 machine cycles before it looks for the data.

Prior to this sequence, however, the program examines bit four of the digit-four time slot (at ROM port 0). If this bit is a ONE— the underrange signal (count < 100)— the program will down-range the DG201 switch to increase a/d sensitivity by a factor of 10. Reading of the BCD data at the input port starts during the LD110 digit-1 strobe (Fig. 5).

The overrange condition (count > 2000) occurs on the digit-1 time slot and forces the digits low during the zeroing interval. In the program, the overrange signal causes the DG201 to up-range and decrease sensitivity by a factor of 10.

The absence of either out-of-range signal tells the program to process all four digits available at ROM port 0. The digits enter during the successive four digit times of the LD110 and are written into RAM 0, register 0, characters 0 through four.

The polarity bit, picked up during the over-range test, is converted into the proper printer character code (10 or 11 for + or −, respectively) and written into RAM.

Since the LD110 provides the digits in an interlaced scan of digits 1, 3, 2, and 4 (D1 = LSB), digits 2 and 3 must be exchanged in memory. The memory locations of the stored a/d and time data are given in Fig. 7. Following the data pick-up are the handling processes that establish minimum, maximum and mean.

**Calculation of data properties**

The new data are first compared with the present minimum and maximum. If the absolute value is less than that of the present minimum, a new minimum and time of occurrence are written into register 1 of RAM 0. If the magnitude is greater than the present maximum, the data and time of occurrence are entered into register 2 of RAM 0.

All of the comparisons take into account the floating decimal point provided by the autoranging a/d converter. Algebraic minimums and maximums can be kept if the sign bit is considered. Then, the minimum is either a minimum positive value or a maximum negative value. The maximum is either a maximum positive value or a minimum negative value.

Mean determination follows the min/max tests. A conversion counter keeps a tabulation of conversions (interrupts). Every 100,000 conversions, or 8 h and 20 min, a new mean is determined. At this time a print flag is set (a non-zero number in index register 15) to print the mean and the minimum and maximum.

Progressing to the averaging process, the program provides the necessary left or right shifting of the new data to reflect the decimal point relationship of the two numbers.

A comparison of the mean-summations’ polarity bit with that of the latest data, routes the program through either the addition or subtraction routine as necessary. A very small mean summation can give a subtraction result less than zero. This possibility is avoided by monitoring of the carry bit after each subtraction.

When 100,000 readings have been summed, the four MSDs of the mean summation are written

---

7. Memory organization of the RAM: 320 bits are arranged in four sets of 16 four-bit digits.

**Electronic Design**, 10, May 10, 1976
The interrupt routine terminates after the actual printing procedure: The decimal-point location must be read, and the proper column located, before the map is completed. The decimal point does not occupy a separate location on the printed line but is simply a second hammer strike in that column.

With the memory map complete, the program checks for ribbon color and adjusts the ribbon position as necessary. The program is now ready for the actual printing procedure:

It synchronizes to the printer by polling ROM port 1 until the reset (R) pulse appears. This signal coincides with the appearance of character 0 under the hammers. The R pulse is also coincident with T1, the pulse that signals that the hammer
mer must be disabled. For the next 16 characters (one line), the program ignores the R signal.

As shown in Fig. 9, the shift registers are loaded following T₁. Row (character) 0 of the memory map is shifted bit-by-bit through RAM 1 output port into the two cascaded 10-bit registers. One bit of the port provides the data line, the second provides the clocking function, and the third provides the shift-register enable, whereby the internal state of the bits appears at the parallel outputs.

**Hammer drives are enabled**

After all the bits are shifted out, ROM port 1 is again polled for timing signal Tₚ. The 12.2-μs machine cycle time allows the µP to load this data in much less than the 5 ms time between pulses. The appearance of Tₚ enables the shift-register outputs which, in turn, activate the 75451 hammer drivers. (A ZERO at the register output enables the hammer drive.)

The program then awaits the return of the T₁ pulse. When T₁ appears, the hammers are disabled, and the next row (character) of the memory map loads into the shift registers. The printed line is completed after 16 iterations and the paper and ribbon are advanced.

If more than one line is to be printed (mean output), the cycle continues on to print the mean, the minimum and its time of occurrence, and the maximum and its time of occurrence.

After exiting from the print mode, the last a/d reading enters into memory. This last printed reading is used for difference comparisons with future data. **

---

**If we haven't made the mechanical filter you need yet, we can.**

The worldwide reputation of Collins’ standard mechanical filters is the same today as it has been for the past two decades: high quality and reliability. Their excellent rejection of unwanted signals has been demonstrated in applications ranging from CB transceivers to missile guidance systems.

Today, as a direct result of our years of experience in these diverse applications, we have a cost-effective solution to your filtering problems readily available.

Moreover, we have the engineering know-how to create an original design concept for your custom requirements.

For information call or write: Mechanical Filters Marketing, Collins Radio Group, Rockwell International, 4311 Jamboree Road, Newport Beach, California 92663. Phone: 714/833-4632.
This display makes oscilloscope timing measurements easier, faster and more accurate.

Main sweep has two intensified zones.
Two intensified zones on the main sweep correspond to the two expanded, delayed sweeps shown below. They are quickly and independently positioned to provide a visual approximation of the \( \Delta \) time measurement.

Two intensified zones on the main sweep correspond to the two expanded, delayed sweeps shown below. They are quickly and independently positioned to provide a visual approximation of the \( \Delta \) time measurement.

Sweep rates displayed digitally.
Digital CRT readout displays both sweep rates for measurement ease and convenient photographic documentation. To the left is the main sweep rate and to the right is the sweep rate for the two alternate (or delayed) sweeps.

Time difference is computed and displayed digitally.
The time difference (\( \Delta \) time) between each of delayed sweeps (or intensified zones) is digitally computed and displayed directly on the CRT for swift and convenient measurement. When similar points on each of the alternate delayed traces are aligned, the \( \Delta \) time readout gives you a highly accurate measurement of the time between the points.

CRT display, photographed on a 7904 oscilloscope, shown full size.

102 ELECTRONIC DESIGN 10, May 10, 1976
Only these new plug-in time bases make it possible.

Controls position both intensified zones.
DELAY TIME positions the first intensified zone. \( \triangle \) TIME positions the second intensified zone relative to the first. The \( \triangle \) delay time value — the time between the two intensified zones — is presented digitally on the CRT.

Alternate traces can be separated.
TRACE SEPARATION activates the \( \triangle \) delay time mode and permits the two delayed traces to be vertically positioned with respect to each other for your most convenient display.

Triggering.
Peak-to-peak automatic triggering offers a continuously triggered display regardless of changes in signal amplitude or frequency. Trigger bandwidth is 400 MHz with trigger sensitivity at least 250 mV.

Trigger holdoff adjustable.
Variable trigger holdoff allows you to obtain stable displays on complex signals like digital data trains.

7B80 sweep rates.
The alternate (delayed) sweeps can be set to any rate up to 1 ns/division on the 7B80. Naturally, other 7000 Series time bases with different performance features can be used with the 7B85 to make \( \triangle \) time delay measurements.

Optional X-Y mode.
For phase relationship measurements, an optional X-Y mode routes the X (horizontal) signal from an oscilloscope vertical amplifier to the horizontal sweep unit without changing input probes.

Here’s how to get more information

Your nearby Tektronix Field Engineer will be happy to show you how these new time bases combine with a 7000-Series oscilloscope mainframe and other 7000-Series plug-in instrumentation to fit your measurement needs. Just call your local Tektronix Field Office or send the coupon to Tektronix, Inc., P.O. Box 500, Beaverton, OR 97077. In Europe, Tektronix Limited, P.O. Box 36, St. Peter Port, Guernsey, Channel Islands.

The 7000 Series...more than an oscilloscope
Graphic-input terminal allows easy writing

A freehand-writing graphic-input terminal that has a simple, sensitive surface and that can be used with any type of stylus, has been developed. The writing surface can be covered with paper to produce hard copy.

Designed at the National Physical Laboratory, London, England, the graphic terminal consists of two orthogonal resistive strips separated by an air gap. Pressure from writing on the upper strip, which is flexible, deforms it into contact with the lower strip. Electrodes are connected across the ends of the strips so that when a current is passed through one strip a uniform voltage gradient is produced.

The voltage at the point of contact is proportional to the position on the X-axis (see Fig.) The second strip acts as the wiper of the potentiometer formed by the first strip. To obtain the Y-coordinate of the point of contact, the functions of the two strips are interchanged by an electronic switch. If the reversals are repeated sufficiently fast, there is a continuous sampling of the X and Y coordinates of the path traced by the moving stylus. In computer sys-

FREEHAND GRAPHIC TERMINAL

Terminal strip input/output connections on these miniature power modules eliminate the need for sockets or soldering. They mount in an area only 3.5" x 2.5". Ratings: 5 volt models to 2.5 amps, ±15 volts to .5 amps. Other models from 1 to 75 volts, all with 3-day shipment guaranteed.

Drive relays, lamps, small motors and similar loads with low-cost Acopian unregulated power modules. Built-in fusing protects against overloads or shorts. Series U models use terminal strip connections. Plug-in modules mount in standard octal sockets; many have adjustable outputs. Guaranteed 3-day shipment.
tems an a/d converter is used to produce a binary representation of the two coordinates.

The input terminal, called Chit, is low in cost and requires only four electrical connections to the writing tablet, which is tolerant of external fields. The surface can be sealed to prevent damage. Since the operation is independent of the absolute value of the strip resistance, a wide range of operating temperatures is allowed.

Solar cell panel adds efficiency and protection

Increased efficiency and protection for solar-cell batteries has been achieved with a new manufacturing technique developed by Mullard of London. These batteries are used for radio repeaters on mountain tops, equipment in desert regions and radio beacons at sea.

The technique consists of embedding the solar-cell array in a flat, molded panel of transparent plastic. Sunlight falling on the solar cells produces electrical energy. Sunlight passes through the transparent, structural areas of the panel with low heat absorption. This minimizes the panel's over-all temperature rise and the cell's operating temperature, thus increasing efficiency.

A typical solar battery contains 34 series-connected cells, each 40-mm in diameter, embedded in a panel measuring $468 \times 365 \times 15$ mm. The array can produce 10.7 W in sunlight.

Improved glass may aid in IC manufacture

A new glass developed specifically for photomasking can overcome the undesirable thermal expansion of the hard glass normally used in photomasks for integrated circuits. This expansion causes a deviation in line width of $1 \mu m/°C$ rise for a $100 \text{mm}^2$ mask.

For LSI with line widths of about six $\mu m$ the expansion is tolerable, but it becomes a problem with very-large-scale integration, which requires line widths of $1 \mu m$.

The Hoya Glass Works, Ltd. of Tokyo has produced an alumina-silicate glass that has an extremely low thermal-expansion coefficient that is not more than 0.3 microns per 100 mm$^2$.

The glass is also three times more resistant to water penetration than current glasses and has a greater resistance to acid corrosion. As a result, etching can be performed with much greater precision and yields of very high-density ICs should be improved.

Low-light underwater TV

A highly sensitive underwater television system that requires little if any artificial lighting has been introduced by EMI Electronics Ltd. of Middlesex, England. The silicon-intensified tube used in the camera is said to be some 2500 times more sensitive than a standard vidicon tube.
CMOS analog switches can precisely control an op-amp’s gain

CMOS analog switches, when used in the proper circuit, can accurately control the gain of precision instrument amplifiers (Fig. 1). CMOS switches are inexpensive and consume very little power, but have fairly high ON resistances, r\(_{\text{ON}}\), which typically range from 100 to 300 Ω. The proper use of a CD4052 as a dual-channel multiplexer can overcome this limitation.

Resistors R\(_{1}\) to R\(_{4}\) form a precision network that is ratio-matched to obtain the desired accuracy. Op-amp A, operates as an inverting amplifier whose gain to point X is \((R_{f} + r_{\text{ON}})/R_{f}\). However, at point Y the amplifier gain is accurately defined by \(R_{f}/R_{i}\). Note that r\(_{\text{ON}}\) has no effect on the gain to point Y.

Since the CD4052 can handle input-voltage swings of \(+V_{s}\) to \(-V_{s}\), the clamp network, R\(_{C}\) and D\(_{4}\) to D\(_{1}\), is designed to clamp node X to these limits.

The design provides four decades of gain or attenuation depending upon the value of R\(_{i}\). For gain, set R\(_{i}\) equal to R\(_{f}\); for attenuation, set R\(_{i}\) equal to R\(_{f}\). (See the table in Fig. 1.)

Gordon L. Wong, Project Engineer, Data Tech, Div. of Penril Corp., 2700 S. Fairview Ave., Santa Ana, CA 92704.

1. By use of a dual-channel CMOS multiplexer, an amplifier’s gain can be accurately defined as \(R_{f}/R_{i}\), independently of the ON resistance, r\(_{\text{ON}}\), of the multiplexer.
Our modular dc supplies have always been UGLY™ because we’re designers, not stylists.

But we may have outdone ourselves with our new SOLV-15.

Like all our other single and multiple-output dc supplies, our 15-watt SOLV-15 delivers its full rated output all the way up to +55°C. And its standard features include: a choice of 16 voltages from 5-24V, currents from 3-0.75A; ±0.1% regulation, ripple-and-noise; foldback current limiting; and a 1-year warranty.

But even with all this, it still looked stark.

So we took a stab at making it more attractive by getting it UL-listed and adding sense protection (free), reverse diode protection (free) and a fixed OVP (free). We wrapped it all up in a new low-profile package that uses the same mounting holes as the supplies you’re probably using now.

And then priced it all a couple of bucks under the nearest competition ($23.50, 100-pieces).

We just figured that since it was so UGLY, it was really going to have to deliver.

Elexon: the ugliest dc supplies on earth.

Get UGLY at Cramer, Newark, MIL-COMM, QPL and Utronics. Or call 714/979-4440.
Control a VCO's start and stop phases with a squelch input signal

A voltage-controlled oscillator (VCO) can be built with a squelch feature that can start and stop the oscillations with a predetermined phase.

Built with five standard ECL gates and two discrete transistors, it was originally designed for phased-locked-loop operation at frequencies of about 10 to 15 MHz (Fig. 1). But with the proper timing capacitor, C, the control voltage, Vc, can cover a frequency range from audio to vhf. The upper limit is about 128 MHz with C = 5.1 pF and R1 = R2 = 300 Ω. Type MC10105 gates, which don't have internal output load resistors, are used; otherwise the VCO's frequency range is narrowed.

Two npn transistors form a constant-current source controlled by the input voltage, Vc, to charge and discharge the timing capacitor, C. Gates G1 and G2 form a bistable latch, and gates G3 and G4 “sense” the voltage across capacitor C. Gate G5 can open the feedback loop by inhibiting G1 and G4.

To help in examining the circuit, assume that the squelch input is HIGH, that output Q1 is LOW and that Q2 is HIGH.

With Q1 HIGH, the charge in capacitor C is gradually changed by the constant current, Ic, until the voltage at Q2 becomes equal to the gate's ECL threshold level. Then the output of G1 becomes HIGH and reverses the state of the latch, G1/G4. Note that one of the output emitter followers is always reverse biased.

Now Q1 is HIGH, Q2 is LOW and the voltage at Q becomes

\[ 2V_{\text{H}} - V_{\text{th}} = -2 \times 0.9 \text{ V} + 1.3 \text{ V} = -0.5 \text{ V}. \]

Voltage \( V_{\text{H}} \) is the ECL HIGH output level and \( V_{\text{th}} \) is the ECL input threshold voltage. The next transition occurs after an interval,

\[ t_i = \frac{2}{I_1} C (V_{\text{H}} - V_{\text{th}}), \]

and the transition that follows occurs after an interval

\[ t_o = \frac{2}{I_1} C (V_{\text{H}} - V_{\text{th}}). \]

The oscillation frequency then is

\[ f = \frac{1}{t_i + t_o} = \frac{1}{2 \left( \frac{1}{I_1} + \frac{1}{I_2} \right) (V_{\text{H}} - V_{\text{th}}) C}. \]

The transfer function of the VCO therefore is

\[ \frac{\Delta f}{\Delta V_c} = \frac{1}{2 C (R_1 + R_2) (V_{\text{H}} - V_{\text{th}})} = \frac{1.25}{(R_1 + R_2) C}. \]

Of course to obtain symmetrical output waveforms, R1 and R2 must be equal.

If the squelch input is set LOW, G1 and G4 are inhibited as soon as Q1 also goes LOW. The oscillations stop, but in a known state—with Q1 LOW and Q2 HIGH. And when the squelch input is made HIGH again, the first oscillation transition occurs after the time interval

\[ t = \frac{C}{I_1} (2V_{\text{H}} - V_{\text{L}} - V_{\text{th}}), \]

where \( V_{\text{L}} \) is the ECL LOW output level. In this manner, the oscillation start phase is defined by the rising edge of the squelch signal.

Plots of frequency vs input voltage are shown on Fig. 2 for \( C = 62 \) and 510 pF. For best linearity the control voltage, Vc, should be restricted between \(-1\) and \(-3\) V.

Tests on the circuit showed that for a temperature change from 0 to 80 °C, the frequency change was 2.3% at nominal output of 12 MHz when the control voltage is \(-2\) V. Spectrum analyzer measurements showed that output jitter at 12 MHz was 15 ps.

Todor Bodurov, Senior Engineer, Linear Circuit Development Dept., Memorex Corp., San Tomas at Central Expressway, Santa Clara, CA 95052.

CIRCLE No. 312

1. The squelch input on this VCO can stop and start the oscillations with a predetermined phase.

2. Best linearity of frequency control is obtained when Vc is kept between \(-1\) and \(-3\) V.
When you go shopping for D/A Converters, please swing by PMI. Ever since we opened our doors six years ago, we've been working hard to spice up our shelves with the widest line of μP-compatible monolithic DACs in the industry. 6-, 7-, 8-, 9-, and 10-bit DACs. Current or voltage outputs. Internal or external references. Routine MIL-STD 883A Level B processing, with Level A available. Guaranteed specs over full MIL Temp range. PMI pioneered monolithic DACs. It's only natural to find more here than anywhere.

And if DACs are new to you, lean on PMI's experience. We've helped designers and project managers put dependable PMI monolithic DACs to work in the most unusual spots. How can we help you with your microprocessor?

Also, our price list, DAC data sheets and App. Notes are yours for the asking. Ask your distributor or call your local rep.

Efficient switching controller drives low-power dc servo motor

A high-performance switching controller for a low-power dc servo motor can be built using a symmetrical complementary-transistor bridge (Fig. 1). The bridge acts as a reversing switch between the motor and a single-ended power supply.

Since the transistors operate either fully on or completely off—except during a very short transition period—much less heat is dissipated than in linear-amplifier circuits. Damping is provided by the circuit's inherent dynamic braking. Since either maximum or zero voltage is applied to the motor, dynamic response is faster than that of linear servo drives.

The circuit uses a dual input-amplifier IC in a nonlinear differential configuration and four output driver transistors. The error-signal input has a common-mode voltage, $V_{CM}$, approximately equal to $V_r/2$. Bias levels, $V_B = R_I V_r/2 (R_1 + R_2)$, which appear across resistors $R_1$ and $R_2$, establish an amplifier dead zone. When the absolute value of the error signal $|V_1 - V_2|$ is less than $V_B$, a voltage slightly less than $V_r$ appears across both the amplifier outputs; thus, no base current flows in transistors $Q_1$ and $Q_2$. However, sufficient base current flows via zeners $Z_1$ and $Z_2$ into the bases of transistors $Q_1$ and $Q_2$ to saturate them. The motor, with the help of diodes $D_1$ and $D_2$, is thereby clamped to ground for dynamic braking.

When $(V_1 - V_2) > V_B$, the output of IC$_{1,-}$ is almost equal to $V_r$, while the output of IC$_{1,+}$ is close to ground. Consequently, $Q_1$ and $Q_2$ are cut off, and $Q_3$ and $Q_4$ are saturated on.

Similarly, when $(V_2 - V_1) > V_B$, $Q_3$ and $Q_4$ are cut off, and $Q_1$ and $Q_2$ are on. Thus the transistors act as a reversing switch controlled by the voltage difference across the input terminals.

The breakdown values of zeners $Z_1$ through $Z_4$ are chosen somewhat larger than $V_r/2$ to ensure an all-off state between current reversals to the motor. Otherwise, catastrophic failure can occur if both transistors of either pair $Q_1$ and $Q_3$, or pair $Q_2$ and $Q_4$, conduct at the same time.

Submit your IFD describing a new or important circuit or design technique, the clever use of a new component or test equipment, packaging tips, cost-saving ideas to our Ideas for Design editor. Ideas can only be considered for publication if they are submitted exclusively to ELECTRONIC DESIGN. You will receive $20 for each published idea, $30 more if it is voted best of issue by our readers. The best-of-issue winners become eligible for the Idea of the Year award of $1000.
132 columns. Over 300 lines per minute. Under $2000:

In printers, it's not just a question of how much they cost, but one of how much you get for your money. And on a price/performance basis, nothing even comes close to the Teletype® model 40 OEM printer.

Besides getting a 132-column, heavy-duty impact printer that delivers over 300 lpm for less than $2000, you also get a printer with outstanding flexibility and reliability.

The big reason behind the model 40's price/performance advantage over the competition is our unique design. Even though it operates at speeds over 300 lpm, wear and tear is less than you'd find in a conventional printer operating at a much slower speed. Fewer moving parts and solid-state components add up to increased reliability and reduced maintenance.

We'd be ahead if we just stopped there, but the model 40 also offers you a number of other features. Like a choice of character sets, operator-adjustable form width and form length, parity error indication, and a built-in self-test feature, just to name a few.

For complete information, please contact our Sales Headquarters at:

The Teletype model 40 OEM printer. Nothing even comes close.
Arrow-M Amber Relays eliminate costly hand soldering.

Only Arrow-M manufactures gas-filled plastic sealed relays, proven to have top reliability over a long life. They're applicable from very low level to high capacity contact loads and maintain highly stable contact resistance, even after long use.

Now here's the really big news: by using Arrow-M Amber Relays on your PC board and using automatic wave soldering, you can substantially reduce your labor costs. And since Arrow-M Amber Relays cost less than sealed metal can relays, the savings are even greater.

Arrow-M Amber Relays. When you want maximum reliability and maximum savings. And only Arrow-M makes them.

Relays for advanced technology.

CIRCLE NUMBER 56
Data terminal features low-cost, programmable character set

A low-cost data terminal, the Data-Term 450, can be programmed to print any character set desired. It boosts a cost of only $1300 in single units for the basic terminal.

The system as supplied prints the standard 96-character ASCII set. In addition, engineering symbols or foreign characters may be printed under keyboard or program control.

To program up to 16 additional special characters, the user punches a sequence of keys that define each point on the $7 \times 7$ dot matrix forming every character. This information is stored inside the terminal, and the character may then be called by a simpler sequence of keystrokes or through external control.

Unused ASCII codes may also be used to recall special, previously programmed characters. For instance, ASCII codes of lower-case alphanumeric characters can be interpreted by the terminal as pre-programmed special characters.

Programmed characters may be single or double width, which allows flexibility in font layout. One disadvantage of the user-programmed character set is that the user-defined characters cannot be stored in the terminal when power is shut off. They may, however, be transferred to cassette tape.

The terminal’s printer uses an impact mechanism onto ordinary paper, so special thermal paper is not required. Print width is 132 columns, and speed is 45 chars/s. Options include higher speeds of 60, 120 and 180 chars/s.

The keyboard is similar to an IBM Selectric, has tactile feedback, and has an additional 30-key alphanumeric keypad with dual function keys.

Communication to the outside world is through a standard RS-232C interface, Bell 113A data set, or an acoustic coupler. When using the latter two methods there is a built-in 3-s delay before the unit will send or receive information. This delay eliminates initial hook-up noise. Transmission speed is switch-selectable from 75 to 1200 baud.

Interetc, a built-in tape microcassette, is also available on the Data-Term 450. A second Interetc tape unit may be added as an external peripheral for dual tape requirements. 25,000 characters may be stored on one tape cassette. The built-in drive adds $700 to terminal cost.

The terminal is internally controlled by an 8080 microprocessor. The internal RAM that does housekeeping functions and stores the programmed characters contains 16,000 bytes. Various high level software packages loaded from the Interetc tape system may be run if additional optional memory is added.

Other standard features: horizontal and vertical tabs, variable form control and terminal weight of 45 lb. The unit consumes 225 W when printing; otherwise it takes 75 W.

Word generator reacts to external inputs

The Model RS-432 data and timing generator can change its output depending upon external conditions. Under microprocessor control, the unit can generate data contingent on special inputs such as levels, pulses or sense switches. It generates data continuously or intermittently. The RS-432 also generates serial or parallel data of specified period or from selected blocks of memory. Simultaneously with the data, all control and timing signals required by the unit under test are available. The RS-432 is completely self-contained, requiring no external clocks or dc power. The basic unit allows the user to configure program memory and word memory to suit the specific application. Memory modules for the program memory are provided in 64 and 256-word blocks.

Matrix printer produces little acoustic noise

Tally Corp., 8201 S. 180th St., Kent, WA 98031. (206) 251-5644. $2575; 90 days.

The Model 1200 dot matrix serial printer features a new low-noise cover for exceptionally quiet operation. The unit prints 132 columns at 120 char/s. The Model 1200 uses a stepper-motor print-head advancement and microprocessor controlled electronics. Other features include dual tractor engagement above and below the print line for positive paper advancement and positioning, and snap-in ribbon cartridge for easy ribbon replacement. Slew speed is 10 in./s. The Model 1200 prints an original plus four carbon copies and handles form widths from 4 to 15 in. Specifications include 6-lines/in., 10-char/in. and a 64 character ASCII set.

Programmable unit offers 100 steps

Texas Instruments, P.O. Box 5012, MS 84, Dallas, TX 75222. (214) 238-2481. $179.95; stock.

Key programmable SR-56 is a 100-step, 10-memory calculator with an algebraic operating system featuring left-to-right entry and nine levels of parentheses. The SR-56 is compatible with the PC-100 print cradle, which allows complete tracing and printout of any calculator operation. Over 25 scientific and statistical operations are possible from the keyboard. The two looping capabilities and four levels of subroutines allow sophisticated programming.

Floppy disc transfers data via RS-232C

Dynalogic Corporation Ltd., 141 Bentley Ave., Ottawa, Canada K2E 6T7 (613) 226-1383. 7002A: $3950; Editor: $495; 30 days.

The Series 7002A DynaTermDisk communicates data through two I/O ports, both RS-232C compatible. One port can be connected to a data entry terminal such as a CRT or hard copy printer, and the other port connected to a mini-computer I/O port. Storage capacity is 630 kilo-bytes on two diskettes. The unit can also automatically copy and verify the contents of one diskette onto another diskette. An optional editor feature is available, which allows the user to edit data from the data entry terminal.

WHY LOOK FURTHER.

NEED A HIGH PERFORMANCE, DEPENDABLE, AND ECONOMICAL DATA MODEM FOR A SPECIFIC APPLICATION?

THE PSH 96A — an asynchronous modem for short haul transmission of digital data at rates up to 9600 bps half/full duplex over non-loaded cable pairs.

THE 48/MULTI — an eight-phase half/full duplex synchronous modem providing high performance at 4800 bps over basic 3002 unconditioned lines.

THE 313B — an FSK full duplex modem providing asynchronous 0 to 300 bps operation over the dial network.

If you do, remember that Penril's complete and versatile product line features a rugged, well-designed, and reliable data modem for almost every data communications situation.

For example, Penril manufactures modems for asynchronous and synchronous short haul transmission at speeds up to 1,000,000 bps — another model for multi-point applications at 4800 bps — and others for asynchronous operation from 0 to 300 bps.

In addition to these models, Penril produces an asynchronous FSK data modem operating at up to 1200 bps over dial lines or 1800 bps over dedicated lines. Or there is Penril's serial asynchronous modem for half duplex operation to 1200 bps with reverse channels of 5 bps or 150 bps. And Penril provides a model series operating at 2400 bps half/full duplex over two or four-wire dedicated or dial networks.

WHATEVER THE PURPOSE AND DESIGN REQUIREMENTS, PENRIL HAS THE MODEM.

Calculator prints and is programmable

$3240; 30 days.
The Monroe Model 1880 programmable printing calculator combines the features of a scientific calculator and portable computer with I/O capability. The heart of this system is a user-microprogrammable microprocessor, plus 7 k bytes of ROM operating system for hi-level instructions and 1.5 k bytes of working storage. This microprocessor subsystem is complemented by a keyboard for input, a 21-column printer for output and a magnetic card reader/writer for offline program and data storage. All of this is packaged in a desktop unit the size of a typewriter. Weight is only 22-1/2 lb. Keyboard operation is simple and straightforward, following algebraic rules of equation solving and includes two-level nesting of arithmetic operations. By single keystroke operations, 27 mathematical functions are provided. The 1880 offers optional user-definable keys which allow the user to address up to three programs or subroutines with one key depression. The 1880 calculator also offers user access to more than 230 microprogramming instructions for implementing an operating system and I/O control. I/O communication is via a serial bus or via an 8-bit parallel input. The calculator also allows byte or word transfer, DMA and interrupts. The unit provides 1024 program steps with main memory expansion in 1024-byte increments to a total of 4096. The programming flexibility of the Model 1860 is further enhanced by symbolic and indirect addressing techniques.

Dialight sees a need:
(Need: The widest choice for your every application.)

Available in red or clear LED packages with or without a built-in current limiting resistor. Red LED is also made without resistor. Suitable for circuit status indication, alpha-numeric displays and visual indicators. Features long wire-wrappable leads. IC compatible with solid state reliability. High luminous intensity, low power consumption, low cost.

LED logic state fault indicators available in 14 models with voltage ratings from 1.7 to 14. Suitable for dense packaging on printed circuit boards—up to 10 units to the inch—IC compatible. With built-in series resistor. Polarity identified. Low power consumption.

Dialight, the company with the widest choice in switches, LEDs, indicator lights and readouts, looks for needs... your needs... and then they develop solutions for your every application. No other company offers you one-stop shopping in all these product areas. And no other company has more experience in the visual display field. Dialight helps you do more with these products than any other company in the business, because we are specialists that have done more with them. Talk to the specialists at Dialight first. You won’t have to talk to anyone else. Send for your free new copy of Dialight’s current catalog.

Burroughs' new, low-cost SELF-SCAN II 240-character displays offer many features compared with CRT terminal displays. Contrast and readability are better than ever under all conditions. Characters are jitter- and flicker-free bright neon-orange color, with no fuzziness or loss of linearity at the edges of the display. An all-new manufacturing process has significantly reduced cost, weight, size, and has improved reliability. And, the SELF-SCAN II panel's 40-character line is compatible with popular software. Graphics can also be displayed using additional drivers.

Other significant advantages include easy interface to micro-processors, thin cross-section, small overall size, and rugged construction for long service life under all operating conditions.

Give your data terminals a bright new outlook; call or write for complete information. Burroughs Corporation, Electronic Components Division, P.O. Box 1226, Plainfield, New Jersey 07061. Telephone (201) 757-5000.

Burroughs
Connector designed for mass termination

3M Co., P.O. Box 33600, St. Paul, MN 55133. (612) 733-1590.

Versatile new male connectors available in two configurations for mass termination applications feature 0.025-in. square pins, with mounting flanges for rack-and-panel applications, and without flanges for midspanning. Manufactured in a variety of sizes from 10 to 50 contacts, they are compatible with Scotchflex-brand socket connectors. Applications include use as a T-tap from a cable bus, a splice connector or an I/O interface. The plastic-connector housing is a glass-reinforced polyester material with a UL flammability rating of 94 V-0. Cables on 0.050-in. conductor centers are available for use with all connectors.

Mylar legends applied to keycaps

Stackpole Components Co., P.O. Box 14466, Raleigh, NC 27610. (919) 828-6201.

Engraving legends on keycaps is a serious economic problem for low-volume users. However, characters printed on sheets of pressure-sensitive Mylar can be applied to Stackpole caps. Because the Mylar characters are recessed into the caps, they can't be peeled off unintentionally. For reprogramming, the Mylar can be removed and new legends applied. Mylar keycaps may be specified for keyswitches LO PRO 5, LO PRO 20, their high-profile equivalents or for custom keyswitches.

Booth No. 2424 Circle No. 323
5-Volt, 10-AMP Power Supply

The Model HE237 Power Supply offers the design engineer, for the first time, a low cost, highly efficient alternative to the size, weight, and heat generation problems normally associated with series-pass regulated supplies. Using state-of-the-art switching techniques and CMOS logic, the HE237 achieves 75% efficiency, at a full load of 10 amps.

The HE237 has the "footprint" and mounting dimensions of the Lambda package size "B" supplies—a feature that allows the engineer to experiment with high efficiency techniques in existing designs. In new designs, the engineer can take advantage of the HE237's small size (6 1/2" x 4 1/2" x 1 1/2") and light weight, (1.7 lbs).

The highly reliable HE237 Power Supply is short-circuit proof, contains over-voltage protection, and is backed by a full two year warranty.

Finally, the HE237 offers the design engineer considerable savings. It is available in both 115 and 230 VAC input models for just $195...quantity, one.

The new Southco, Fl, sheet-edge insert snaps into a prepunched notch in a thin sheet and remains in place, held by a spring leg that locks behind the panel. This makes it easy to screw into the edge of a sheet without the need for flanges or riveted brackets.

Card-edge connector uses zero insertion force

Amp Inc., Harrisburg, PA 17105. (717) 564-0101.

Requiring a minimum of 0.5-in. mounting width, new zero-insertion-force connectors accept PC boards inserted from either the top or the side for high-density packaging applications. Designed for use with double-sided or multilayer boards from 0.054 to 0.071-in. thick, the connectors are available with up to 280 contacts (140 dual-contact positions) on 0.125 x 0.125-in. spacing. Actuating mechanisms include lever-operated cam and push-pull slides. The activating mechanism requires less than 0.450-in. linear travel to establish electrical contact. When opened, the contacts are withdrawn behind internal housing barriers for protection during PC-board insertion.

THE NEW

WESTON AUTORANGING
PORTABLE DMM

The best buy ever in a portable digital multimeter

ONLY $195 Performance, quality, reliability and price. The new Weston Model 6000 is a total value package and the best buy ever in a portable digital multimeter. Just check these performance and convenience features:

Autoranging—plus factor in a portable
The simplicity, speed and accuracy of automatic ranging is a big advantage in a low cost portable digital multimeter. And in the Model 6000, it's available for the five standard measurement functions . . . AC/DC Volts, AC/DC Amps, Resistance . . . in 20 broad ranges . . . with full overload protection. Zero adjustment for all ranges is built-in . . . automatically.
A bonus feature is a 10 Amp AC/DC current range . . . not usually available in digital instruments. And a special "Hold" input jack provides a convenient memory retention capability for remote measurements.

Superior performance in a portable
Even in a low priced portable, Weston quality proves itself. The high performance capability of the Model 6000 is typified by an accuracy of 0.35% with resolution of 100 µV, 1 mA and 10 ohm.

Large, easy-to-read anywhere display
Even in bright sunlight, it's easy to read the large 0.5" high LCD 3½ digit display. Alternate blinking of the LCD's provides an over-range indication that prevents erroneous readings. And minus polarity is measured and displayed automatically without reversing leads.

Low power operation
Power source for the Model 6000 is two inexpensive, easily available 9V transistor batteries. Long battery life is assured by special circuits designed by Weston for low power drain. And when the batteries do run low, the LCD display blinks to tell you.

Small and lightweight . . . but rugged
The Model 6000 portable is small in size and weighs less than two pounds. The rugged glass-filled Lexan® case can withstand tough treatment. A combination carry handle/display cover/tilt stand makes it convenient and practical for field or bench use.

Weston service back-up
The Model 6000 is backed-up with the Weston total service commitment. Complete full year warranty, with service available at any of Weston's domestic or foreign service centers. Another plus factor for a low priced portable DMM.

The new Weston Model 6000 Autoranging Portable DMM doesn't scrimp on performance, quality or reliability . . . it just brings them to you at a better price.

See the Model 6000 at any Weston Distributor. Or, write directly to Weston for additional information.

Tool organizer holds many tools

Platt Luggage Inc., 2301 S. Prairie Ave., Chicago, IL 60616. (312) 225-6670. $12.75 (1-5).

Platt pallet, molded of tough urethane, can hold a large selection of small tools. Put up over a work bench, it keeps tools out of the grit and grime of tool boxes. The organizer is molded in one piece; no stitches, seams, flaps or rivets form any of the pockets. It’s unconditionally guaranteed for 5 yr.

CIRCLE NO. 327

Power cables suppress rfi to 45 GHz

Capcon Inc., 147 W. 25th St., New York, NY 10001. (212) 253-6275.

Lossyline power conductors and cables provide rfi suppression of more than 100 dB. Unwanted noise to 45 GHz is absorbed and dissipated by a lossy medium that surrounds the central conductor. In microwave ovens, the cable has been used to counteract radiation leakage when carrying 50 A at 6000 to 50,000 working volts. Cables come with standard current ratings of 1 through 100 A and standard voltage ratings of 125, 250, 440 or 550 V ac or dc at frequencies of 25, 50, 60, 400 or 1000 Hz. Operating temperature ranges from -55 to 250 C. High-voltage ratings to 100,000 V are available for transmission cabling.

CIRCLE NO. 328

Precision rf connector for low loss and VSWR

Weinschel Engineering, 1 Weinschel Rd., Gaithersburg, MD 20760. (301) 948-3434. $75 (unit qty); stock to 60 days.

The Model 1565 precision 7-mm rf connector for use to 18 GHz is specially designed for applications where insertion-loss and VSWR-repeatability are of primary importance. It meets all requirements of IEEE STD 287, Design 2, and will mate nondestructively with other 7-mm connectors that conform to the interface dimensions of the standard. The unit features front-end replaceable mating contacts; life under normal use is 5000 matings. Replacement contacts, relatively inexpensive compared with the price of a connector, greatly extend connector life.

Stainless-steel tools vacuum solder

Consell, 463 Payne Dr., Cheshire, CT 06410. (203) 272-6837. Mini-Mini: $9 (unit qty); stock.

A series of three tools will remove solder from printed-circuit boards by vacuum action. One of these, the Mini-Mini, is suited for the finest PC-board repair and re-work. The 6.25-in. tool is constructed of stainless steel except for the Teflon tip. The other tools, the Mini and Maxi, are used for bigger jobs. To use the tools, a soldering iron first is applied to the connection to melt the solder. The plunger on the tool is pushed in, and the suction tip is placed in contact with the molten solder puddle. The trigger button is depressed, creating a high vacuum, which then sucks up the solder.

Stay current with small lamp data from General Electric.
It's free.

Check these 6 halogen cycle lamps GE has added to its low-voltage line.

General Electric now offers over 27 halogen cycle lamps that pack high light output in small packages. (In addition, GE offers 8 sealed beam halogen lamps primarily for aircraft applications.) Bulb diameters range from $\frac{3}{8}$" to $\frac{1}{2}$". Lengths from .520" to 2.25". Voltages from 3.5 to 28. O.V. And candlepower from 2.15 cd up to 250 cd.

They’re ideal for you if you’re designing applications such as optical systems, instrumentation, illuminators, fiber optics, card readers, displays and aircraft navigation. A variety of terminals are offered.

They’re ideal for you if you’re designing applications such as optical systems, instrumentation, illuminators, fiber optics, card readers, displays and aircraft navigation. A variety of terminals are offered.

For updated technical information circle the number below or write GE for Bulletin #3-5357.

These GE wedge base miniature lamps offer you savings in time, money and space.

These lamps are ideal for applications such as indicators, markers and general illumination where space is at a premium. Their wedge-based construction makes them easy to insert and remove. They don’t require bulky, complicated sockets. And because the filament is always positioned the same in relation to the base, you get consistent illumination from lamp to lamp.

You can choose from over 25 types of GE wedge base lamps. Voltages range from 6.3 V to 28 V. Candlepower from 0.03 to 12 cd. Bulb sizes range from subminiature at 6mm to a heavy-duty bulb at 15mm.

To send for updated wedge base lamp technical information, circle number below or write GE for Bulletin #3-5259.

These three free GE catalogs include important data changes that could affect your present design. Send for yours today.

Sage Laboratories, 3 Huron Dr., Natick, MA 01760. (617) 653-0844. $1500; 60 days.

The FP279 series of 32-way power divider/combiners is exemplified by a 3.4-to-4.2-GHz model that specifies a return loss of 19 dB minimum and insertion loss of 17.5 dB maximum. Output balance is ±0.5 dB. Isolation between outputs is 18 dB minimum. The unit employs a type N input connector and type SMA connectors for all output ports. The Model FP279 measures 8 x 5.5 x 1 in.

Synthesized sig gen spans 2 to 18 GHz

A synthesized microwave signal generator, the Model 8672A, covers the 2-to-18-GHz frequency range in one solid-state package measuring only 5-1/4-in. high. The new unit offers AM/FM and calibrated output. It has a frequency resolution of 1 to 3 kHz over the frequency range. Frequency stability is better than ±5 in 10⁶ parts per day with the internal frequency standard. Spurious signals are more than 70 dB below the carrier at 6 GHz, more than 60 dB down at 18 GHz.

ELECTRONIC DESIGN 10, May 10, 1976
To make sure we’re speaking the same language, let’s define total TTL compatibility:

1. You need only one power supply (+5V).

2. I/O logic and clock levels are directly TTL compatible (eliminates -12V supplies).

3. On-chip clock generators—TTL input.

Benefit: 50% less power. Eliminates negative power supply. Double density, lower cost.

We want you to start looking to Synertek for a whole line of TTL-compatible—totally compatible—MOS parts. Looking for 2K dynamic shift registers, for instance? We've got 'em (sorry, but you will need one little resistor). 1K static RAMs? We've got 'em, to 150 ns! 4K and 16K ROMs? 8-bit microprocessors? They're all here and all totally TTL-compatible.

There are a lot of MOS houses. But the guys who are really making the technology work for you work here.

Get our new short form catalog from Jack Balletto at Synertek, 3050 Coronado Drive, Santa Clara, CA 95051. (408) 241-4300. TWX: 910-338-0135.
MICROWAVES & LASERS

4-way divider/combiner accepts 100 mW/port

Sage Laboratories, 3 Huron Dr., Natick, MA 01760. (617) 653-0844. $325; 60 days.

A four-way matched power divider/combiner, the FP1372, covers the 3.7-to-4.2-GHz frequency range with an insertion loss of less than 0.3 dB and VSWR of less than 1.2:1. Isolation between outputs is greater than 20 dB. In combiner applications, the input power rating is 100 mW per port.

Small WG isolator covers 26 to 40 GHz

Trak Microwave, 4726 Eisenhower Blvd., Tampa, FL 33614. (813) 884-1411. $425; 10 days.

A small, compact 26-to-40-GHz waveguide isolator, the Model 2571-1810, measures only 4-1/8 x 55/64 x 13/16 in. and weighs just 5.5 oz. Isolation is 23 dB minimum with an insertion loss of 1.2 dB maximum. Flanges are UG-599/U.

CIRCLE NO. 339

1-15-GHz detector avoids bias circuitry

Omni Spectra, 21 Continental Blvd., Merrimack, NH 03054. (603) 424-4111, $175 (1-9); 90 days.

The Model 20751 Schottky detector doesn't require the power supply and associated circuitry usually needed to establish a bias level. The zero-bias 20751 detects cw or square wave, pulse or frequency-modulated signals over the range of 1 to 15 GHz. With some performance degradation, the unit can also be used up to 18 GHz. The detector measures 1.35 in. in length.

New ideas from a new source for flat cable and connectors

The source: Alpha Wire, one of the oldest full-line wire and cable manufacturers. Our cable is compatible (matches all flat cable connectors designed for 0.050 in. conductor spacing). It has excellent teardown characteristics, is ultra-flexible, and UL listed. Exclusive footage indicator on the reel shows how much cable is left.

Our complete line of connectors (female sockets, headers, DIPs and PCBs) also offer some new ideas:

- Microetched Offset Tines grip conductor securely and prevent conductor damage. (Burrs and sharp edges removed.)
- Eliminates Waste assembler can correct mistakes if he makes a bad crimp.
- Universal Bench Press crimps all connectors. Eliminates need for separate adapters.
- Allows Denser Wiring unique design allows cable to remain within profile of the connector.
4-8 GHz FET amp has 6-dB NF

Aertech Industries, 825 Steward Dr., Sunnyvale, CA 94086. (408) 732-0880. Under $4000; 69 to 75 days.

A 4-to-8-GHz GaAs FET thin-film amplifier, the Model A6709, offers 28-dB gain, 6-dB noise figure and +10-dBm power output. A 19-dB-gain version is available in the Model A6713. Both models have either a low dc voltage bias or an optional 115-V-ac power supply.

CIRCLE NO. 341

Low-loss couplers have directivities to 30 dB

Merrimac Industries, 41 Fairfield Pl., West Caldwell, NJ 07006. (201) 228-3890. $120 to $140; 30 days.

A family of stripline directional couplers, the C2M-G and C2-G Series, combines high directivity with low loss. The C2M-G Series includes more than 20 standard models covering bands in the 1-to-18-GHz frequency range, and the C2-G Series includes more than eight standard models covering bands in the 500-MHz-to-12.4-GHz range. Models in both series are available with 6, 10, 20, and 30-dB coupling values. A typical model, the C2M-20-1.5G, has the following specs: frequency range of 1 to 2 GHz, nominal coupling of 20 ± 1 dB, frequency deviation of ± 0.75 dB, maximum VSWR of 1.20:1, insertion loss of 0.25 dB (over coupling loss), forward power of 50 W and reverse power of 20 W.

CIRCLE NO. 342

Radiation meter covers 0.3-to-18-GHz range

General Microwave, 155 Marine St., Farmingdale, NY 11735. (516) 694-3600, $750.

A precision battery-operated power-density meter—the Model 3—responds uniformly to potentially hazardous nonionizing energy radiating or leaking from rf and microwave sources from any direction over the frequency range of 0.3 to 18.0 GHz. The meter has three 10-dB power ranges with full scale readings of 2, 20, and 200 mW/cm²; isotropy of ±0.05 dB; calibration accuracy of ±0.5 dB; and a recorder output jack. The sensing probe can be mounted directly on the meter, or through an extension cable that allows remote operation.

The inside story of the amazing new $31 Compact 1.

Take a close look.

Beneath the handsome exterior of Zero’s new VIP Compact 1 you’ll find a feature you’ve never found on a $31* instrument enclosure before. Those rugged steel and aluminum panels are hiding a removable chassis. Which means you can now easily build up your equipment on the free chassis, and then simply re-assemble the enclosure around it.

A result of thorough design, Compact 1 delivers an amazing new level of quality, strength, efficiency and economy. If these are your requirements for a small instrument enclosure, you’ve found what you’ve been looking for. We’re ready to ship any of the twelve standard sizes to you within two weeks.

Write for your free catalog today.

*From $30.80 to $38.65 in quantities of 50.
Grayhill brings all PC terminals out one side

switches from logíc levels up to ¼ amp

- ½ inch switches with 10 or 12 positions—1 or 2 poles per deck—1 to 12 decks.
- Designed for wave-soldering process—resists flux contamination
- Enclosed construction at price levels as low as or lower than open wafer switches.

Here’s a new Grayhill miniature switch specifically designed for the small loads—and the specialized mounting techniques—of low voltage circuitry. Probably the smallest switch you can find with all PC terminals in the same plane, the switch is surprisingly small in the price dimension too... for enclosed construction and Grayhill quality. For more information on this new member of the Grayhill Series 71 family, write for Bulletin #236... and consult EEM for information on other Grayhill switches.

Three-digit DVM chip requires only 30 mW

By combining low-power CMOS technology with proven quantized-charge feedback techniques, Siliconix has produced the LD130—the first monolithic DVM circuit in an 18-pin DIP. Analog as well as digital functions are included on a single CMOS chip that typically dissipates only 30 mW. When the LD130 is used with a display, decoder, power supply, reference source and several external capacitors it forms a complete 3-digit DVM.

The LD130 provides multiplexed BCD outputs that can drive one standard TTL load each. Overrange and underrange signals from the chip can assist in applications that require autoranging. As an additional feature, the display blinks when the input is overrange. A signal from the chip is also available to operate a polarity indicator in a display. Interdigit blanking has been incorporated on the chip to permit interfacing with gas-discharge type displays. Four npn transistors drive the three digits and sign, and a BCD-to-seven-segment or other type of decoder must be used to decode the BCD for display driving.

Four internally compensated CMOS op amps and a comparator are included in the LD130. The signal-conditioning part of the LD130 has a 1000-MΩ input impedance and typically a 4-pA input bias current. The input range is ±999 mV full scale and the unit is designed to operate from ±5-V power supplies.

The on-chip clock requires only one timing capacitor of about 2.5
nF to establish a sampling rate of 10 samples per second. Two other capacitors of about 0.1 µF are required for integrating the measured voltage and storing error voltages. All three capacitors may be inexpensive disc ceramics.

The LD130 uses a single, positive 2-V ground-based reference, that could be generated by a current-limiting diode and a cermet potentiometer—or merely by the wiper of a potentiometer across a zener diode, since the input impedance at the reference terminal is 1000 MΩ.

The DVM chip performs an auto-zero function prior to each measurement cycle. The BCD reading from the previous measurement cycle is transferred into latches for the output multiplexer at the start of each auto-zero cycle. The algorithm automatically deals with inputs of either polarity.

Price of the LD130 is $12.50 in single units, and drops to $8 in 1000-unit lots. Delivery is from stock.

CIRCLE NO. 301

V/f/v converter works through 5 decades

Intech, 1220 Coleman Ave., Santa Clara, CA 95050; (408) 244-0500; $15 to $20; stock.

A monolithic voltage-to-frequency-to-voltage converter, the Model A-8400, provides a simple, virtually adjustment-free component for data encoding and decoding applications. Packaged in a special 14-pin DIP, the IC uses an improved charge-balancing technique that combines high linearity over five decades along with inherent monotonicity. As a v/f converter, the A-8400 has an input voltage (current) range of 0 to 10 V (0 to 1 mA). The proportional full-scale frequency output through the 100-kHz band is established with an external resistor and capacitor. In the f/v mode, the time constant of the output integrator can be externally varied. Conversion linearity is within ±0.05% at 100-kHz full-scale and ±0.01% at 10 kHz. Temperature stability is typically ±50 ppm/°C and power-supply range is ±12 to ±17 V.

SOLID STATE IMAGE SENSING.

UNDER $700.

RETICON cameras can be found doing complex non-contact measurement and inspection jobs in practically every industry. They are used to measure hot-rolled steel, inspect glass bottles, size bolts and rivets, check packaged goods, monitor print quality and a lot more.

Our new LC64P camera makes this advanced technology now cost-effective in such simple applications as edge and width monitoring of sheets and mass produced parts.

This camera provides you with a variable-threshold, computer-compatible digital output as well as analog video with 200:1 dynamic range. It is housed in a rugged 3.5" x 3.75" x 3.5" sealed aluminum casting for reliable operation in extreme industrial environments. It requires less than 2 watts from a ±15V power supply and includes a choice of 5 different lenses. The camera is compatible with RETICON's RS600 series processors which provide automatic categorizing of parts, high/low limits, analog outputs for feedback in process control and direct measurement readout.

CMOS counters offer TTL functions

Motorola, 3501 Ed Bluestein Blvd.,
Austin, TX 78721. (512) 928-2600.
$1.35 to $2.03 (100-999); stock.

Four CMOS circuits are synchro-
nous or synchronous clear, respec-
tively. The other two, the MC-
1416B and 163B, are four-bit
hexadecimal units with the same
respective options. The CMOS
parts are functionally equivalent to
the 74160 through 163 TTL coun-
ters and feature internal look-ahead
and carry output. The counters
operate from 3-to-18-V supplies
and can drive a low-power Schottky-
TTL load.

CIRCLE NO. 345

Sonar system
comes on a chip

National Semiconductor, 2900
Semiconductor Dr., Santa Clara,
CA 95051. (408) 732-5000. $12
(100); stock.

A single IC, known as the LM-
1812 transceiver, contains all the
elements needed in a sonar system.
The new circuit consists of a 12-W
ultrasonic transmitter and a selec-
tive receiver that includes a 10-W
display driver. Further the pack-
age requires no heat sink. Oper-
at ing from a 12-V battery, the
LM1812 transmits pulses of about
200 kHz for about 800 µs through
an external transducer. Between
pulses, the receiver listens for an
echo and drives a display with the
resulting signal.

Chopper-stabilized amp
has 0.1 µV/°C drift

Datel Systems, 1020 Turnpike St.,
Canton, MA 02021. (617) 828-8000.
$39 to $49 (1-9); stock.

Monolithic chopper-stabilized am-
plifiers offer inverting, noninvert-
ing and differential modes of oper-
ation. The Model AM-490-2 series
has input offset errors as low as
0.1 µV/°C and 1 pA/°C and comes
in a hermetically sealed, 8-pin
TO-99 package. De common-mode
rejection is 160 dB, and supplies
can range from ±12 to ±20 V dc.
Maximum quiescent current is 5
mA. Warmup time to rated accuracy
is only 200 ms.

CIRCLE NO. 347

THOUSANDS OF OPTION COMBINATIONS IN
ACCURACY . . . GAIN . . . AND BANDWIDTH IN NEWPORT'S
WIDEBAND DC DIFFERENTIAL AMPLIFIERS - FROM $160

Newport amplifiers and transducer conditioners are valuable for any
application where extremely precise low noise wideband signals exist. They
are ideal for thermocouples, load cells, DC excited strain gages and other
low level sources. Outputs are useful for DAS, recording galvanometers,
oscillographs, recorders and digital voltmeters. Newport's companion 80A
transducer conditioner features tri-current excitation which eliminates lead
wire effects from single active arm measurements.

Speed custom designs with CMOS masterslice

International Microcircuits, Inc.,
3000 Laurence Expressway, Santa Clara, CA 95051. (408) 735-9370.

The latest entry in a family of masterslice custom CMOS chips—the MasterMOS-S—contains the following: 106 complementary pairs of MOS transistors, along with 10 output-buffer circuits, four high-current n-channel drivers, and 18 interface pads ready to be interconnected for each custom application. Like other members of the family, the MasterMOS-S chip can cut costs and reduce development time for custom circuits of moderate complexity. Typical development charges for a custom CMOS circuit using MasterMOS-S are less than $3000, and typical production prices range from $3.50 to $2.40, depending on quantity.

CIRCLE NO. 348

ICs interface logic with inductive loads

Rifa, Pack S-161 11 Bromma, Sweden. $1.35 to $1.80 (100).

Bipolar drives allow interfacing between 5-V logic and inductive loads. The PBD 3513, a dual driver in an 14-pin ceramic package, has TTL-compatible inputs and can also be fed from relay contacts in 12-V systems. The circuit is designed for 5-to-12-V supplies and can sink 300 mA. The PBD 3520, in a metal TO-99 package, can handle voltages down to −56 V. The TTL-compatible circuit sinks 150 mA with a logic ZERO input.

CIRCLE NO. 349

Disc has made it easy for the OEM using optical encoders in small quantities to realize costs in the same low range as the big users—like under $100.00. We’ve maintained the same high order of resolution, accuracy, and reliability found in our more expensive units for this new EC series. "EC," obviously, is our economy model, but it could also stand for exceptional capabilities. Here’s what you get for your $99 (much less in quantity):

- LED source
- 20 to 1024 pulses/revolution
- Differential electronics
- Square wave output
- ±2.5 minutes accuracy
- Solar cell light sensors
- Instrument bearings
- ¼" shaft for interfacing

Translated into benefits, these features mean the Disc EC ROTASWITCH Encoder gives you superior performance, a long service life, and a unit cost you just can’t touch.

That’s the model EC 81. It has a single channel output. If you need dual channel, we also offer the EC 82 at $125.00 in single quantities. It too plummets to well under $100.00 in quantity.

A new spec sheet is just off the press—write or call for your copy. Immediate questions can be answered by calling 714/979-5300.

INTEGRATED CIRCUITS

1-k MOS RAMs can replace bipolar types

We tested 129 of our new Series E Relays at loads from dry circuits to 3 Amps. After 35-billion operations, only 10 single-cycle misses were monitored.

Series E Relays offer:

- Indefinite life
- No contact bounce
- Operation in all positions
- Contacts stable to ±0.015 ohms over life
- Reliability at dry circuit or power loads
- Self-healing contacts
- Hermetically sealed contacts
- 1250V rms contact breakdown
- Low cost

Series E Relay uses a rugged LC2 welded capsule rather than a fragile glass reed switch. This patented design holds a film of mercury securely to the metal walls of the capsule. With every operation, the mercury film renews the switch contacts. You get the reliability of mercury relays, but with complete freedom of mounting orientation. LC2 welded capsule reliability is proven by hundreds-of-thousands of units in the field, as well as billions of cycles under stringent laboratory conditions.

Send for a FREE SAMPLE of the LC2 welded capsule on your letterhead. Circle the reader service card number for Series E Relay information.

ICs select TV channels

Plessey Semiconductors, 1674 McGaw Ave., Santa Ana, CA 92705. (714) 540-9979. $3.50 (100).

Two sensing ICs for TV-channel selection can be driven directly from two-terminal push plates, eliminating the need for conventional pushbuttons. The ML231B and ML232B both offer six-channel selection, direct neon drive, low-impedance drive to the tuning Varicap, and they operate from a 33-V Varicap supply. The ML231B has an additional output that goes high with no channel selected, while the ML232B has an additional input for channel-by-channel step advance. Both circuits require a maximum input current of just 1 mA, a maximum supply current of 5.5 mA, and operate over the 0- to 65-C temperature range.

CIRCLE NO. 352

3-terminal regulator outputs 1.5 A at 37 V

National Semiconductor, 2900 Semiconductor Dr., Santa Clara, CA 95051. (408) 732-5000. $3.00 to $11.00 (100).

An adjustable three-terminal IC regulator, the LM117, provides over 1.5 A of output current at any output voltage from 1.2 V to over 37 V. Packaged in standard transistor power packages, the LM117 has a line regulation of typically only 0.01% per V and load regulation of 0.1% for a 1.5-A change. Ripple rejection of 80 dB can be obtained at any output voltage. Also, full overload protection is included on the chip. Output current is limited to about 2.3 A. Thermal overload protection limits power dissipation should die temperature exceed 170 C.

CIRCLE NO. 353

16-k ROM has 450-ns access

General Instrument, Microelectronics Group, 600 W. John St., Hicksville, NY 11802. (516) 733-3306. $19.50 (1000); 8 weeks.

A 16-k bit static ROM—a RO-38316B—operates from a single 5-V supply and features an access time of only 450 ns. The fully static device offers TTL compatibility and a 2-k × 8-bit organization.

*In quantities of 50-99 or as low as $27 in quantities of 1-9.
In our products are more fully developed...

Standard Condenser capacitors are indeed fully developed to produce the optimum in performance and durability. Standard is in one business only, the design and manufacture of the world's finest capacitors. We have designed and delivered thousands of specialized capacitors for industry. In fact, what you think of as "special" may be among the many designs already available from stock at Standard. However, if you require capacitors of unusual shape, size, value and material, our engineering department will help you design and produce them to your exact specifications at stock prices. For immediate action, send us a sketch and complete details.

Write or phone for catalog and details.

**INSTRUMENTATION**

Amplifiers deliver flat output from 0.15 to 300 MHz

One amplifier that takes the place of several: That's the benefit you get with ENI's new family of wideband Class A power amplifiers, the 400A series.

The series' flat gain characteristic of ±1.5 dB, or better, over the wide bandwidth of 150 kHz to 300 MHz—coupled with a choice of three power levels (3, 10 and 40 W)—encompasses an extensive range of applications. Thus you can avoid annoying bandswitching over several units, and you can probably save money as well.

Four models comprise the series at present, two with 3-W outputs (403LA, 400AP), one with 10 W (411LA), and the last with 40 W (440LA). Two or four units of any model can be combined to provide even higher power without affecting the other specs.

What do you trade off to get the wide band and other features? Not much. The ENI amplifier series delivers linear power to any load from an open to a short, and it's unconditionally stable. No matter what the mismatch, the 400A won't oscillate or burn out.

Harmonic distortion of all models is better than 25 dB down (at outputs slightly below rated power —check the spec sheets), and even better at reduced power. Noise figure is 9 or 10 dB, depending on the model.

Nominal gain of the 3-W models is 37 dB; those of the 10 and 40-W units are 40 and 45 dB, respectively. Input/output impedance of all models is 50 Ω; input VSWR is 1.4 or 1.6 max, depending on the model; output VSWR stays below 2.3.

Prices of the 403LA, 411LA and 440LA are $795, $1725 and $3990, respectively. The 400AP costs $575. Delivery time is 30 days.
New Hi-Temp Thermostat

...with European Acceptance

Ideal for a variety of high temperature applications! Elmwood’s new snap-action RC thermostats include a glass-bonded mica (ceram-plastic) base that allows set points to 550 °F (290 °C). The patented metal sleeve insert and rivet construction permit listings by European agencies as well as U.L. and C.S.A. The RC’s are SPST, pre-set, tamperproof, and available with mountings, terminals and brackets to suit. Want more? Call or write Elmwood Sensors, Inc., 1659 Elmwood Ave., Cranston, R.I. 02907. Phone 401/781-6500.

Meet the \( \mu \)PD8080A. From NEC Microcomputers, Inc. The microprocessor that's both fully software and pin compatible with Intel's new 8080A. And it's backed by all the chips, support systems, software, and service you need to make it into a complete microcomputer system — the \( \mu \)COM-8.

**THE CHIPS.**
We start with not one, but four 8080-type microprocessors.

At the top of the line is the \( \mu \)PD8080A. It gives you everything their 8080A does, plus extras like full BCD capability for both addition and subtraction. For low-cost applications, we also have a 1.25 MHz option — the 8080A-E. Plus there are two other models, featuring improved I/O.

In addition, we can give you the best in RAMs, ROMs, and PROMs, including the only Electrically Alterable PROM with the speed to match the processor. Maintenance Program (MMP) for storing common macros and sub-routines for use with our Macro Assembler.

**AND THE SERVICE.**
The \( \mu \)COM-8 package also includes complete documentation, an ever-expanding library of Applications Notes, and a responsive, in-depth applications engineering service, available nationwide.

**SO...**
Whatever your application or your needs — first source or second source, large volume or small, chips or complete systems — take a look at everything our 8080A gives you.

You really can't afford not to.

WHERE TO BUY IT.

INSTRUMENTATION

DMM promises rock-steady performance

Dana Laboratories, 2401 Campus Dr., Irvine, CA 92713. (714) 833-1234, $549; 30 days.

Model 4600 4-1/2-digit DMM is said to provide accuracies equal to that of many 5-1/2-digit DVMs. It combines this accuracy with full autoranging over each of its five functions and high six-month stability. Other specs include NMR of 80 dB, 10,000-MΩ input impedance, and optional BCD output or battery-powered operation. The five functions are: ac and dc volts (10 µV to 1000 V), ohms (10 mΩ to 20,000 kΩ), dc and ac current (10 nA to 2 A). The dc accuracy of the 4600 is within 0.01% rdg ±1 digit for six months and is maintained over 20 to 30 C and up to 80% relative humidity.

Booth No. 2710 Circle No. 354

IC tester programs with magnetic cards

Just insert a preprogrammed magnetic card into the slot of the 5045A IC tester, and the unit will do the rest. Dc parametric and functional tests are performed on a wide variety of logic families and functions up to 16 pins (24 pins optional). Diagnostic tests are run, and a thermal printout tells the user the type of failure, pins failed, voltage/current analysis of failed pins and other data. Test patterns can be generated by algorithmic techniques or by storing a truth table in memory.

**PROFESSIONAL DISCOUNT PRICES AVAILABLE ON**

Texas Instruments Engineering Calculators

**PHONE TOLL-FREE**

800-638-8906

**FOR THE CURRENT LOW DISCOUNT PRICE OF THE LATEST MODEL TEXAS INSTRUMENTS CALCULATOR OF YOUR CHOICE**

Texas Instruments SR-52

Programming power from Texas Instruments. Easy hand held programming for scientists, engineers, students — anyone who works with advanced mathematics. Check these features: 224 program locations, 20 addressable memory registers, 23 preprogrammed key functions, indirect addressing, permanent program storage on magnetic cards.

Texas Instruments SR-56

More power from Texas Instruments. Hand held key programmable calculator. 100 program steps, 5 program levels (up to 4 levels of subroutine may be defined). Easy single step editing. Main features include 26 preprogrammed key functions, 10 addressable memory registers, algebraic logic and 9 levels of parentheses.

PC-100

Lock down printer for a hard copy of your results; step by step listing of programs, or “debugging” programs. The PC-100 printer may be used with the SR-56 or SR-52.

**OTHER MODELS AVAILABLE**

**ALL THE FAMOUS TEXAS INSTRUMENTS ELECTRONIC CALCULATORS ARE AVAILABLE AT DISCOUNT PRICES**

Mail and phone orders accepted. Master Charge and BankAmericard accepted. Add $2.50 per unit for shipping and handling. Maryland residents add 4% sales tax.

Use our toll free phone: 800-638-8906 (Maryland residents phone: (301) 340-7200) to order or for current discount quotations on the leading brands of electronic calculators: Texas Instruments, Hewlett-Packard, Rockwell, Ricoh, Kingpoint, Corona, Nosco, and many more.

**THE GUARANTEE**

10 day money back trial. If you are not completely satisfied you may return the Texas Instruments calculator you order within 10 days for a cash refund or charge cancellation. In addition Texas Instruments Inc. and Capital Calculator Co. will warrant each calculator sold for a period of one year against defective parts and workmanship.

Indicators come in host of sizes and ranges

Serie 7000 analog panel instruments offer distinctive style and functional flexibility in four sizes: 2-1/2, 3-1/2, 4-1/2, and 5-1/2 in. The three-way choice of mounting (front, bezel and lens), the front-panel decorator plates, and the slide-out scales allow a maximum selection from inventory. Taut-band mechanisms and 1% tracking are standard in many ranges. Series 7000 is available in ac and dc current and voltage ranges, as well as thermocouple temperature indicators and VU meters.

**Here’s all you need for computer/process interface!**

**UNI-DRIVER,** the one stand-alone interface between your computer and all commonly used final control elements. It maintains process control at the last command level, even with the computer shut down, and provides “back up” manual control.

Mix or match any combination of control cards to drive contactors, heaters, motors, pumps, power controllers, valves, set points, motor speeds, solenoids, shutters, louvers, fans, lamps, stepping motors, you call the shots. Up to 64 proportional outputs or 512 on-off outputs per Uni-Driver.

Eliminate a rack full of "black boxes!" Call collect (612) 941-3300 and ask for UNI-DRIVER! Also, ask about ANA-PLEXER. That’s our combination Mux & A/D converter for sampling process control signals of almost any analog transducer or sensor. Directly interfaces with your CPU without external I/O.

NEW APPROACH TO LOW LEVEL DATA ACQUISITION

Phoenix Data's new 8000 Series data acquisition system offers adaptability to virtually any analog input signal currently in use—offering automatic or programmed gain selection with 11 binary ranges from ±10 millivolts to ±10.24 volts full scale. The data word (12 binary bits) is combined with the range data (4 binary bits) for a 16 bit output word in the automatic ranging mode. The system will resolve input changes of 5 microvolts on the ±10 millivolt range for an overall analog dynamic range of 132 db.

FEATURES:
- ADC resolution of 12 binary bits.
- 11 binary gain ranges.
- ±10 mv to ±10.24V input ranges.
- Solid state MOSFET multiplexing.
- Throughput rates from 1 to 20 KHz.
- Auto or programmable gains.
- Up to 128 channels per chassis.
- System accuracy of ±0.05% of reading.
- System T.C.: 0.001°F SR ±1°RTI/C.

If it's stability, accuracy, speed, or all-around quality you need in Data Conversion, contact Ron Brunnemer, director of marketing, or the representative in your area.

Freq synthesizer expands to 48 channels

Rockland Systems, 230 W. Nyack Rd., West Nyack, NY 10994. (914) 623-8666. $27,500 (12 channels); 120 days.

System 51 provides up to 48 channels of spectrally pure and highly stable frequencies from dc to 3 MHz with 1-Hz resolution throughout the range. High speed programming (5 µs) is accomplished while maintaining amplitude and phase continuity. The system is self-contained in its own forced-air-cooled rack and consists of the Model 5196 controller, Model 5112 mainframe, and Model 5101 synthesizer channels. Outputs include: 1) sine wave, 1-V rms, 50-Ω source impedance; 2) square wave, TTL level, 30-TTL load capability; 3) square wave, TTL level, complementary, 30-TTL load capability.

The Plessey Sampler.

Just $15.00, and you can sample 18 values between 0.001 µF and 1.0 µF, 100V to 1,000V, from our broad range of metallized film capacitors manufactured in California. It's just enough to give you a taste for Plessey quality and performance. And show you how the simplicity of our minibox design fits right into your packaging requirements. Compact. Non-burning. With no lead forming or cutting required to simplify PC board assembly. They're ideal for flow soldering. And in production quantities, you'll find that they fit right into your budget as well.

Call the Plessey Distributor nearest you, or contact Plessey Capacitors directly. For only $15.00, you'll receive our Series 160 Minibox Capacitor Sampler containing over 300 pieces to assist with your design requirements.

PM MAGNETIC SHIELDS

Immediate Delivery—For Over 90% Of Current Photomultiplier Tube Types

These high permeability AD-MU magnetic shields are fully hydrogen annealed, ready for use. Already tooled—no tooling cost.

For your special application or specific environment, our Problem Solving Magnetic Shielding Specialists can either modify a stock shield, or custom design a shield to your exact requirement.

18 pages of advanced shielding techniques and components. Also 4-Page Reprint from Electronic Design. Yours for the asking.

Norland Instruments, Norland Dr., Fort Atkinson, WI 53538. (414) 563-8456.

Six new options for use with the NI 2001 programmable calculating oscilloscope extend the application and interfacing of the unit in digital data acquisition and reduction. Included are a serial asynchronous digital I/O, a file option, an X-Y plotter option, a computer link option, an 8-bit parallel digital I/O and a 12-bit DAC output.

New from Centralab...

**CERBON™ TRIMMER RESISTORS**

**Affordable Stability...**

**300% More Stable Than Carbon...**

**at a Carbon Trimmer Price!**

**Why pay more?** With Centralab's new CERBON trimmers you get stability approaching cermet and at carbon prices... As little as 28¢ in distributor 1,000 quantities; as low as 10¢ in high volume orders.

**The secret of CERBON superior performance?** A totally new thick film resistor element, which combines both potentiometer and conventional thick film technologies, plus a heat stable ceramic substrate, plus a dual-tine contact spring, plus "Fluxgard" protection from dust and wave soldering contaminants. In short, a totally balanced electromechanical system.

**Look at these benefits:**
- TCR less than -400 ppm/°C.
- CRV less than 2% of maximum resistance.
- Rotational life exceeds 500 cycles.
- Adjustability (typical) - 0.05% of total voltage.
- High overload capability - 1 watt at 25°C ambient for 1,000 hours exhibits less than 2% cumulative resistance change.
- Maximum stability in humid environment — Resistors exposed to an atmosphere of 40°C at 95% relative humidity for 300 hours return within four hours to +2.5% of their initial readings.

**CERBON trimmers are offered in a resistance range of 1 K ohm to 1 megohm with a choice of standard PC terminal configurations. They fit universally accepted circuit board mounting patterns. And they're ready now for fast delivery in any quantity.**

Write for complete technical data on Centralab's new CERBON trimmer resistors. Or call (915) 799-3961 for a free evaluation sample. Move up to CERBON and save!

---

**AVAILABLE CIRCUIT OPTIONS**

Thanks to their ceramic substrate, Centralab CERBON trimmers permit a variety of screen printed circuit options. Here are three typical circuits:

**TERMINAL SHORTHING**
One of five electrical termination options available.

**OPERATIONAL AMPLIFIER NETWORK**

Typical CERBON trimmer resistor network incorporating one variable and two fixed resistors on dual substrate configuration.

**VOLTAGE DIVIDER**

Fixed and variable resistors can be ratio matched for precise values and to insure temperature tracking. Eliminates need for costly discrete resistor selection.

---

Knob colors available in white, blue, red and green for ease in assembly operations.
Inspired design...meticulous craftsmanship in a very low cost, very low profile relay

The Guardian 1475 relay: Engineered to work like clockwork in your most demanding single pole or double pole high density packaging applications. It switches currents from dry circuit right on up to 5 amps that could weld contacts on other small relays and reeds. All because of design features like these (indicated on the above illustration):

(A) Convoluted stationary contacts with built-in wipe because of (B) armature with off-center fulcrum. (C) .031" diameter terminal pins on .1" grid spacing for PC boards are molded into base with reinforced bosses around thick center section of pins. May be deformed without affecting adjustment. (D) Sealed thermoset glass-filled polyester housing and cover. (E) Built-in bosses provide air space between board and base for better heat dissipation. Plus U/L recognition...and more:

Sealed to shrug off 650 °F wave soldering or immersion in cleaning solvents. Sealed to keep contamination outside—where it can't foul contacts. Fast acting, with typical attract time of 3.5 ms; release time, 2.2 ms at up to 50 operations per second. With contact bounce of less than 1 ms on N.O. contact. Shock and vibration resistant. Typical mechanical life of 100 million operations.

Each relay's performance and reliability are proven by nine—yes, nine!—individual tests. (Operation at normal, specified pick up and release voltages; time delay limits on attract and release; contact resistance limits; contact gap and pressure; and ground test.) The nine testing sequences are automatic on every relay. A single failure? Automatic rejection. To the scrap pile.

ED #10
Two units measure L:
One digital, one analog

Boonton Electronics, Rte. 287 at Smith Rd., Parsippany, NJ 07054. (201) 887-5110. $1050 (62A); 2 wks.

Two new Model 62 series inductance meters provide two-terminal, series-inductance measurements at 1 MHz with low test current. The analog Model 62A has full-scale manual ranges of 1 to 3000 µH in a 1-3-10 sequence; the digital 62AD has four decade ranges, manually selected or autoranged, from 2 to 2000 µH full scale. Basic accuracies are ±(0.5% rdg + 0.5% fs) for analog and ±(0.5% rdg +0.2% fs) for digital display.

Compact rf sweepers join modular test line

Tektronix, P.O. Box 500, Beaverton, OR 97077. (503) 644-0161. $1400; stock.

SW 503 (50-Ω) and the SW 503 option 1 (75 0Ω) rf sweep generators are compact units designed to operate in the company's TM 500 series power module. Both units cover a frequency range of 1 to 400 MHz, have a variable sweep rate, step attenuator, 20-dB vernier attenuator, and a crystal-controlled marker generator that provides comb type markers at 1, 10 and 50 MHz.

Spectrum analyzer shows 72-dB range

1-to-300-MHz spectrum analyzer features a spurious-free 72-dB dynamic range with phase-locked 1-kHz resolution. Internal calibration for frequency and amplitude is included. The P9040 is available with power supply for independent use with any oscilloscope. Input signal sensitivity is −100 dBm for the 50-Ω version and −50 dBm for the 75-Ω.

The Servo-Tek World of DC Servomotors

Wide range of permanent-magnet dc models available.
Servo-Tek’s Permanent-Magnet DC Servomotors are precision made to give highly reliable performance. Their stability, high output-to-size ratio and speed range from 0-10,000 rpm with output torques to 2.0 oz-in make them ideal as prime movers in servomechanisms. Diameter 1.135 in, lengths up to 3.253 in. A unique field structure of Alnico VI results in minimized cogging (slot lock), a prerequisite to optimum servo performance. Models are available with a variety of operating voltages and with various mountings and integral gearing. Moderately priced with quantity discounts.

INSTRUMENTATION

Function gens deliver ‘high-voltage’ outputs

Interstate Electronics, 707 E. Vermont Ave., P.O. Box 3117, Anaheim, CA 92803. (714) 772-2811. Model F44, $595; F47, $675.

Series 40 function generator is said to be the first with sweep markers and high-voltage output. Two generators deliver an output to 40 V, open circuit, and produce waveforms from 0.004 Hz to 4 MHz. Model F44 provides linear sweep capability, and Model F47 adds logarithmic linear sweep and operator-controlled step-frequency calibration between main dial frequency settings. Both multifunction generators also feature frequency markers. Additionally, the selection of waveforms offered on both models includes bipolar and unipolar, positive and negative, variable-width pulses down to 120 ns, all with offset control.

Booth No. 2320-2322

Pulse generators drive MOS circuits

E-H Research Labs, 515 11th St., Box 1289, Oakland, CA 94604. (415) 834-3030. Approx. $600.

Model G725 MOS driver is the latest in the company’s Generation 70 series of pulse generators. The G725 is ideal for use as a clock or data driver for all families of MOS circuits. Internal clock rates from 1 Hz to 10 MHz and widths from 50 ns to 500 ms allow the G725 to be used as a single-phase driver for shift registers and other logic arrays. For multiphase operation, the two buffered trigger outputs allow several G725s to be combined while maintaining phase relationships. Two remote-probe units for normal and complementary output allow the G725’s output to be connected directly to a wafer probe, test fixture, or test circuit. The probe will drive a capacitive load of 100 pF with a rise time of 1 ns/V. Average output current is limited to 20 mA for probe protection.

Scope probes snap apart

Tektronix, P.O. Box 500, Beaverton, OR 97077. (503) 644-0161. (01, $30; 05, $60; 08, $45; stock.

A new modular concept divides scope probes into three parts (probe heads, cables, and connector/compeniation boxes) that snap together, making maintenance and repair less expensive, faster and much easier. The P6101, P6105 and P6108 are modular, miniature, general-purpose probes. The P6101 is a 1X, 1-MΩ probe; P6105 is a 10X, 10-MΩ probe; and P6108 is a 10X, 10-MΩ probe when used with a 1-MΩ input scope.

X-Y recorder makes spectral curves

Model 1044 response recorder works with the 1038 measurement system to make permanent high-definition response curves on special-calibrated 8-1/2 x 11-in. paper. The 1038 system measures swept-frequency gain, insertion loss, and return loss in either one or two channels over the frequency range from 1 MHz to above 40 GHz. The 1038 also analyzes spectrum content from 1 to 20 GHz.

Scope, DMM and counter get together

Vu-Data Corp., 7170 Convoy Ct., San Diego, CA 92111. (714) 275-6572. $1250; 30 days.

Model PS915/975 is the only test instrument that includes a digital multimeter (DMM), a frequency counter and an oscilloscope packaged together in a single unit with all three measuring devices possessing their own dedicated displays. All three can be used simultaneously or independently. Model PS915 mini-scope is a 20-MHz, triggered sweep, single-trace scope. Vertical sensitivity is 10 mV/div. Model 975 DMM-counter is a 3-1/2-digit, autoranging meter (ac volts, dc volts, and kt), as well as a 4-digit, 20-MHz frequency counter.

33% more power to the people. 
Power/Mate presents Econo/Mate II.

The open frame power supply.

Now Power/Mate brings you 33% more power in the same package size with the second generation of our Econo/Mate series. The size is the same, the basic components are the same for easy interchangeability. But that's where the similarity ends. Econo/Mate II adds features like dual AC primary and a plug-in IC regulator for improved regulation. And Econo/Mate II is tough. Computer design, quality control, and Power/Mate's experience helps insure 100,000 hr. MTBF even at this higher power output.

But for all its features, Econo/Mate II is still, most of all, economical. We wouldn't call it Econo/Mate if it wasn't. Econo/Mate II is in stock, ready for delivery. Send for our free brochure.

prices start at $19.95.

INSTRUMENTATION

Chart recorder wears two hats

Rustrak Model 500 series of servo chart recorders is available as both an OEM unit and as a laboratory recorder. A wide selection of sensitivities, chart speeds, and custom OEM packaging features are available. Calibrated chart width is 100 mm, and writing is accomplished by an easily changed fiber-tip cartridge, positioned by a null balance, potentiometric rotary servo motor. Sensitivity is 0 to 100 mV dc full scale with other sensitivities available.

Backplane tester handles 16,000 points

Teradyne, 183 Essex St., Boston, MA 02111. (617) 482-2700. $15,000; 20 wks.

N123 is a bench-top tester for performing continuity tests on backplanes with up to 16,000 points, although it is usually most economical for units with fewer than about 5000 points. The self-contained unit includes a CRT display, a magnetic-tape-cartridge unit and a strip printer. The N123 is capable of self-learning an interconnection scheme and will find all wiring errors in a single pass.

Booth No. 1117-1124

Scope offers built-in digitally delayed base

Philips Test & Measuring Instruments, 400 Crossways Park Dr., Woodbury, NY 11797. (516) 921-8880. $2495; June.

A digitally delayed time base that enables accurate location of events in pulse trains is a key feature of the PM3261 oscilloscope. Other specs include: 120-MHz bandwidth, 3-ns rise time vertical amplifiers; main and delayed time bases with 5 ns/div maximum sweep speeds; clear front-panel design giving proven ease of operation; high-speed, high-sensitivity triggering beyond 200 MHz; and 20-lb weight, making the unit highly portable.

CIRCLE NUMBER 104
Ann Arbor makes over 1000 standard RO and KSR display terminal models. Alphanumerics. Graphics. Or both.

We also thrive on tough CRT display applications. Unique character sets. Unusual graphics. Difficult interfacing. Custom keyboards. Special packaging. You name it.

Standard or custom, every terminal produced is based on a field-proven Ann Arbor engineering concept. DESIGN III desktop terminals to complement any office decor. Compact, rugged Series 200 modular terminals that defy industrial environments. Or barebones board sets for OEMs who prefer to roll their own.

Many companies sell CRT terminals. But Ann Arbor sells creative solutions to CRT display problems, as well.

Probably at lower cost than anyone else in the business.

Contact us at 6107 Jackson Road, Ann Arbor, MI 48103. Tel: 313-769-0926 or TWX: 810-223-6033. Or see our catalog in EEM, Volume One.

**Digital IC tester works with automatic handlers**

Electro Scientific, 13900 N.W. Science Park Dr., Portland, OR 97229. (503) 646-4141. $1195; stock-90 days.

Model 1249 digital IC functional tester interfaces with automatic DIP handlers and offers selectable test voltages. The unit checks ICs in the DTL, TTL, HTL, and CMOS families without requiring a comparison device. A built-in test code comparator checks the test result against a preset nominal and signals the handler. A special feature is the selection of test voltages for CMOS devices. Three levels are offered: 5, 10 and 15 V.

Booth No. 2406 Circle No. 377

**Digital scope stores signals**

Nicolet Instrument, 5225 Verona Rd., Madison, WI 53711. (608) 271-3333. $6200 to $7200; 90 days.

The second generation EXPLOR-ER digital oscilloscope uses an a/d converter to digitize the input signal and store it in a solid-state memory. The stored signal is then reconstructed through d/a conversion on the cathode ray tube (CRT). Since the signal is stored in memory, the waveform can be manipulated during or after recording for closer examination. Bandwidth is dc to 5 MHz (with 94A plug-in). Memory is 4096, 12-bit words, which can be used in halves or quarters for measurement, display or readout to peripherals.

Trimming capacitors fit tiny hybrids

Johanson Manufacturing Corp., 400 Rockaway Valley Rd., Boonton, NJ 07005. (201) 334-2676. $1.95 (1000 up); 2 wks.

The Johanson 9410 series trimming capacitors are now available in a variety of mounting configurations including stripline, stripline-offset, PC and bottom-tuning types. Their small size, only 0.2-in. square and 0.045-in. thick, allow applications in tiny hybrid circuits such as in electronic-watch, crystal-oscillator and uhf-microwave applications. Capacitance values range from 1.0 to 45 and 7 to 45 pF and working voltages up to 250 V dc.

Pressure transducers handle 10,000 psig

I. C. Transducers, Inc., 1750 Junction Ave., San Jose, CA 95112. (408) 998-8720. $95 (1 to 9); stock.

The Series 750 solid-state pressure transducers are designed for very high pressure applications. It is claimed to be able to handle more than $5 \times 10^9$ pressure pulses of 0 to 10,000 psig at 2400 pulses/min. A variation of the 750, the Series 900, features a flush-mounted diaphragm for measuring high frequency pressure phenomena. Outputs of the two series of transducers are 0-to-100-mV full scale. Other specifications include a repeatability of 0.05% FS, an excitation of 12 or 24 V ac; an overpressure range of 200% and an operating temperature range of -40 to +250 F.

Booth No. 2601-2603

Chip capacitor adjustable 1 to 55 pF

Vitramon North America, P.O. Box 534, Bridgeport, CT 06601. (203) 268-6261.

A new version of the Vee Cal adjustable/fixed chip capacitor enables NPO parts users to add or subtract capacitance by connecting adjustment points, while retaining the integrity and stability of a fixed capacitor. The new VC2A has adjustment points on the top plane over a capacitance range of 1 to 55 pF in 0.5-pF steps. The chip measures 0.12 x 0.10 in.

CIRCLE NUMBER 110
PCB rotary switches come in many heights

Standard Grigsby, Inc., 920 Rathbone Ave., Aurora, IL 60507. (312) 897-8417.

A line of PC-board rotary switches for perpendicular mounting includes the SM-PCB Series in profile heights of 0.625, 0.742 and 0.875 in. However, where space and height are a prime consideration, any variable in height between 0.625 minimum and 0.742-in. standard may be specified. The SK-PCB series is a slightly larger, lower-cost switch and is available in a mounting height of 0.875 in. All the switches are available as single or multideck assemblies and with levers. Circuit components can be added to individual switches to provide a complete switching system. Many options are available.

CIRCLE NO. 384

Solid-state relays protected for shorts

Heinemann Electric Co., Magnetic Dr., Trenton, NJ 08602. (609) 882-4800. $14.30 (100-up); stock.

A new line of solid-state relays, presently rated to 10 A at 120 and 250 V ac, is optically isolated, operates with an extended control-voltage range from 3 to 32 V dc and is TTL, DTL and MOS-logic compatible. To prolong life and increase reliability, the relays contain a built-in snubber network to protect against high dv/dt; fused output triacs protect against short circuits. Their operating range is -40 to 100 C with either zero-voltage or nonzero-voltage switching models. Actuation time is 9-µs max in the zero-voltage switching model, and 2-µs max in the nonzero-switching model. Release time is 8.3-µs max in both configurations. Isolation resistance is at least 10^9 ohm. The relays can handle a one-cycle nonrepetitive peak surge of 1000% of the relay's current rating.

Booth No. 2119  Circle No. 385

50-Ω attenuators fit BNC connectors

ITT Pomona Electronics, 1500 E. 9th St., P.O. Box 2767, Pomona, CA 91766. (714) 623-3463. $24.95 (unit qty); 2 wk.

A BNC 50-Ω attenuator, Model 4108, for use with pulse, microwave or uhf instruments, has a female BNC on one end and male on the other. It has a nontarnish finish, Teflon insulation and gold-plated contacts. It is 1.97-in. long and 0.57 in. in diameter. Five different versions provide attenuation of 3, 6, 10, 14 or 20 dB. Attenuation tolerances run from ±0.4 dB up to 1 GHz for the 3-db unit; ±0.9 dB to 8 GHz for the 20-db unit.

Programmable display driver handles 8 colors

Kinetic Systems, Maryknoll Dr., Lockport, IL 60441. (815) 838-0065; $3850; stock.

A complete programmable color display system (less the CRT display) is housed in two 2-unit width CAMAC modules. The Model 3232 system is a character oriented module set that generates an eight-color display on any red-blue-green, 525 line, raster scan CRT monitor. The system can handle a maximum of 2048 characters and inputs are available for a joystick, pushbuttons or a trackball to move the cursor. Each character can be any of the eight possible colors as can the space between characters.

Booth No. 2214-2216

Data-acquisition system expands to 256 channels

Micro Networks, 324 Clark St., Worcester, MA 01606. (617) 852-5400, See text.

The MN7002 data-acquisition subsystem handles 16 single-ended analog channels or eight differential. The subsystem contains the multiplexer, sample-and-hold amplifier, control logic and 12-bit a/d converter on a 2.75 x 4.5-in. circuit card. Expansion of the system is possible up to a maximum of 256 channels. Each channel input has an impedance of 100 MΩ, minimum and can handle ±10-V common-mode. The over-all system linearity over the full 0-to-70°C operating range is within ±1 LSB. Absolute accuracy of the system is ±0.5% of full scale range, including zero error over the full range and the CMRR is 72 dB, minimum, for dc-to-1-kHz inputs. Crosstalk between channels is 80 dB (for a 1-kHz signal and adjacent off and on channels). Data can go through the system at a 40-kHz rate when the MN7002 operates in an overlap mode (new channel addressed while a/d converter is performing conversion on previous data). Price of the MN7002 starts at $495 for 1 to 24 units. A MIL-temperature version—the MN7002H—is also available for $865.

Programmable amps use 3-bit digital control

Preston Scientific, 805 E. Cerritos Ave., Anaheim, CA 92805. (714) 776-6500. See text.

Wideband programmable-gain amplifiers permit a 16-to-1 range of digitally selectable gain settings. The GMD-PG programmable amplifiers can be set to any of five pre-established gain levels of 1, 2, 4, 8 and 16. The GMD-PG requires a 3-bit digital control while the GMD-AGC has automatic gain ranging and a 3-bit digital output code for data logging. Gain accuracy for either unit is ±0.01% and the gain stability is ±0.01%. Both amplifiers have a gain tempco of 10 ppm/°C and a linearity of ±0.01%. Also, both amplifiers have a 20 µs settling time for the output to reach within 0.01% of its final value after a gain change and only 10 µs if there is no gain change. The GMD-PG costs $395 and the GMD-AGC $1045. Delivery of either model (with an a/d conversion system) is 10 to 12 weeks.

Thumbwheel switch includes counter/timer

International Microtronics, 4016 E. Tennessee St., Tucson, AZ 85714. (602) 748-7900. $7.50 (TTL); $9.50 (CMOS); stock to 2 wks.

A counter-timer switch consists of a thumbwheel switch with a decade counter (SN7490 or MM74C90) built-in. It accepts a train of pulses and when the counter's content equals the number displayed on the thumbwheel switch an "equal" output is generated. Any number of switches can be cascaded to form a multi-decade counter-timer. The units have provisions for clock-in, reset, carry, equal-out and preset. Both front (SF) and rear (SR) mount models are available with either TTL or CMOS compatible logic.

Circle No. 390

Synchro-to-BCD modules offer scale adjust

Computer Conversions, 6 Dunton Ct., East Northport, NY 11731. (516) 261-3300. $375 (large qty.); 4 wks.

A series of three or four-decade, synchro-to-BCD-converter modules is available with a choice of scale factor. The modules measure 2.6 X 3.1 X 0.82 in. and are designed for PCB board mounting. They convert synchro or resolver inputs of 11.8 or 90 V, 60 Hz into three or four-decade BCD data, representing angle with an accuracy of ±6 or ±30 minutes of arc. Unipolar and bipolar (±180°) models are available. The converters have isolated reference and synchro inputs and an optional zero-offset adjustment. The digital outputs are DTL/TTL compatible and bidirectional input data are accepted. Model SBC40 requires a 26 or 115-V, 60-Hz ac reference input, +15 V dc at 40 mA and +5 V dc at 600 mA, max. Operating temperature ranges are 0 to +70 C or -55 to +85 C.

Circle No. 391
Two-Tone SSB RF Test Set

Model 315 combines two Model 925 RF Signal Generators having "Signalock" with a Model 210 Signal Combiner, resulting in a two-tone test set with unsurpassed stability from 50 kHz to 80 MHz. Signal level of each tone or combined tones is adjustable from 0.1 µV to 2 volts with ±10 Hz stability. Signal spacing is from 100 Hz to almost 80 MHz. Intermodulation distortion is 60 dB down at full output: better at lower outputs. Write or call today for complete specifications and pricing.

MODULES & SUBASSEMBLIES

Log amp accepts bipolar input signals

Burr-Brown, International Airport Industrial Park, Tucson, AZ 85734. (602) 294-1434. 100-up prices; $26 (4127J); $31 (4127K); stock.

The 4127 hybrid log amp accepts input signals of either polarity. It has a wide dynamic range—up to six decades of current and four decades of voltage. The unit is available with initial accuracies (log conformity) of 0.5% full scale (4127K) or 1% full scale (4127J). It operates over an ambient temperature range of −10 to +70°C and is housed in a ceramic DIP that measures only 1.4 × 0.8 × 0.25 in.

CIRCLE NO. 392

MIL-spec converters offer wide choice

Hybrid Systems, Crosby Dr., Bedford Research Dr., Bedford, MA 01730. (617) 275-1570. From $49 (1 to 9); stock to 8 wks.

A family of over 20 hybrid data conversion devices is designed to meet full MIL-STD-883 specifications. Included are general-purpose d/a converters, multiplying a/d converters, sample/hold amplifiers and multiplexers. Converter resolution ranges from 8 through 12 bits. All of the converters are processed to class B or C of MIL-Standard 38510. The family includes: 8, 10 and 12-bit multiplying DACs (DA331 and 348 series); 10 and 12-bit general-purpose DACs (DAC335 series); 10 and 12-bit low-power DACs (DAC347 series); 8, 10 and 12-bit successive-approximation a/d converters (ADC503 and 580 series); a fast sample-and-hold amplifier (SH702); and an 8-channel analog multiplexer (MUX202).

Booth No. 1523 Circle No. 393
SCR power modules deliver 110 A at 1200 V

Gentron Corp., 6667 N. Sidney Pl.,
Milwaukee, WI 53209. (414) 351-1660. $50 (100-up); 3 to 4 wks.

The 5100 series of Powertherm power control modules handles 1200 V at 110 A. Two basic circuits are available: an anti-parallel SCR circuit, and SCR and diode arrangements. The modules have a thermal resistance of 0.4 C/W maximum.

CIRCLE NO. 511

Germanium transistors handle currents to 35 A

Germanium Power Devices, P.O.
Box 65, Shawsheen Village Station,
Andover, MA 01810. (617) 475-5082. See text.

The 2N1520 and 2N1521 pnp germanium transistors can handle 35 A at up to 80 V. The devices are housed in TO-36 packages and cost from $3 to $5, depending upon quantity. Delivery is four weeks.

CIRCLE NO. 512

LED lamps can replace T-1-3/4 incandescents

Dialight, 203 Harrison Pl., Brooklyn, NY 11237. (212) 497-7600. For 1000-up quantities: $0.54 (without resistor); $0.69 (with resistor); stock.

Developed as a direct replacement for the T-1-3/4 incandescent lamp, the series 549 Bi-Pin LEDs come in two models. One has an integral resistor for direct use at 5 V and 16 mA, and the other, a 1.7-V unit, requires an external series resistor that makes possible a wide range of operating voltages and currents. Pins are molded into the black plastic case, which has a flat for indexing to establish correct polarity. Terminations are 0.025-in.-square leads with gold plating.

The single-chip 2650 is easiest-to-buy, too. Now only $21.50 (100-up).

Full support of customer and product is the key to ease of development with the 2650. Applications engineers in the U.S. and abroad are at your beck and call at every stage. Software for almost anyone’s requirements and machines. Development hardware is versatile and inexpensive. All circuits are multi-sourced.

Flow Chart: How to travel safely and quickly from spec sheet to your µC.

1. Applications Engineers — in the field now, more coming. Specific assistance to you is available around the USA, and in Belgium, Holland, Germany, France, Sweden, Britain, Italy, etc.

2. Multi-sourced 2650 — available in any quantity from Signetics, at the unprecedented low price of $21.50. Also available from AMS and Philips, and from Signetics’ authorized distributors.

3. Development Software — includes the PL µS, an extremely efficient High Level Language (compiler) that reduces programming effort and cuts development time. ANSI standard Fortran IV executes on most machines without alteration. 2650AS1000/1100 Assembler and 2650SM1000/1100 Simulator are available in both 32- and 16-bit, on GE and NCSS time-sharing.

4. Multi-sourced Support Circuits — You’ll need MOS and/or Bipolar Memories, Interface and Logic. Signetics has everything for a complete system. Back up any item from other sources. Coming soon from Signetics are: Programmable Peripheral Interface and Communications Interface, A-D Converters, Synchronous Data Link Controller, 16k NMOS & Bipolar ROMs, 4k & 8k NMOS EROMs, and 8k Bipolar PROMs.
Development Hardware — Design/develop/prototype with a variety of cost/capability levels of hardware support. Including prototyping cards and kits, smart typewriter demo card, 4k-byte RAM card, and more. Applications help if you need it.

TWIN With Floppy Disks — "crashproofs" your system checkout. With DOS, Resident Assembler, and Text Editor. You develop programs and circuits together in an actual system environment with TWICE (TestWare In Circuit Emulator). PROM programming, too.

Over 30% Faster 2650 — By the time you've proven out your μC, you'll have available a faster 2650 if you want it. Uses the same software. For still higher speeds, call Signetics Bipolar Microprocessor Marketing about our 2650 emulator using 3000 series μP.

You go from gleam-in-your-eye to proven prototype in less time for less cost, and the μC you develop is easier and cheaper to produce in quantity, when you start with the 2650. Start now by mailing the coupon.

Attach this to your letterhead for fast response.

POWER SOURCES

Ac source regulates output as both line and load change

TDC Div., Whitcomb Ave., Littleton, MA 01460. (617) 458-3374. See text.

At first glance, the Stabilac ac power source, from the TDC division of Frequency Technology Inc., might look like any other constant-voltage transformer (CVT). But look further:

The Stabilac delivers up to 50 kVA. The CVT can't.

The Stabilac gives good regulation under simultaneous line and load variations. The CVT doesn't.

The Stabilac isolates the load from the line and suppresses input spikes. Not the CVT.

And if these aren't enough, the Stabilac is said to be 20 to 40% smaller, lighter and less expensive than a CVT of equal power rating. Surprisingly, the Stabilac is passive; it uses no electronic feedback or SCRs to maintain the output voltage.

How well does it regulate? Output stays within ±2-1/2% from no load to full load with a simultaneous line-voltage change of ±15%. If the line remains constant, a no-load-to-full-load swing affects the output by −3%. Or, with constant load and input variations of ±10% or −20%, regulation is ±1-1/2%. Note: these are all typical figures.

You also get some regulation during short-term (15 min or less) overloads. The voltage drop during overload ranges from 6% (for a 1/2-load to 150% full-load variation) to 25% for 1/2-load to 250% full-load change.

Other key specs of TDC's Stabilac include a harmonic distortion of less than 5% and efficiency of better than 80% at full load. (Another version offers a square-wave output for subsequent rectification.)

Although the Stabilac's spec sheet doesn't list a figure for isolation or fully characterize the noise-suppression capabilities, it does state that "over 95% of a 500-V spike superimposed on a 230-V line will be filtered out."

Both single and three-phase models are available, in ratings ranging from 0.25 kVA to 50 kVA (1 φ), and 6 to 150 kVA (3 φ). Primary and load voltages are 120, 240 or 480 V, depending on the model. Some units offer more than one output winding.

Typical weights and prices are as follows: In the single-phase Stabilacs, which are of open construction, the 0.5-kVA model weighs 18 lb and sells for $155; the 20-kVA unit weighs-in at 470 lb and costs $1740.

The 3-φ models come in a metal cabinet. Representative weights range from 235 lb for 6 kVA to 1500 lb for 60 kVA. Prices are $1330 and $5190, respectively.

POWER SOURCES

Converters come in various configurations

Bikor Corp., 1228 253rd St., Harbor City, CA 90710. (213) 325-2820. Price starts at $127.00; stock to 3 wks.

Three new families of power supplies are being unveiled by the company. DDU Series consists of 48 models and are dc-to-de unregulated converters for voltage transformation and isolation. Input and output voltages available are 12, 24, 48 and 110 V dc with a choice of 48 through 220 W of output. Ripple is 0.5% max. DDR Series consists of 136 models of dc-to-de regulated converters, and the ADR Series of 34 models of ac-to-dc regulated converters. Both series offer linear or switching regulators with 0.2% regulation and 0.3% max ripple. Single through four-output models are standard. Input voltages available are 12, 24, 48 and 110 V dc and 115 V ac, 50 to 400 Hz. Outputs range from 5 through 250 V dc with up to 180 W per output. Overvoltage protection is optional.

Booth No. 2515  Circle No. 514

Dual-output units deliver up to 120 W

Abbott Transistor Labs, 1224 Anderson Ave., Fort Lee, NJ 07024. (201) 224-6900. $62 to $119; stock.

This OEM “LC” series converts 115 V ac, 47 to 240 Hz to dual outputs of 5, 12, 15, 24, 28, ±12, ±15 V dc. These models can deliver 15, 30, or 60 W per output. Line and load regulation are less than 0.1%, and ripple is 10 mV rms, 30 mV pk-pk. Full output power is available up to 50 C with no derating, forced-air cooling, or heat sinking needed.

Booth No. 2112  Circle No. 515

Frequency converters shrink in size

Elgar, 8225 Mercury Ct., San Diego, CA 92111. (714) 565-1155. Model 501, $1050; 4 wks.

The new “C” series of ac power sources is said to be one-third the size and one-half the weight of the company’s conventional ac sources. Typical “C” series specs are 115 V ac or 230 V ac, 50 or 60-Hz input; 115, 230 or 26 V ac, 45–10-kHz output with 0.5% harmonic distortion. Model 501C is rated at 500 VA, is 5.25 x 19 x 17 in. in measurements and weighs 60 lb.

Booth No. 2713  Circle No. 516

Supplies aim at floppy-disc drives

Power-One, 531 Dawson Dr., Camarillo, CA 93010. (805) 484-2806. $120; stock-2 wks.

This new series is designed to power floppy-disc drive systems, including controller/formatter circuitry, from manufacturers such as Pertec, Diablo, CDC, Shugart, etc. First to be offered in the series is Model CP-162, a triple-output unit capable of powering two individual systems simultaneously. Outputs are 24 V at 5 A, 5 V at 3 A, and ±5 V at 0.6 A, all with overvoltage protection. Of special interest is the 24-V regulator, capable of delivering up to 6-A output current for 500 ms upon initial system power-up. Following power-up, 5 A is available on a steady-state basis. Standard features include 115/230 V ac input, built-in overload and overvoltage protection, ±0.05% regulation, and remote sensing. Maximum ripple is 1.5 mV pk-pk, and transient response is specified at 30 μs for a 50% load change.

The IMSAI 8080.
A commercial yet personally affordable computer.

If you thought you could never afford a computer at home, think again. The IMSAI 8080 is built for rugged industrial performance. Yet its prices are competitive with Altair's hobbyist kit. Fully assembled, the 8080 is $931. Unassembled, it's $599.

The IMSAI 8080 is made for commercial users, and it looks it. Inside and out. The cabinet is attractive, heavy gauge aluminum. The heavy duty lucite front panel has an extra 8 program controlled LED's. It plugs directly into the Mother Board without a wire harness. And rugged commercial grade paddle switches are backed up by reliable debouncing circuits.

The system is optionally expandable to a substantial system with 22 slots in a single printed circuit board. And the durable card cage is made of commercial-grade anodized aluminum.

The IMSAI 8080 power supply produces a true 28 amp current, enough to power a full system. You can expand to a powerful system with 64K of software protectable memory plus an intelligent floppy disk controller. You can add an audio tape cassette input device, a printer plus a video terminal and a teletype. And these peripherals will function with an 8-level priority interrupt system. BASIC software is available in 4K, 8K and 12K.

Get a complete illustrated brochure describing the IMSAI 8080, options, peripherals, software, prices and specifications. Send one dollar to cover handling to IMS. The IMSAI 8080. From the same technology that developed the HYPERCUBE Computer architecture and Intelligent Disk systems.

The Tekinformer, a four-page house organ, is designed to keep its readership abreast of the latest developments in metal packages for hybrid microelectronics. Tekform Products, Anaheim, CA

CIRCLE NO. 538

Graphics display terminal
Features of interactive computer graphics display terminals are covered in an eight-page booklet. Hughes Industrial Products, Carlsbad, CA

CIRCLE NO. 539
"I’ve purchased $50,000 worth of products through the GOLD BOOK"

"The GOLD BOOK provides a convenient comparison of products from multiple sources, as well as vendor phone numbers," writes M.G. Stickler, P.E., General Manager, Computer Engineering Division, Pentamation Enterprises, Inc.

Mr. Stickler is involved with design, production, installation, and maintenance of minicomputer and microcomputer systems for his Bethlehem, Pa., Computer Facilities Management firm.

"I find the GOLD BOOK extremely useful...I’ve probably used it about 70 times, and as a result, we’ve purchased $10,000 worth of power supplies, $2,000 in keyboards, $30,000 in microcomputers — about $50,000 to date."

This is the GOLD BOOK in action. This is the GOLD BOOK working for you. (The GOLD BOOK goes essentially to Electronic Design’s audience of known specifiers.)

Mr. Stickler, like 78,000 engineers, engineering managers, purchasing agents and distributors throughout the U.S.A. (plus 13,000 overseas) has his own personal copy of the GOLD BOOK. He uses it to specify and buy products.

THIS IS ELECTRONIC DESIGN’S AUDIENCE WORKING FOR YOU!

Electronic Design / GOLD BOOK

HAYDEN PUBLISHING COMPANY, INC.
50 Essex Street, Rochelle Park, New Jersey 07662. Tel: 201-843-0550
**Electronic Design**

**Electronic Design's** function is:
- To aid progress in the electronics manufacturing industry by promoting good design.
- To give the electronic design engineer concepts and ideas that make his job easier and more productive.
- To provide a central source of timely electronics information.
- To promote communication among members of the electronics engineering community.

Want a subscription? **Electronic Design** is sent free to qualified engineers and engineering managers doing design work, supervising design or setting standards in the United States and Western Europe. For a free subscription, use the application form bound in the magazine. If none is included, write to us direct for an application form.

If you do not qualify, you may take out a paid subscription for $30 a year in the U.S.A., $40 a year elsewhere. Single copies are $1.50 each.

**If you change your address**, send us an old mailing label and your new address; there is generally a postcard for this bound in the magazine. You will have to requalify to continue receiving **Electronic Design** free.

The accuracy policy of **Electronic Design** is:
- To make diligent efforts to ensure the accuracy of editorial matter.
- To publish prompt corrections whenever inaccuracies are brought to our attention. Corrections appear in "Across the Desk."
- To encourage our readers as responsible members of our business community to report to us misleading or fraudulent advertising.
- To refuse any advertisement deemed to be misleading or fraudulent.

Microfilm copies are available of complete volumes of **Electronic Design** at $19 per volume, beginning with Volume 1, 1952 through Volume 20. Reprints of individual articles may be obtained for $3.00 each, prepaid ($5.00 for each additional copy of the same article) no matter how long the article. For further details and to place orders, contact the Customer Services Department, University Microfilms, 300 North Zeeb Road, Ann Arbor, Michigan 48106 telephone (313) 761-4700.

Want to contact us? If you have any comments or wish to submit a manuscript or article outline, address your correspondence to:

**Step-by-step coverage of defense radar system design . . .**

**INTRODUCTION TO DEFENSE RADAR SYSTEMS ENGINEERING**

James N. Constant

This all-inclusive handbook covers virtually every facet of radar technology that must be mastered in order to design a complete defense radar system. In fact, it concludes with a step-by-step procedure for specifying and designing a complete radar system for a given application. Separate chapters cover target characteristics; radar detection; radar receivers; radar system error model; flight of a ballistic missile; ballistic reentry trajectories; trajectory prediction; radar data processing; reflector antennas; and array antennas. Order your 15-day examination copy today! #9194, 344 pages, cloth, illustrated, $22.95

---

**15-DAY FREE EXAMINATION!**

Hayden Book Company, Inc.

50 Essex Street

Rochelle Park, N.J. 07662

☐ Please send me my copy of INTRODUCTION TO DEFENSE RADAR SYSTEMS ENGINEERING to read and use for 15 days. At the end of that time, I'll send a check or money order for $22.95, plus postage and handling, or return the book and owe absolutely nothing.

☐ I want to save money! I have enclosed full amount. Publisher pays postage and handling. I get a complete 15-day money-back guarantee.

Design Data from Manufacturers

Advertisements of booklets, brochures, catalogs and data sheets. To order use Reader-Service Card

GIAN T FREE CATALOG

New 172-page catalog! Packed with 1,000’s of hard-to-find buys in Optics, Science, Electronics. Loaded with optical, scientific, electronic equipment available from stock. Rare surplus buys. Many “one-of-a-kinds”. Ingenious scientific tools. Components galore: lenses, prisms, wedges, mirrors, mounts, accessories. 100’s of instruments: pollution test equipment, lasers, comparators, magnifiers, microscopes, projectors, telescopes, binoculars, photo attachments, alternate energy sources. Shop, save by mail! Request free Catalog “DA”.

FFT Analyzer Provides Instant Results; Allows Continuous Viewing and Editing

Designed for operation by engineers rather than computer experts, the “DSP” Digital Signal Processor is portable and provides instant, Real Time answers for 12 distinct signal-analysis functions. It conditions and analyzes two signals, correlates their mutual properties, and displays results in a broad variety of forms and formats. Real Time operation is to 25 kHz. By means of a “joystick”-controlled cursor, data is traced for instant, calibrated 6-digit LED readout of frequency, amplitude, time and phase. Accepts analog waveforms or digital data for 57 analysis ranges from 10 Hz to 150 kHz with resolution narrow as 0.01 Hz. Averages up to 4096 ensembles. Throughput over 300,000 words/sec.

Are you using the #1 training courses in electricity & electronics?

BASIC ELECTRICITY and BASIC ELECTRONICS

By Van Valkenburgh, Nooger & Neville, Inc.

Derived from the COMMON-CORE Training Program initially developed for the U.S. Navy, these unique texts are now about to enter their third decade of use in schools, industries, and communication utilities. They continue to be exemplary training texts in their subjects. Carefully integrated illustrations comprise almost half the course material. These perform a remarkable job of visualizing complex theory and applications. Readers are able to grasp essential concepts right away without having to wade through pages of wordy explanation. Thorough, comprehensive coverage. Available in separate paperbacks or one cloth volume. Write for FREE brochure.

New and current products for the electronic designer presented by their manufacturers.

CIRCLE & MULTI-FEED-THRU CAPACITORS, available in a wide range of sizes and configurations, with NPO, BX, Z5U and Y5V characteristics. For use as feed-through elements, where volume efficiency of capacitance performance is required. Applications also include filter networks, pulse and logic circuitry, and signal bypass to ground elements in broadband circuits. Available in configurations suited to customer needs. Johanson/Dielectrics, Inc., Box 6456, Burbank, CA 91510 (213) 848-4465.

Synchro to Linear DC Converter: Infinite Resolution. Full \( \pm 180^\circ \) or Limited Angle DC Output \((\pm 90^\circ)\), \( 0 \) or \( \pm 15 \) minute accuracy at input rates up to 1440/sec., 60 or 400 Hz input. Custom Output scaling available. Module 2.6" x 3.1" x .82". H. Price from $350 in quantity. Other CCC products are Synchro to Digital, Digital or DC to Synchro Converters, Solid State C. T.'s or CDX's, and Absolute Encoders. Send for Free Catalog & Application Notes. Computer Conversions Corp., East Northport, N.Y. 11731 (516) 261-3300.

STURDLITE ELECTRONIC WORK STATIONS designed to meet exacting requirements for electronic testing, production and assembly. Electrical outlets available in almost any quantity and in convenient locations. Free catalog. Also, free planning service is available. Angle Steel Div., Kewanee Scientific Equipment Corporation, Plainwell, Mich. 49080 Phone (616) 685-6831.

Electronics Design: BICENTENNIAL ISSUE This historic 254-page issue traces the developments of the electronics industry from the Colonial period to today. Has received both Presidential commendation and official recognition by the American Revolution Bicentennial Administration. Supply limited. Send check for $4 each to: Bicentennial Issue, Electronic Design, 50 Essex St., Rochelle Park, N.J. 07662.

ID/INSPECTION ARROWS Identify problem and action areas at a glance with colorful pressure sensitive arrows. Use for inspection, QC, flagging, repair identification, assembly drawings and instructions. Permanently affix or reposision. Die cut from paper or vinyl tape. Won't fade, dry out, or lift. Standard and fluorescent colors in 1/4", 3/8", and 1/2" lengths. From $2.40/M in 5-49M qty. Webtek Corporation, 4326 W. Pico Blvd., Los Angeles, CA 90019 (213) 937-4763.
Atomic Frequency Standard Model

FRT for Lab/Field. Output 10-5 - 10.1 MHz, Short Term Stability $<1x10^{-10}$ $\tau = 1$, $<1x10^{-11} \tau = 100$s. Drift typ $1x10^{-3}$/M. Coupled with Receiver-Controller EFR. Sync to Standard Freq. absolute freq parts in $10^{-7}$. Efratom Calif., Inc., 3303 Harbor Blvd., E1, Costa Mesa, Ca. 92626 (714-556-1620)

New and current products for the electronic designer presented by their manufacturers.

**Thin-Trim variable capacitors** provide a reliable means of adjusting capacitance without abrasive trimming or interchange of fixed capacitors. Series 9401 has high Q's and a range of capacitance values from 0.2-0.6 pf to 3.0-12.0 pf and 250 WVDC working voltage. Johanson Manufacturing Corporation, Boonton, New Jersey (201) 334-2676.

**Thin-Trim Capacitors**

**MINIATURE IRONLESS ROTOR DC MOTORS** offer efficiencies to 80%, low inertia, rapid response and high starting torque. 24 and 12 VDC models available. Motor time constants are 17 and 23 ms respectively. Rotor torque is 100 and 50 gcm and starting torque 600 and 230 gcm respectively. 12 VDC units can be ordered with either a single or extended double shaft. Tac versions also available. For reel and capstan drives, chart and pen drives, etc. North American Philips Controls Corp., Cheshire, Conn. 06410. (203) 272-0301.

**MINIATURE IRONLESS ROTOR**

**TRAINING TEXT**

**The AMP Box Connector** is ideal for systems with up to several hundred contacts. It features an innovative "box" contact design that accepts square, rectangular, round, or formed channel pins. Available in many pin and receptacle configurations and with external keying. From the people who offer technical assistance at its best: AMP Incorporated, Harrisburg, PA (717) 964-0100.

**AMP BOX CONNECTOR**

**THIN-TRIM CAPACITORS**

**THIN-TRIM**

**THERMOELECTRIC MODULE**... a remarkable value for only $20 (ppd.), can be used in water coolers, small refrigerators, hot and cold temperature sources, spot cooling for electronic components and other applications. Operates at 3.5 VDC, 8.5 amps, $T$ Max at $Q_c$ Zero is 60°C, Th is 50°C, $Q_c$ Max at $\Delta T$ Zero is 19 watts, Max. Op. temp is 100°C. Price includes Thermoelectric handbook. CAMBION, 445 Concord Avenue, Cambridge, MA 02138.

**THERMOELECTRIC MODULE**

**Hi-Rel 12 Bit Ladder Network** Added to the industry's most complete standard ladder network product line is the AD850/U/F/883. The ladder is a 12 bit binary current network for user configured avionics systems where minimum space, weight and reliability are important. Accuracy is 1/4 LSB of 12 bits. Price is $50.00 in 100's. Analog Devices, Norwood, Mass. 02062 617-329-4700.

**HI-REL 12 BIT LADDER NETWORK**

**New Electronic Gage, Easy To Use.** Thickness, Alignment, diameter or deviation measurements, concentricity, orbit tracing, etc. Accuracy up to ± micro-inches (± 0.001 inch), resolution <10 microinches. Utilizes non-contacting inductive measuring techniques—unaffected by oil, grease, or water. Replaces LVDT, air gage, dial indicator, micrometer, etc. $1,995. Ask for information on KD-2602-2S. Kaman Sciences Corporation, P.O. Box 7463, Colorado Springs, Colorado 80933, (303) 599-1500.

**NEW ELECTRONIC GAGE**

**Model 9201 Power Switch**, miniature DPDT toggle is designed to meet international dimensional/electrical specs. Electric life: 25,000 make-and-break cycles at full load. Contact rating: 6 amps with resistive load @ 120 VAC or 28 VDC. Free Engineering Sample on request. C&K Components, Inc., 103 Morse St., Watertown, MA 02172, (617) 962-0800.

**POWER SWITCH**
A Software Library, developed and maintained by users to provide access to the programming efforts of other handheld, programmable calculator users. Viola Grange invites your programs. Contributors receive free the volume in which they are published. Vol 1 is a source containing practical formulae, skillful programming, and imaginative treks into mathematics and engineering. Published quarterly. $6. The Viola Grange, Rt. 2, Box 965, Estacada, OR 97023

APPLICATIONS PROGRAMS

The Model 1000 Directional Wattmeter is an accurate and portable insertion RF wattmeter using plug-in detectors and quick-change RF connectors, which measure forward & reflected CW power. The Model 1000 features a large scale, easily read meter movement. Standard ranges are 5 watts to 10,000 watts; frequency range is 2 to 1,000 MHz. TUCKER ELECTRONICS CO., PO BOX 1050, GARLAND, TEXAS 75040 (800) 527-4642 (In Texas Call (214) 348-8800)

RF WATTMETER

Resident COBOL compiler system for the 8080 microprocessor. Runs on any 16K RAM system. With a few exceptions, the level of COBOL offered (relative to ANSI X3.23-1974) is: nucleus level 2, table handling level 2, sequential, relative and indexed 1-0 level 1, and sort-merge level 1. Reference manual $6. Also available: complete disk operating system including a powerful job control language, an assembler, a text editor, a debugging system, file utility routines. Mini-Software Inc., Box 7438, Alexandria, VA 22307

8080 COBOL COMPILER

EC's new ECL compatible Logic Delay Module features ECL input and outputs; 16-pin DIP package (.250 high); precise delays from 25ns to 250ns; and with 20% taps—each isolated with 70 ECL dc. fan-out capacity. Engineered Components Company, P.O. Box Y, San Luis Obispo, CA 93406 (805) 544-3800.

ECL LOGIC DELAY MODULE

New Multi-Slide, Multi Circuit DIP Switches . . . wide variety of switching combinations. Freq. Range Sel. test pt. monitoring, select on test, atten. level selection, program addressing, cross pt. switching, 2 poles, 4 pos., 4 poles, 2 pos.; 1 pole, 8 pos.; 4 poles 2 pos. (var.) True "break-before-make"; spring-loaded double bearing detent; gold/nickel contact plating; self-cleaning wiping action for consistent performance. Minelco Div., Gen. Time, 135 S. Main St., Thomaston, CT 06787 (203) 283-8261

DIP SWITCHES

RADAR SYSTEMS

A FORMS FEED TRACTOR slewing at 37 lips with 140 in/oz of torque. Electronic vernier adj. sets TOP OF FORM: quarter, single & double line feed in forward or reverse are standard. Options of PERF. SKIP, PAPER FEED TIME OUT, END OF FORM SENSING & SELECTABLE TOP OF FORM are available. The design assures operating simplicity, long life and trouble free performance in heavy duty operation. TRAKTEX 45 Ryegate Terr. Monroe, Ct. 06468 203-261-9011

FORMS FEED TRACTOR

STRIP/BUS BY ROGERS. Low Cost Bus­sing Systems; easy installation, reliable solder joints; greater pin exposure. Write or call for details. Rogers Corporation, Rogers, CT 06263. Phone (203) 774-9605.

Now you can look to one source for your solenoid requirements and for unbiased advice on the type best suited to your needs... because Oak builds them all. Call toll free 800-435-6106 for price and delivery information or write for technical bulletins describing the complete Oak line of solenoid products.

OAK Industries Inc.
SWITCH DIVISION/CRYSTAL LAKE, ILLINOIS 60014

SOLID STATE RELAYS WITH SOMETHING EXTRA

From Elec-Trol, a complete line of 3 to 45 Amp, 120 to 480 VAC output, AC or DC input Solid State Relays, and custom designs to meet your needs. All feature: Zero Crossover Switching to eliminate RF noise and load current or voltage surges. Photo Isolation between Input & Output. Input Current Limiter on all DC models prevents relay closure by input transients & increases LED life. Built-in Snubber Network in Output prevents uncontrolled operation due to load-line transients. IC Compatibility and Reverse Polarity Protection on all DC models. Call or write for complete information today.

HP 9830A* users... forget memory overflow problems

With our EM-30 Extended Memory System, you'll eliminate the need to redesign programs because of memory overflow.

Make it easy for yourself... an EM-30 gives you these important features:

- **economic expansion** of your HP 9830A* read/write memory to 32K bytes
- the ability to **easily work** with large arrays of data without peripheral storage
- **full compatibility** with all software, peripherals and HP ROM options
- easy installation in minutes—the EM-30 is a direct plug-in replacement for HP memory.

NEW! Powerful ROMs on the way. A RUN FAST command will greatly accelerate program execution. And a LIST ALL command permits listing of all programs. These capabilities will be conditionally available to buyers of EM-30 memory systems.

**As low as $4230 for 32K.** Expand a fully loaded 15K-byte 9830 to 32K for only $4230. By adding the EM-30, your HP 9830A* will give you minicomputer memory capacity with desk-top convenience. And you'll get the same high quality and reliability you'd expect from an HP product.

**Introductory Offer.** Send us a list of your ROMs, options and peripherals, we'll send you a cassette with a collection of appropriate commercial programs. And we'll add your name to a growing list of 9830 users interested in exchanging programs and techniques.

For more information, call us collect at (213) 966-7431. Or write Infotek Systems, 733 E. Edna Place, Covina, Ca. 91723.

New multiturn trimmer... in low profile design.

From the trimmer specialists at CTS comes the new "low .250" profile..."low cost" Series 186 cermet trimmer. A double value in 17-turn ¾" rectilinear design.

Add to that the low ±100 ppm/°C standard TC, multipaddle contractor, clutch stops, reliable-stable CTS cermet resistance element and power rating to ¾ watt @ 25°C... and you have one super trimmer value!

It's available in two popular pin configurations — .100" and .200" offset side-to-side spacing. Enjoy greater economy in data processing, communications, instrument or equipment applications by specifying the new CTS Series 186 cermet trimmer. For complete information write CTS OF WEST LIBERTY, INC., 6800 County Road 189, P.O. Box 266, West Liberty, Ohio 43357. Phone (513) 465-3030.

CIRCLE NUMBER 283
What's new in solid state...

Announcing the 1-chip COSMAC CPU and the 4-chip CMOS system.

Now, a CMOS system that really delivers the promise of the microprocessor. It's the expanded RCA 1800 family with CDP1802, our new one-chip COSMAC CPU. And it gives you an unsurpassed combination of flexibility, performance and cost effectiveness.

This cost effectiveness starts with price: $23.50 for the CDP1802CD in 100-piece quantities. But there's more to it.

Simple COSMAC architecture lowers memory costs because of 1-byte instructions and internal address pointers. It also reduces I/O costs. Plus design and learning costs.

Then you have the familiar CMOS savings. Single power supply. Single-phase clock. Less cooling and other equipment, thanks to low power and high tolerances.

For all these reasons, we believe no other microprocessor matches the RCA 1800 for system cost effectiveness. What's more, you can get the whole system from us: CPU, ROM, RAM, I/O. Everything you need including complete design support. From the first house in CMOS.

For more information, contact your local RCA Solid State distributor. Or RCA.

Write: RCA Solid State. Box 3200, Somerville, NJ 08876; Ste. Anne de Bellevue H9X 3L3, Canada; Sunbury-on-Thames, U.K.; Fuji Bldg., Tokyo, Japan.

RCA 1800. The full spectrum in one low cost system.
