T³L: a noise-immune extension of the TTL family
Low cost n-channel MOS process uses ion implantation
Digital IC models for computer-aided design, Part 5

PLASMA DISPLAYS PUT ON AN ANALOG FACE

Intercon 74 Special HOW THE ENGINEERS ARE EVALUATED
FEATURES:
High luminous intensity
Low cost
Low power consumption
IC compatible
Vibration/shock resistant
Solid state reliability
Life measured in years
Wide viewing angle

Dialight's high brightness 521-9200 LED is an intense large area light source that has this typical luminous intensity:
@ I₀ = 20 mA I₀ = 2.0 mcd.

APPLICATIONS:
Panel lighting · Circuit-status indicators · Back lighting of annunciators · Alpha-numeric displays · Automobile dashboards · Appliances · Desk-top calculators · Housewares

9¢
Quality LEDs are 9¢ each when purchased in million piece quantities

21¢
LEDs from 100 to 999 are only 21¢ each.

17¢
If you need LEDs from 1000 to 9999, Dialight has them for 17¢ each.

28¢
Even if you only need LEDs from 1 to 99, Dialight has them for 28¢ each.

16¢
Quantities from 10,000 are a low 16¢ each and Dialight can fill your order today

FREE!
With this coupon you can get a free LED sample. Send this coupon to your nearest Dialight distributor or give him a call.

Electronics/March 7, 1974
FOR NEW STANDARDS IN SPECTRUM ANALYSIS, THINK HP

Affordable spectrum analysis

A new 1500 MHz plug-in for HP 180 series Scopes

Just $3450. The 8558B Spectrum Analyzer plug-in is priced low enough to make it practical for every workbench; no need to “timeshare” the expensive analyzer. And since it’s part of the HP 180 Scope family, the mainframe can do double-duty using the wide selection of other 180 plug-ins.

Lab Grade Performance. Compare the 8558B’s frequency and amplitude accuracy against any other analyzer and you’ll quickly see how good it is. Frequency response over the full 0.1-1500 MHz range is ±1 dB, and there’s an LED display of frequency with ±5 MHz accuracy. Distortion free dynamic range exceeds 70 dB. Signal levels from +30 dBm to −117 dBm can be measured. Resolution bandwidths from 1 KHz to a wide 3 MHz are provided.

Three Control Simplicity. For most measurements, you simply set two frequency and one amplitude controls. Resolution bandwidth and sweep time are automatically optimized. Panel markings guide you to control settings that minimize the possibility of errors from signal overloading.

For full information on this tremendous value in spectrum analysis, call your nearest HP field office. Or write.

Highlights
The cover: Analog display takes on new glow, 89
Bar graphs driven by digital circuitry are the latest development in the fast-moving field of gas-discharge technology. Having no moving parts, a Burroughs panel is a strong challenger to existing electromechanical indicators.

Car makers need perfect devices for pennies, 74
Semiconductor manufacturers have yet to learn that automobile economics demands higher levels of quality control and reliability than even aerospace programs. This was the message from automotive company representatives at an ISSCC discussion and a panel sponsored by Electronics’ magazine.

How companies evaluate EE performance, 107
Today’s more thorough and more objective evaluations are improving communications between managers and EEs and often help the individual engineer plan his career more effectively. This Special Report surveys systems in use at firms across the country, and a questionnaire invites Electronics’ readers to tell how they react to being evaluated.

Simpler n-channel process increases yields, 117
Higher yields mean lower costs, yet the resulting ion-implanted metal-gate MOS devices perform as well as silicon-gate LSI. They also operate off +5 volts and are fully TTL-compatible.

And in the next issue . . .
Optical waveguide moves into systems . . . a 12-bit microcomputer . . . designing with computer-generated Smith charts.
As evaluation of an engineer's job performance has become more sophisticated, the process of evaluation itself is having increasingly more impact on the career of every engineer. What's more, evaluation has become an increasingly effective tool in helping supervisory personnel do their job.

Since evaluation used to be thought of as just a necessary chore, we were surprised at some of the changes in attitude that we found when we conducted a survey for our report on the dimensions of engineering evaluation today (see p. 99).

For one, an unexpectedly large number of EEs not only approve of the concept, but, in fact, desire to be evaluated—and then informed of the results. Indeed, more and more companies are encouraging the engineer to comment on his rating by providing space for that purpose on the evaluation forms.

The most important byproduct of evaluation procedures is an increased communication between supervisor and engineer, which leads to higher productivity and greatly helps in career planning.

Our survey's cross-section, while representative, was necessarily a small one. So, to get a better handle on the pros and cons of evaluation—and find out how you readers react to your company's evaluation procedures—we've included two questionnaires in this issue (see p. 103 and p. 104). We urge you to take the time to fill one out. In an upcoming issue, we'll publish the results, as well as the most illuminating comments that we receive.

The automobile represents a relatively new and potentially lucrative market for electronic products.
A more functional generator for $495.

The new Krohn-Hite Model 5200 linear sweep/function generator gives you more versatility and performance for your money. If that's a sweeping statement, we stand ready to prove it! Model 5200 generates basic sine, square, triangle and ramp waveforms that you can manipulate with sweeps and triggers from 0.00003Hz to 3MHz. For even more versatility, the new Model 5300 adds an exponential ramp for logarithmic sweeping at only $695. For fast action, call the Wavemakers at (617) 491-3211, TWX 710-320-6583, Krohn-Hite Corporation, 580 Massachusetts Ave., Cambridge, Mass. 02139.

Readers comment

Date-coding ICs

To the Editor: This is to supplement Fred U. Rosenberger’s letter on the problems of date-coding ICs [Electronics, Dec. 20, 1973, p.6]. The confusion that Mr. Rosenberger mentions is, in fact, already with us because several manufacturers use a three-digit code. They must eliminate the initial seven, banking on the likelihood that the user won’t mix parts made recently with parts made a decade ago or a decade hence. Thus it was that I was asked to determine if an op amp marked 316 was, in fact, LM316. It was not, but it certainly was date-coded for the 16th week of 1973.

I suggest that if manufacturers who use the four-digit code would substitute the letter D for the seven, and if manufacturers who use the three-digit code would prefix their codes with the letter D, it would cause less confusion.

Lawrence W. Johnson
Hewlett-Packard Laboratories
Palo Alto, Calif.

HP-35 statistical analysis

To the Editor: In “doing statistical analysis with a single data entry,” [Electronics, Nov. 8, 1973, p.121], Walter Manka suggests a 10-step method for finding standard deviations. Here’s a key sequence that eliminates one of the steps: DATA, ENTER, ENTER, X, RCL, +, STO, ROLL DOWN, +. If you have a large number of data inputs, saving that single step can save a lot of time.

It is also possible to use the HP-35 calculator as a counter, taking advantage of the behavior noted by J. Snaper in another Engineer’s Notebook, “Storing two constants instead of just one,” [Nov. 8, 1973, p.121]. Just load the increment, push ENTER three times, and you are ready to count. To set the display to zero, push CLX, and each press of the + key will then change the display by the desired increment.

The Rev. Walter L. Pragnell
Grace Church
Everett, Mass.

To the Editor: The Engineer’s Notebook, “Doing statistical analysis with a single data entry,” shows an equation that is not the generally accepted one for relatively small sample sizes, where N is less than or equal to 30. The correct equation is:

\[ S.D. = \left[ \frac{\sum (D_i)^2}{N - 1} \right]^{1/2} - \left[ \frac{\sum (D_i)^2}{N(N - 1)} \right]^{1/2} \]

With this equation, the mean, variance, and standard deviation can still be determined with a single data entry on the HP-35 calculator.

Paul Wahlstrom
Reserve Mining Co.
Silver Bay, Minn.

■ The author replies: Where a rigorous analysis is required, your equation should be used. By increasing N, the two equations approach equality. The differences between the two equations with N = 5 is about 12%, with N = 10, it is about 5%, and with N = 30, it is about 1.7%. These differences usually are not large, compared with the indeterminate errors present. Therefore, it becomes a matter of convenience which equation to use.

For example, with N = 31, there is still a difference of 1.02%. In some situations, this may still be significant, requiring that your equation be used with sample sizes greater than 30. The accuracy desired depends on the situation. The important point is that statistical analysis can be done on the HP-35 with a single data entry.

Cutting keystrokes

To the Editor: Some keystrokes can be trimmed from the method suggested by Philip Geffe in “Evaluating polynomials and finding their roots by means of the HP-35” [Electronics, Engineer’s Notebook, Nov. 8, 1973, p.120]. The polynomial can be written as:

\[ P(x) = a_n x^n + a_{n-1} x^{n-1} + \ldots + a_1 x + a_0 \]

For evaluating \( P(x_0) \), the key sequence becomes:

\[ x_0, \text{ ROLL UP, ROLL UP, ROLL UP, } a_n, x, a_{n-1}, +, x, a_{n-2}, +, x, \ldots, a_1, +, x, a_0, + \]

The longer the polynomial is, the more keystrokes can be saved with this method.

John A. Ball
Harvard College Observatory
Harvard, Mass.
Great American Logic.
From Jefferson, Franklin, Madison, and HiNIL.

Give your industrial control system a great constitution with HiNIL, the high noise immunity logic from Teledyne. It works reliably in adversity—like the great political logic our Founding Fathers used in the Constitutional system.

HiNIL doesn’t operate illogically when it sees electrical noise and high voltage transients. With a 3.5 volt guaranteed noise margin (versus 1.0 V for CMOS and 400 mV for TTL), it runs without shielding. HiNIL also runs true when the power supply doesn’t. It doesn’t need expensive regulated supplies, filters and spot regulators because HiNIL’s power supply tolerance is a comfortable ±1 V.

And HiNIL is slow—that’s right, slow not fast. Its 100 nanosecond propagation delay is fast enough for most control systems. But it won’t be switched falsely by noise spikes when a fork lift rolls by (can you say the same for the hair-trigger logic you’ve been using?).

Like the Constitution, HiNIL is adaptable. It interfaces easily with TTL, DTL, RTL, MOS and CMOS directly, through open-collector outputs or through interface circuits. And it comes in about 40 types: from diode-expandable gates to quad schmitt triggers, shift registers, display decoder/drivers and a dozen other complex MSI functions. All conveniently packaged in ceramic or molded silicone DIPs.

Finally, HiNIL is cheap. It’s priced right in there with TTL so you can save a small fortune on supply regulation, noise suppression and other “extras” you’ll no longer need.

So if you want to read about great logic, trade in your history books for Teledyne’s free literature on HiNIL. Better yet, experience HiNIL in your own designs. Get it from Teledyne, reps or distributors. Write or call now.

THE BROAD-LINE PRODUCER OF ELECTRONIC PARTS

---

### 40 years ago

From the pages of Electronics, March, 1934

**Radio and the FCC**

President Roosevelt has asked that a new Federal Communications Commission be set up to take over the functions of the Federal Radio Commission and the communication responsibilities of the Interstate Commerce Commission. Two bills accordingly have been introduced in Congress: Representative Rayburn's bill which would create the new Communications administration and set it in operation with the existing radio laws; and Senator Dill's bill which would repeal all present radio legislation and enact a wholly new law in its place.

The Federal Radio Commission has been purely a traffic-regulating body. The new Commission of seven will handle ether traffic and in addition take over rate-fixing and the supervision of all charges made for interstate and international communication. Excepted from this, however, will be broadcasting advertising rates—broadcasting being clearly defined by all parties as not a common carrier. Supervision of operating conditions by broadcasters will be continued by the new Communications Commission.

While there is always the hazard that a new group of seven political appointees will find work to keep themselves apparently busy and to build a vast bureaucracy as in the cases of other Washington commissions, it begins to be apparent that the force of the new communications administration will fall chiefly on the wire services where the vast bulk of the dollar volume lies. There is as yet little continental radio communicating service...

When the new FCC comes to fixing upon international radio rates, the dilemma is presented as to how the American commission can fix rates, when it has no authority over the various foreign governments which cooperate in the interchange of radio messages! On the other hand the FCC can play a great future part in coordinating American communication services and putting the Government firmly behind American operating companies...
One 18 GHz box does it all! FM, pulsed RF, CW
5-day delivery

Why pay for CW only? Systron-Donner's Model 6057 frequency counter measures virtually any microwave signal from 20 Hz to 18 GHz with 1 Hz resolution. CW and AM measurements are fully automatic; FM and pulse modulated carriers use a simple 3-step operation to get direct answers.

The 6057 is priced at $5,450, which is just about what you'd expect to pay for comparable instruments without FM and pulsed RF capability. However, S-D gives you a choice. If it's CW only you need to measure, then choose our Model 6016 at $4,575, or for only $3,695 you get a Model 6092 manual T.O. measuring system.

For details, a demo or 5-day delivery, call your Scientific Devices office (listed below). Or call collect S-D's Quick Reaction Line (415)-682-6471.

In Europe: Systron-Donner—Munich, W. Germany; Leamington Spa, U.K.; Paris (Le Port Marly) France.

In Australia: Systron-Donner—Melbourne.
Am26S12 Quad Bus Transceiver. Designed using Schottky clamped transistors, the Am26S12 has a bus driver current sink capability of 100mA at 0.8V (maximum) which enables it to drive as many as 200 devices. Receiver hysteresis provides high noise immunity with noise margins of greater than 1.0V. The unique terminating scheme of the Am26S12 allows each end of the bus to be terminated with a resistor as low as 100 ohms. Threshold limits are 1.4 to 2.0V ± 0.2V. Also available: The Am26S12A. Pin-compatible with DM8838. Threshold limits, 1.2 to 2.25V ± 0.2V.

It’s a bus driver with the world’s highest drive capability and a bus receiver with unbelievably high noise immunity together in a single package.

It’s the speedy new Am26S12 Quad Bus Transceiver. Yet another step forward in our relentless effort to become the sixth largest maker of integrated circuits in the country by 1975.

Advanced Micro Devices Inc. (We’re going to be #6.)
Silicon gate, ion implanted complementary MOS is in volume production at Intel. The first circuits in our new silicon gate CMOS family form a variety of two-chip digital watches. There'll be other circuits for many other applications soon.

Now you can talk confidently about making many kinds of equipment with orders of magnitude less battery drain and the cost advantages of complex, economical CMOS arrays. You can talk about them now with Intel.

Intel’s silicon gate CMOS arrays have only nan­-amperes of leakage current on standby and dissipate only microwatts in operation—far less than standard metal gate CMOS. Smaller chips, higher densities of logic and storage functions per chip, and tighter process control all improve the cost side of the cost-performance ratio.

This advanced CMOS technology will move ultra-low-power designs ahead just as Intel’s silicon gate p-channel and n-channel MOS technologies are moving microcomputer and memory designs ahead.
Intel's watch circuits exploit this technology to limit the power dissipation of a two-chip watch system to 15 micro-watts, while driving a liquid crystal display directly at high voltage and maintaining an accuracy better than 1 minute per year.

You can get the circuits now—the 5801 oscillator/divider and the 5201 and 5202 decoder/drivers. The 5201 displays seconds on command. Both display hours and minutes and flash the colon at 1 Hz. A standard crystal, a 1.35V cell, and a tiny voltage converter regulated by the CMOS circuits complete the watch module.

The watch circuits illustrate how Intel's silicon gate CMOS technology improves performance in both low voltage and high voltage operating ranges. They're a small sample of the exciting CMOS designs you'll be talking about with Intel. Don't wait—write now for more information on silicon gate CMOS. Intel Corporation, 3065 Bowers Avenue, Santa Clara, California 95051 (408) 246-7501.

intel delivers.
CCD inventors win Liebmann award

With the charge-coupled device rapidly finding its way into practical applications, its co-inventors—Willard S. Boyle and George E. Smith—have been honored by the IEEE with the Morris N. Liebman memorial award. Citing the two Bell Telephone Laboratories engineers for leadership in the field of MOS-device physics, the award was presented at the recent International Solid State Circuits Conference in Philadelphia.

The acceptance of CCDs was not unexpected by the two Bell Labs men. Both envisioned from the outset the three principal applications areas that are emerging: imaging, memories, and analog delay lines. For his part, though, Boyle has been mildly surprised at how fast imaging applications are moving. “We’re now talking about some large arrays that work,” he points out, such as the 256-by-220-bit one in Bell’s experimental video camera [Electronics, Feb 21, p. 29]. (Smith and Boyle are shown on a video monitor through the lens of the experimental Bell Labs’ camera.)

Boyle who is now executive director of Bell’s Allentown and Reading, Pa. labs, believes that imaging has probably come on first because “there just wasn’t anything that did the solid-state imaging job very well. It filled a vacuum.”

Smith, a department head in the Unipolar Integrated Circuit Laboratory, remarked how easy it was to get good transfer efficiency into the devices: “That was our first bugaboo,” he says, but it was quickly overcome.

As for memory applications, Smith notes that several companies are making CCD memories at the 4,096-bit and 8,192-bit levels and “it’s not going to stop there. I think they’ll start to trickle into systems, and then it will be like RAMs vs core. The important thing is that those companies making RAMs can use the same production lines to make CCDs,” he says.

Boyle foresees use of future CCD imaging in a variety of consumer products, but he also looks for incorporation of CCDs into instrumentation. “If you have a good linear device with good resolution,” he observes, “it should get into spectroscopy, for example, and maybe even astronomy.”

Smith thinks astronomy is probably a rather esoteric field for CCDs, although he won’t rule it out. However he expects “more mundane” uses to be found for the devices. “A big use,” he says, “could be in machine-positioning functions, such as mechanical-assembly machines, because you’d get good positive feedback.”

Heath makes assembled instruments, kits compatible

Deciding to home in on the industrial assembled-instrument market, the Heath Co. has started to phase out its more exotic scientific instruments, such as the spectrophotometer. The principal architect of the change for the Benton Har-
"Delivery In 42 Weeks?"

For some companies that's a death sentence.

Picture yourself waiting—42 weeks!—for a 10-cent part you desperately need to complete your product. That's typical of the leadtimes being quoted for all kinds of components and materials as industry after industry gets hit by shortages. And there you are with your overhead costs soaring, your unhappy customers demanding shipment, and your production line at a standstill. It's a chilling thought. But for a lot of people, it's real, and right now. And from the looks of things it's going to get worse.

What can you do about it? Line up alternate suppliers and investigate substitute materials. But do it now before your shortage becomes a crisis. Be prepared to spend a lot of time pouring through catalogs, talking on the telephone, and pounding on doors. Or save yourself this hassle and start with Visual Search Micro Film. The vital information you need is all right there—up to the minute information about products and manufacturers. All researched, indexed, and organized for instant retrieval. If there's a second source for the things you need, odds are it's listed in VSMF. The cost? Less than you now pay a file clerk. One of the small costs of doing—or staying—in business.

Just send in the coupon and we'll give you the complete story on what VSMF can do for your company.

Information Handling Services, Denver Technological Center, P.O. Box 1154, Englewood, Colorado 80110, (303) 771-2600.

O.K. Give me a no-nonsense explanation of how VSMF can solve my delivery problems.

How one electronics company saves $157,200 a year with an Applicon Graphic System.

Applicon Graphic Systems help designers and draftsmen improve their output while saving hundreds of manhours and thousands of dollars.

For example: one electronics manufacturer uses his AGS 700 to design twenty new PC boards per month. Two sizes are involved: one with twenty-five ICs, one with fifty. With the AGS 700, he saves 52 manhours on each board of the first type and 79 manhours on the second. Combined savings add up to $157,200 a year – far more than the cost of his AGS.

Savings like these are being realized in diversified applications: electronics, architectural, mechanical, diagramming, and others.

For more information, send the reader service card. Or mail the coupon below.

People

bor, Mich., firm, is Jimmy Lee, newly named engineering vice president. Lee, who has an MSEE from Georgia Tech, formerly was manager of the Heath/Schlumberger scientific instrument line.

"We're concentrating on those instruments compatible with the rest of the Heath line—electronic test and measuring equipment and automotive-test equipment," he says. Besides consolidating Heath's two engineering staffs, the move will bring the marketing of the new line into closer compatibility with that of other Heath products. "A $6,000 instrument doesn't lend itself to mail-order," Lee comments.

While the industrial and the hobbyist lines aim at the medium- to low-cost instrumentation market, there are differences: "Sometimes it's only a styling change; sometimes the instrument's design is involved." Differences are dictated by the differing needs of the customers, and by economies of production. "Take frequency counters, for example," Lee says. "We go up to 600 megahertz for our industrial counters, and the hobbyist doesn't need that sensitivity."

But the biggest factor is the more price-conscious kit builder. "The kit product may have a switch with wires to the pc board—we can save him some money," he points out. "But in the assembled product, we'll have a switch that plugs into the pc board. It's a more expensive part, but it saves labor."

The new line will be marketed through Heath's retail stores and by mail—a growing trend for medium-priced instrumentation sold to industry and consumers alike.

In phase, Jimmy Lee will phase out Heath's exotic instrument line.
When you talk about designing and packaging miniature, low current High Voltage Power Supplies and Voltage Multipliers, the name ERIE should come to mind first. Why? No other manufacturer of these sophisticated devices has its own capacitor and rectifier technology in-house. Only ERIE does it all. Our many years experience in producing State of the Art high voltage capacitors and high voltage silicon rectifiers — plus an unsurpassed technology in circuit designing, packaging and encapsulation, makes ERIE an ideal source for your high voltage component needs. From very low input voltages, ERIE can produce output voltages up to 50,000 volts.

Application for these compact, high reliability devices includes night-vision image intensification systems, Apollo TV cameras, CRT displays, Avionics systems exposed to rugged environments, Industrial, commercial and military equipments ... an almost infinite variety of applications. So bring ERIE in early. Let us design and build your High Voltage Power Supplies and Voltage Multipliers. We're equipped to handle large or small volume orders ... in-house.

Write for our 32-page catalog ... High Voltage Components and Devices ... or for technical assistance, call 613/392-2581

Bern Golbeck's nifty idea gave a crisp new feel to rotary switches.

A few years back, Oak's Director of Engineering, Bern Golbeck, had a hunch. Use two ball bearings instead of one, and let them index a simple starwheel. This would give crisp detenting while greatly reducing the wear on any single moving part.

It worked. The two ball bearings, controlled by flat springs, travel independently over notches in the starwheel. Detenting is smooth, even and sure. Positioning is precise. And it gives a crisp, uniform feel that you're sure to recognize.

We call this fancy detent system Unidex, and it's just one of many improvements Oak engineers like Bern have pioneered. Since Unidex, we've added molded rotors and molded sections to our rotaries—innovations that are now benchmarks of the industry. And today we're busy incorporating PC board mountings into almost all our switch designs for the quickest and simplest installation possible.

We think you and the people who use your products will notice the difference great ideas like Unidex make. Just try, for example, the storage select switch on an IBM System/370 Model 145 operator's console. Or the sweep selector on a new Hewlett-Packard 1220A oscilloscope. You'll feel it.

While you're at it, write Dave Clifton at Oak. He'll send you free literature detailing the broadest line of quality rotaries in the industry. And he'll pass along some of Bern's helpful ideas on how to choose the right rotary switch for your job.

"Nice going Bern"

Circle 19 on reader service card
We can deliver the world’s smallest 180° air variable capacitors.

On time.

And since we’re nice people, we don’t even charge much for them. So if you have an application that calls for a sub-miniature capacitor that you can “tweak” to a specific frequency, these Johnson trimmers are ideal.

You can choose from either PC or stripline mount, either vertical or horizontal tuning. These Type “T” capacitors are about one-third the size of the familiar type “U” capacitors, so you can save space, cut costs and insure improved performance in the most compact electronic equipment.

Rotors and stators are precision-machined from solid brass extrusions, resulting in exceptional stability and uniformity. High Q—typically 2000 at 150 MHz. Temperature coefficient is a low plus 30 ± 15 ppm/°C. High torque (1½ to 8 oz./inches) holds rotor securely under vibration. They’re designed to meet or exceed EIA-RS 204 and MIL Standard 202C Methods 204A and 201A.

In short, these capacitors may be just what you’ve been looking for. It’ll only cost you a stamp to get more information. And if you give us your phone number, we’ll call you and send free samples after we have clarified your application.

E. F. JOHNSON COMPANY
3005 Tenth Ave. S.W. / Waseca, MN. 56093

☐ Please send me technical information on the type T.
☐ Also, include information on your entire line of variable capacitors.

A flexcircuit for the new Mustang II

We did it for Ford.

Ford Motor Company hopes for big things for the 1974 Mustang II, with consumer acceptance equal to or better than the original Mustang.

It's a quality engineered, totally new automobile. And part of its quality, though unseen, lies in the Schjeldahl flexible circuit used behind its attractive and functional instrument cluster.

This new flexcircuit was engineered to accommodate multi-plane design with errorless connections. At the same time, possible future circuitry needs for safety standard items such as ignition interlock systems and additional warning lights were provided.

Flexcircuitry may be the answer to your electronic design problem too. It's now six years old with Ford Motor Company. And they've proven that it will do the job like nothing else could, along with reducing manufacturing costs.

Schjeldahl did it for Ford.

Amphenol connectors help assure correct weight in new automatic weighing system.

Meat merchandising has taken a big step forward with advanced solid state circuitry. The system includes a scale, mini-computer, and a printer in an integrated modular package that can weigh and price meat in seconds.

Amphenol 221 Series micro-miniature connectors share the responsibility for transmitting weight and price data to the mini-computer. Their low cost, sturdy design, and high-reliability contact configuration make them ideal for this application.

The 221 Series does the same kind of reliable work in a variety of equipment in the electronic data processing, telecommunications and home entertainment industries.
new electronics

Amphenol connectors help transmit computer data in new high speed printer.

Amphenol assembly services help produce new credit card verifier.

A unique modular matrix printer was recently developed to interface with mini-computers, medium-speed batch terminals, and other installations requiring high speed data output. Data is received at up to 75,000 characters per second. The data is then carried through PC cards to a printing head with an output of up to 165 characters per second.

Precise signal input and data output depend on consistent and accurate information flow. That's why this peripheral systems manufacturer specifies Amphenol 225 Series PC connectors and 6034 Series trimmers. They also rely on Amphenol connectors as an important link to the power supply portion of the printer.

A major computer corporation recently developed a new computerized credit system. To eliminate a costly investment in production equipment and inventories, they turned to the Amphenol Cadre Division.

All assembly and material supply is now handled by Amphenol people including component preparation, stuffing and wave soldering of printed circuit boards, hand wiring, and mechanical assembly. In addition, unique quality control tests are carried out.

Over 500 units have already been produced with excellent turnaround time and high product quality. They are now in use by a nationwide resort and restaurant chain for added customer convenience and man-hour savings.

Circle 23 on reader service card
There's more to resistors than resistance

If you're really serious about cost, be serious about quality.

If you think all resistive components are the same, listen to what these users have to say about Allen-Bradley fixed composition resistors:

**Buyer**—"A-B has shipped nearly four million parts without a single reject or problem. The quality is superb. I've spent 12 years in production control and purchasing. I've seen the amount of down-time, rework and field retrofit caused by others."

**President**—"We have used many millions of Allen-Bradley hot-molded resistors. The uniformity of quality from one shipment to the next is truly outstanding."

**Engineer**—"When we use A-B resistors instead of some other make, it's one less component we have to worry about."

"We learned the hard way. The subtle things make the difference. They all add up to the top quality we want in our products."

**Purchasing Agent**—"We wish we had more Allen-Bradleys."

Circle 24 on reader service card
Texas Instruments is having yield problems with its much-heralded 4,096-bit RAM, the TMS4030. The result is that at least one customer is using an additional supplier while a second has contingency plans for a 1,024-bit part, threatening TI’s lead in the 4k memory market. Hewlett-Packard, which has gone to Mostek to satisfy its needs, says that those TMS4030 memories it has on hand are “excellent,” but that it isn’t getting enough. And Datapoint, a San Antonio, Tex., terminal and peripheral maker, says it isn’t alarmed because it can switch to a 1k memory.

Meanwhile, TI, which is working to increase yields and volume, says, “We are convinced that the 4k RAM will be producible in large volumes this year” but won’t commit to definite delivery dates now.

United Systems Corp., Dayton, Ohio, is mounting a well-financed drive designed to take over a larger share of the test and measurement market. The company has developed more than 20 new products for introduction during the first quarter of 1974 in a design effort that has cost more than half a million dollars thus far.

Included are new housings and proprietary circuitry, some of which is in the form of custom LSI chips. The objective is to make the company’s new products more attractive, both physically and economically. For example, United’s 4½-digit panel meter sells for $219. The nearest competitor is priced at $250.

The HT (for high-technology) series makes its formal debut at IEEE’s Intercon 74 March 25 (see p. 147) where 22 members of the family are being shown.

Motorola Semiconductor will soon launch a major invasion of the MOS data-communications market. Following the announcement of its 8-bit n-channel silicon-gate microprocessor chip set (see p. 29), Motorola will introduce a number of MOS parts intended for data communications. The microprocessor set itself includes a sophisticated asynchronous communications adapter that directly interfaces to a modem, and a synchronous adapter is to follow.

Some of the other new parts are designed for use with the microprocessor; others stand alone. All are n-channel or complementary-MOS. Next is a single-chip 300-bits-per-second modem designed to replace the Bell 103, to be followed by a 2,400 b/s, 201-type modem; a European CCITT modem; a bit-rate generator; a subscriber dialer; a first-in, first-out register for changing data rates; Touch Tone encoders and decoders, and a 1,200 b/s modem.

Taking technology to its logical extreme, both American Microsystems Inc. and Standard Microsystems Inc. have developed single-chip printing calculators. The AMI device, developed with Sweden’s Facit-Odhner, is on a 214-by-218-mil chip, making the circuit one of the biggest ever developed at AMI. It contains all the control logic, arithmetic unit, memory, timers, and clocks and hammer drivers, all running off the same +6 volt (operating mode) and -13 v (standby) supplies. The Facit calculator, a 10-digit machine called the 1145, sells for $349. It prints on the familiar roll of 2-inch paper tape and operates from house cur-
Signetics to offer CCD shift register

Signetics will announce in the last quarter of this year a 16,384-bit CCD dynamic shift register, **becoming the first major American semiconductor maker to announce a CCD memory product**. The device is intended to replace disk and drum memories, and the company aims to **eliminate medium-size disks by 1975**. In addition to a cost of 0.1 cent a bit, the part runs at 20 megahertz, compared to the 3 to 5 MHz of today’s MOS shift registers.

International Rectifier to offer LEDs

Power semiconductor specialist International Rectifier is about to enter the market for light-emitting diodes. First products will be discrete infrared LED's with wide frequency response and spectral response closely matched to fiber-optic transmission lines. **These products can transmit a TV signal and are also useful for high-voltage optical couplers**, which will be introduced later. The company does not plan to enter the visible LED arena.

CML Satellite faces shakeup

Industry sources see a shakeup brewing at CML Satellite Corp. among cash rich Comsat and its domsat partners, MCI and Lockheed. **The likely outcome will be one or more partners dropping its share of the operation.** A reason: Comsat, barred from dominating CML, is said to feel hamstrung by the company’s financial pinch, especially since its partners came in with only $1 million each.

Fueling the rumors are serious talks between CML and American Satellite Corp. about some form of merger, a latchup both acknowledge they would like as they admit they’re seeking partners. One official close to the discussions rates it “better than 50-50.” CML, MCI, and Lockheed officially refuse any comment but a CML officer assures that the company will continue its newly planned program (see p. 42).

Ceramic package costs less and seals cooler

Diacon Inc. is marketing a new ceramic IC package **that not only seals at a lower temperature, but costs less than side-brazed or co-fired packages that typically seal at 310°C.** “MOS and linear devices with close-spaced metalizations, shallow-diffusion, and surface sensitivity suffer when subjected to high-temperature assembly,” says Bryant (Buck) Rogers, president of the San Diego package company. “Consequently, lowering the sealing temperature to 265°C by using our lead-tin-indium seal should boost IC manufacturing yields.” The package, a member of the cerdip family, is priced at 24 cents each in the 14- and 16-lead versions in million-lot quantities.
WE PUT 14 YEARS OF THYRISTOR EXPERIENCE INTO EVERY UNITRODE SCR.

And that means a better industrial product. Our performance record proves it. In industrial/commercial applications, the use of Unitrode SCRs doubled last year and has doubled again this year. For the military, Unitrode supplies more lead-mounted SCRs than everyone else combined. Unitrode is the only SCR supplier with Military Qualification Approval on all TO-5 and TO-18 mil. specs. Why this kind of acceptance? Our experience. It means a lot to people who've had experience with less.

Our broad line of SCRs including plastic and hermetically sealed metal types offers a wide range of choices for literally hundreds of applications. The Unitrode SCR product line ranges from our very popular, rugged 0.8 amp TO-92 plastic package and TO-18 hermetically sealed series to our 1.6 amp TO-5 and TO-39 series. Some series are available to 600 volts.

It's what you would expect from a company that makes thyristors a major part of its effort—not just a sideline.

Motorola joins microprocessor race with 8-bit entry

Motorola will supply all the 5-volt components for its microprocessor, assuring compatibility with TTL.

The microprocessor race appears to be heating up with Motorola's development of its eight-bit, n-channel microprocessor family. The five-chip set, which includes a central processor, the 6800, along with random-access and read-only memories, and peripheral and communications interfaces, is expected to give Intel's n-channel, eight-bit systems, built around the new 8080 CPU, a run for their money.

Although all the details of the Intel chips have not yet been revealed, both microprocessors offer about the same number of instructions—78 for the 8080 and 72 for the 6800—with roughly comparable performance. The Motorola microprocessor, however, may result in system savings for certain applications by requiring fewer interface circuits and power supplies.

Significantly, the Motorola microprocessor set forms a complete microcomputer that needs only a single 5-volt supply and one external clock—no multiplex, multiple supplies, or interface packages are required. The chips, built with an ion-implanted n-channel silicon-gate process, will enter production in November.

Motorola's Semiconductor Products division has put extensive effort into developing the microprocessor because it feels this device is the key to getting the MOS business it hasn't enjoyed so far.

The single microprocessor chip (MC6800) is equivalent to about 120 MSI TTL packages. It has 72 self-contained basic instructions with decimal and binary arithmetic capability, variable-length instructions, double-byte operations, two accumulators, and seven addressing modes. The typical instruction time is under 5 microseconds, and since up to 64,000 bytes can be addressed in any combination of RAM, ROM, or peripheral registers, peripheral capacity is almost unlimited.

Another key component in the family is the MC6810, a static, 500-nanosecond 128-by-8-bit static RAM designed for use with the MPU, but other RAMs, including the 4,096-bit MCM6605, or other types and speeds of memory can be used. The MC6816 ROM is a static 1,024-by-8-bit memory for use with the system, but other ROMs are also usable.

The microprocessor set is organized around the popular parallel data-bus concept introduced by Digital Equipment Co., Maynard,

Bussed. Motorola's microprocessor is organized around the parallel data-bus concept. Up to 10 LSI chips can be directly attached to the bus—ROMs, RAMs, peripheral interface adapters (PIA), and communication interface adapters (CIA).
Mass., with its PDP-11 mini-computer. All memory and peripheral/interface chips simply hang on the eight bidirectional data lines (16 address lines are provided). Chip interfaces are tri-state, and up to 10 LSI chips can be directly attached to the bus for operation to 1 megahertz—ROM, RAM, the peripheral interface adapters (PIA), and communications interface adapters (CIA). A bipolar bus extender can be added to drive still more peripherals, but a significant system can be assembled from the 10 chips.

For this operation, a peripheral adaptor, the MC6820, is provided. It is a bidirectional unit with two parallel eight-bit outputs that can drive two peripherals, or its two outputs can be used together for higher throughput.

The final member of the family is the MC6850 asynchronous communications interface adapter—a synchronous version will be announced later. This bidirectional device takes a load off the MPU for sending and receiving data from remote locations. It directly interfaces to most standard modems, or it could interface to a single modem chip, such as the one now under development at Motorola.

Along with the chip sets, Motorola is offering a hardware simulator, called "Exerciser," to ensure that first prototypes work properly. This table-top microcomputer, which will be priced at about $5,000, will include a debugging board and a program to print out the contents of all registers.

And here’s a C-MOS microprocessor

While many semiconductor manufacturers have settled on an n-channel process to implement their latest microprocessor designs [Electronics, September 27, 1973, p. 33], RCA has taken the complementary approach. The result is the industry’s first C-MOS microprocessor.

With its standard 4000 series COS/MOS technology, RCA’s 2-chip 8-bit microprocessor set—a single-chip design is under way—has all the advantages that C-MOS circuits offer. It can operate off power supplies providing anywhere from 5 to 15 volts, it has 40% noise immunity, and it dissipates power at the micro-watt level. According to Jerry Her- tozn, director of RCA’s Technology Center at Somerville, N.J., the chips will be available for sampling this year.

Because it is so easy to use and consumes so little power, the chip set will be particularly useful for low-cost high-volume applications, such as process control and manufacturing automation, point-of-sale terminals, and programmable calculators. Perhaps more significantly, its C-MOS process could make it especially attractive for microprocessor control in cars.

The microprocessor, which will come in a 40-pin package can be used with any mixture of RAM, ROM, and peripheral input/output circuits. It is capable of addressing up to 65,536 eight-bit bytes, so that quite large and flexible processing systems could be implemented, even though its instruction set is limited to only 25 instructions. What’s more, when operating from a typical supply of 10–12 v, the machine cycle time is a respectable 3 microseconds. And using a standard 1-µs RAM, the microprocessor chip set has a maximum 6-µs fetch-execute time for any instruction.

The CPU has a unique hierarchy. At its heart is a 16-by-16-bit scratch-pad memory, which serves to reference the accompanying RAMs and ROMs. These 16 registers, called the register matrix, are addressed by any one of three P, X, or N registers, which are all four bits wide.

With these registers, fetch and execute is done in two steps. The N register and another I register are used to hold the instruction fetched from the main memory. The contents of the I register determine the instruction type to be executed. Depending on the reading, the contents of the N register are used to select one of the scratch-pad matrix registers that control the input/output devices.

The P register is used to determine which one of the 16 scratch-pads is to be used as the program counter, while the X register is used to address the scratch-pad matrix
Government electronics

Richard E. Wiley named FCC chief

The appointment of Richard E. Wiley to become chairman of the Federal Communications Commission has drawn good notices from industry observers who used phrases like “bright,” “hardworking,” and “looks at both sides of the issues” to describe the 39-year-old lawyer. Wiley, who has been an FCC commissioner for more than two years and was previously the body’s general counsel for one year, will succeed Dean Burch, who will leave shortly to become a counselor to the President with cabinet rank.

Observers watching his performance as commissioner, don’t expect any drastic departures from the commission policies established under Burch’s stewardship. It is expected that Wiley will continue Burch’s emphasis on fostering competition with AT&T monopoly services, while perhaps adding some new touches of his own—such as clearing up obsolete regulations. And while Burch was considered to be a friend of the cable-television industry, Wiley is seen as being “pro-broadcasting industry,” but fair-minded about it.

Wiley is likely to preside over “the second Nixon phase of the FCC”—the Administration will have appointed all seven members by the time Wiley’s term is up in three years. After Burch’s departure, the commission will shrink to four members when another member’s term expires this summer.

Although the President can only appoint four from his party, the Democratic seats will be filled by persons sympathetic to the administration. Nominal Democrat James H. Quello may soon be confirmed for one seat, since opposition melted away during Senate confirmation hearings. Widely mentioned for the two other slots are Ward White, minority Republican communications staffer with the Senate Commerce committee, and Luther Holcomb, vice chairman of the Equal Employment Opportunities Commission.

Industry executives generally approved of Wiley’s appointment. “Dean Burch worked hard to make the FCC a dynamic organization, and it looks like he’ll carry on in that tradition,” comments William G. McGowan, board chairman of MCI Communications Corp. Another industry official, who declined to be named, uses words like “hardworking, knowledgeable” in saying that Wiley “understands the many complex and broad issues that confront the commission. That’s not true of all commissioners.”

Wiley has campaigned for the chairmanship almost from the moment he came aboard. Helping, too, was the 1968 campaigning he did for President Nixon before he joined the commission. He is reputed to have political aspirations beyond his new post. Born in Peoria, Ill., he received his BS degree from Northwestern University and his JD degree from Northwestern School of Law in 1958. After three years as an Army legal officer, Wiley joined a Chicago law firm, was assistant general counsel for Bell & Howell Co., and was a partner in another law firm before he joined the FCC as general counsel in 1970.

Commercial electronics

Electronic cure for VTR’s mechanical ills

Some of the hottest items under development are solid-state analog delay circuits for communications, radar, and audio and TV equipment. Although the approach making the headlines is the charge-coupled-device delay line, Reticon Corp, Mountain View, Calif., has applied its self-scan MOS image technology to come up with a circuit that corrects time-base errors caused by variations in video recorder tape drives.

The mechanical problems of driving the video tape at an even speed past the tape head have been expensive to solve. One way to correct for image-degrading time-base errors is to digitize the signal and regenerate it with a precise digital/analog converter. But this is expensive; a videotape recorder maker can’t afford that kind of signal control, and so far no maker has managed to cut costs or dared to cut performance to the point where home VTRs can sell below the $300-$500 range.

With the Reticon device, which is called a serial analog memory (SAM), a pair of shift registers clock the video signal independently into and out of an array of MOS capacitors. With 64 capacitors and a clock rate of up to 10 megahertz, the SAM provides a maximum delay of 6.4 microseconds. The TV raster scans one line in about 63 microseconds, so a single SAM can correct time-base errors of up to 10% of the line width. The cost is $1 a bit in OEM quantities.

Load and charge. The input shift register samples the analog signal by operating a set of switches that

New FCC chief. Richard E. Wiley, new FCC chairman, is considered likely to foster competition with AT&T and be pro-broadcasting.
allow the signal to charge the bank of capacitors serially. When a start pulse loads the first bit of the register, the first switch closes and the first capacitor is charged. When the register shifts the bit to the next cell, the first switch opens, isolating the capacitor, and the next switch closes, charging the second capacitor. The start pulse thus has a maximum repetition rate of 1.8 times the clock frequency, where N equals the number of capacitors.

The output shift register reverses the process. The start pulse loads the register’s first bit and connects the first capacitor to the output line, so that it discharges. As the bit travels down the register, it successively discharges each capacitor and reconstructs the waveform, with a new time base determined by the clock rate. A capacitor can take a new input signal as soon as it is discharged.

All of the circuitry for the SAM is fabricated on Intel’s standard 67-by-300-mil silicon-gate MOS chip. To build it, Reticon uses the process and production facilities of the Intel Corp., its part owner, which are right across the street from its plant. Reticon has provided sample circuits to several manufacturers, and the SAM has already been installed in equipment.

John J. Rado, Reticon’s president, says the circuit is also suitable for digital filtering, including fast-fourier transforms, time and frequency expansion and compression, pattern recognition, bandwidth compression for multichannel transmission, and other applications.

Anyone for tennis—via color TV?

The contenders may not be Billy Jean King or Bobby Riggs, and the site of the match may not be the Astrodome, but the basic game is tennis—now in a coin-operated color-video version.

Called “Wimbledon,” the new game uses a TTL processor and a television set to simulate a tennis match—complete with the sounds of play, a grass-green field, white border lines, white ball, tennis rackets in four different colors, and scores displayed on a bright yellow background. The first coin-operated color game, it is being marketed by Nutting Associates, Inc., Mountain View, Calif., which was among the originators of black-and-white video games two years ago.

Color, says William G. Nutting, president of the firm, is an important advance because black-and-white games are rather dull in appearance. He expects Wimbledon to recapture the market in “sophisticated locations, whose clientele won’t tolerate the clanging of pinball machines.” The generic name “pong” refers to the sounds of play the video games produce. In the past two years, some 22 game manufacturers have come out with black-and-white pong games, Nutting says.

The TTL processor, reports Miel Domis, Nutting’s project engineer, controls the three guns of the color tube to simulate the motion of the rackets and ball on the colored field. The image of the field is generated by a solid-state memory, while the processor itself produces the other movements by generating digital vectors.

The players move sliding resistance controls, one for each racket. Control positions are stored in registers while the controls change the trigger settings of timing circuits, Domis explains. The timing changes vary the rate at which the electron guns are gated by the data words representing the rackets and ball, making them appear to move as the guns sweep across the field. If the ball hits the racket, a rebound vector is started by a flip-flop output. If not, or if the ball goes out of bounds, a point is scored and displayed.

No endless volleys. A 14.318-megahertz crystal output is counted down to time the motions and generate the TV gating, synchronization signals, and also the sounds of play for Wimbledon. The composite signals are fed to the set’s antenna terminals. And there is another new feature for those who have learned to lock a pong game into a stable state where the paddles or rackets are placed so that the ball oscillates endlessly back and forth. Now, after eight volleys, a counter triggers a change in the ball’s vector.

Having created color control, Domis is now considering other games, such as billiards or pool, where color would create a more realistic game.

Solid state

Low-power Schottky gets second sources

Texas Instruments will shortly get its first competition in low-power Schottky TTL. Both Signetics and Fairchild will begin introducing the hard-to-make devices, which so far offer the best performance/power tradeoffs to military OEMs.

Signetics is entering the 54LS market with a few simple circuits—the 54/74LS0 and 05 hex inverters in March, and some dual JK flip-flops—the 54/74LS112, 113, and
the

30Hz Resolution Revolution

Spectrum Analysis in the 0-to-1800 MHz region

The TEKTRONIX 7L13 adds revolutionary measurement power to spectrum analysis: 30 Hertz Resolution that is useful all the way to 1800 MHz.

There is no smearing from drift or FM in this 200 Hz/div display, even though the total sweep time is 20 seconds. Signals are resolved to 70 dB down even though they are only 500 Hz apart. Center frequency is 1555 MHz.

It is generally understood that High resolution means the ability to distinguish between signals differing little in frequency. Actually, the design that makes 30 Hz resolution possible results in more than just the ability to distinguish between close together signals. The design of the 7L13 means better sensitivity, -128 dBm; less drift, under 2 kHz per hour; less FM, under 10 Hz phase locked; it means less noise... it means the revolutionary analyzer performance that is available from Tektronix, Inc. in the 7L13.

Because of the resolution revolution, the performance of your edge-of-the-art circuitry and devices can now be quantified, not guessed at. A discussion or demonstration of TEKTRONIX Spectrum Analyzer performance can be arranged by any Tektronix Field Engineer. Call him or use one of the two reader service numbers below.

7L13 Spectrum Analyzer—$6500
7613 Variable Persistence Mainframe—$2500

For a demonstration circle 32 on reader service card
114-in May and June, Product manager Stan Brue derle says the company will introduce 20 products this year, including the 54/74LS 181, a 4-bit arithmetic unit, and some other medium-scale-integration items.

Fairchild's first low-power Schottky parts, to be available in late March, will be small-scale-integration products. According to Rob Walker, product planning manager in the Digital Products division, "they are specified at twice the speed of the TI devices—5 nanoseconds typical and 10 ns maximum. Walker expects the Fairchild products, catalogued the 9LS, to serve "as a replacement to all H series and a lot of S circuits, as well as standard TTL."

TI presently offers about 60 circuits in the 54LS family. Signetics does not expect to compete across the board for some time, and is introducing the line now in the expectation of participating in some projects later this year. Low-power Schottky devices are presently going into avionics and ground transportable equipment operating at over 5 megahertz.

Low-power Schottky offers typical power dissipation of 2 milliwatts per gate while operating at 10 ns gate delay and 35 MHz flip-flop toggle rate. The regular 54/74 series has five times the power dissipation at comparable performance. The low-power series 54L, which dissipates only 1 mw/gate, operates at 33-ns gate delay and a 10-MHz flip-flop rate.

The C-MOS circuits match low-power Schottky at low frequencies, but C-MOS power dissipation goes up exponentially and crosses that of low-power Schottky at around 2 MHz. Low power dissipation is a must for military suppliers, and avionics contracts conventionally specify bonuses for undercutting power requirements and penalties for exceeding them. Signetics believes that low-power Schottky capability is essential for companies that wish to continue to supply the military. Within five years, Brue derle says, 54LS will be the standard military-design tool.

Military pressure for a second-source to TI induced Signetics to spend the money raised during last fall's $20 million stock sale for the ion-implantation and thin-film equipment necessary to build 54/74L. Signetics already uses ion implantation in every product line and has a thin-film process comparable to Fairchild's Isoplanar.

The first key to building the 54LS line is a technique, derived from LSI processing, for fabricating resistors no bigger than conventional Schottky resistors.

Thermoplastic used between IC layers

Multichip LSIs with thermoplastic insulation between the layers of wiring interconnecting the chips has been developed in a joint Japanese-U.S. research program. Tokyo Shibaura Electric Co.'s Research and Development Center and the General Electric Co.'s Electronics Labo-
an unbeatable combination...
350 MHz and 1ns/div in a portable!

Dual trace, 350 MHz bandpass, high writing speed, 5 mV/div to full bandwidth and 1 ns/div sweep together with many operator conveniences assure fast accurate high-speed oscilloscope measurements. This combination is now available in a portable—the 485 from Tektronix. It weighs just 24 pounds, allowing you to move it in the lab and shop, or you easily take it with you on installation and repair jobs.

**HIGH-SPEED MEASUREMENTS WITH SELECTABLE INPUT IMPEDANCE**

Full capability 50 Ω and 1 MΩ measurements are available at your fingertips. The 5 mV/div deflection exists to the full bandwidth of 350 MHz in 50 Ω, and 250 MHz in 1 MΩ. The 50 Ω input is protected against the inadvertent application of excessive signal strength. When it happens, you simply press the reset.

**SINGLE-SHOT FAST PULSE RECORDING**

If your application involves high-speed single shot phenomena, an optional P11 CRT phosphor and the TEKTRONIX C-31 Camera allow you to record on film at 6.0 div/ns. Use of the Writing Speed Enhancer substantially increases this speed.

**ACCURATE TIME RESOLUTION MEASUREMENTS**

In many of today’s pulse applications, accurate time measurements are vital. An unmagnified sweep speed of 1 ns/div permits time resolution measurements in the vicinity of 200 picoseconds. This high-speed accuracy combined with horizontal sweep switching present time measurement capability unheard of in a portable oscilloscope.

**BONUS FEATURES**

Some of the operator conveniences are: A-external trigger view, delayed sweep, automatic scale factor read-out, horizontal sweep switching, A-trigger hold-off, bandwidth limit, beam finder, frequency selectable fast-rise calibrator, automatic focus, and battery operation with the TEKTRONIX 1105.

Full realization of these many ease-of-operation features can only be gained through actual hands-on experience. Your local Tektronix field engineer has a 485. Call him for a personal demonstration.

If you’d like additional literature, write Tektronix, Inc., P.O. Box 500, Beaverton, Oregon 97005. In Europe, write Tektronix Ltd., P.O. Box 36, St. Peter Port, Guernsey, C.I., U.K.

Electronics review

ratory, Syracuse, N.Y., have conducted the engineering research.

The advantages of the process, called semiconductor thermoplastic dielectric by GE, include reduction in circuit size and weight, elimination of labor-intensive processes, including wire bonding, and improved heat-sinking and reliability. A variation of the approach has been developed for microwave applications.

In the basic process, standard IC chips with conventional aluminum bonding pads are positioned precisely on an aluminum substrate, covered with a sheet of FEP, a fluorocarbon plastic, and then subjected to heat and pressure. The chips are pressed slightly into the substrate. The plastic at the top of the chip is extruded to produce a thin plastic layer covering the chips and a thicker plastic layer filling in spaces between the chips.

Holes are etched in the plastic layer for interconnections, which are copper, with a titanium barrier layer between copper and aluminum pads to prevent undesirable solid alloys. The insulation for the second and subsequent interconnection layers is also plastic, but the companies won't disclose its composition.

How big? An experimental circuit includes 11 TTL chips on a 25-milimeter square, 2-mm-thick, substrate. The two layers of wiring form 312 interconnections. The power dissipation is 2 watts, and temperature rise is 25°C. Thus, the completed product functionally replaces an equivalent number of integrated circuits mounted on a multilayer printed circuit. What's more, the unit insulated with thermoplastic is smaller and can be fabricated by batch processes that yield improved performance and reliability.

Microwave integrated circuits are built on a beryllia substrate with deposited connections to the reverse side of the chips, but the insulation system is similar. An experimental circuit on a 7-mm-square substrate has a power output of 14 W at 1.5 gigahertz and a bandwidth of 250 megahertz. Multichip circuits, therefore, have been shown to be suitable for micropower to high-power devices from dc to microwave frequencies. GE managed the design and evaluation, and Toshiba has handled the fabrication.

Consumer electronics

Depthmeter's sonar put on a chip

With ICs turning up in more and more products, it's not surprising to find one in a product for the angler or yachtsman. Now, National Semiconductor Corp., Santa Clara, Calif., is producing a single-chip sonar system for an under-$100 fishfinder/depthmeter.

The bipolar integrated circuit, which measures only about 80 by 90 mils, includes a complete 12-watt transmitter—perhaps the first practical monolithic transmitter—and a receiver that drives a neon bulb with 10 w of power. The part was developed as a custom product for a large depthmeter manufacturer by National development engineers Thomas A. Frederiksen and William M. Howard.

Echoes. The system consists of a piezoelectric transducer mounted on the hull under the water, the receiver and transmitter, the IC, and a rotating-disk display. The transmitter feeds 12 W at 200 kilohertz to the transducer for approximately 800 microseconds. The transducer both converts this signal to a sonic wave, which is sent toward the bottom, and picks up echoes from fish or the bottom.

If the received signal is large enough to trigger a threshold detector and get through a special impulse-noise limiter, a neon bulb mounted on a rotating disk flashes. The angle at which the bulb flashes indicates the depth. Multiple flashes can occur—showing, for example, both a school of fish and the bottom. The system timing is derived from the rotating disk, which is driven by a small battery-operated motor.

Benefits offered. A single inductor is used to set both receive and transmit frequencies, eliminating the need for tuning the system in production, as is necessary with discrete units. What's more, frequency drift does not affect operation. And, in contrast to current gear, any transducer can be used. Present depthmeters require that the equipment be tuned to the transducer, a problem when a transducer or finder must be replaced.

No external transistors are required because the 18-pin package contains all semiconductors other than a swamping diode on an output transformer. But the transducer and the neon bulb require voltage transformation, since the transducer impedance is a high 600 ohms. And triggering the neon bulb requires substantially more than the 12-volt operating supply. Large Darlington power transistors on the chip drive the bulb and transducer, a piezoelectric crystal.

Communications

Optical waveguide has own modulator

Electro-optical modulators built right into tiny monolithic waveguides for laser light are the latest links in the chain of development leading toward practical fiber-optic communication systems [Electronics, May 24, 1973, p. 33].

RCA's David Sarnoff Research Center, Princeton, N.J., and Bell Laboratories, Holmdel, N.J., have eyeing an electro-optic modulator. RCA's device is built into a light waveguide.
Picture video copies like these as part of your system.

$2950, single unit price.

Hard copies are the record keeper of modern display systems. They're a time-saver, too, providing output for busy people to read at their leisure. Unfortunately, however, copy quality has been inconsistent. Until now. Look at our versatile, low-cost 4632 Video Hard Copy Unit! Our 4632 gives your systems consistent high quality, high resolution, grey scale and black and white copies on 8½" x 11" paper. In other words, copies you can read.

It interfaces quickly to alphanumeric or graphic display terminals and scan converters. All you need is access to one of these video sources: 1. Composite video; 2. Video, horizontal drive, vertical drive; 3. Video, composite sync. And it operates at any standard line rate.

The 4632 is a dry process performer using 3M® Dry-Silver paper. It's light and compact, yet built sturdily for hard use and designed for easy servicing.

We have more display ideas for your system, too. Such as scan converters and a full line of monitors and displays. OEM and end user quantity discount prices available. For the complete picture, phone your nearby Tektronix office or write:
Tektronix Information Display Division,
P. O. Box 500, Beaverton, Oregon 97005.

Graphics. The mind's eye, for those who think tomorrow.

Circle 37 on reader service card
fabricated low-loss optical waveguides and used them to modulate light at rates that could exceed 1 gigahertz. Once developed, such devices could be used to modulate signals for thousands of telephone channels in one waveguide.

The RCA modulator is made by depositing a film of niobium on a crystal of lithium tantalate, which is then placed in a furnace. Niobium atoms diffuse in to replace the tantalum and form a tiny waveguide of lithium-niobate tantalate. Because that compound has a higher refractive index than lithium tantalate, light coupled into the guide remains inside.

In a typical layer, about 30% of the tantalum in the substrate is replaced by niobium near the surface. This fraction falls to zero at a depth of about 2 micrometers. One device fabricated in a single-mode guide required 6.5 volts for 80% modulation at a wavelength of 6.328 angstroms and 3.5 volts at 4.495 angstroms.

Modulation is performed by varying the voltage applied to the waveguide. As the electric field varies, the crystal's refractive index changes, and this change is used to produce amplitude modulation or beam diffraction.

The RCA device will operate—at 0.1 milliwatt per megahertz—as fast as it can be driven,” according to Brown F. Williams, head of quantum electronic research at the center. The limit on frequency is the capacitance of the electrodes connected to the waveguide. Single-mode losses are of the order of 1 decibel per centimeter. The device has an active volume of 0.12 by 0.02 by 0.02 inches.

The Bell single-mode waveguide modulator is fabricated using an out-diffusion technique in which lithium atoms are removed from a lithium niobate crystal. What's left is a lithium-deficient waveguide at the surface of the crystal. Power requirements for the unit—0.4 milliwatt per megahertz—are somewhat more than for the RCA device. Thus, at 0.4 W, the modulator will operate at 1 GHz. The active region of the modulator measures 0.24 by 0.002 by 0.002 in.

The RCA unit is an amplitude modulator, whereas the Bell Labs device modulates phase. Both modulators operate at wavelengths from the visible to the near-infrared.

**Energy**

Communicating may replace commuting

The energy crisis may well accelerate the adoption of a far-reaching change in life style: communicating instead of commuting to work. The change has long been touted by futurologists, but research in computer and telecommunications technology indicates that it may be economically practical, even now—at least for some businesses. The University of Southern California, working under a grant from the National Science Foundation, is studying the subject, which could be a vital one for car-oriented Los Angeles, where USC is located.

The study, being coordinated by Jack M. Nilles, director of interdisciplinary program development, is concentrating on near-term practical results. A major part of the study is investigating those companies that Nilles classifies as "people huddled around a computer"—banks and insurance companies, for example.

Nilles points out that the workers in such companies could be dispersed to work centers near their homes. The additional costs involved would be for terminals plus communication lines to the central organization. These costs would be about the same as the present costs of commuting, he adds, suggesting that employees would walk or bicycle, rather than drive, to work centers near their homes, and they would pay at least part of the terminal costs in lieu of commuting expenses. The estimated energy consumption for a car in a typical Los Angeles round-trip commute of 22 miles is 50 kilowatt-hours, compared to only 2 kilowatt-hours for computer and telephone lines.

Among the technical problems being investigated is the man-machine interface. Nilles suggests that the traditional typewriter keyboard plus CRT terminals may not be optimum. Serious investigation must also be devoted to the communications lines. Present 3-kilohertz telephone lines could become inadequate if many companies adopt remote operations, and coaxial-cable or even fiber-optic communications lines might be needed.

**Microwaves**

Barritt diodes find new applications

Barrier injection transit-time diodes—Baritts, for short—have been little more than laboratory curiosities. But their status may be
If you need a 3-Station Digital Logic Test System, we can save you

$92,000

Compare the Hughes 1024's price and performance with the General Radio 1792, Teradyne 115, and other higher-priced systems. Three Teradyne 115s, for example, can easily set you back $210,000. Get the new Hughes 1024 system with three independent work stations instead, and you invest only $118,000.

We can charge less because we've built in more flexibility and economy. The 1024's disk-based system uses a common mini-computer and disk mass storage to drive up to three work stations. You can start with the basic control unit and one work station (256 two-way lines) for as little as $68,000, and readily add two more stations for $25,000 each.

The stations can be remotely located. They operate simultaneously, with each one performing a programming task or testing different card types. Not only that. Each station can handle up to 1024 two-way lines, with special interface configurations to test ECL and other logic families.

You get high speed, automatic dynamic-response testing (100 nsec) vs. the static testing most competitors offer. And a software-controlled probe quickly isolates manufacturing failures.

Now, all this might not mean much if the Hughes 1024 didn't have a superior test language and supporting software to cut test-program generation down to size. But it does. Plus a comprehensive file management, interactive CRT edit, and a real-time, disk-based operating system.

We'll supply test programs for your 1024, or other test systems. We'll also convert existing test programs to the 1024 language.

Hughes has pioneered in developing automatic test equipment for many projects. And now Hughes offers a complete logic-testing capability from hardware through test-generation service.

Mail the coupon today. How could you find a better way to save $92,000?

changing as the Baritt finds applications in self-mixed doppler radars, X-band microwave generators in intruder-alarm doppler radars and in anti-skid braking systems.

Baritts have two serious disadvantages. They require 60 to 100 volts bias—while Gunn diodes use 6 or 12 v. What's more, their power output has been limited to about 10 milliwatts at 11 gigahertz—at least an order of magnitude less than Gunn devices.

However, a Swedish company, IMA Microwave Products, believes that the Baritt has enough going for it to give it the edge in certain applications. IMA has developed a complete intruder-alarm doppler-radar module using a Baritt, and is offering Baritt samples rated at 30 mw cw at 7 GHz, 20 mw at 9 GHz and 10 mw at 10 GHz. The worldwide doppler-alarm industry, which uses thousands of Gunn diodes every week, is the market IMA is aiming at.

IMA, a joint venture between the Microwave Institute in Stockholm, a government-sponsored research establishment, which does the R&D; ASEA, an electrical equipment manufacturer, which makes most of the semiconductor products; and Incentive AB, which provides financial backing.

Pros: Peter Weissglas, a professor at the Microwave Institute and consultant to IMA, lists the pros of Baritts in doppler alarms:
- The 10-GHz radar has an output of 5 mw, the same as many similar Gunn radars.
- The IMA module has a much longer effective range than Gunn modules because Baritt module noise is some 20 to 30 decibels better than Gunn module noise. That means fewer Baritt radars are needed to protect the same area.
- The Baritt is easier to set up in an alarm, because it is made of silicon, and so is more frequency stable with temperature changes than a gallium-arsenide Gunn unit.
- Accidental surges that will destroy a Gunn device don't affect a Baritt, so fewer should be wasted during installation.
- In the long run, the Baritt should be cheaper to manufacture, because

News briefs

IBM and Owens-Illinois agree on cross-license
IBM and Owens-Illinois have hammered out a non-exclusive cross-license for the manufacture of plasma-panel products. IBM has paid an initial $2 million to use the Owens-Illinois Digivue panel display. A non-refundable $1 million is earmarked for future royalties and the rest covers royalties and payments for IBM's past use of the technology in data-processing terminals for banks. Industry experts say that the panels may turn up next in IBM terminals for airline scheduling and stock-quotation systems.

Solarex to buy Centralab's solar-cell operation
In a move that would markedly expand its fledgling photovoltaic cell business, tiny Solarex Corp., Rockville, Md., has agreed in principle to buy the solar-cell operation of Globe-Union's Centralab division, El Monte, Calif. Price and details of the final agreement, which hinges on Solarex's ability to raise the capital, are expected in a few weeks. Committed to terrestrial uses, Solarex [Electronics, Feb. 21, p. 32] would acquire Centralab's photovoltaic-production line in space leased from Globe-Union and gain such customers as TRW and Lockheed.

Computer to ease Bay Bridge traffic
A minicomputer that is programmed to ease traffic congestion is going into operation this month on the San Francisco-Oakland Bay Bridge. Part of a Department of Transportation project, the $350,000 installation consists of a Data General Corp. Nova 1210 with 8,000 words of memory at the bridge's plaza and magnometers at the bridge's midsection to record traffic volume. Cars will be sent from the toll booth at intervals of 4 to 10 seconds.

Western Union starts service center
Service support for their more than 13,000 leased terminals is being offered by Western Union Data Services Co., Mahwah, N.J., through Termicare, an automated computer center for diagnosis, documentation, and service dispatch. Users calling the center will receive preliminary assistance from a service analyst who can call up each malfunctioning terminal's service history on a CRT. If a field engineer is dispatched, data on the service call is recorded in the file for further updating.

Japan opens exhibit to foreigners
Japan's Printed Circuit Association show (June 1-4) will be open to non-Japanese exhibitors for the first time this year, providing an entree for American electronics firms. The Tokyo show includes exhibits of materials, production machinery, and components, as well as seminars, and demonstrations of printed-circuit techniques and labor-saving technology.

Buckbee-Mears expands metal-plating line
Buckbee-Mears, St. Paul, Minn., a major supplier of etched lead frames for ICs, has completed a $200,000 expansion of its precious-metal-plating line. Vice president Lee Barton says this will "more than double the company's capacity to supply over-all silver-plated and spot-gold-plated lead frames" at a time when IC makers, demanding more product output, are also worrying about material shortages.

Addenda
A new high temperature for superconductivity of -418°F has been recorded at Bell Laboratories. The superconducting material was a niobium germanium alloy. Scientists at Westinghouse Research Laboratories are developing a lock that opens by voice command to sell for less than $100.
Lockheed Introduces 192 New Memory Products.

Lockheed Electronics SENTINEL Memory System makes it all possible. With SENTINEL you have the advantage of buying a customized memory, while paying only a standardized price. SENTINEL consists of standard modular memory boards, power supplies and chassis. These can be combined in 192 ways to satisfy almost any customer’s specific need.

Because SENTINEL is modular, it gives you flexibility in putting together your own system. Or we can do it for you at half the cost and time of starting from scratch.

One of the beauties of the SENTINEL Memory is that you don’t have to buy the entire system to get exactly what you need. SENTINEL flexible combinations include assemblies from 4K by 18 up to 128K by 36 or any combination in between in modular increments of 4K, 8K or 16K words... all at submicrosecond speeds.

For more information on SENTINEL, write Lockheed Electronics, 6201 East Randolph Street, Los Angeles, California 90040. Or call (213) 722-6810.

At Lockheed we build custom memories from stock.

**Electronics review**

It is well within established silicon technology. Weissglas admits that a dc up-converter is needed to get 60 V from the standard 12-V standby batteries. Yet, he says, the extra cost is cancelled “because you can cut out the Schottky-diode detector from the receiver system.” The Baritt diode used as transmitter has sufficiently low noise to serve as detector as well, he says, whereas a Gunn radar needs a Schottky detector because the Gunn is too noisy for detection. In support of this, Prof. of electrical engineering, George I. Hadad, of the University of Michigan, Ann Arbor, who has extensively studied microwave devices, says that the low conversion loss and low noise of Baritts will offset their disadvantages in doppler-radar applications where self-mixing is impossible.

**Not all agree.** Jim Charters, engineering manager of Microwave and Electronic Systems Ltd. Newbridge, Midlothian, Scotland, one of the biggest makers of doppler intruder alarms, thinks the 60-V requirement is a serious drawback. Any up-converter, he says, will need to be very stable to avoid fluctuations at 12 V being multiplied and causing frequency changes.

Charters says the frequency stability and reliability of Gunn devices are not problems. And the longer life of Baritt diodes remains to be proved. In practice, higher sensitivity is not useful, according to Charters, because if the range is extended to take advantage of it, the sensitivity becomes too great close in. Furthermore, insects, such as moths, near the antenna can set off the alarm. Nonetheless, he acknowledges that an alarm maker not committed to Gunns might find Baritts attractive.

Despite the controversy in the area of doppler alarms, the Lucas Electrical Co. of Birmingham, England, is investigating the possibility of using a Baritt-powered radar as part of a vehicle anti-skid system. The company hopes that the radar will be able to pick out consistently the instant before the wheel locks, and trigger release of the brakes. Mechanical sensors aren’t accurate enough, and a Gunn radar can’t remain stable and sensitive enough through the wide temperature range involved.

IMA’s samples use a simple pnp structure made with standard varactor technology. A p+ substrate holds an epitaxial n layer into which is diffused a shallow p+ top contact. The only critical factors are the n-layer thickness, which is 6 to 7 micrometers for X band, and its doping level, which is $2 \times 10^{15}$. This structure is mesa etched to make devices about 8 mils in diameter.

The power density is low, and junction temperature is not more than 100°C. Samples are scheduled for year-end distribution. Weissglas says they will make good low-noise local oscillators in full-size radars and communication systems.

**Satellites**

**ASC, CML revise domsat plans**

When Western Union launches its own Westar satellite this spring, it likely will be launching several competitors’ systems as well. This may happen because building expensive technological systems in an uncertain market is causing several companies to change their plans.

American Satellite Corp. (ASC) has drastically revised its plans and will now start its system by using Westar. CML Satellite Corp. plans to lease this fall one or two transponders on Westar for test and sales purposes over two years. Moreover, Western Union and RCA GlobeCom are talking about a possible link-up. And, Western Union is said to be talking with AT&T and Southern Pacific, among others, in an effort to fill its spacecraft.

Although the companies’ actions may dampen a spacecraft market, it will allow them to go into operation earlier and cheaper without the high hardware costs of their own initial systems. It also will give them time to test out techniques and better gauge the market before they send

**Electronics review**

up their own spacecraft. For Western Union, it means short-term customers and a long-term effort to fill the gap when the customer-competitors leave for their own systems.

ASC originally was going to start with Canada's Anik 2 domsat and then buy three satellites from Hughes for a $25 million second phase while developing a "permanent" third-phase system under the over-all $100 million program. Instead, beginning this summer, the company will lease three transponders from Western Union's Hughes-built Westar series for $4.8 million a year, drop the use of Anik 2, and cancel the Hughes contract, for which it already has made $5 million in progress payments. The company still plans to launch a three-axis-stabilized spacecraft by 1977, according to John G. Puente, vice president, technical.

"By this move, we save up-front money," Puente says, including $30 million in launch costs and $90,000 per year for each transponder, as Westar is cheaper than Anik. The Western Union contract is extendable beyond 1976, and the company has Anik as a possible backup. The new system will cost an estimated $70 million, including launch costs, Puente estimates.

The revised plans will allow both ASC and CML to further develop newer 12- and 14-gigahertz transmission techniques for direct rooftop communications. ASC's second phase will be a mixture of communications at 4 and 6 GHz and 12 and 14 GHz. CML's satellite will use only 12 and 14 GHz. In June, CML expects to go out for bids for a subcontract to develop the higher-frequency technology and within a year after that it plans to award the prime contract to build three spacecraft.

These satellites will be built while it leases Westar. The company basically is looking at spin-stabilized 1,500-pound spacecraft for its $130 million system. Getting partners Comsat, MCI, and Lockheed to agree has also helped delay plans that originally called for bids to go out last fall (Electronics, June 21, 1973, p. 72).
There are some good reasons for being brand-conscious. Here are three of them:

1. **ACCEPTANCE** — Without question, BUSS® is the best known and most widely accepted name in fuses and fuseholders of all types. There's no need for introductions or explanations. When it's BUSS, no questions are asked.

2. **QUALITY** — You can take BUSS quality for granted, because BUSS doesn't. Not only are BUSS fuses manufactured to exacting quality control standards, but every one is electronically tested.

3. **SPECIALIZATION** — All BUSS resources are focused solely on manufacturing quality fuses and fuse mounting hardware. Such a concentration of undivided attention automatically results in a superior product.

So be brand-conscious —

**YOU'LL ALWAYS BE AHEAD WITH BUSS.**

NOTES: (1) LZ models are adjustable between the following limits: LZS-10 2.5 to 6V; LZS-11 8 to 16V; LZS-20 8 to 15V; LZS-30 2.5 to 6V; LZS-33 8 to 15V; LZS-34 2.5 to 6V; LZD-12 ± 14.5 to ± 15.5V; LZD-21 ± 2.5 to ± 6V; LZD-22 ± 8 to ± 15V; LZD-23 ± 8 to ± 15V; LZD-31 ± 2.5 to ± 6V; LZD-32 ± 8 to ± 15V; LZD-35 ± 8 to ± 15V; LZT-36 2.5V to 6V for ± 5V output only, ± 14.5 to ± 15.5 for ± 15V output only. Contact factory for current ratings at voltage settings not indicated in the tables. (2) All prices and specifications are subject to change without notice.

### SPECIFICATIONS FOR LZ SERIES

**Regulation**
0.15%—line or load; models LZS-10, LZS-30, LZS-34, LZD-21 and LZD-31 have load regulation of 0.15% ± 5mV; model LZD-12 has line or load regulation of 0.25%; LZT-36 line regulation 0.15% (±5V); 0.25% (±15V); load regulation 0.15% ± 10mV (±5V), 0.25% (±15V).

**Ripple and noise**
1.5mV RMS, 5mV, pk-pk

**Temperature coefficient**
0.03%/°C

**Overshoot**
no overshoot on turn-on, turn-off, or power failure

**Tracking accuracy**
2% absolute voltage difference for dual output models only and only for the ±15V output in LZT-36; 0.2% change for all conditions of line, load and temperature

**Ambient operating temperature range**
continuous duty from 0°C to +50°C

**Wide AC input voltage range**
105 to 132 Vac, 57-63 Hz

### Storage temperature range
-25°C to +85°C

### Overload protection
fixed automatic electronic current limiting circuit

### Input & output connections
printed circuit solder pins on lower surface of unit. For model LZT-36 the ±15V outputs are independent from the 5V output.

### Controls
screwdriver voltage adjustment over entire voltage range.

### Mounting
tapped holes on lower surface

### Physical data
- Size: see tables
- Weight: LZ-10 series 10 oz. net 18 oz. ship.
- LZ-20 series 17 oz. net 25 oz. ship.
- LZ-30 series 24 oz. net 32 oz. ship.

### 60-day guarantee
60-day guarantee includes labor as well as parts

Cooling, lifting, holding, pulling, damping, drying...

Rotron has a way...with air

Air, in the hands of the world's most advanced manufacturer of precision air moving devices, has a potential for doing things that designers and manufacturers are beginning to appreciate.

Forced convection cooling of electronic equipment—providing for more densely packaged components with equal or even greater system reliability—is just one of the jobs air, by Rotron, performs so well.

In buffer columns and tape hold downs and a dozen other non-cooling applications within the electronics industry alone, air moving devices from Rotron simplify system design, increase both efficiency and reliability.

Rotron's extensive line of air movers require an absolute minimum of space (as little as 1 cu. inch). They're quiet. (As low as NC 20). They consume surprisingly little power (a low of 5 watts). And they are exceptionally reliable. (Ten years and more of continuous duty without maintenance.)

Learn more about the Rotron line of fans and blowers, with pressures to 165" wg., flows to 2600 cfm. Contact your local Rotron representative or distributor or write us directly.

Why settle for less when the best costs no more.

Electronics/March 7, 1974
New engineers quit DOD over salaries, promotions

Engineering salaries in the Pentagon’s in-house laboratory system have failed to keep pace with those of private industry, unlike most Federal pay scales for most administrative and other specialties. So says the Directorate of Defense Research and Engineering, which complains that the starting Federal salary for a new BS in engineering in the spring of 1973 is about $1,500 a year less than that of private industry because of the latter’s increased demand for engineers and physical scientists. Because, too, controls on the number of Federal jobs have slowed down Civil Service promotions, DDR&E says “many of the bright, young people we were able to attract two or three years ago are leaving.”

OMB chokes plan for emergency medical services

Despite congressional, departmental, and medical support, the powerful White House Office of Management and Budget is strangling a program to fund local emergency medical services, confide officials at the Department of Health, Education, and Welfare. Congress has authorized $185 million over three years to pump life into local emergency communications networks [Electronics, Jan. 10, p. 80], but OMB has cut the fiscal 1974 funding from $45 million to $27 million. Moreover, the regulations on how to grant the money are coming out so late that the fiscal year could end before all the money is spent.

Will Congress notice? “Congress has so many things to be upset about right now that it might not do anything,” one official worries. Another official offers a possible solution: get funds committed for as many networks as possible and hope for more money in fiscal 1975.

Navy researchers develop high-power satcom test facility

Details of a new Naval Research Laboratory installation for high-power testing of communication satellite components and materials are to be disclosed at the March 26-28 millimeter-wave-technique conference in San Diego, Calif., at the Naval Electronics Laboratory Center.

The installation at the Microwave Space Research Facility, Waldorf, Md., has a 1-kw Kα-band power capability in the 36-38-GHz band. As a result, says NRL’s R.E. Cushing, principal investigator for the project, system designers can now obtain complete high-power testing of system components during development of a satcom terminal, saving time and money and preventing component failure in future satcom system use. A small interior radiation chamber is for antenna and materials evaluation at high rf flux densities and power levels to 1 kw cw for long intervals of time. Direct-reading digital calorimetric water loads have been developed for waveguide and radiation sources.

Secure voice unit formed for military communications

A Secure Voice Consortium made up of representatives of all defense communications users has been established by the Directorate of Defense Research and Engineering to eliminate duplication and coordinate military programs on secure communications. The SVC will oversee implementation of the interim system, Autosevocom Phase 2, as well as development of narrow-band 2-8-kilobit/second voice-processing equipment for use where wide-band digital transmission will not be available. Large-scale integrated circuits, are “the key to the economic implementation of the relatively complicated voice-processing algorithms needed,” says DDR&E director Malcolm Currie.
Washington commentary

The domsat shakeout

When the Federal Communications Commission gave its long-delayed blessing two years ago to the competitive development of domestic satellite systems, there was much speculation about whether the marketplace could support the six systems proposed. It was then that Dean Burch—who is now leaving the commission to join the White House staff—displayed the characteristic common sense that was to mark much of his rule as FCC chairman.

Burch's law was simply "let the marketplace decide." In judging petitioners' applications to launch satellites for domestic service, he said, the FCC would base its decisions on technical considerations only.

The wisdom of that judgment is borne out by the news that American Satellite Corp., CML Satellite Corp., and possibly RCA Globcom and AT&T, will now buy transponder space on Western Union's Westar satellite—the first domsat scheduled for operation and to be launched in April (see p. 42). The shakeout in domestic satellites clearly is well under way.

The shakeout also demonstrates the wisdom of Western Union's gamble in placing its order for satellites before it received FCC approval of its plan. By getting its order for satellites and NASA launch rockets in first, WU achieved a significant leg up on the competition.

Financing their respective entries into the new and undeveloped communications satellite market proved the principal problem for most of the companies. Fairchild Industries, which now has total control of American Satellite after a two-step acquisition of Western Union International's 50% interest, has had difficulties as well. Predominantly known as a military aircraft maker, Fairchild's push to get public investment for its infant American Satellite flopped last year. CML Satellite, with holdings equally divided among Comsat Corp., MCI Communications Corp. and Lockheed, has also had fiscal problems. Comsat, it seems, is the only one with money to spare, yet is precluded from bankrolling its partners by FCC's restrictions on investment in and control of CML.

However, AT&T, RCA Globcom, and Hughes-GTE have sufficient resources to leverage their way into the domsat market later, should it prove lucrative for Western Union. Fortunately for Western Union, it managed to find the funds to make its commitment first. As one company official now says of Westar, "my guess is that we'll go to launch sold out."

Problems of innovation

Starting a totally new industry in 20th century America is more than difficult. It is almost impossible—particularly if your resources are limited and the new business threatens to disrupt the existing marketplace. This is the hard lesson being learned by Richard Ahern, the young entrepreneur promoting the concept of electronic shopping in the home by means of an AT&T Touch Tone telephone linked to a computer catalog with voice answer-back.

Ahern's Computer Shopping Inc. is hardly an industrial giant. And in an industrial society where oligopoly is the rule rather than the exception, Computer Shopping's limited resources are a large part of its problem. The other part is a very human fear of the unknown, from which no corporate leader is immune. It is a fear that can destroy the innovator seeking to alter the status quo.

Since Ahern unveiled his computer shopping system last year—one he contends can save the U.S. "a minimum of 600,000 barrels of gasoline a day" by eliminating unneeded supermarket shopping trips—the new company has struck out in its efforts to get a major food retailer to participate in a demonstration prototype system. Ahern says the food retailers fear that such a system could severely reduce purchases of their highest-profit items customarily bought on impulse—fresh produce, meats, and such unnecessaries as costly frozen chocolate cakes, pies, or cocktail glasses. Moreover, says Ahern, large food chains with an estimated $100,000 invested per store balk at a concept that might make such outlays unprofitable.

Unfortunately, Computer Shopping is unable to afford the high cost of a demonstration prototype system—something that most of the conservative industries he expects to service want to see first. Working hardware is virtually essential to any high-capital-risk venture.

Now, however, Computer Shopping believes it can get a $100,000 commitment from the Federal Energy Office for a demonstration system, provided it can find a customer to make a comparable investment. At the very least, this is what computer shopping needs. If it does not get it, another innovative concept may fail—and with it will go a significant potential market for electronics technology. —Ray Connolly
Savings you can achieve by using LSI Pin Bar for your common spaced bussing applications. Whether low production or high (up to 8,000 pin terminations per minute), the job can be done for 3 to 6 cents per pin—compared with two recent independent studies that show wire bussing costs, including rework, approaching a minimum of 10 cents per termination in high production quantities. A major manufacturer of telephone products is convinced. He saved $68 dollars per chassis when Pin Bar replaced every common spaced wire bussing circuit for high frequency multiplexing, data transmission, power and ground applications. And while saving, he gained foolproof terminations at higher production rates, lower uniform contact resistance, efficient back panel design, and a "spec" performance component produced to his exact requirements. Give us your common spaced bussing problem. We'll send free samples and prices immediately. Or we'll visit your plant to discuss Savings You Can See! LSI Pin Bar Products

IPL readies photodiode array for merchandise mark reading

All the noise being made about the use of charge-coupled devices for solid-state imaging arrays has tended to push the older photodiode sampling arrays into the background. Nevertheless the first large orders for two-dimensional arrays are likely to be for photodiode, not CCD, devices.

U.S. point-of-sale equipment makers National Cash Register and Singer will use optical wands for merchandise mark reading in some new equipment ranges, and currently the favored technology for the wand optical sensor is a photodiode array. It might be typically 50 diodes long by 15 deep. One contender to supply the arrays is Integrated Photomatrix Ltd., Dorchester, England.

IPL will show what can be done with two-dimensional arrays at the electro-optics exhibition in Brighton later this month. The company will show a demonstration camera fitted with a 64-by-64-diode array on a quarter-inch square MOS chip incorporating all scanning circuitry. The array alone takes up an area 192 mils square. The chip is in a 24-pin dual in-line ceramic package, with a borosilicate window.

Analysis. Besides point-of-sale gear, IPL is pushing the array in medical electronics for automatic imaging and analysis of slides containing blood samples, cervical smears, and the like. Manual inspection is lengthy and hospitals cannot get people to do it. Video-tube imaging has been tried, but automatic analysis is complicated because of the analog output signals.

According to Peter Fry, IPL technical director, an electronically scanned matrix with about 100 diodes on each axis would be enough for satisfactory analysis. Positional information is automatically obtained from the diode coordinates, so that the array is already half-way to a digital output.

Like Reticon Corp., Mountain View, Calif., IPL has made devices and systems based on a single row of diodes. But there are important differences between the technology necessary for a line and a matrix. In a line, the diodes can be as close together as possible—1-mil centers are possible—to get maximum utilization of silicon area, because the sample and recharging circuitry can be on the side. However, the matrix obviously can not have the circuitry alongside. Address lines between each diode line in both axes force the diodes apart. Fry believes that 3-mil centers will be the best compromise because that spacing is far enough apart to allow diodes that are big enough to be properly sensitive, but close enough together to allow a big matrix on a reasonably sized chip.

The address lines connect with

French ready packet-switching link to start data network

As the first step towards a digital data network, French government engineers last month began testing an experimental packet-switching link between Paris and Rennes in Brittany. By early next year they hope to tie in industrial and commercial customers on a trial basis. Long-term plans call for a network—code-named Hermes—tied into the national telephone system.

Telecommunications administration officials are in no rush to get Hermes into service; their main thrust right now is to solve the pressing problem of providing phones for everyone who wants them. But in the brand new laboratories of the two-year-old Centre Commun d'Etudes de Telecommunications (CCETT), development of packet-switching techniques is being pushed, anyway.

In contrast to the other major French experiment in packet switching, the Cyclades project, which links together big scientific computers [Electronics, Feb. 21, p. 56], the Paris-Rennes link is oriented toward a network serving many clients with simple data-transmission problems. Also, the multiclient link will give CCETT a look at how to compute the data volume that flows from individual terminals into the network. This is needed so that future charges to Hermes customers can be scaled down as volume increases.

CCETT calls this first system RCP, for Réseau de Commutation par Paquets. In the first stage of system experiments, data packets are being transmitted at a speed of 4,800 bits per second on ordinary telephone lines. Each packet, made up of about 63 eight-bit bytes, is grouped with up to three others in a frame along with error-correction codes and addresses. In addition, the system automatically modifies the transmission speed to adapt source capacity to receiver capacity.

Next year, the CCETT will set up a third packet-switching center in Lyons and boost transmission speeds over the three-cornered network to 9,600 bits per second in each direction between the switching computers. Some time next year, also, CCETT hopes to have about 10 computers tied in and probably 100 or more terminals from trial clients like banks feeding directly into the packet-switching centers.

Several more years will be needed before a complete national packet-switching grid is opened to everyone. Before that stage, the CCETT will have to design a replacement for the RCP network. The new switching computers must be larger than the present Digital Equipment Corp. PDP-11s. And it will be some time in the 1980s, engineers figure, before the Hermes system linking telephone subscribers will finally be in operation.
shift registers along two sides of the matrix. One shifts quickly and selects individual diodes. The other shifts at 1/64 the speed and selects lines. Line selection is via aluminum interconnects, and diode selection via diffused interconnects. The diffused interconnect carries the charge sample out of the array.

Fry explains that the metal line ideally should carry the charge, and using the diffused line brings serious delay problems due to resistance and capacitance. For instance, if simple sequential scanning of each diode were used, delay would cut the sample rate of the 64-by-64-diode array to about 0.5 megahertz, which is far too slow to be useful.

Thus, he has devised a parallel scanning technique that removes the delay. He can not switch the line functions about and carry the charge on the metal lines, because IPL uses metal-gate MOS technology with only a single metalization layer. Using the metal line to carry the charge would make processing far too complicated.

The 64 diffusion lines feed into 64 integrated capacitors along one side of the chip. A complete line of 64 diodes is sampled simultaneously, and the charges pass in parallel to the capacitors, from which they are read out in sequence. A space of 4 microseconds is allowed for sample and transfer. Readout takes 200 nanoseconds per capacitor, so the fastest frame scan time is just over 1 millisecond.

## France

### Philips develops Gunn amplifiers

Over the past few years, Gunn diodes have made their way as low-power sources from the laboratory into the real world of microwave equipment. Now, Gunn-effect amplifiers—also called transferred-electron amplifiers—are about ready to move out, too.

At Laboratoires d’Electronique et de Physique Appliquée, a Philips Group research facility near Paris, researchers spearheaded by Robert Spitalnik and Alain Rabier expect to complete by May prototypes of a C-band transferred-electron amplifier module they have developed. RTC-La Radiotechnique-Compelec, a sister company in the Philips Group, will fabricate the prototype and then produce 50 of the modules by September with diodes from LEP.

**Space.** These particular modules are slated to go into the French satellite-communications ground station at Pleumeur Bodou, where they’ll serve as drivers for traveling-wave tubes. In this application, the amplifiers have a gain of 8 decibels with a maximum ripple of 0.5 dB from 5.9 to 6.4 gigahertz.

Actually, the 500-megahertz bandwidth isn’t much for the Gunn amplifiers that LEP has developed. Other modules have a 6-dB gain over the X-band range of 7 to 11 GHz. The noise figure is a remarkable 15 dB, and the power output is 100 milliwatts with no more than 1 dB drop over the whole bandwidth. To be sure, field-effect transistors out-perform Gunn diodes where noise is concerned, and avalanche diodes outdo them in power. But there’s a niche between the two for Gunn amplifiers, Spitalnik feels, particularly in wideband countermeasures receivers.

To build devices that can fill this niche, LEP combines a notched cathode for the diode itself and a beam-lead mounting. The gallium-arsenide diodes, fabricated in an epitaxial layer grown on a GaAs substrate, have cathode notches about 2 micrometers wide with an impurity concentration of 2 to 3 x 10^14 atoms per cubic centimeter.

After the notch comes a flat transit-time region of about 10 μm doped at 7 to 9 x 10^14 atoms/cc. With this doping profile, the electric field is flat at 11 kilovolts per centimeter along the active length of the diode, and the diode operates stably when biased at 13 V.

To keep the gain flat over the bandwidth, LEP matches the diode to a 50-ohm output by a microstrip equalization network. The diode itself is mounted on the microstrip by means of a beam lead that can handle currents to 1 A.
REI has one question for people who buy electronic test equipment.

Why?

When you need it fast . . . rent it. Purchasing equipment usually involves long delivery lead times. When you rent your electronic equipment from REI it's a safe bet that you can get what you need within 36 hours of the time you call in your order, sometimes sooner. This fast service is possible because we maintain 9 Instant Inventory Centers throughout the U.S. and Canada, stocking millions of dollars worth of equipment.

When you need it for only a short time . . . rent it. Need equipment for a short-term project? Rent it from REI. When you don't need it any more, return it to us. It's the easy, low-cost way to use the equipment you need for just the time that you need it.

When you care about what it costs . . . rent it. Renting from REI can be less expensive than purchasing. There's no capital investment to adversely affect your company's cash flow. This means you'll get more mileage from your equipment budget. And, since you can treat your monthly payments as an expense in most situations, you'll also achieve tax advantages from renting.

All REI rental equipment is guaranteed to meet manufacturers' specifications and is operationally checked out prior to shipment. Routine maintenance is provided free of charge. Certification and calibration are available upon request. Our flexible arrangements include rental, rental-purchase and leasing packages to give you the use of equipment from one week to three years or more.

Get your free copy of our 1974 catalog that lists virtually every item in our rental inventory. Use reader service card, or write Rental Electronics, Inc., 99 Hartwell Ave., Lexington, MA 02173. For immediate information, call your local REI Instant Inventory Center listed below. Once you rent from REI, you may never buy electronic test equipment again.

Rental Electronics, Inc.

Thomson-CSF readies a translucent video disk

Thomson-CSF intends to unveil a video disk player within the next four or five months. Company officials now say their research group has been getting very good color images with a player that pairs a soft translucent plastic disk and a laser-based readout system. The bandwidth of the encoded video signal is 4.5 megahertz, the disk spins at 1,500 revolutions per minute, and it carries up to 40 minutes of program.

Robert Pontillon, who directs Thomson-CSF's audio-visual activities, says that the French company is pushing hard for an agreement on a single standard for video disk players. The other European contenders are Philips Gloeilampenfabrieken, and the Telefunken-Decca venture, Teldec. Like Thomson-CSF's, Philips' player uses optical readout, but the Dutch company opted for a rigid, reflecting disk. Thomson-CSF, therefore, can't make its player compatible with Philips', but Pontillon maintains that the French playback system could be made compatible with Teldec disks, which have a pressure-sensitive readout.

German company to mass produce electronic speedometer

VDO Adolf Schindling, a leading European automobile-instruments maker, is about to begin production of electronic speedometers on a large-volume basis, making it the first company to have readied such speedometers for mass production. The units will go into passenger cars that will come off the assembly lines of a German automobile producer starting this spring.

The new VDO speedometers offer several advantages over conventional mechanical systems, the prime one being that the vehicle no longer needs a flexible shaft. Instead, a wire—one that can easily be run in the car's cable harness—is used for sending the speed and distance pulses from the transducer to the speedometer and its mileage indicator. The key component is an integrated circuit developed by Intermetall GmbH, an affiliate of the ITT Semiconductor group. The price of the electronic speedometer, VDO says, will be about the same as a conventional one plus its flexible shaft.

Electric bus to use sophisticated electronic controls

Chloride Technical Ltd., part of the British Chloride Group—whose activities include automobile batteries—has developed an electrically powered 50-seat single-deck city bus that makes considerable use of electronic controls. It will go into trial service in Manchester in a few months. Maximum speed is said to be 40 miles per hour and range 40 miles on a single charge of the 330-volt lead-acid battery. Normal battery recharge time is not more than 5½ hours, so that it can be recharged between morning and evening peak use times.

The bus uses a series-wound dc main-drive motor controlled by a 1,000-ampere thyristor chopper-controller, which incorporates a regeneration system that recharges the batteries during deceleration and braking. The controller has been developed by Sevcon Engineering Ltd. of Gateshead, a subsidiary of Technical Operations Inc., Burlington, Mass. It includes logic on the speed/time relationship, which keeps down acceleration and deceleration to comfortable levels. A pulse regeneration technique is used: current builds up in the armature and contacts until at a pre-set level it transfers through a diode to the battery.
Siemens turns to MOS ICs for remote TV control

Watch for West Germany’s Siemens AG to offer an all-MOS set of integrated circuits for remote control of color-television receivers. The complete set, to hit the market during the second half of this year, will consist of three standardized MOS circuits—one each for the control system’s transmitter, receiver, and memory. It will sell for about $15, roughly equal to the price of all other integrated circuits—between eight and 10—used in German-built color-TV receivers today.

Desk-calculator makers in Japan set quality standards

In the near future, desk calculator purchasers may look for a new mark—a stylized B and M—that goes with the quality standard to be introduced on March 1 by the Japan Business Machine Makers Association. The association hopes the standard will help to maintain product quality despite the current high level of competition. Eligibility for the mark includes registration of the model, inspection of the company’s plant and after-sales service setup, and inspection of the quality of calculators. The quality test will include repeated computation, to assure that there are no errors, and a vibration test.

The association now has 14 manufacturers who produce calculators. Estimates of the number of “outsiders” that produce calculators range up to 50 companies. Most of the outsiders’ calculators are exported.

SAAB-Scania takes over Facit’s computer systems

Sweden’s SAAB-Scania has taken over development and marketing of complete computer systems developed by office-machine maker, Facit. Now, SAAB, which has concentrated in large computers and large-computer bank-terminal systems, will be able to move into the lower level of computer applications. The Facit systems include an electronic invoicing system, multi-access office computer system, and a program-control system using magnetic tapes and alphanumeric CRT display screen.

At the same time, the take-over will also enable SAAB to use the well-developed world-wide Facit marketing organization. SAAB has concentrated its computer sales in Scandinavia and some East European markets, although last year it established a U.S. subsidiary, Data-Saab Systems Inc. SAAB has one bank-terminal system in operation in the U.S., at New York City’s Central Savings Bank.

Facit will retain development and marketing of its computer peripheral equipment, including tape punches and readers, which it sells to a number of computer makers. Facit will also continue to handle production of the computer systems that SAAB is acquiring.

Cables and Wireless picks Italian group for earth-station gear

Cable and Wireless Ltd., operators of seven satellite communications earth stations around the world—all built for it by Marconi Co. Ltd.—is moving to the Italian consortium Consorzio per Sistemi di Tele-communicazioni via Satelliti SpA. (STS) for its next two stations. These stations will be in Fiji and in Dubai in the Persian Gulf. STS has a contract worth some $5 million for the antenna structures and some other equipment, possibly including much of the transmit and receive gear. Marconi has to be content with an $800,000 order for some receiver subsystems and modulators. Other UK companies have taken smaller orders for ancillary equipment.
At Last... a Fully Pre-Insulated Disconnect!

Now you can have a precision-assembled, fully pre-insulated female disconnect or male tab... eliminates fitting the insulation after crimping the terminal, it's a one piece insulated disconnect ready to install... saves time, improves reliability. One squeeze from your standard or popular ratchet-type SHURE-STAKE® tool gives you a fully insulated compression connection designed and tested to NEMA DC2-1970 and UL486 requirements.

The compact size permits high density wiring (.375 min. centers for female) with one step installing convenience and a new level of no-flashover reliability.

There's even a pre-insulated flag disconnect and fully insulated splice in the line... write for details. The Thomas & Betts Co., 36 Butler St., Elizabeth, New Jersey 07207. (201) 354-4321. In Canada, Thomas & Betts Ltd., P.Q.

Goes On Straight
Pre-insulated female disconnect available for #22 to 10 AWG wire range. .250 x .032 Tab Size.

Pre-insulated flag disconnect accommodates #16 to 14 wire range.

Makes A Splice
Extra long insulator on male tab overlaps female to make a fully enclosed splice. Wire range from #22 to 10 AWG.

 Turns Corners
Pre-insulated flag disconnect accommodates #16 to 14 wire range.

Cat. No. RB-2577F
Cat. No. RB-25177
Cat. No. RB-2573

Sold Only Through Authorized T&B Distributors

Circle 57 on reader service card.
Everyone talks corrected reliability,
here's the way it looks.

Switches under glass.

The heart of every AE correed is a reed switch consisting of two overlapping blades. For protection, we seal them inside a glass capsule. But only after we pull out all the dirty air and pump in a special, pure atmosphere. That way there's no chance of contact contamination or oxidation. Ever.

Notice our terminals are one piece. A special machine delicately forms them to precision tolerances. It's a lot of work, but one-piece terminals have distinct advantages over the two- and three-piece kind.

For one thing, there's no extra joint so you're always assured of a positive contact. Also, one piece terminals are more reliable when the correed is used to switch low-level analog signals. That's because thermal EMF is reduced to practically zero.

A different kind of bobbin.

Since we go through so much trouble with our correed capsules, we designed a special bobbin to protect them.

It's molded of glass-filled nylon. (You know how plastic chips and cracks.) Moisture and humidity have no effect on this stubborn material. No effect means no malfunctions for you to worry about. No current leakage, either.

Running the full length of the bobbin are a series of slots. They pamper the capsules and keep them from getting damaged or jarred.

And to help you remember which terminal is which, we mold the terminal numbers into the end of the bobbin. You can read them at a glance.

Little things mean a lot.

Reliability means that we pay attention to the little things. Like the tiny pressure rods we use in every miniature correed. They're placed at each end of the bobbin, across the one-piece terminals. What they do is prevent stresses from being transmitted from the terminals to the reed blades. This keeps the contact gap right on the button. All the time.

The contacts are normally open. To provide them normally closed, we employ another little device—a tiny magnet. It's permanently tucked into a slot next to the reed capsule. The magnetic action keeps the contacts normally closed.

Coiled by computer.

Once all the parts are secure in the bobbin, we cover them with protective insulation. Around this, we wind the coil. You can be sure the coil winding is correct. It was all figured out for us by computer.

Our next step is to protect the coil. We do that with more protective insulation.

A coat of iron.

On top of the insulation goes a layer of annealed iron. It acts as a magnetic shield and minimizes interaction between coils. Also, it improves the sensitivity of the entire unit. A coat of iron is standard on all AE correeds.

Finally comes super wrap.

To wrap it all up, we use some very special stuff. A layer of mylar laminated material. It's so tough we guarantee it to withstand all cleaning solvents known to man.

Free Correed Handbook

This 60 page handbook explains advantages and disadvantages of correeds, describes the different types, and tells how to use and test them. To get your free copy, just write John D. Ashby, GTE Automatic Electric, Northlake, Illinois 60164.
P&B's reputation is important to you when you need Electromechanical Relays.
It's built on cost and quality, broadest selection.

We believe you'll have a hard time matching the cost-to-quality ratio of our relays. You might find lower prices. We don't think you'll find better quality.

Put the two together—competitive prices and outstanding quality—and you have the relays that won't compromise your equipment's quality. P&B.

We'll stake our reputation on that.

You get more design options, too, when you bring your relay application problems to us. We'll show you more different standard electro-mechanical relays than anyone else. Nearly seventy basic designs. More than a thousand different combinations of voltages, contact arrangements, mountings and enclosures. All available from your authorized Potter & Brumfield distributor.

When a standard relay won't meet your requirements, we'll supply one just for your application. We've been doing just that for thousands of relay users for the past forty years.

For a free 226-page catalog showing all of our relays, call your local P&B representative. Or write Potter & Brumfield Division of AMF Incorporated, Princeton, Indiana, 47670. Telephone 812 385 5251.

Solving switching problems is what we're all about.
Hewlett-Packard presents a small miracle, the HP-65:
the only fully programmable
pocket-sized computer calculator,
$795.

Once you had to know a "computer" language, work at a desk and have a large budget to use programming. No longer.

The HP-65 is fully programmable.

It's the first fully programmable pocket-sized computer calculator in the world.

With an HP-65 you can write programs just by pressing the keys in sequence, without using a special "computer" language. You can edit programs, i.e. add or delete steps at will. And you can record your programs on magnetic cards for subsequent use anywhere.

The HP-65's 100-step program memory, in combination with its 51 pre-programmed arithmetic, logarithmic, trigonometric and exponential functions, its operational stack and its nine addressable memory registers, permits you to write exceedingly complex programs.

Its user definable keys let you program up to five routines using any of the machine's pre-programmed capabilities. You can also label portions of your program so the calculator can branch to a specific instruction or choose between alternate computational paths based on logical comparisons ($x = y$, $x \neq y$, $x > y$, $x < y$) or the condition of the HP-65's two flags.

The HP-65 also lets you use pre-recorded programs.

HP offers a series of pre-recorded program packages called Application Pacs at $45* each. Each Pac contains as many as 40 programs dedicated to a specific discipline (currently Electrical Engineering, Mathematics, Statistics, Medicine and Surveying, with more to come).

We also maintain a Users' Library of owner-contributed HP-65 programs which are itemized in catalogs distributed periodically to subscribing owners. Programs may be ordered from the Library for a small handling fee.

The HP-65 is a powerful pocket-sized calculator.

The HP-65 ranks with our popular and powerful HP-45 as a keyboard-operated calculator. It's pre-programmed to handle 51 functions and operations.

The HP-65 is priced at just $795.*

What you gain in time, precision and flexibility may well save you that amount in a matter of weeks. The price includes one 11-ounce HP-65 with rechargeable battery pack, AC adaptor-recharger, carrying cases, a year's subscription to the Users' Library, Owner's Handbook, Quick Reference Guide and a Standard Application Pac that contains 17 representative pre-recorded programs, 2 diagnostic cards, 20 blank cards, a head-cleaning card and instruction booklet.

The HP-65 may be ordered on a 15-day trial basis. For details send the coupon. Or call Customer Service at (408) 996-0100 for the outlet nearest you.

Hewlett-Packard makes the most advanced pocket-sized computer calculators in the world.

HEWLETT PACKARD

Electronics/March 7, 1974
NOW THERE'S A CHOICE WITH THREE BIG DIFFERENCES

120 MHz, 20 lb and a logical layout

This oscilloscope does the job. The job being servicing, testing and developing communications and computing systems.

For this you need a bandwidth of at least 100 MHz, therefore Philips supply 120 MHz in order to keep ahead of component developments like Schottky TTL.

A sensitivity of 5 mV is more than adequate, while a weight of only 20 lb comes as a pleasant surprise, (parking being what it is, every pound counts on a service call).

And a logical front panel layout is equally important since it lets you take measurement easier, quicker and with less possibility of error. (One example of our logic is the separation of main and delayed time base controls in order to avoid any ambiguity).

Even more

As well as these obvious benefits, the new PM 3260 has even more significant features like : the clean display, even at the highest writing speeds; the wide use of thin film circuits that help the space and weight reduction and that increase overall reliability; the specially-developed power supply that accepts any line voltage / frequency and DC and that dissipates only 45 W, thereby eliminating the need for a fan (and associated filters) and finally, the modular construction that gives fast access to all boards, controls and components.

First in a family

The new PM 3260 is also the first in a new series of oscilloscopes that will soon include higher and lower bandwidth instruments – all with the same important benefits of high performance, light weight and excellent ergonomic design.

To find out more about the first in the family write to :

Test and Measuring Instruments Inc., 224 Duffy Avenue, Hicksville, L.I., N.Y. 11802
"We expected the quality. What floored us was the throughput."

In a fast-growing company like Industrial Nucleonics, there's constant pressure for increased productivity. But Walter Canter, IN's VP of Manufacturing, knows that product quality has to come first, and his job is to increase production without sacrificing that quality. If he can find a way to boost both quality and throughput, he's way ahead of the game—the game in this case being backplane wiring.

"The backplanes that go into our large AccuRay process automation systems run from a few hundred points to eight or nine thousand. Like most people, we used to manually inspect the wiring. That took time. Worse, it was subject to the same kind of human error it was supposed to uncover."

The answer was a Teradyne N151 Computer-Operated Backplane Test System, which now completely checks the wiring on a 6,000-point backplane in about 15 seconds. With no programming to worry about. The N151 learns the wiring either from a known good backplane or from the same program used to control the wiring.

What all this means to Walter Canter is this: "We save money on backplane inspection time, and we save money later in the final testing of systems. The N151 paid for itself here in 10 months. Best of all, our N151 works two shifts a day, six days a week, with no downtime to speak of."

Find out more about Teradyne's N151, the system that has literally revolutionized backplane testing. Write Teradyne, 183 Essex Street, Boston, Massachusetts 02111. In Europe: Teradyne Europe S.A., 11 bis, rue Roquépine, 75 Paris 8°, France.
Solid-state imagers halfway there

Industrial-quality CCD, injection, and MOS versions are available, but broadcast-type equipment is still several years away

by Laurence Altman, Solid State Editor

Solid-state imaging devices, hailed as the new generation of camera technology as early as 1970, are still not commercially available for high-density facsimile and video-camera applications. And while it is becoming clear that cameras that can meet the tough demands of manufacturers of broadcast and consumer equipment are still at least two or three years away, a wide variety of industrial equipment has become available. These products include lower-resolution linear and area imagers (charge-coupled, injection, and MOS devices) for such applications as slow-scan optical character recognition and basic-recognition intrusion systems.

Consider the developments of the last month:

- Bell Laboratories has built a CCD vidicon capable of full Picturephone resolution (250 by 225 lines) for data-transmission systems, and, in the process, designed a high-yield device structure that greatly reduces the manufacturing tolerances.
- An injection-type MOS camera has just been introduced by General Electric. While capable of only 100-line video resolution, it's so sensitive that it can detect images illuminated by nothing more than the light from a candle. Signal-to-noise ratio is 1,200 to 1, and peak sensitivity is about 300 milliamperes per watt. This camera joins the 100-by-100-element CCD imager from Fairchild Camera & Instrument.
- Finally, and perhaps most significant in foretelling developments, workers at RCA Lancaster are operating a CCD video camera that's capable of the full 525-line video resolution. This 512-by-320-element array is technically capable of performing in today's TV systems.

But it should be pointed out that available camera components fall short of the resolution and picture quality required for most video applications; standard industrial-quality data-transmission, video, and facsimile equipment; and toughest of all, low-cost consumer cameras capable of displaying good pictures on home TV monitors at a price less than $200.

Indeed, some observers have begun to question whether solid-state techniques will ever be capable of producing imaging devices comparable in quality and cost to today's vidicon tubes—a standard 525-line black-and-white video camera from Japan can be bought for less than $200.

These new developments indicate that solid-state imagers are clearly
Probing the news

ready to penetrate many industrial markets. One user, Richard Van Thyne of Recognition Equipment Co., Dallas, states that “all three types of solid-state imagers—CCD, injection, and self-scan—are being evaluated for both simple character-recognition systems, like card and postal readers, and the tougher-to-implement point-of-sale applications. “For the OCR systems,” says Van Thyne, “a linear scanner is sufficient because the material has to move past the image head anyway. And the available CCD and MOS scanners can already do the job. The problem is cost—we’d buy all we could at $5 apiece, and the vendors would supply all we wanted at $100 apiece. It’s mostly a question of getting the economics together.”

But Van Thyne indicates that it’s not just the cost of the image component that must be considered—the total system saving can be considerable with solid-state imaging devices because they are smaller, use less power, and are generally more reliable. “You’ll pay more for a device you know is reliable” and can operate at a fraction of the power dissipation and light levels that generally are available from tube imagers, he points out.

Whether industrial users know it or not, device manufacturers see them as providing a foot in the door for many special-purpose imaging applications. According to Gilbert Ameleo, in charge of CCD device work at Fairchild, “The industrial market provides a proving ground where many of the advantages of solid-state imaging can be tested.” Even the early low-resolution image devices, like the 100-line camera, are already in demand for fly-by-surveillance and monitoring applications because they are lightweight and rugged. But Ameleo cautions that penetration into industrial, let alone the broadcast or consumer markets, rests with the ability of solid-state imager manufacturers to increase device density to the standard 525-line TV level. At this level, the solid-state device would begin to penetrate such fields as facsimile and page-reader equipment, to name two.

The density gap is quickly being filled by devices such as Bell Labs’ 250-line and the RCA’s 525-line imagers. The Bell device is promising because it greatly relaxes the manufacturing tolerances required in dense image arrays. Michael Tompsett, supervisor of the Bell CCD group, points out that the structure “considerably relaxes demands in mask making and photolithography because no narrow gaps have to be etched.” The smallest device feature is the electrode itself—in this case, it measures larger than 15 micrometers.

This means that yields on CCD imaging chips can be quite high, even though the chips themselves are very large—500 mils and larger on a side—pointing to much lower manufacturing costs than might be expected for jumbo chips, “In fact,” says Tompsett, “the problem with the commercial production of CCD imaging chips from the supplier’s viewpoint may be that the price may fall too fast.” And although most device manufacturers say they will supply both chips and complete camera systems, low prices on chips would stimulate more interest in supplying complete camera and monitoring systems.

RCA, which has been a major supplier of video-camera tubes, is clearly aiming at the systems market—a realization that may not be too far away, to judge from its 525-line CCD camera. According to Robert Rodgers, manager of the Lancaster camera group, the device, although still developmental, is technically capable of competing with many vidicons. “We have it hooked up to a standard TV monitor, and it’s hard to tell it from a standard TV image. The CCD-camera cost, however, would be high, and because of this penetration into the general vidicon market, is still some years away.”

This goes for both the broadcast camera market and the consumer home-video market. “For the broadcast market,” says Rodgers, “even a 512-by-320-element camera is not good enough because sponsor pressure requires that the image quality must be higher than that shown on a home-TV monitor.” And for the home-video market, the $200 vidicon presents a formidable competitor.

But as a special purpose camera, such as for low-light-level news and sports applications, teaching aids, and medical applications, the solid-state video camera may soon be in the picture.

Bell ringer. This CCD vidicon built by Bell Labs can produce Picturephone resolution (250 by 225 lines). Researchers there also managed to reduce manufacturing tolerances.
Our High-Rel Team is set to tackle your linear IC RFQ's.

Anytime you need High-Rel Linear IC's for military aerospace or industrial applications, come to RCA. Your RFQ's will receive first class "team" attention.

RCA has come on strong to meet your needs for High-Rel Linear IC's. With a team dedicated exclusively to High-Rel IC's and a MIL-M-38510 approved facility, we are keeping pace with the industry's increasing demand for high-reliability linears.

Our team can bring you a variety of High-Rel circuits, such as Operational Amplifiers, Differential Amplifiers, Transistor Arrays, RF Amplifiers, and Voltage Regulators, all processed to MIL-STD-883. Here are just some of the more popular amplifier circuits offered.

Automotive electronics

Electric vehicles draw interest

Electronic control systems are part of struggle to overcome cost, performance limitations in transit efforts

by Ray Connolly, Washington bureau manager

Consumers of the Western world waiting for an electric vehicle to rescue them from their dependence on gasoline pumps still have several years to wait. And when the first EVs arrive in quantity, they will most likely be in the shape of buses, rather than passenger cars. Moreover, those buses with their electronic control systems probably will have been made in Europe or perhaps Japan, rather than in the United States.

Surprisingly, those conclusions drawn from the Third International Electric Vehicle Symposium in Washington didn't discourage the electronics engineers at the three-day meeting near the end of February. "That may be discouraging for car drivers, but it is good news to us," contended one Westinghouse Electric Co. engineer, who noted that solid-state technology is still a newcomer to the EV marketplace. "There is still a chance."

How chancy is the potential for electronics as the principal control system for electric over-the-road vehicles? Most Americans acknowledge that they do not yet know, because the domestic market has not yet been tapped as it is beginning to be in Western Europe, where vehicle development is further along. There, the emphasis is on city buses and delivery vans with the capacity to carry the large, heavy battery packs now required by EVs. But the potential for electronic control systems unquestionably exists, if they can be proved economically competitive with older, established mechanical contactor systems and torque converters.

"It is still feasible to consider the mechanical contactor systems, for these have been greatly reduced in size and relative cost from the early days of streetcars and electric cars," says Ford Motor Co.'s Lewis E. Unnewehr. "However, many investigators feel that solid-state devices and circuits hold the most promise, and there is no doubt that such systems can give a smoother, more sophisticated type of control and would be much smaller in size."

Conflict. However, some European EV specialists have different views of the economics and performance of electronic control systems. On the cost side, David Gurwitz, managing director of Britain's Sevcon Ltd., says that electronic controls as they now exist are too expensive. To move a small, implant personnel carrier, for example, a minimum solid-state system could cost $200. For a large vehicle capable of accelerations to a top speed of 60 miles per hour with the torque equivalent of 200 horsepower, a control system could cost as much as $1,000 each in quantity. "These costs are not competitive," says Gurwitz.

Gurwitz' frustration with solid-state control costs was matched by one French engineering executive's concern with the performance of present controls. General manager Pierre Margrain of Establissements E. Ragonot, an affiliate of the Thomson Lucas Group, called for conflict. However, some European EV specialists have different views of the economics and performance of electronic control systems. On the cost side, David Gurwitz, managing director of Britain's Sevcon Ltd., says that electronic controls as they now exist are too expensive. To move a small, implant personnel carrier, for example, a minimum solid-state system could cost $200. For a large vehicle capable of accelerations to a top speed of 60 miles per hour with the torque equivalent of 200 horsepower, a control system could cost as much as $1,000 each in quantity. "These costs are not competitive," says Gurwitz.

Gurwitz' frustration with solid-state control costs was matched by one French engineering executive's concern with the performance of present controls. General manager Pierre Margrain of Establissements E. Ragonot, an affiliate of the Thomson Lucas Group, called for

Is there a consumer market?

In 1972, the New York-based Electric Vehicle Council commissioned a market study that determined there were about 55 million Americans who would be interested in a plug-in automobile for urban use if it could deliver a top speed of 40 miles per hour, would travel 150 miles without recharging, and could be bought for less than $2,000. Both that range and price are still beyond the state of the EV art—now limited to about 50 miles and a price tag closer to $4,000—but much has changed in America in the past two years.

Chief among these are the attitudes of the consumer, lately discontented with seemingly unending waits to buy limited quantities of gasoline. If there is an indication in the number of consumers who called the Third International EV Symposium anxious to see the exhibits—and in some cases, "place my order for an electric car"—then the principal obstacle to developing the consumer market would seem to be only the absence of a proven consumer product.

Offsetting the EV's high first cost and range limitations are its distinct advantages in the area of low fuel costs—about one-half cent per mile—as well as its low pollution level and relatively simple maintenance compared to conventional vehicles.

Of the 42% of U.S. consumers who expressed an interest in an electric vehicle, more interest was shown by women than men (43% vs 41%), by younger people than older (half of those in the 18 to 29 age bracket), and by big-city dwellers (48%) than those in rural or other urban areas. Said one analyst of the data, "in developing the market, it seems that college students and liberated women should come first."
Now, you can order COS/MOS parts processed to MIL-M-38510 from the first supplier to achieve QPL approval for C/MOS, and the first IC supplier to achieve approval for any Class A parts.

Orders are now being taken for eleven High-Rel IC’s fully-processed to MIL-M-38510 — Class A, B, or C.

Probing the news

development of high-power transistors with collector currents as high as 500 amperes so that the company's urban-vehicle controller can achieve economies as high as 80% in labor costs by replacing 33 components with no more than four or five that could cost 20% less. Margrain says he believes such components will be developed for use as choppers in EV speed-drive systems. Ragonot's prototype urban-vehicle controller has 11 independent power blocks, each consisting of three parallel transistors, driven in a Darlington assembly by a fourth. The problem, says Margrain, is the cost and complexity of the circuitry, as well as the associated problems of getting so many transistors to work in parallel.

Systems. Though most Americans concede that EV applications are more advanced in Europe and Japan—where gasoline prices have always been higher and the distances between cities comparatively shorter than in the U.S.—the belief that the higher level of American systems-engineering expertise may prove an advantage in the long run. While all participants acknowledged that the limitations of battery technology are still the biggest handicap facing EV programs, Edward E. David Jr., Gould Inc.'s executive vice president for R&D, condemned the lack of system design. The former Science Adviser to the President said: "On-road truck and passenger vehicles are not realities today [because] too little effort has been spent optimizing electric vehicles from a total systems standpoint. Until recently, most electric vehicles were developed by removing an internal-combustion engine from an existing vehicle and adding standard batteries, motors, and controls. That is not adequate, and we now see that for a lead-acid battery to support broader vehicle applications, we must optimize all portions of the vehicle" before it can be economically marketed and manufactured.

That view was echoed by Siemens AG's Rudolf Wagner, who observed that "we EEs are technically inferior to machinery designers" in the automotive industry when it comes to determining with precision the long-range production costs of a mass-produced vehicle. But, Wagner added, "we accept the challenge."

Before an EV can be successfully marketed, much needs to be done to determine accurately the product's reliability and performance data in order "to make decisions on mass production, requiring a very high capital investment." By Wagner's estimate, "at least 10,000 cars will have to be built so that all technical data will be solidly grounded." Moreover, he urged the infant industry to move quickly to develop technical standards, especially in such areas as battery chargers, "so that the electromotive engine does not fail at the start."

Postal program. Some symposium registrants saw a certain irony in that the biggest EV effort in America is being sponsored by the U.S. Postal Service, an agency not ordinarily associated with innovative technology. Of the USPS program to move from 30 prototypes to 300 operational electrically powered postal vans in one bound, one Briton said, "a very, very brave jump indeed." Building even 100 vehicles "is enough to drive anybody mad," he argued, warning that "problems are going to exist" in the program because "none of the companies operating in the U.S. could expect to build even 10 vehicles at anything resembling real cost.

Westinghouse Electric Corp.'s Pittsburgh R&D Center identified some of the EV postal-route requirements in that city, reported a team of its specialists at the meeting. On three routes, mileage requirements varied from 12.3 to 28. Stops and starts totaled 375 on the longest run and 477 on the shortest. Kilowatt hours per mission ranged from 8.75 to 15.1, according to the study.

Are these and other proposed electric vehicles efficient? For the long term, the answer is a definite "yes," according to analyses by Westinghouse and others. In a study by Westinghouse's A. H. Long and three of his colleagues, the comparative costs per mile for an EV in 1973 were already competitive with conventional cars. They are 18.7 and 18.5 cents, respectively, on the basis of combined fixed and variable costs. And, as U.S. gasoline costs rise and emission-control systems continue to reduce the mileage per gallon, the Westinghouse study estimates that internal-combustion vehicle costs will nearly double by 1983 to 33.3 cents per mile.
The engineering data in this 40 page catalog makes it indispensable.

Performance curves, dimensional drawings and EIA specifications make it a virtual handbook on a complete line of standard capacitors and ceramic substrates available from Centralab Distributors.

Traditionally, distributor catalogs have consisted of condensed product descriptions and catalog listings. They've seldom provided the engineer with all of the information he would like to have in specifying the exact component to fit his particular application.

That's why engineers will find the new Distributor Catalog on Centralab's complete line of electro-ceramic products such a radical and welcome departure. It not only provides all the product specifications needed on capacitors and ceramic substrates, but includes comprehensive technical data such as performance curves, test specifications and dimensional drawings. It's a real aid in the proper selection of the right component to meet specific application requirements.

There are 535 new items alone in this catalog. They include alumina substrates, now available in 10 standard sizes from Centralab Distributors. The broad line of capacitors include ceramic discs, new monolithics — chips, axial and radial lead—aluminum electrolytics, polystyrenes and special application ceramics including RF, feedthru and high voltage. Four capacitor kits are also described.

Off-the-shelf availability of the standard products in this catalog make it an indispensable specification tool. You can get your copy from your nearest Centralab Distributor. Ask for Catalog 101. Or write Centralab Distributor Products, Dept. C-1.

This new Distributor Catalog is graphically simplified and color keyed to make selection of individual requirements easier than ever before.
Automotive electronics

Is electronics heading wrong way?

Auto makers complain that semiconductor devices for cars need to be more cost-effective and more reliable

by Lawrence Curran, Managing Editor, News

In the eyes of the automobile industry, semiconductor manufacturers still have a long way to go both in understanding the penny-watching economics of the auto makers and in demonstrating that semiconductor devices are reliable enough for automotive use. Those were two of the salient points made at a panel entitled “Automotive Electronics Revisited,” during the International Solid State Circuits Conference last month in Philadelphia, and at a follow-up discussion there with Electronics editors.

Auto company representatives stressed, too, that reliability and economics are tightly intertwined in their industry—the auto manufacturer has to pay not only for the electronic systems but also for their service during that part of a car’s life that’s under warranty.

Regarding reliability, the auto spokesmen said flatly that they don’t want to pay for any bad semiconductor devices. Their reliability requirements are often more stringent than those in the aerospace industry, they maintain, where semiconductor suppliers have become accustomed to talking with their customers about “lot tolerance percent defective” levels—the acceptable percentage of defective parts in a lot. Automotive manufacturers have no such tolerance. John Webster, manager of electronic-product development at Chrysler’s Huntsville, Ala., division, perhaps best crystallizes his industry’s view when he says that semiconductor manufacturers have to learn to subscribe to the “childish simplification” embodied in a grocery-store analogy.

Economics. Says Webster, “If you buy a 50-pound bag of potatoes and you get three bad potatoes, you can take them back, and that grocer will give you three new ones. He’ll do it happily because he wants you to come back again.” By the same token, Webster says, if a semiconductor supplier “is shipping us half of 1% bad parts and we’re buying 20 million of them, he can forget about doing business with us the next time around.”

Frank E. Jaumot Jr., director of research and engineering at the Delco Electronics division of General Motors Corp., Kokomo, Ind., also hammered at economics to his ISSCC panel audience when he said that automotive manufacturers still aren’t necessarily enamored of electronic systems. If the choice is between an electronic solution to a problem and a cheaper mechanical or electromechanical solution, the auto maker will pick the cheaper unit.

Jaumot, though, made the point that electronic systems are beginning to prove their value in systems where considerable experience has been gained. For example, Jaumot says, electronic ignition systems have 1% of the failures of their mechanical predecessors. “The problem with the electronic-ignition system,” Jaumot says, “is that the failure is usually catastrophic; it’s a tow-in job 40% of the time,” whereas the mechanical system degrades slowly.

Chrysler’s Webster agrees that switching to electronics for the ignition system, which Chrysler pioneered and now is installing in all its
The new version, made by Robert Hood of Delco, has cut the failure rate in that system. At Chrysler, there have been about 20% fewer electronic failures than the mechanical systems had, although the age-old problem of semiconductor "infant mortality" still haunts users (see "Electronic ignition: the first 100 miles").

At West Germany's Volkswagenwerk AG in Wolfsburg, the use of electronic fuel-injection systems gives fewer failures—70% fewer—than the old carburetor, says Klaus Stamm, of Volkswagen's research-and-development staff. Stamm says, though, that failures in the electronic-injection system are 2.3 times more costly to repair.

**Unfulfilled promise.** Further, says Stamm, the advance billing of greater reliability for integrated circuits promised by their manufacturers hasn't proved out. Some 25% of the failures in Volkswagen flashing warning lights have been traced to faulty integrated circuits. Nevertheless, Volkswagen is going to an injection system that is more fully integrated than the original. The new version, made by Robert Bosch GmbH, uses three ICs and a total of 80 electronic components, compared with 300 discrete components in the original.

The toughest lesson for the semiconductor industry in dealing with Detroit, Chrysler's Webster believes, is to learn that automotive manufacturers aren't going to change their way of operating to accommodate the semiconductor manufacturer; the reverse will have to happen.

Regarding Detroit, Webster says "They've been building cars for lots of years, and they really know what they're talking about. They're almost unbelievable in their demands from the economic standpoint." With a car that contains all kinds of combinations of options—a lot of them involving electronics—coming off production lines each minute, the auto makers have to make sure that parts are available at the lowest possible price. "The rest of us have to do it their way, and that's true of electronics, as well," Webster emphasizes.

For ICs, Chrysler's Huntsville division has worked out a sampling plan that applies an acceptable quality limit (AQL) of 0.15 until experience is gained with a given semiconductor maker. Then if he's found to be delivering good parts, the AQL level is cut back so that fewer of those parts are tested. An AQL level of 0.15 means one bad device in 315, "and that's pretty mean," Webster admits.

**The AQL challenge.** For their part, panelists representing the semiconductor industry aren't wild about working under the shadow of such stringent demands as that AQL level or the need to supply huge volumes on a fast-turnaround basis (which happened with seat-belt-interlock systems for 1974 models).

Will Steffe, analog design manager at Fairchild Semiconductor, observed, "We may argue about whether we'd want to sign a contract with that AQL number in hard, black writing." William Davis, who is responsible for design engineering for consumer, linear, and non-entertainment products at Motorola's Semiconductor Products division, argues for more understanding of semiconductor cycle times on the part of automotive manufacturers, just as semiconductor makers must realize that Detroit won't stop production lines because promised devices aren't there.

We have a problem with cycle times, too," Davis says. "It takes a certain amount of development time, mask time, and production time to get the material through and get it out. We don't feel they really understand that."

Robert Hood, Fairchild's manager of automotive systems engineering, says the problem in the auto industry "is that the underlying concept is, 'All right. Today, let's shoot the designer and go into production,' and that's not the best thing to do—either from a cost or reliability standpoint. How we all learn to grapple with that over the coming years is going to be interesting."

**Electronic ignition: the first 100 miles**

Chrysler statistics show that the first 100 miles are the riskiest for electronic-ignition systems. In fact, during the first 10 miles, there is a substantial semiconductor "infant-mortality" rate. For more than 6,000 failed systems from a total of about 2 million produced for a given model year, 24% of them failed in the first 100 miles, and 15% of those failures happened in the first 10 miles of driving.

Interestingly, almost half the units that came back to the dealer as faulty turned out to be functioning properly, but, of the true failures, 78% resulted from component failures, "most of which were semiconductor failures," says John Webster, manager of electronic-product development at Chrysler's Huntsville, Ala., division.

**'Self-repairing' seat-belt systems**

Little statistical data has been gathered by automotive companies on seat-belt interlocks because the systems still haven't been in the field long enough. Delco's Frank Jaumot Jr. says Delco itself had to supply far more semiconductor devices than it had expected because outside suppliers were late with deliveries. But now that large quantities are coming from the semiconductor industry, he's pleased that the solid-state industry "really turned to on seat-belt systems and really put the relay people down." GM had designed a backup relay system for use if semiconductor suppliers dropped the ball, but it wasn't needed.

One reason, though, that few statistics are available on seat-belt-system failures, says Chrysler's John Webster, is that if the system fails, yet the car still runs, "we'll never hear about it. Out numbers are unbelievable at this point. Our digital clocks weren't that good, and they use the same C-MOS technology," Besides he says, "the seat belt is a self-repairing system." By that, Webster means that consumers are finding ways to disable what many regard as a nuisance, even though the system is a federally mandated safety feature.

Computers

Unidata starts long climb upward

European computer combine must deal with problems of nationalism as it prepares to do battle with the dominant IBM

by James Smith, McGraw-Hill World News

On Jan. 15 the nameplate came down on the headquarters of Siemens Data SpA at Via Fabio Filzi 25A, Milan, and a new sign went up announcing Unidata—the tripartite company formed by Philips, Siemens, and CII to cut into IBM’s domination of Europe. The event, repeated in Spain, Belgium, the Netherlands, Austria, and elsewhere, coincided with introduction of the 7720, the first computer in Unidata’s new line of five or six machines. Six months after its formation, Unidata seemed on the right track: A troika of managers from the parent firms was presiding over working sales offices in seven countries, a second machine was scheduled to appear in a few months, and the group was working on an advanced second-generation lineup. But as good as this record is, setting up a transnational European rival to IBM and other American firms isn’t easy. Competitors are predicting Unidata will have to do a lot more before its success is certain. For example, a squabble over French contributions, only just settled, threatened to break up Unidata at the start. So far, the organization is not much more than a sales operation directly headed by a three-member board of management consisting of the president of CII (Compagnie Internationale pour I’Informatique) and the heads of the Philips and Siemens data divisions. Many of the sales operations are still not formally incorporated, and some consist mainly of changes of the name on the door. Accommodating various market shares is probably the least of Unidata’s worries. Any real merger of sales operations involves tremendous fiscal, managerial, and psychological problems. In addition, Unidata must step into a maze of contracts and offers made by the original sales organizations and persuade customers to accept Unidata. With such complications on the marketing side, it is not surprising that Unidata has scarcely broached the possibility of eventual fusion of production facilities—the area in which Common Market Commission experts estimate that real operating efficiencies lie. While Unidata’s management board has direct control over selling operations, it has merely coordinating control over supply centers, which in the foreseeable future will remain in the hands of the partner companies. Research and development, plus investment in production, is apparently left largely to each individual partner. Unidata’s role is to coordinate development of software and hardware and to negotiate production contracts for specific machines. Moreover, while the partners may effect some economies by phasing out overlapping machines in their existing lines, little production rationalization is probable on the present generation of machines, the technologies of which are essentially different. The Unidata 7720, for example, is basically the P2000, designed by Philips. Subsidies. In addition, government subsidies to the various national partners present another obstacle to merger that the complicated Unidata formula does not seem likely to overcome. French partner CII, expected to build two of the eventual five or six Unidata units, will get the bulk of the funds for its Unidata R&D commitments this year from the French government’s Délégation à l’Informatique Split. In Germany, to protect Philips’ share of office-computer market, there will be two companies. One will be 80% owned by Philips with the rest in the hands of a planned holding company. The second, for medium and large units, will be controlled by Siemens. In the French setup, to be in existence by the end of this year or early ’75, CII will have the 80%.

At least where interactive design and drawing systems are concerned. Among these tools for designing and preparing finished art for IC’s, PC’s and electrical schematics, one system has become the hands down favorite of the major U.S., European and Japanese manufacturers. The Calma Graphic Data Station. It didn’t happen overnight. The Calma system earned its place over the past two years by outperforming other systems in the toughest kind of competition. By consistently achieving twice the throughput. By performing reliably when others failed. By supporting more work stations without loss of performance. By making it more economical to expand than other systems. Today, you don’t have to take a chance on the untried. Calma has proved itself. Just ask around. The experience of others will make your buying decision easy. Write or call today for literature or a demonstration. Calma Company, Corporate Marketing Headquarters, 1930 Isaac Newton Square East, Reston, Virginia 20090. Phone (703) 471-1450.
**The British are coming**

All concerned agree that Unidata would be playing a much stronger hand if it could add a fourth to the three computer makers that have combined to form the new super-company. The fourth they have in mind is Great Britain's International Computers Ltd.

Although the president of Compagnie Internationale pour l'Informatique, Michel Barré, says that discussions with ICL are under way, what is happening seems to be a replay of French and British failure to reach agreement two years ago. As Common Market Commission sources note, ICL's line is not compatible with those of the three partners, and ICL is interested in keeping things that way to protect its 35% share of the British market.

Joining Unidata, whose machines are compatible with IBM hardware, would simply expose it to the U.S. giant. What's more, the British, fresh from success in East European markets, are now preparing an attack on West Europe. "ICL's machines are competitive with Siemens' upper line, and as far as use is concerned, they can substitute for the IRIS, CII's line," says a Brussels consultant.

Some industry experts think the British company can easily get 10% of the existing European market share in France and Germany in the next five years—the time in which Unidata is expected to take to develop its second-generation line. A Philips Electrologica spokesman declines to call the contacts with ICL "negotiations." "There is no base for negotiations," he says flatly. "And the British market is heavily protected."
that stage with non-European companies would mean the failure of the all-European effort. We do not want such a solution."

The question of American participation may be the first ripple of a major disagreement between Unidata's partners. Though Unidata's sales figures—about $700 million by the three partners—and number of installed computers—17,000 machines—look good on paper, the fact is the combine, with 8% of European sales compared to 13% for Honeywell-Bull and 60% for IBM, is just on the borderline of what experts consider economically sound.

"We would favor contact with anyone, including the Americans, provided they have a similar base," says a spokesman for Philips Electrologica, the Dutch giant's computer arm. Even CII's big private shareholder, Compagnie Générale d'Electricité, wants a U.S. link to promote the viability of the group before investing the additional funds needed to meet CII's Unidata research commitments. The furor over CGE's reluctance to put up its share of the needed investment money threatened to break up Unidata before it got off the ground, and was settled only the last week in February by the French government's willingness to increase to $52 million the amount required to carry CII through this year.

Unconcerned. Officially at least, CII's partners do not seem bothered by the French firm's problems. "No company can pull out," explains a Siemens official, "because they would be left with a torso—one or two machines—without a complete line. The longer Unidata lasts, the greater the momentum built up."

Even if Unidata gets the size it needs and manages to rationalize its production, other problems may still exist. Computer experts say Siemens, which relied heavily on its old license ties with RCA to beef up its research and development, may gradually move out of the mainframe business and broaden its telecommunications activities.

CII, anchored to large machines, might stand to broaden its market penetration outside France, where it has practically no presence. But the main partner to benefit from Unidata, according to this argument, would be Philips. The giant would gain the market needed to develop its general-purpose computer line—which thus far seems to be losing about $70 million a year.

Not everyone agrees. One of Unidata's Italian competitors sees the 7720 as a further design of the Siemens 4004—a point which Unidata hotly disputes—and he thinks Siemens may come out ahead.

In either case, the French firm, which is by far the smallest of the triumvirate, when measured in total sales, appears likely to be on the short end. That prospect may already be troubling some of CII's non-government shareholders. If and when the Dutch or Germans start getting most of the benefits, what will happen to French-government participation?
Changing MOS wafers in 36 hours

Western Digital uses special equipment and facilities to cut time from the usual weeks or, in—some cases—months

by Paul Franson, Los Angeles bureau manager

Making changes in MOS masks can delay production for weeks or even months. That’s what motivated a three-year-old MOS firm in Newport Beach, Calif., using some ingenuity and modifications of tools that are readily available, to cut that time down to 36 hours and sometimes even less.

The company, Western Digital Corp., uses a combination of tailored equipment, in-house facilities, and carefully thought-out procedures to effect the dramatic saving in time. William Roberts, vice president for R&D, says that, while several factors enable Western Digital to respond so quickly, the most important is its use of a photoplotter, rather than rubylith masks. Other important contributors are a much-modified Applicon design system and the fact that the company has its own mask shop.

Perhaps the most interesting aspect of Western Digital’s system isn’t so much that it is unique, but rather that the company has attacked the time problem and licked it to the extent that president Alvin B. Phillips can declare flatly, “We have the world’s fastest system.”

The photoplotter is perhaps the key to the process. The company uses an inexpensive ($38,000 original price) machine from the Gyrex Corp. rather than the more common $300,000 David Mann photomask maker. Roberts points out that the Gyrex machine wasn’t designed for LSI work—it was originally intended for circuit boards—and doesn’t have anywhere near the resolution of the Mann machine. But “it turns out that we don’t need it,” says Roberts. “The mask aligners can’t align accurately enough to take advantage of the Mann’s capability.”

Western Digital has modified the Gyrex machine substantially. It is controlled by cassettes generated by a Digital Equipment Corp. PDP-11, rather than the paper tape originally used. Richard Perrin, manager of product design engineering, says: “We took the Gyrex controller out of the loop. We use ramping techniques that give a 3-to-1 improvement in speed over the paper tape, and, in the process, eliminated many errors that resulted from use of the paper.”

Along with the photoplotter comes another practice that is unusual for Western Digital, a small semiconductor firm: The company

The shrewd timing of Western Digital

Western Digital started in business at what is considered a terrible time by most standards—April 22, 1970, in the midst of the worst slump ever to hit the semiconductor business. However, the company’s progress since then has been most impressive. The latest figures show $3.5 million in sales and 25% pretax profits in the quarter ended Dec. 31. This is almost three times the sales of the corresponding 1972 quarter. Nevertheless, the chairman and president, Al Phillips (left) gets annoyed when people seem surprised. “It’s all according to the plan I established over three years ago,” he points out.

Phillips says that the bad times when he started didn’t cause problems. It even might have been an advantage. “My business plan said I would lose money for two years, and its realism probably helped me get capital.” Emerson Electric made an initial investment of $1.5 million in the company. And the St. Louis parent is happy about the relationship. Says a spokesman: “They’re doing very well—in fact, we just added to our equity.”

Phillips, who likes to call his own shots, had previously set up and managed the Rockwell Microelectronics facility, and before that, Sylvania’s integrated-circuit operation. There he watched the company pioneer in SUHL TTL, then lose its lead to the Texas Instruments 54/7400 series—because, says Phillips, of overly cautious and conservative higher management. He has also worked at Motorola and General Electric.

To get his infant company started,
makes all its own masks from bare glass. This obviously helps turn-around in the present tight market, and Phillips says it gives far better quality and lower cost. The company has even applied for a patent on its techniques.

Cassette control. The Gyrex machine is run from a cassette generated by the Applicon design system. The firm feels that this is also vital—but not for initial layouts. "The aid for us in this computer-aided-design system is in making changes quickly and accurately," says Perrin. He points out that in designing a chip with 100,000 components, it's difficult to avoid a few mistakes, but he feels that the system corrects them fast. The Applicon setup could be used on-line with the Gyrex plotter, but Roberts says that would sacrifice much flexibility just to save some hardware, and it would be especially unfortunate if the system were to break down during mask making.

Western Digital uses manual layout and design initially, since the company feels that the Applicon is "a very expensive drafting machine," says Perrin, adding that people seem to be much better at layout than machines. But the Applicon is used for rote work, such as the repetitive cells in circuits, and to prepare completed segments of the circuits. "The designer thinks; we draw." Input to the Applicon is from an Autotrol digitizer. The company doesn't use standard cells, usually considered a time-saver. "We've gotten away from them," says Perrin. "They work, but they're not dense enough for the high-volume parts we're making."

The initial logic simulation is done by a program Western Digital developed. The Applicon itself operates from a PDP-11, and is one of the first Applicon design systems to use a minicomputer, rather than a large computer. The present system has about 20,000 words of core memory, which will soon be increased to about 28,000, plus a 500-million-word disk memory. This is to be increased to 10 million words, which will permit all current design efforts to be stored and eliminate the need for loading from cassettes each time. A multicolor California Computer Products model 936 high-speed drum plotter is used to generate artwork copies.

Interactive editing. The Applicon CRT interactive terminal is used in the actual editing; Perrin says it's very fast and effective for editing designs. The company also has programs to check design-rule violations, many developed in-house.

Comparing his computer-aided-design process with that of larger firms, Roberts points out that it is a small, dedicated system ready for use. "The bigger a CAD system is, the more cumbersome it is to use. And when we get a tape off the Applicon, we don't worry about it. We know it's good."

Though almost all semiconductor companies talk about fast turn-around, few in practice aspire to times like those of Western Digital. Fast turnaround at most is four to six weeks, and the average may run into months; some can do the job in a week under crisis conditions. Smaller firms generally have to wait in line for outside maskmaking and other services, and at the large companies there is fierce competition for in-house services. And some experts maintain they could do the job faster, but see no real reason for it.

Roberts says that the CAD system will be even more valuable when the company gets into the read-only-memory business; Western Digital will announce shortly an 8,192-bit silicon-gate n-channel ROM. "We expect to be able to go from customer tapes to mask in 12 hours or so," says Roberts. "We will be able to directly generate the cassette for the Gyrex, plus a test program for our Spartan tester. I can't imagine why anyone would get involved with rubies for ROMs, but I know many companies are trying to do it that way. The result is weeks or months of delay. We'll have parts in a few days."

Phillips picked a new technology. He settled on silicon-gate technology, even though it is a more difficult process than the more popular aluminum-gate technology. He concentrated on that one process: "Companies that try to do too much get poor yields." The process has been p-channel, but a compatible n-channel variation will shortly be added for 4,096-bit random-access memory and microprocessor chips.

Initially, the company concentrated on calculator chips with a contract from lse Electronics of Japan to get things under way. Now, Phillips is looking for 25% of the U.S. personal-calculator-chip market this year with its "chipstick" eight-digit, floating-decimal-point circuit with memory. This part is being sold in large quantity to Bowmar and Commodore, two of the three largest calculator companies (the other is TI), and others. This would rank Western Digital among the top chip suppliers, with TI, Rockwell, and MOS Technology Inc. But unlike the first two, Phillips has no plans to go into the end-user-equipment business—except to market his Spartan LSI test system, originally developed for in-house use. What is unusual for a small semiconductor company, Western Digital also makes its own masks and molds its own plastic cavity packages. The company also makes custom chips, including units for the 40,000 credit verifiers installed by TRW Data Systems, but its moving away from custom chips to standards. And Western Digital's data communications parts go to more than 600 customers.

For now, Phillips is forecasting sales of $18 million and profits 20% higher than this year; the current order backlog tops $30 million. And the company's first plant expansion is in progress; when Western Digital moved into its present facility three years ago, the building was almost empty, but it's full now and being expanded by one half, to 40,000 square feet. The company is also adding 12,000 square feet in Malaysia.

Phillips is especially happy with his location near Los Angeles and far from Silicon Valley: "I'm glad we're not there! Labor is scarce up there, and there are no secrets and no discipline among workers. Here it's warm, it's close to Newport Beach, where I keep my Islander 29 sailboat, and there's plenty of labor around."
You liked us in the lab. You’ll love us in hostile environments.

We’re known for our reliable, lab-grade tape recorders/reproducers. Always have been. And now that Astro-Science has joined us, we’ve added a broad new line of compact, state-of-the-art data acquisition recorders for land, sea and airborne applications. The result? Twice the line, twice the selection of reliable tape recorders/reproducers. The largest line in the industry.

Concentric reel and dual capstan design means lighter, more compact recorders.

Our MARS series features “basic dual capstan design and concentric reel mechanism”. That’s a longwinded way of saying “slimmer and trimmer”. The dual capstans are driven at different speeds and hence develop constant dynamic tension within the closed loop of tape across the magnetic heads. A tape wrap angle of more than 226 degrees around the capstans develops the necessary forces to transmit positive drive power from the capstans to the tape. The large wrap angle effectively clamps the tape to the capstans and isolates the reels from the capstan drive without need for pinch rollers, thus doing away with a primary source of dynamic skew and flutter when operating in severe environments. The reels are mounted in a concentric arrangement, one on top of the other, to conserve space and ensure minimum size and weight.

Talk about rugged. These MARS series airborne modular recorder systems operate in the severest of environments: ±10G Vibration, 15G shock, with 30G crash safety; −55°C at +55°C temperature range. Sea level to 75,000 feet altitude. They fly where the flying is rough.

Take our svelte MARS 1400. It’s the smallest and lightest multi-speed, lowest power consumption, 14-inch wideband 1 MHz airborne recorder in the field. But our MARS 1000 is slimmer and trimmer still! Both operate at 6 electrically-switchable tape speeds (17s through 60 ips); 14-28 channels with 1 MHz at 60 ips wideband direct recording capability; or 42 tracks with 250 kHz at 60 ips. Digital and FM capability are also available.

Another bantamweight is the MARS 2000. It’s a multiband recorder designed for airborne environments typically encountered in high-performance aircraft. It features up to 14 channels for recording Direct and FM signals on 10½ inch NAB-type reels, either intermediate band or wideband. Six electrically-switchable speeds from 17s through 60 ips. Absolute tape speed accuracy: only ±0.20% of nominal tape speed at any constant temperature or humidity. And a record and reproduce capabilities for Direct and FM analog signals. Weighing in at just 32 pounds, it’s the smallest multi-band recorder available.

The M-14E is something special. For use in aircraft,
aboard ships, on field vans or other hostile environments, it's the smallest and lightest wideband 2 MHz system available which handles 1-inch tape on 14-inch NAB reels. It is lightweight, state-of-the-art, compact, reliable and easy to maintain.

Its reliable kin, our M-14G, is a wideband 2 MHz portable recorder/reproducer designed for tight spots. Its rack-mountable field enclosure includes all local controls and record-reproduce functions for total performance. The 14G offers full 14-channel, 6-speed reproduce capability for data analysis in Direct or FM modes of operation.

Designed to military specifications, the M-14G provides full front accessibility and modularity to permit complete service and maintenance without removing the unit from its rack.

**Our CPR-4010 and 4040 bring the lab into the field.** The rough and ready CPR-4010 provides laboratory-caliber performance in the field. This reliable unit has up to 7 channels on 1/2-inch tape. Up to 14 on 1-inch tape! Seven speeds ranging from 15/16 to 60 ips are standard. It’s a standout in case of maintenance and repair, offering a hinged back panel for complete accessibility of all components and plug-in modules which can easily be changed.

Our newest entry into the wideband recorder field is the CPR-4040. It's a winner in the cost-to-performance ratio. This co-planar, portable reel-to-reel gem has 7 electrically-switchable bi-directional tape speeds ranging from 15/16 to 60 ips. Plus direct signal electronics which provide response to 1 MHz at 60 ips. And the same ease of maintenance and repair as the CPR-4010.

**The VR-3700B gives you more channels to choose from.**

Our VR-3700B is a real laboratory problem-solver. Yet it offers simplicity of design and reliability unmatched by any machine in its class.

It operates within a wide range of speeds and frequencies. With 7, 14, 28 and 42 channels of record/reproduce.

For ease of setup, each amplifier assembly contains 7 record and 7 reproduce channels. All electronics are modular, electrically-switchable and capable of operating at any of 8 speeds in Direct or FM modes. It's easy to maintain with proven reliability. Low cost. (High-density PCM/DHDE signal electronics available on order.) Its data packing density of 33,000 bits per inch per track of tape is the highest in the industry. Coupled with the lowest error rate around—one in 10 million bits—the VR-3700B is the only reproducer in its class with this capability.

**Bell & Howell is now Data Acquisition and Analysis Center U.S.A.**

Now, no matter what your requirements, Bell & Howell has it. Up. Down. On the ground. Portable or stationary. Bell & Howell probably has the data acquisition and analysis unit to fit your requirements. When you've got it, you needn't flaunt it. But the fact is, we've got it.

The Danameter
$195.

1 Year Battery Life.

In a digital instrument, you’d expect to fool with a battery regularly, recharging it or replacing it. Not with The Danameter. The battery will last you at least one year. And even if you find a way to wear it out, you’re only talking about 69¢.

Liquid Crystal Readout.

The specifications on The Danameter show at a glance that this is a more accurate instrument than the one it’s designed to replace. Yet there is another type of inaccuracy The Danameter solves—in an even more dramatic way. These are the errors that occur every day in reading an analog voltmeter. Scales are hard to separate. Increments of measurement are greatly restricted. Precise readings are difficult to make.

When you measure with The Danameter, you interpret nothing. All you are shown is a number that is precisely the information you require. It’s accurate to a degree that you never imagined possible in an instrument at this price.

Once you have selected the proper function position, The Danameter instantly interprets, selects, and converts your information. It shows in a large liquid crystal display that adjusts to all light conditions. Even direct sunlight.

Automatic Polarity.

In measuring voltage, you’re accustomed to swapping leads to get a reading. The Danameter instantly determines polarity, and then displays it as either positive or negative. All in a fraction of a second, with no help from you.

Almost indestructible.

The Danameter has only one function selector. It’s recessed behind the molded edges of its cycolac case. You can drop it on concrete. You can kick it down the hall. When you pick it up, it’ll be working perfectly. This is the first true portable instrument of its kind. For $195.

Call Cliff Hamilton collect at (714) 833-1234. Ask for your nearest Dana representative.

Others measure by us.

Electronics/March 7, 1974
Here we are again with some more good news for OEM's. PDP-8 price reductions of up to 40% for single units. Plus quantity discounts of up to 36%.

But that's not the half of it. Our Standard-8 OEM systems can be had for less, too. (Complete hardware and peripheral packages at a bargain price.) And many dollars off on interfaces.

And peripherals. Save big on software, too. Surprised? You shouldn't be. This sale is only part of our never-ending OEM campaign to make more computer cost less. What

Plasma's progress: gas-discharge technology moves into analog realm

Screen-printing and internal-address techniques used in digital displays are combined to form a digitally addressed analog bar graph with no moving parts; 200-segment bars yield a resolution of 0.5%

by Richard Saxon, Burroughs Corp., Electronic Components Division, Plainfield, N. J.

Despite all the brouhaha reverberating through industry about the relative merits of light-emitting diodes, liquid crystals, electrochromics, and other exotic display technologies, many of the most successful displays in use today are of the gas-discharge variety. Not only is this technology doing well commercially, it is also advancing at an unprecedented rate on a technological level. In fact, more progress has been made in developing new gas-discharge products and processes during the past two years than had been made in the preceding 10. Large message-display panels have become a reality, multicolored displays are just coming out of the laboratory into limited production, and compatibility with MOS drivers has been achieved.

One of the most exciting new developments in this area is a digitally addressed Self-Scan (a registered trade mark of Burroughs Corp.) analog bar-graph display (Fig. 1). Unlike the electromechanical indicating devices it is designed to replace, the new display has no moving parts. A combination of the screen-printing technique used in the manufacture of Panaplex (a trademark of Burroughs Corp.) II display panels, and the simplicity of the internal-address drive circuitry in the Self-Scan panels has made possible an extensive family of extremely rugged, low-cost, linear indicating devices.

The first in the series of new displays is a flat panel containing two separate bar graphs. Each bar is composed of 200 closely spaced segments so that, at normal viewing distances, the glowing segments blend into a continuous, but precisely controlled, bar length.

The display is designed to be used in a scan mode, with a cathode-drive circuit common to both channels. Corresponding segments of both bars are bused together in a three-phase configuration with two independent anodes and separate reset cathodes (Fig. 2). These techniques enable only six active drivers to operate both channels. If more than two channels are needed, it is a simple matter to add additional panels. The cathodes of the new panel or panels are simply connected in parallel with the old ones, and a new driver is provided for each new anode.

Since each element represents a discrete, reproducible display step, each segment of the display is directly...
**The many faces of gas discharge**

Burroughs' new bar-graph display is only one manifestation of recent progress in gas-discharge readouts. Large panels having as many as 250,000 display cells have been developed, as have devices capable of producing a full spectrum of colors. Some displays, such as the Digivue panel made by Owens-Illinois, even have an inherent storage capability that eliminates the need for a refresh memory, while others allow the production of precisely controlled gray scales.

Gas-discharge panels are particularly well suited for large displays with variable brightness because of the ease with which large numbers of cells can be matched for both optical and electrical parameters. Unlike light-emitting diodes, which must be individually selected for brightness matching and which may match at one drive current and not at another, the cells in a gas-discharge panel are inherently well matched. In a typical device, the cells are all enclosed in a common envelope with a common fill gas. When the panel is operated so that each cell is turned on for a length of time that is long, compared with its ionization time, the slight variations in ionization time caused by minor geometrical variations are not important, and all of the cells in a panel can be regarded as identical.

The result is that brightness can easily be controlled by varying either the duty cycle or the cell current, with no visible cell-to-cell variation.

Gas-discharge displays have traditionally offered the user a choice of about three colors: neon orange, plus the red and amber hues that can be filtered from it. Now, two techniques for the generation of other colors have been proven feasible.

The first method uses the ultraviolet component of the gas discharge to excite a phosphor coating within the panel to produce visible light. Different colors can be obtained by using different phosphors or by filtering the output of a phosphor that produces white light.

The second method is more versatile and permits color to be changed electronically. With this method, both the ultraviolet and visible outputs of the gas discharge are exploited. At low drive-current levels, very little visible light is produced, but enough ultraviolet is generated to saturate a zinc orthosilicate phosphor, producing a green glow. As the drive current is increased, the visible neon orange emission becomes stronger, changing the display output to red.

Other color combinations beside red-green can be obtained by selecting different phosphor coatings. These can be expected to lead to inexpensive multicolor graphic displays in the not-too-distant future.

Relatable to a digital number. For instance, on the 200-segment bar, a digital count of 127 will result in a bar with 127 elements illuminated.

**Sandwiching the panel**

As shown in Fig. 2, the display consists of a rear ceramic substrate, a spacer, and a glass front plate. The segment-metallization pattern is screened onto the ceramic substrate, as is a black dielectric material that surrounds the metallization. The black material creates a light-absorbent background that enhances the display's contrast ratio. Two transparent conductive anodes are applied to the glass front plate, and the rear substrate, spacer, and front plate are then sealed together in a sandwich-like construction. The display is evacuated through a small hole in the back substrate and is then filled with a neon-gas mixture.

In almost every respect, except the shape of the metallization pattern screened onto the substrate, the construction of the display is the same as the construction of the Panaplex II digital display [Electronics, April 12, 1973, p. 92].

At first, it may seem impossible to generate 400 discrete bar lengths (2 bars × 200 segments per bar) in a device that has only seven input lines. The trick is to exploit the glow-transfer principle in which the glow is first established at the reset cathode, and then, by using a repetitive scan, the glow is transferred sequentially up to the desired segment height.

When the panel is energized, the current flow between the keep-alive anode and cathode establishes a glow discharge at the keep-alive cathode (Fig. 3). In the vicinity of this glow discharge, there is a heavy concentration of electrons, ions, and metastables. The area around the keep-alive cathode is open so as to allow the metastables and charged particles to diffuse into the region of the reset cathode.

A three-phase clock with a fourth reset phase controls the transfer of glow along the panel. To initiate a scan, the reset input to the J-K flip-flops is brought to ground potential, which sets both Q outputs of the J-K flip-flops to the logic 1 state and turns off reset transistor Q1, grounding the reset cathode. The anodes are connected
through limiting resistors to the +250-volt power source. When the reset cathode is grounded, the gas is ionized above this single cathode. The glow occurs within a fraction of the 60-μs clock interval because of the presence of the metastables that have diffused into the region from the keep-alive cell.

After the gas around the reset cathode is ionized, and the reset pulse is returned to the logic 1 state, the first negative transition of the system clock advances the counter (which is made up of the two J-K flip-flops). The relationship between the reset pulse and the three clock pulses is shown in Fig. 4.

When the counter advances, reset transistor Q1 is turned off, and transistor Q2 is turned on. Transistor Q2, coupled to the phase 1 bus, grounds every third cathode, while the reset cathode is returned to off-bias potential. While the reset cathode is grounded, ionizing particles diffuse along the anode cavity to the adjacent (No. 1) cathode. When the phase 1 cathode is brought to ground, the gas near cathode 1 ionizes very rapidly, while ionization is no longer supported at the reset cathode, since this electrode has been returned to off-bias potential. The rapid transfer of the ionization glow from the reset cathode to cathode 1 is attributable to the high concentration of priming particles near cathode 1.

As soon as a glow is established near cathode 1, the flow of current through the anode-current-limiting resistor reduces the anode voltage to a level that is sufficient to maintain the glow at cathode 1 but too low to cause ionization at any other grounded cathode. In other words, although every third cathode is grounded at the same time, ionization takes place much more rapidly at the primed cathode than at any of the others (Fig. 5). And once it takes place, the anode voltage drops so low that none of the others can ionize at all.

The next clock pulse turns off transistor Q2 and turns on Q3. This grounds the phase 2 cathode and returns the phase 1 cathode to the off-bias condition. While ionization was present at the φ1 cathode, the concentration of charged particles was heaviest around the adjacent cathodes (φR and φ2). When the counter advanced, the φ1 cathode was reset to off-bias potential and the φ2 cathode was grounded. Since the φR cathode was still at off-bias potential, ionization could not form on the reset

3. Driving. After glow is established above keep-alive cathode, it can be rapidly transferred to reset cathode (φR) when that cathode is grounded by turning off Q1. Glow is then propagated up the bar graph by sequentially grounding φ1, φ2, φ3, etc. Capacitor C1 provides a slight overvoltage to the reset cathode when Q1 is turned on. This increases the margin for resetting the panel.
cathode, so the glow is formed on (or transferred to) the \( \phi_2 \) cathode. The next clock pulse turns off transistor \( Q_3 \) and turns on transistor \( Q_4 \), so that cathode \( \phi_2 \) is returned to off-bias potential and ionization transfers to the preionized, and now grounded, \( \phi_R \) cathode.

As the counter advances, the cathode buses are sequentially grounded, causing the glow to transfer down the panel. After the glow is transferred to the last cathode in the display, the reset pulse again grounds the \( \phi_R \) cathode, and the scan cycle begins again.

**Selecting the scan rate**

To eliminate perceptible flicker, the scan rate must exceed approximately 60 Hz. A 60-Hz scan rate requires 16.6 milliseconds per scan; thus, for a 200-element bar graph, each element is turned on for a maximum of approximately 83 \( \mu \)s.

To ascertain if these numbers are reasonable, one must ask what determines the maximum scanning rate of the display. The limiting factor turns out to be the requirement that any cathode that has been ionized and

![Diagram](image)

4. **Timing.** Although all cathodes bused to a common driver are activated at the same time, glow only transfers to the one that has been primed by ionizing particles from adjacent glowing segment.

![Diagram](image)

5. **Priming.** Presence of priming particles not only reduces ionization time, it also cuts ionization voltage from high value of unprimed cell \( (V_{\text{on,un}}) \) to a value \( (V_{\text{on,p}}) \) close to the cell sustaining voltage \( (V_\text{c}) \).
though each anode must, of course, be driven separately. On each scan, the anodes are both turned on at the beginning of the rest period, and they are turned off independently when the desired bar heights are reached.

One design for the anode drive circuit makes use of a series pass transistor, either as a saturating switch with an appropriate anode current limiting resistor or, preferably, as a switched-current source. This technique conserves power, but requires either a capacitive or an active level-translator to control the +250 V with the normal logic-voltage swings. An alternative approach utilizes an npn transistor to turn the panel anode off by clamping it to a voltage lower than its sustaining voltage. This latter technique wastes power when the anode is off, but it saves a level-translation stage. Both configurations are illustrated in Fig. 6.

One advantage of this method of determining bar height is that the brightness of the bar does not vary with its length. No matter how long or short the bar is, each segment that is to be turned on at all is turned on for the same length of time as every other energized segment—83 µs for a 60-Hz scan.

**Bar graphs are practical**

When one considers that the indicator of the familiar analog panel meter moves in a circular arc because it’s easier to build that way, not because the world wanted it to have that configuration, one realizes just how attractive a truly linear display can be. For a marine depth sounder, for example, downward is clearly the direction for the bar length to go as the depth increases.

Two applications that are made to order for the bar graph are matching and comparison. If an operator must adjust some controls until two (or more) voltages (flow rates, pressures, or other measurements) are matched, there is probably no simpler way than to adjust them until two adjacent bars are the same length.

Similarly, if a pilot wants to find out at a glance if all four engines of an airplane are equally loaded, what could be easier than a look at an array of four bars? If it is necessary to read off a number to several decimal places, a digital meter is required; but for many applications, the bar graph fills the bill.

A nearly universal comparison setup is shown in Fig. 7. Voltage inputs are shown, but any other quantities could be displayed by putting suitable signal-conditioning circuitry in front of the voltage inputs.

A 50-µs clock controls the three-phase drive circuit and a divide-by-200 counter. When the counter reaches 200, a reset signal energizes the reset cathode on the panel and initiates the ramp generator. The ramp generator starts at zero and is at maximum at a count of 200.

This ramp signal is routed to two comparators whose outputs are connected to the anode drivers. The other comparator inputs are the signals to be monitored. The comparators hold the anode transistors off (the segments glow) until the internally generated ramp voltage reaches the level of the externally applied voltage, when the anode turnoff transistor quenches the glow.

---

*Metastables are gas atoms that have been raised to an intermediate energy level from which they cannot return to the ground state without interacting with other particles or the walls of the chamber. If this interaction takes place with an atom of lower ionization energy, then the metastable causes this other atom to ionize. In the panel, the metastables of the neon ionize the atoms of an additive gas upon collision.*
T^3L achieves C-MOS noise immunity while retaining TTL speed

Inserting a third transistor in a TTL circuit makes the threshold voltage about half the logic swing, or nearly the optimum for noise immunity; drawback of lower density is offset by ease of mixing TTL with T^3L

by Werner Fleishhammer, Günter Schneider, and Gerd Koppe, Siemens AG, Munich, West Germany

The best things in digital circuits do not come free. For instance, part of the payment Schottky transistor-transistor logic makes for being faster than unclamped TTL is a heightened susceptibility to noise, so that it also requires tighter wiring rules and more attention to grounding and transmission-line problems.

Optimum noise immunity is obtained by digital circuits in which the threshold is in the middle of the logic swing. Complementary metal-oxide-semiconductor (CMOS) logic satisfies this requirement, but the faster, noisier TTL circuits do not. Typically, a TTL threshold voltage of 1.4 volts is only about 37% of the 3.5 V (0.1 to 3.6 V) logic swing, and noise immunity is both asymmetrical and around 1V at a low level, which is only 28% of the logic swing. The percentages are even worse with low-level logic and Schottky-TTL.

Therefore, a logic family combining C-MOS noise immunity with TTL speed would fill a gap in existing logic families. The lead came from noting that one diode voltage drop of 0.7 V will shift threshold voltage and the logic swing to 2.1 V and 4.2 V (0.1 to 4.3 V), respectively, making the threshold voltage near the optimum 50% of the logic swing. The shift also provides a symmetrical noise immunity range of about 1.7 V, or about 40% of the logic swing. Similar improvements are achieved with Schottky-TTL.

Circuits that feature this extra diode drop have been named T^3L here because the input threshold voltage is determined by three base-emitter voltage drops. They were initially developed a few years ago by RCA in the U.S. and later by Siemens AG in Germany. T^3L circuits feature increased noise immunity, possibly complementary outputs, and slightly higher speed than conventional T^2L. However, these good things also come at a price, both literally—the circuits cost more—and in terms of space—since no T^3L MSI is available at the present time. Consequently, when maximum density and minimum cost are at a premium, T^2L will probably prevail. But, since T^3L can readily be interfaced with T^2L, mixed systems can be designed that exploit the advantages of each family.

How it's done, what it does

Figure 1 shows a T^3L NAND gate alongside a typical T^2L NAND gate. At inputs I_1 and I_2, resistor R_1 and R_2 are provided with clamping diodes D_1 and D_2, allowing unused inputs to be left floating because they are tied internally to V_{cc} through resistors R_3 and R_4. The shifts in threshold level to three base-emitter drops, or 2.1 V, is accomplished by the insertion of transistor Q_3 between the phase-splitting transistor Q_2 and the output transistors. This insertion, coupled with the need for an output voltage of 4.3 V in the high state, required the upper output stage to be modified from the standard...
Two other modifications of the T\(^2\)L gate in Fig. 1b should also be noted. They are provided by transistors Q\(_4\) and Q\(_{Qs}\), which improve the switching speed and the dynamic current drive capability without increasing static power dissipation. If the output switches from a high to a low level, Q\(_4\) turns on and provides extra current to the base of the lower output transistor Q\(_s\). During switching from a low to a high level, Q\(_s\) turns on and delivers additional base current to the upper output transistor Q\(_T\). The increases in threshold and output voltage is illustrated in the voltage transfer characteristic curve shown in Fig. 2.

The output was designed to deliver full line current while maintaining logic voltage levels in both the low and high states and for 100-ohm lines. At low levels, this is done by having transistor Q\(_4\) turn on transistor Q\(_s\) when the output voltage exceeds 1.6 V. The small resistance of R\(_{10}\) allows high-level currents of 33 milliamperes at 2.6 V.

Typical input and output characteristics are shown in Fig. 3. In the low condition (dotted line), the input current is 2.5 mA. One output can typically drive eight T\(^2\)L inputs, which compares favorably with the fanout of 10 featured in most T\(^2\)L families. The output drive in the low state (dashed line) and in the high condition (solid line) demonstrate its high current drive capabilities. Despite the good drive capabilities and complexity, average power dissipation is only 28 milliwatts per gate, higher than standard T\(^2\)L. The typical gate delay time, however, is shorter. For a 50-pico farad load, T\(^2\)L has a 14-nanosecond maximum gate delay (10 ns typical) as against the 22 ns of T\(^2\)L. The speed-power product of T\(^2\)L, however, is about twice as high.

Where it’s useful

The ease with which T\(^2\)L circuits can be interfaced with the T\(^2\)L logic family is illustrated by the hookup schemes in Fig. 4. To drive T\(^2\)L by T\(^2\)L, all that is necessary is to insert a resistance of 2.2 kilohms to V\(_{cc}\) between them. The reverse is even less trouble—T\(^2\)L logic needs no extra circuitry to drive T\(^2\)L. This makes it easy for a designer to combine in a single system the noise immunity, complementary output and drive capabilities of T\(^2\)L with low-cost and high density advantages of standard T\(^2\)L.

But the main usefulness of the new logic family lies in the area of design automation. T\(^2\)L’s higher noise immunity in the low state and its smaller output resistance in the high state allow for simplified techniques of system wiring and the connection of two or more backplanes, into each of which many printed-circuit boards may be plugged. Standard T\(^2\)L, and especially Schottky T\(^2\)L, requires good RF wiring practice utilizing ground planes, power supply decoupling and thorough consideration of line-to-line crosstalk—considerations that are difficult to include in design automation programs. At Siemens, the programs used in developing new systems around T\(^2\)L need few electrical restrictions.

To illustrate, within one backplane in a T\(^2\)L system, serially wired networks up to 7 feet long can readily be driven. Between different backplanes in a system, flat cables with an 100-ohm characteristic impedance can have lengths up to 34 feet without needing the special driving and receiving gates and line terminations that T\(^2\)L circuits would require.

At high speeds and for longer-line lengths, however, careful consideration of noise margins becomes critical. Three factors cause a device in the low state to suffer more from noise than when in the high state. First, ground noise is larger. Second, distortion due to reflection is also larger, since the voltage swing of the propagating signal wave is higher for the falling than for the rising edge. Third, the signal level of the falling edge deteriorates along the line because of the resistive component of the input impedance of the load gate circuit.

Unlike T\(^2\)L, which has a lower noise margin at the low level than at the high level, T\(^2\)L has a higher noise margin in the low state. T\(^2\)L’s low output resistance in the high state eliminates pedestal problems with the signals pulse’s leading edge causing spurious triggering. When a long line is driven by one T\(^2\)L circuit, the signal swing is large enough for all gates on the line to be switched by the initially propagating signal. Thus a satisfactory noise margin is provided at every point of the line. Voltage induced by one line connecting logic circuits in an-

---

2. An ideal change. For T\(^2\)L, both the output voltage and threshold voltage increase by 0.7 V, leading to a threshold voltage that is 48% of the logic swing—almost the optimum for noise immunity.

3. Current-voltage characteristics. Input current versus voltage (dotted line) is about 2.5 mA in the low state. Output low voltage (dashed line) and high voltage (solid line) versus current demonstrate drive capability of T\(^2\)L.
4. Saving Interface. T3L can drive T2L directly (above) and can readily be driven by T2L (below), so that it can be used for special applications without complex interfacing and logic level shifting.

The line running parallel to it and connecting other networks are a critical factor in determining whether undisturbed signal transmission is possible. These induced crosstalk voltages are larger in T3L than in T2L, because of larger voltages on the signal lines. However, they are more than offset by T3L’s better noise immunity so that the permissible coupling length for T3L logic is approximately 60% higher than that of T2L.

The initial development effort at RCA and then at Siemens AG led to the family of eight circuits shown in Fig. 4. Both Schottky-diode-clamped and standard unclamped circuits are available. They are being used to a large extent in medium-sized basic processor units, along with T2L MSI circuits. Other semiconductor companies, like Motorola, Signetics, and Transitron, are building these circuits under subcontracts from Siemens AG.

The T3L family consists of NAND gates with two, three, four, five or six inputs, inverters, and two master-slave flip-flops. These circuits are available in four different 16-pin dual-in-line packages. These are shown in the upper row of Fig. 5. The two master-slave flip-flops have the same noise-immunity and line-drive characteristics as the gates. Both flip-flops have the same internal structure except that the logic input can be altered to make one an RS-master-slave flip-flop, and the other a D-master-slave flip-flop (Fig. 6). They have independent preset, clear and clock inputs. Information from the logic inputs enters the master with the falling edge of the clock pulse and is transferred to the outputs with the rising edge. On the D-type flip-flop, information may change while the clock is low. The RS flip-flop can also be used as a D-type flip-flop by connecting together S and R inputs.

A family of similar circuits with Schottky diodes has also been developed. It consists of the four different packages shown in the lower row of Fig. 5. To make use of the higher speed of internal gates, most of the circuits

5. Family portrait. Various T3L gate combinations are available in four types of standard 16-pin DIP packages. Although not as fast as the fastest Schottky T2L, T3L is faster than available C-MOS, and provides comparable dc noise immunity.
have two-stage logic and complementary outputs. There are expandable AND-OR/NOR gates, an expander, AND/NAND gates, and NAND gates. The gates have the same characteristics and loading rules as the $T^3L$ gates, except that threshold and output levels are slightly different because of the Schottky diodes and both speed and power dissipation have increased. The typical delay time for both outputs of an AND-OR/NOR gate loaded with 50 pF is 8 ns (11 ns maximum).

**Typical applications**

A signal-transmission circuit which combines the noise immunity and complementary outputs of Schottky $T^3L$ is diagramed in Fig. 7. The circuits with inverting and noninverting outputs are used as a differential line transmitter. This, when coupled with a differential receiver such as Texas Instruments' SN 75107, realizes a transmission system for devices separated by as much as 200 feet. The system is operable even when a dc noise voltage of up to 19 V is applied between the grounds of both devices. Neglecting cable delay, the propagation delay over the differential transmitter and receiver is typically as low as 24 ns.

$T^3L$ gates are also useful where high noise immunity is not a necessity but where the logical structure of these Schottky-diode circuits simplifies the design concept and improves circuit speed. For example, a very fast and simple RS flip-flop can be realized with only one AND-OR/NOR gate if the gate's noninverting output is fed back to one of its inputs.

This logic family is still at a small-scale integration level. Future developments will include MSI development and mixing $T^3L$ and $T^2L$ in medium-sized basic processor units and peripherals, as well as and in input-output controllers. The use of $T^2L$ wherever possible will optimize the systems' logic power and cost, while $T^3L$ will be mixed in wherever noise immunity and complementary outputs are called for.

---

**6. Dependency relation.** An expanded diagram of Fig. 5d demonstrates how, by changing logic inputs, the same internal structure can be used to realize both an R-S- and a D-type master-slave flip-flop. Information enters on the falling edge of the clock pulse and is transferred to the output on the rising edge, but on the D-type flip-flop information may change while the clock is low.

Methods of evaluating job performance of engineers appear to have passed through two or three cycles during the last couple of decades. Although different companies may be at different points on the trend line, depending on size of department and management's current bent, the approach to rating EEs has swung from bland informality to strictly check-list formality.

Today, performance evaluation has stabilized at a point somewhere between these two extremes, combining the use of written forms with personal contact between the supervisor or manager and the working engineer. What's more, it also appears that today's engineer expects—in fact, desires—to be evaluated and then told about his rating.

These conclusions were gleaned from a sampling of a cross section of electronics companies throughout the country to find out how engineering departments evaluate job performance. In general, here's what Electronics reporters found out in this roundup:

- Most written evaluation forms are a combination of one-word ratings—excellent, good, fair, poor—and narrative description.
- Practically every department performs evaluation annually, but most stress that keeping tabs on how EEs are doing is an ongoing process throughout the year-usually on an informal basis.
- Some companies include space on their forms for the evaluated engineer to comment on his rating, and others also make room for a projection of goals for the coming year.
- Evaluation forms are generally designed by personnel departments, rather than the engineering departments. However, forms for EEs have different formats from those for hourly blue-collar employees.
- Although criteria may vary from company to company, engineering managers have clearcut ideas of what they are looking for in their men and stick to them.
- Every company reports the existence of a dual-ladder promotion system.
- Working-level EEs generally approve of the evaluation systems. Complaints center around failure of supervisors to be objective.
- Supervisors generally approve of the systems too. Their complaints: Engineering project schedules don't coincide with required evaluation dates, making it difficult to complete thorough ratings.

**Times are changing, but why?**

While there are variations from these generalizations, both the supervisors and the working EEs agree that thorough performance evaluations are more important today than in the past. The reasons for this attitude are not completely clear. To get a bench mark on this point, engineering managers were asked if they evaluate EEs any differently from how they had been evaluated as beginners. The responses were equivocal.

Many say that, as designers, they did not get the same amount of attention from their supervisors that they now give their people. Others recall that, in the past, evaluations were much too subjective. If they didn't make any waves, their ratings were high. In some cases, evaluation had been so distasteful to supervisors that they let each EE fill out his own check sheet. Still others
claim that there has been no change in the way evaluations are done, yet they agree that the results are more important today than they have been in the past.

One clue to the growing importance of performance evaluation comes from an engineering department manager in the Midwest who says, "there's more interest now by engineers in feeling they've contributed to a part of the end product. So they want to know what they're doing and how well they're doing it."

An East Coast engineering vice president points out that companies in general are opening up more to employees, perhaps in response to complaints in recent years by assembly-line workers of boredom and management indifference to their psychological well-being. This reaction has increased the value of personal contact, and the annual evaluation is the means to ensure it. Management is now striving to treat all employees as humans, rather than as cogs in the corporate machine.

A West Coast project manager stresses that career planning for engineers is more important today than in the past, and companies feel a responsibility to encourage short- and long-range employment goals. "Ten years ago we didn't give much thought to the next job or the next raise," he relates. "Now, engineers worry about where they're going, how they plan their future. That's why the evaluation process today covers the guy's goals and ambitions."

Reflecting appreciation for this concern, an EE in this department remarks that he has no respect for engineers who try to get ahead by job-hopping. His feeling is that performance evaluation is important because it affords an opportunity to work out a realistic career path without having to leave the company.

Not surprisingly, the way companies handle evaluation of engineers fits their general image very closely. For example, the hot, fast-moving semiconductor houses in California's Silicon Valley tend to rate performance on the run--virtually from day to day--and rewards come equally fast. Big aerospace firms like Hughes Aircraft, Los Angeles, and Grumman Aerospace, Bethpage, N.Y., have carefully programmed systems that interface with education subsystems.

Such large, diversified manufacturers as General Electric and GTE-Sylvania rate generalized characteristics, but depend on their chiefs at the working level to track the specifics.

On the other hand, a small firm in a highly competitive market, Data Precision Co., Wakefield, Mass., is inclined to tie an engineer's performance to how the final product comes off the manufacturing line. As expected, small firms have the least formal evaluations, but the engineers have high visibility throughout the design and production cycles.

**Evaluation reflects the company image**

EES in companies outside the traditional electronics industries are not necessarily ignored minorities. In the Chrysler Corp. Automotive division, for instance, there are few EEs, compared to the army of mechanical engineers, and they are involved in relatively new development projects, which causes them to stand out.

Says Robert Weir, manager of engine electrical development for Chrysler, Detroit, the problem with EEs in an auto company is not so much how to evaluate them,

---

**Behavioral evaluation at Grumman**

"Many evaluation methods fail because they try to accomplish too much" observes Daniel Knowles, personnel director at Grumman Aerospace, Bethpage, N.Y. "What we hope to achieve--by limiting our objectives in designing evaluations--is to assist individuals in planning development needs along their career paths."

Performance appraisal, Knowles explains, has evolved over the years from the haphazard to the traditional, and recently to the "behavioral" approach. "Today's employee wants to have the opportunity to ask why. There is more of a trend towards participatory and democratic management structures, with the emphasis on improvement of employee morale and decision-making. The autocratic management of the past is almost obsolete today," he observes.

As a result, Knowles has been revamping the entire evaluation system for the 44-year-old company, a project aimed at dealing with both the individual's performance and his career development. A new evaluation form, in effect for a little over a year, uses a narrative-discussion approach to provide a more flexible means of performance appraisal than in the past. The system is not limited to engineers. It covers all employees. Knowles emphasizes that the appraisal is strictly geared to the individual's development needs. It provides a more accurate and meaningful evaluation than the more formal concept, he adds, but it is not a means for obtaining salary increases or instituting disciplinary measures.

A one-page appraisal form, completed by the engineer's supervisor and reviewed by his superior, is broken down into six sections--performance evaluation, promotion considerations, level of education, training needs, over-all performance, and comments by the employee.

This evaluation form, which can be used one to four times a year, depending on the number of department assignments an individual gets, covers both engineers and supervisors, with a different set of criteria used for each group. For example, the engineers' characteristics are quantity and quality of work, cooperation, initiative, reliability, responsibility, attendance, work planning, communications, costs, and safety factors, among others. In addition to these qualities, supervisors are evaluated in terms of cost control, development of subordinates, delegation of responsibility, and "their efforts in the area of equal-employment opportunity."

This last point is of significance to Grumman's personnel administrators, who point out on their appraisal forms that supervisors should maintain "good-faith efforts" with affirmative action goals, especially noting "utilization, counseling, and development of minority and female employees."

The Grumman evaluation sheet also has space for the employee's comments. In addition, he has an opportunity to discuss the evaluation with his supervisor before signing the form.

Wayne Consolla, an electronics engineer, comments that this feature provides a viable outlet for the individual to voice opinions--either about the company or about the comments made on the appraisal form. He adds that the
but how best to move them around. “We have to be concerned with handling a double-E if the area he is working on is de-emphasized. Chances are, he is an outstanding man, and we want to keep him, but the opportunities to relocate are limited, compared with mechanical engineers here.”

This is not the situation for semiconductor companies. Because of the great competition to get enough engineers, the evaluation systems at Signetics, Sunnyvale, Calif., American Microsystems Inc., Santa Clara, Calif., and Fairchild Semiconductor, Mountain View, Calif., for instance, are geared to keeping EEs happy and productive.

Luther Hintz, manager of TTL design at Signetics, performs both an annual, formal review and an informal, biweekly review, but he says that the biweekly check is more important. While the annual review covers long-range goals for the engineer, the intermediate review touches on such questions as whether the project is running on schedule and what modifications have to be made. From this, the employee gets a good idea of how he would be doing even before he reads and signs the formal, annual evaluation.

At AMI, an annual check list must be filled out, but there’s a great deal of emphasis on individual commentary. The evaluation includes the person’s plans to develop his employability and plans to move ahead. The last section asks the employee what he has done to implement his goals of the previous year.

John R. Duffy, manager of computation products at AMI, says the interface between engineers and managers is so close that when a project goes exceptionally well, “it’s easier to get approval for raises. It’s related to the fact that groups in semiconductor houses are much smaller than in other companies, and it’s easier to recognize one person’s contribution,” he adds. It’s also easier to spot the poor performers in semiconductor companies. Fairchild, which has a procedure for giving mid-year rewards for outstanding performance, also has procedures to try to boost the output of sub-par workers. If someone’s performance isn’t up to snuff, he gets a warning as soon as the problem arises, reports James M. Comstock, manager of MOS calculator products.

Comstock’s philosophy is “if you have a problem, don’t procrastinate. Kick it around. Sometimes engineers have skills that would be better applied in other divisions. Just because a guy doesn’t match up on one place doesn’t mean he can’t do well elsewhere in the company.”

**R&D types are included**

Managers and employees agree that performance evaluation—both formal and informal—is a good means of establishing communications. Beginners, especially, find that required evaluations during the year help them get on the right track in a company; a conversation with a supervisor may reveal that the employee did not fully understand departmental procedures.

Contrary to the myth that EEs working on research and development are above all these policies, the *Electronics* round-up indicates that performance evaluation is as important in advanced-product-development labs as it is in production-oriented departments.

This point was confirmed by Robert Harwood, man-

*Electronics* / March 7, 1974

101
Evaluation of EEs: How’s it done? Does it work? Is it changing? Here’s a way to find out now

Rating performance of EEs appears to be important these days in large companies and small. But there are questions about how well evaluation is done, and whether or not engineers feel that they benefit from the results.

To get an idea of how readers handle this procedure, we’ve prepared the two questionnaires on the following pages with room for your written comments. The first questionnaire is for those being rated, and the second is for those doing the rating. If you are on both the giving and receiving ends, you may want to fill out both questionnaires.

To submit your questionnaire(s), clip the page, fill out your replies, and mail before March 29, 1974 to:

Nonsupervisory engineers questionnaire

(Supervisory personnel. see next page)

How are you evaluated?

1. Are you presently working for a department in which you receive formal performance evaluations? Yes ___ No ___

2. If so, what is the frequency? Annually ___ More often ___ Less often ___

3. Does your supervisor personally review with you your work performance? Yes ___ No ___

4. Do you (a) see the evaluation, (b) sign or initial the evaluation, (c) add comments of your own to the evaluation? (Check all applicable spaces.)
   (a) Yes ___ No ___
   (b) Yes ___ No ___
   (c) Yes ___ No ___

5. Who performs the evaluation of your performance? (Check all applicable spaces.)
   Immediate supervisor ___ Peers ___
   Department manager ___ Others ___

6. Do you think evaluations of your performance are fair? Yes ___ No ___

   Comment: ____________________________________________

7. Do you feel that you have enough opportunity to choose between either moving up the pay scale as an engineer or up the promotion ladder in management? Yes ___ No ___

   Comment: ____________________________________________

8. In event of layoffs, do you favor the "bumping" system in which senior engineers can take over jobs held by lower-ranking EEs at lower salaries, rather than leaving the company? Yes ___ No ___

   Comment: ____________________________________________

9. Would you like to have formal "up evaluation" of your supervisors or management, that is, you would evaluate their performance? Yes ___ No ___

10. If yes, which is more important to you? (a) Technical performance is more important ___ (b) Administrative performance is more important ___ (c) Both are equally important ___

11. What aspect of your performance is the most important to be evaluated?

   Response: ____________________________________________

   Why? ____________________________________________

12. Is your boss doing a reasonably good job of evaluating your performance now? Yes ___ No ___

   Comment: ____________________________________________

Title and function ____________________________
Highest degree ____________________________ Age ______
Total years in engineering ____________________________
Your company's main products ____________________________
City ____________________________ State ____________________________

Note: All responses will be kept in strictest confidence. Only cumulative totals and conclusions — without names — will be published. To be counted, returns must be received by March 29, 1974.
Supervisory personnel questionnaire

How do you evaluate?

1. Do you use a formal, written performance evaluation of EEs in your department? Yes ___ No ___

2. Do you review evaluations with EEs personally? Yes ___ No ___

3. How often do you perform evaluations? Annually ____ More often ____ Less often ____

4. What are the three most important performance characteristics that must be evaluated?
   (a) ____________________________________________
   (b) ____________________________________________
   (c) ____________________________________________

Comment: _________________________________________

5. What is the purpose of employee evaluation? (Check all applicable items.)
   Improve performance ____ Career planning ____
   Promotion ____ Salary review ____

6. Is the format for evaluating EEs designed by (a) The engineering department ____
   (b) The personnel department ____
   (c) Other ____

7. Do you have a dual-ladder promotion system for EEs who want to remain in technical work rather than move to supervisory positions? Yes ____ No ____

8. Do you believe that the promotion system works (a) Very well ____
   (b) Fairly well ____
   (c) Poorly ____

9. Do you favor formal evaluation for your performance by your subordinates? Yes ____ No ____ No opinion __

Comment: _________________________________________

10. Do you show written evaluations to those EEs you evaluate? Yes ____ No ___

11. How do you handle EEs whose performance is under par? Response: __________________________________________

12. In event of layoffs, how do you choose those who are terminated? Response: _________________________________________

13. Do you evaluate personnel any differently than you were evaluated in the days when you were a beginner? Yes ____ No ____

Comment: _________________________________________

Title and function __________________________________

The Digitest 610 is a portable DMM that measures volts, amps, and ohms plus component surface temperature. When trouble shooting, this plus feature allows the user to quickly identify defective components by surface temperature measurement.

This light-weight, compact, 11,000 count unit goes where needed. When regular power sources are not available the built-in nickel cadmium power pack provides many hours of reliable portable measurement. Bold bright Sperry planar gas discharge displays provide easy viewing, even at angles up to 130° and in direct sunlight. Data can be clearly read at distances up to 40 feet.

Easy to operate push button switches enable rapid selection of all 16 ranges from zero to full scale without further adjustment. Non-skilled personnel can use the Digitest 610 with no training, yet the unit's precision design gives the trained technician and engineer the high degree of accuracy that he needs.

In addition to AC and DC volts, AC and DC currents, the Digitest 610 can measure resistances from 0.1 to 5 megohms, and temperatures from -50°C to +200°C. Accuracy is 0.1% and CMR is 100dB.

Sold and serviced throughout the United States and Canada. U.S. distributorships available.

We packaged 21 MPC's in this hostile environment. The sardines were delicious!

new multi-pole, miniature PC relays feature low cost, high reliability

Our new MPC DC-miniature relays for printed circuit board mounting are the smallest high reliability components on the market. Patented hingeless armature construction ensures long mechanical life. New interlocking housing design provides maximum contamination protection. Excellent power handling capacity, maximum motor volume and modular construction all contribute to greater design freedom. Ideal for telephone, office equipment, alarm and instrumentation applications. For full information contact Allied Control Company, Inc., 100 Relay Road, Plantsville, Conn. 06479. Tel. A COMPLETE LINE OF RELAYS • INDUSTRIAL CONTROL SYSTEMS • SOLENOID VALVES
At Intercon time, IEEE's 'getting down to business'

The show theme this year reflects the state of the industry, the state of Intercon, and the state of IEEE, as the institute and the show management settle into new images

by Gerald M. Walker, Associate Editor

With an entrepreneur-engineer in the president's chair and with Intercon opening March 26 under the theme, "Getting down to business in electronics," the Institute of Electrical and Electronics Engineers takes on a decidedly business tone this year. Even the Intercon technical sessions have fallen in step, featuring mostly applications and marketing talks, rather than a potpourri of research status reports.

There are a number of reasons that IEEE is appealing as much to the members' account books as to their minds. While it's fair to wonder what electronics companies have been doing until now, other than getting down to business, the Intercon theme seems to reflect the industry's gestalt. The show is tracking the pervasiveness of electronics in the worldwide marketplace, the booming sales of last year, the necessity for tightening business practices in the uncertain year ahead, and the emphasis on applications that these trends impose.

For another, the institute's role in aiding engineers' careers is also starting to change IEEE's image to some extent. Thus, one session of the technical meetings is devoted to pension-investment plans, a subject that would seem to be more appropriate for a meeting of well-heeled doctors than EEs. Nevertheless, personal business and investment will, no doubt, continue to be a topic for future Intercon programs.

Membership in the IEEE gained slightly in 1973. Non-student members declined less than 1%, but student participation increased, despite a drop in total engineering-school enrollments. Interest among students has been spurred by IEEE's professional-development activities, instituted last year [Electronics, March 15, 1973, p. 95].

Finally, there's IEEE President John J. Guarrera, who is founder, president, and chief executive officer of SaCom, a microwave-equipment firm in Los Angeles. Even though Guarrera, a 1943 graduate of Massachusetts Institute of Technology, was once an engineering teacher and a developer of airborne and ground-based beacons and the triode microwave oscillators used in radar, his personality is much more business-like than academic. He too seems to fit the times.

By 1970, Intercon had reached a diminished state through a combination of factors, including the shift of the industry away from dependence on defense R&D, defection of semiconductor exhibitors, unresponsive show management, and a job-eroding economic downturn. A foundation of instrument manufacturers remained, but show activities on four floors of the New York Coliseum had been reduced to two. The show became an Austro-Hungarian Empire of exhibitions—a dream of past glories, while the edifice was being dismembered by specialized vertical shows.

New management took over for Intercon in 1973, and this year there's renewed confidence that the changes begun then will breathe new life into this year's conference. So the theme, "getting down to business," is as much a reflection of Intercon's new management as it is the state of the electronics industries. It means that Intercon will provide the place and the stimulus to get down to business.

The show is intended to emphasize commercial activity, rather than engineering development, and to include distributors and manufacturers' representatives on the Coliseum floors, along with manufacturers. Intercon management wants once again to make the show a place to introduce new products, as well as a place for representatives of new industrial, commercial, and consumer markets to attend. However, these goals have not yet been achieved.

William C. Weber Jr., operations manager for the show, estimates that attendance should increase from 24,000 in 1973 to 30,000 this year. Some 225 exhibitors are expected to occupy more than 400 booths, compared to around 175 in 350 booths last year. Both the New York area IEEE sections and the Electronic Representatives Association chapters have been active in planning the show, together with the IEEE Conference...
Board. This participation should increase interest and promote attendance from these local groups, says Weber.

The energy crisis may also help attendance this year, he adds. Because employing companies will probably limit travel by engineers, a broad, horizontal show like Intercon could take precedence over attendance at several special exhibitions. In addition, the long-range outlook appears healthy, starting in 1976, when Intercon is to begin alternating between New York and Boston. At that time, the Nerem show in Boston will be phased into Intercon, so that the East Coast's two-city schedule will resemble that of Wescon. “Sooner or later it will make sense to have a show in the Midwest, too,” Weber observes. “It would be a part of the growing importance of electronics in industrial and automotive centers.”

Will Intercon ever climb back to the size of the mid-1960s? It’s doubtful. Weber contends that the number of exhibitors could be doubled in the next five years, but times have changed too much to expect anything like the crowds of the past.

On the other hand, he envisions the IEEE show becoming a kind of industrial fair that provides an umbrella over a number of small, special-purpose exhibits, containing such elements as a small packaging show, a small medical-electronics show, a small automotive-electronics show, and a small industrial-electronics show under one roof.

Under this concept, these entries would join the product promotions mounted by the instrument and components houses that now make up Intercon. Then the “business” that Intercon is “getting down to” might once again represent the entire range of the electronics industries.

A tailored technical program

This year's technical sessions, to be held at the Statler-Hilton Hotel, complement the show theme. The program is the result of a conscious effort by the program committee to analyze and please the Intercon audience. Like the show, the technical program is the outcome of two years of rethinking and revamping. Last year, when the idea of accentuating applications began, 82.9% of the attendees rated the show excellent to good. Also more registrants attended more technical sessions than they had in the past—another objective set by the program committee. The most popular session last year was the panel featuring the three developers of the transistor, who appeared as part of the 25th anniversary observance of the transistor's invention.

Technical sessions that drew the largest audiences included discussions of minicomputer applications, MOS-LSI applications, computer-controlled test-system instruments, and automotive electronics. Also favored were sessions on microprocessors, solid-state imaging, and television.

Based on these votes of confidence, program chairman J.A.A. Raper, manager of advanced circuits and control for the Defense Electronics division of the General Electric Electronics Laboratory, Syracuse, N.Y., believes the program is on the right track for this year. Among the highlights of the three-day program, Raper lists a panel on marketing, design, and applications of electronic calculators; the foreign thrust to capture larger shares of U.S. markets; changes in CATV; and technology of point-of-sale systems. Also, recognizing the growing sophistication of a hobby, a panel will discuss development of radio hardware and its deployment by amateurs for communications in space.

Problems to be discussed

Focusing on day-to-day engineering problems, a panel on “The Semiconductor Crunch,” will emphasize delivery and price, and another will consider “Testability—the Key to Automation in Circuit Testing.” Two sessions on the rapidly proliferating microprocessor will deal with architecture and applications.

“Investment plans for Engineers and Employers,” mentioned earlier, will have four speakers—Frank Cummins, the IEEE counsel on Government affairs, who has worked on pension legislation in Washington; Richard Backe of Sperry Rand Corp., who is chairman of the IEEE Pension Committee; William Astrop, IEEE's investment counselor; and Thomas Sternau, the IEEE insurance-plan administrator.

Another session that is more or less on the professional-development level is entitled, “Technology As-

Alone again. Sparsity of crowds is also under attack by Intercon management by getting local IEEE sections involved in planning.
Down to business. With more booths filled by more exhibitors, Intercon 74 will try to live up to its theme and its goal of promoting sales.

assessment and the Engineer." Topics to be covered are the future of artificial intelligence, forecasting communications technology, tentative forecasts for ultrasonics, results of manufacturing-technology forecasting, an assessment of the SST's failure, and a discussion of the engineer's role in technology assessment. There were two sessions on this subject on the 1973 program, and both drew big crowds. And since technology assessment has become one of IEEE's ongoing tasks, this topic will probably become a fixture for future Intercon technical programs.

The most offbeat session this year undoubtedly is "New Advances in Parapsychology," reviewing research into extrasensory perception [Electronics, Feb. 7, p. 82]. Topics will cover mental telepathy, use of the subconscious mind in problem-solving, and the relation of bodily electrical fields to health.

These sessions should provide a good test for Raper's goal of establishing a distinct personality for the Intercon technical program. "We can ensure a loyal following by patterning the program to the following," Raper points out. "Before we could do this, the conference board spent some time reflecting on the question, 'What are we trying to do with this program?' The pattern was set when we decided that the program has got to match the specific audience, rather than trying to please everyone and doing none well."

The change in the meeting location downtown to the Statler-Hilton may counteract attendance falloff caused by the fuel shortage. Because the hotel is just across the street from Pennsylvania Station, EEs coming by rail from Long Island, Philadelphia, and New Jersey can register conveniently. As always, chartered buses will shuttle attendees to and from the Coliseum so that commuters can get into the Intercon loop without having to use any public transportation in Manhattan. On the other hand, if companies clamp a tight lid on travel budgets, the months of planning for Intercon could be rewarded by empty meeting rooms and a silent Coliseum.

In the meantime, things are not very quiet at the New York headquarters of IEEE. By the end of 1974, a special committee will probably name a successor to Donald Want a booth? W. C. Weber, operations manager, says there's no reason that sales reps and distributors should not take show booths.
What’s on Film Theatre?

In keeping with the Intercon theme of getting down to business, the program committee has arranged for a radical departure in the Film Theatre, normally run in the Coliseum exhibit area. This year, the films will include, not only the usual technical documentaries, but a series of highly rated management lectures produced by BNA Communications Co. and donated by RCA Corp.

Each day, starting on Monday afternoon, March 25, a different topic, encompassing a complete management course, will be screened. These films will not be repeated. The program consists of:

- "The Effective Executives" presented by famed management consultant Peter Drucker.
- "Motivation and Productivity" shown in two parts.
- "Managing Discontinuity," also in two parts.
- "Organization renewal," concerning coping with change.
- "Management by Objectives," including a case history.

Fink, executive director and general manager, who is retiring in 1976. To ensure what politicians call "an orderly transition," the new director will start several months before Fink retires. Since the general management is a big job, with salary to match, the selection committee will be looking for a top-flight manager-lion to $14 million.

With an engineering reputation. Because a career in engineering "is almost required," this would rule out a professional association manager and point to someone who can handle an annual budget of $10 million to $14 million.

As Fink describes the position, it requires a manager with an engineering reputation. Because a career in engineering "is almost required," this would rule out a professional association manager and point to someone from the electronics industries. In addition, says Fink, "the new general manager will sit on top of a complex organization with nine bosses [the board of directors]."

During the year-long overlap, the incoming manager will first learn the ropes of the inside of IEEE, getting to know the staff and mastering the many, many committees that make up the organization. The second step will be to get a handle on the external issues—IEEE's career functions, the pension plans, engineering demands during the energy crisis, and the sometimes-touchy relations with the technical societies operating under the IEEE imprimatur.

For IEEE, it's Guarrera

While the search for a general manager goes on behind the scenes, highly visible out in front this year is IEEE president John Guarrera. Even though he's the head man of an electronics company, Guarrera feels he's still more of an engineer than a chief executive. He'll need both skills during this year, when the institute hopes to consolidate its professional-development activities, including its new, slightly higher profile in Washington.

But he's quick to point out that IEEE's technical activities will continue to be of prime importance. "It's dangerous to ignore the forefront role in technology IEEE enjoys," Guarrera cautions. "If not for the success and reputation of this organization as No. 1 in technology, we could not have accomplished any of our goals," he adds.

One important project that ties together IEEE's role is technology forecasting. By getting an honest evaluation of the future, engineers will have a chance to redirect their careers—to "tune up in areas where they are rusty," he states. "The step-function approach to careers creates a mess in the engineering community," Guarrera points out, in reference to the expansion and contraction of jobs that accompanies changes in technology and the electronics marketplace.

At the same time, the institute this year will emphasize information on product applications to assist members in the day-to-day needs of their present jobs. "Obviously, not all of engineering is state of the art," the president explains.

Among outside projects, Guarrera is strongly pushing a portable pension for engineers, passage of a meaningful congressional bill for research to develop alternate sources of energy, and renewed Government support of research and development—either by direct funding or through tax credits. All three are complex issues that require understanding of both engineering and economics, not to mention insight into political wheeling and dealing.

Guarrera states: "Engineers are used to making judgments only in the areas of their expertise and leaving the economics to others. But we have to get experts to help us separate the real from the baloney on these issues and try to avoid the baloney. We don’t want headlines—just results.”

Looking at the year ahead, the IEEE president confides, “I like to think I’m involved in making waves, and I’ll continue to make waves in this organization when it’s necessary for the members’ needs. In this job, you have to be responsive—responsibly.”

The leaders: "I don’t believe in destroying an organization to change it," says IEEE president John Guarrera (left). "The changes we’ve made have demonstrated the flexibility of IEEE." Donald Fink, IEEE general manager (right), states, "IEEE has shown all other technical societies how much can be done in a short time by changing to career activities successfully without breaking apart."

Electronics/March 7, 1974
We've found an ideal ROMmate for your microprocessor.

Big ROM contributes 16K bits program storage at lowest cost ever

Every little 8-bit microprocessor needs a companion ROM willing to share cramped quarters and supply low-cost program storage. And there's no more perfect companion than EA's 4800 MOS ROM. It has a compatible 2048 x 8 organization and a 100-piece price of $28. It will eagerly move in, custom-programmed, to join your microprocessor in 6 to 8 weeks.

Your microprocessor will find our big ROM is extraordinarily undemanding to live with. It doesn't need a clock because it's static. It gets along without address decoding circuits because it's decoded internally. It doesn't require input pull-up resistors because they're already on the chip. It demands only two supply voltages, +5v and -12v.

And it will welcome more ROMmates with outstretched OR-wired outputs.

Our ROM's maximum access time is 1.2µsec — fast enough to satisfy your microprocessor. Power dissipation is a low .032 mW/bit. It's clothed in a 24-pin silicone-molded DIP. And it will also take on a 4096 x 4 organization to mate with any 4-bit microprocessors you happen to have around.

Contact us right now for data showing how easily the EA4800 interfaces with popular microprocessors.

Transistor array converts to fast-switching thyristors

by H.S. Kothari
Central Electronics Engineering Research Institute, Pilani, India

An ordinary monolithic transistor array can be wired to perform as multiple four-layer silicon-controlled switches by making use of the terminal to the array's substrate. For example, a seven-transistor array having common emitters can be used to implement a seven-stage ring counter.

As shown in (a), the npn transistor array has a separate connection to its p-type substrate. The array is easily wired as shown in (b), with the substrate being employed as a common anode to form npnp structures that can be regarded as silicon-controlled switches. And since the geometry of each transistor is very small, switching times can be on the order of a few nanoseconds.

**Wiring transistors as thyristors.** Integrated seven-transistor array (a) can be wired as silicon-controlled switches by making use of their common substrate connection. The transistors can then be operated as four-layer devices (b) that have switching times on the order of a few nanoseconds. One application for the npnp switch array is illustrated in (c)—a seven-stage ring counter.

---

The schematic of the ring counter is drawn in (c). The first stage is turned on by the trailing edge of the reset pulse. Now, when a clock pulse is applied to the input transistor, the voltage at this transistor's collector drops, and the other counter stages are turned off. In this way, a trigger pulse is transferred from the first stage to the second stage. The next clock pulse causes a trigger pulse to go from the second to the third stage. This process continues and repeats when the seventh counter stage triggers on the first counter stage.

The hold-on current for any stage can be between 50 microamperes and 1 milliampere. The negative voltage amplitude of the reset pulse should be large enough to lower the voltage of the anode gate of the first stage so that this stage is sure to fire. The anode-gate voltage, therefore, is made negative with respect to the anode voltage.

The length of the triggering delay is determined by the capacitance value selected. Voltage amplitudes can be made as large as the collector-emitter breakdown limit of each transistor by increasing the supply voltage, as well as the zener voltage, to some suitable maximum level.
A few inexpensive complementary-MOS ICs can be used to create a bounceless buttonless touch-switch array. The resulting switching circuit takes advantage of the extremely high input impedance of C-MOS devices to detect the ambient signals (electrostatic charge and power-line hum) present on a person's finger. The circuit's outputs are solid-state switches that are capable of controlling audio or analog signals with negligible distortion and that, in many cases, are compatible with existing circuitry. Light-emitting diodes provide a visual display of the current state of these switches.

The heart of each touch-switch (a) is a set-reset flip-flop (one-quarter of a quad latch) whose inputs are biased to the VDD supply through 22-megohm resistors. Under normal (resting) conditions, this renders the inputs inactive, and the flip-flop retains its last state. When a finger or large conductive object touches either the on or off input, a noise voltage appears across the bias resistor at that input and is amplified through the regenerative action of the flip-flop. This sets the flip-flop to the desired output state, where it remains until reset by touching the other input.

The flip-flop's output simultaneously controls an analog switch and a buffer/inverter that drives a panel-mounted LED. The output from the buffer can also be used to activate a TTL input, provided that the internal pull-up supply (VCC) is made equal to the TTL powersupply voltage. The 100-kilohm resistor and the 0.1-microfarad capacitor serve to decouple the VDD bias supply so that there is no interaction between the input and display portions of the circuit.

The block diagram (b) shows how a quadruple touch-switch array looks. The touch-sensors should be small metal plates—squares or disks having a side or diameter of 1 to 2 centimeters are best. A substantial increase in plate area results in a proportionate increase in the quiescent hum pickup, and can reduce circuit reliability unless the sensor is mounted very carefully. At the expense of added construction complexity, the LEDs or their mountings can be given a conductive coating, permitting them to serve as the solid-state equivalent of illuminated push-button switches.

Touch-actuated switching. A simple touch-switch (a) can be built with complementary-MOS ICs. The high input impedance of the C-MOS latch permits the ambient signals of a fingertip to be sensed. The latch's output then controls a C-MOS analog switch, which implements the desired switching function. The LED indicates whether this analog switch is on or off. A quadruple touch-switch array is shown in (b).
circuit's TTL interface must be sacrificed.

In remote locations, where power lines or other major electromagnetic-field sources are not available, it is advisable to install a second contact (at ground potential) on each sensor, so that a slight conduction between the two contacts will assure triggering. Also, to eliminate any chance of damage to the flip-flop inputs from an external power source, the inputs should be protected against excessive current flow with 56-kilohm resistors, as shown.

Switching regulator produces constant-current output

by Steven E. Summer
Hauppauge, N.Y.

The high efficiency that can be achieved with switching regulators need not be restricted solely to voltage regulators. By taking advantage of the convenience of a monolithic voltage regulator, a free-running constant-current switching regulator having a 1-ampere output can be built for applications like battery charging.

A 723-type IC regulator acts as the circuit's reference and comparator. The IC's 7.15-volt internal reference is scaled to approximately 3 V by the voltage divider formed by resistors R1 and R2. These resistors also feed the IC's noninverting input, while resistors R3 and R4 drive the IC's inverting input. The lower end of resistor R4 is connected to shunt resistor R5, and approximately 1 V appears across this shunt when the IC's comparator terminals are nearly balanced.

A hysteresis voltage of around 28 millivolts is applied to the IC's noninverting input through resistor R6. This sets the minimum output ripple of the circuit at 28 milliamperes peak to peak. But if the storage time of output transistor Q1 is significant, the ripple current will be higher.

When the circuit's feedback loop calls for a current increase, the output stage of the IC regulator conducts and a current pulse of 12 mA flows into the VC terminal. (The size of the current pulse is determined by resistor R7.) This current pulse drives transistor Q1.

The zener diode (D1) is used to bias the output stage of the IC regulator, while the junction diode (D2) operates as a freewheeling diode. Inductor L1 and capacitor C1 filter the switched waveform. The circuit's maximum operating frequency depends on the size of the load and is typically 20 kilohertz.

**Constant-current source.** Switching regulator circuit provides a 1-ampere constant-current output that has a peak-to-peak ripple of 28 milliamperes. The integrated 723-type voltage regulator functions as a reference source and a comparator. Transistor Q1 is a current booster, while inductor L1 and capacitor C1 filter the switched waveform. The circuit's operating frequency can be as high as 20 kilohertz.
FET CHIPS
For Hybrids
from the industry leader in high-quality FET products

When your hybrid design calls for FET chips to a JEDEC specification, your first choice should be Siliconix JEDEC-equivalent dice. You can select from more than 500 different JEDEC-type FET chips, all manufactured with the same meticulous attention to product quality which has made Siliconix a byword in the industry.

FET Input Op Amp

All standard Siliconix FET chips are equivalent to their JEDEC or house-numbered parents on all testable parameters. We have hundreds of JEDEC and house-numbered parts in our product line. To specify a JEDEC-equivalent chip simply add the suffix "CHP," as in 2N4416 (JEDEC registration) = 2N4416CHP (chip form). When your design calls for a special device, remember that we’ve produced over 4000 different FETs sorted to custom electrical specifications—We’ll be happy to select to your individual requirements.

For additional information on chips recommended for new equipment design or replacement service, plus a list of tested parameters and test conditions.

The world's largest manufacturer of miniature aluminum lytics wants to show you their etchings.

In the production process of electrolytic capacitors, the etching and forming of the foil is one of the most critical processes. The design of the foil directly affects performance and life.

This is why United Chemicon designs, etches and forms all its own foil and achieves complete quality control of every one of the over 60 million miniatures we sell each month. We know that we must use exactly the right type of foil to meet our customers’ specific performance characteristics. That’s why we welcome special, tough applications.

Now that you know more about our etchings, you should also know that our special machinery division designs, develops and builds all our machinery. Every capacitor is automatically aged and 100% tested.

This control guarantees an unparalleled degree of product uniformity, predictability and reliability of supply.

Shouldn’t you know us?

Write, call 315/474-2954 or wire for full information and latest technical bulletins.

United Chemicon.

Simplified n-channel process achieves high performance

Ion-implanted metal-gate process, cheaper than silicon-gate technology, has the same advantages, operating on +5 volts for TTL compatibility; high-speed static memory has 350-ns access time and draws only 250 mW

by R. J. Huber, K. F. Smith, D. R. Hill, J. N. Fordemwalt, J. W. Hanson, and W. H. Dobelle, University of Utah

To satisfy demands for a single MOS process that can accommodate today's increasingly complex digital systems, such as medical prostheses and instrumentation systems, an ion-implantation n-channel metal-gate process has been developed. It achieves high operational performance in fully TTL-compatible large-scale integrated circuits. The process, which was developed under a contract funded by General Instrument Corp., Hicksville, N.Y., is significantly simpler and cheaper to implement than silicon-gate technology or other published n-channel metal-gate processes. Production economies are achieved by high yields, which are, in turn, attained through a reduction in the number of steps necessary in processing.

Their ability to operate from a single +5-volt power supply enables the new ICs to provide both the memory and processing requirements of the more conventional data-processing and calculator equipment, as well as to provide new microcircuit capabilities for a growing number of telecommunications, industrial, and biomedical systems.

The range of MOS performance has already been extended by these new ICs in memory and processor circuits. A 5,120-bit read-only memory has an access time of 500 nanoseconds and typical power dissipation of only 100 milliwatts. A 1,024-bit (quad 256) static random-access memory, which has a read time of 450 ns and write cycle time of 500 ns, draws a low 250 milliwatts of power when operating and less than 40 mw when standing by. The size of the ROM chip is only 121 by 126 mils, and the RAM chip is 160 by 164 mils. What's more, the process has been used to fabricate a 16,384-bit ROM containing nearly 19,000 transistors (Fig. 1).

The process is simple

Like all of today's functional n-channel processes, this one uses ion-implantation techniques to do three things: control enhancement thresholds of the n-type gate regions, increase field-inversion voltage for better isolation between devices, and produce depletion-load devices.

But, unlike other ion-implanted n-channel processes, the main objective of this metal-gate process is simplicity. Indeed, this process produces LSI circuits more easily and more cost-effectively than others because of the reduction in the number of critical process steps and the use of conventional oxide masks, rather than polysilicon or silicon-nitride masks.

The process requires only two ion-implantation steps and eliminates the need for silicon nitride and the attendant complex etching procedures. Simple metal gates are used, even though they normally result in larger geometries than silicon gates, but the simplicity of the process offsets this disadvantage.

Getting rid of the silicon-nitride masks was a major boost to yield. True, the use of a silicon-nitride layer to mask against reoxidation is a technique successfully employed in a number of ion-implantation processes, but silicon nitride requires specialized equipment for deposition and more complex yield-killing etching techniques.

Finally, arsenic is used as a diffusant to still further
simplify the process. Arsenic-diffused junctions are less mobile than phosphorus junctions during subsequent high-temperature processing. The source of the arsenic diffusion is a commercially available arseno-silica film, applied with a conventional photoresist spinner. But, in mass production, a more conventional sealed-tube technique may be employed.

**Importance of controls**

However, some aspects of this process require careful control. The most critical of these is the total depth of the implanted ions in the channel regions of both enhancement- and depletion-mode transistors (Fig. 2). To preserve the low body-effect coefficient (which determines the effective threshold voltage for a given substrate bias) of the high-resistivity starting material (15 to 25 ohm-centimeters), the thickness of the oxide grown in these devices must be carefully controlled. If the oxide is too thick, an insufficient portion of the implanted atoms will reside in the silicon. If it is too thin, the implant will be too deep and the body-effect coefficient will suffer.

Indeed, at this point, it is necessary to control the oxide thickness through which the ions must be implanted to 5,000 Å ± 50 Å, a degree of accuracy that requires some unconventional process-monitoring techniques. A rapid method for control of this thickness is to compare the color of the interference pattern produced by the wafer in process with that of a standard that has been accurately calibrated.

With this technique, the boron atoms implanted through 5,000 Å of silicon dioxide at about 150 kiloelectronvolts gives an impurity distribution in the silicon shown in Fig. 3. With this distribution and the subsequent minimal heat cycles of the wafer, the body-effect coefficients do not change from those of the starting material.

The usefulness of this ion-implantation process to fabricate low-voltage circuits is confirmed by the electrical characteristics of individual depletion- and enhancement-mode devices:
- Enhancement-mode threshold: \( V_{TE0} = +0.85 \pm 0.3 \text{ V} \).
- Depletion thresholds, \( V_{TD0} = -2.5 \pm 0.3 \text{ V} \).
- Field-inversion voltage, \( V_{TF0} \) greater than 30 V (thick-oxide threshold).
- Enhancement-gain factor, \( \beta_E = 25 \text{ to } 30 \mu A/V^2 \).
- Depletion-gain factor, \( \beta_D = 35 \text{ to } 40 \mu A/V^2 \).
- Drain breakdown voltage, \( BV_{DSS} \), approximately 35 V.

The thresholds of both enhancement- and depletion-mode devices are kept well below 3 V, underlining the low-voltage TTL-compatibility of the process. Moreover, device stability is assured by the large (5 times threshold) field-inversion voltage and the high (35-V) junction-breakdown voltage.

**Designing tighter circuits**

A key advantage of this n-channel ion-implanted metal-gate approach is that small-geometry devices can be produced in tighter LSI configurations than ever before achieved with metal-gate processes. Arsenic diffusion allows close control of diffusion depths, which, in turn, guards against spreading of the diffusion regions. On the other hand, ion implantation eliminates field-inversion problems so that relatively thin-field oxide can be used.

The RAM and ROM circuits already built clearly show the virtues of this process. The 1,024-bit static RAM fits on a chip measuring 165 by 160 mils (it has a static cell area of only 12.2 mils\(^2\), while the 5,120-bit ROM fits on a chip 121 by 126 mils.

The RAM circuit actually uses three different transistor thresholds, which can be tailored to their most convenient values for low-voltage circuit design. The enhancement-mode threshold of \(+0.85\) V is set by the boron implant, and the depletion threshold of \(-2.5\) V is set up by the phosphorus implant.

If a transistor is given the full dose of both implants, the threshold will be approximately \(-1\) V; thus, all three thresholds are obtained with no increases in processing steps. The \(-2.5\)-V depletion and the \(+0.85\)-V enhancement transistors are used in the peripheral circuits and
Although the process is new, the RAM cell is based on the conventional bistable flip-flop. The loads are depletion-mode transistors, and the others are enhancement-mode devices. The -1-V and the +0.85-V thresholds are used in the memory cells themselves.

A schematic of the static-RAM cell is shown in Fig. 4. Each memory cell is composed of six transistors in a conventional bistable flip-flop. The load transistors are depletion-mode transistors with thresholds of -1 V. The bottom transistors in the flip-flop and the pass transistors are enhancement-mode devices with 0.85-V thresholds. All other depletion-mode transistors in the remainder of the circuit and in the peripheral circuits have thresholds of -2.5 V. The -1-V threshold in the load transistors of the memory cell results in a better design than a cell that uses enhancement-load devices or depletion devices with -2.5-V thresholds as loads. With enhancement-load devices, Vcc, minus some threshold voltage, appears at the gate of the bottom transistors, whereas the depletion-mode transistors used as a load allows the full Vcc power-supply voltage to be applied. Thus, the bottom transistors can be smaller for the same current drive when using depletion, rather than enhancement-load devices. However, a -2.5-V depletion transistor, rather than a -1.0-V transistor of the same size used as a load device actually degrades the performance of the cell, since the bottom transistors must sink the transistor-load current, as well as drive the outboard pull-up transistors and the capacitance load. An additional and perhaps more significant advantage of the -1-V threshold over the -2.5-V threshold is the lower power consumption for a given geometry.

On the other hand, the use of a depletion transistor with a -1-V threshold in the peripheral circuits would make the design extremely difficult because these circuits are designed for high speed, while size and power are of secondary importance. The body-effect reduces the -1-V threshold to nearly zero as the source voltage of the load transistor approaches the potential of the power supply.

These circuits, using only depletion transistors with -1-V thresholds as loads, would be too slow, especially where high-voltage-output drives are required. Moreover, since the power supply is only 5 V, it is absolutely necessary to have drivers in the peripheral circuits that can drive hard to the power supply, a condition suitable for depletion transistors with -2.5-V thresholds. Enhancement-load devices won't work because their outputs can only swing to within a threshold of the power supply, and bootstrapping their voltages requires too much space.

Unusual circuit

Besides the memory cell itself, most of the circuits used in this RAM design are similar to the conventional depletion-mode inverter (Fig. 5a), with one notable exception. The push-pull stage is coupled with a conventional depletion inverter (Fig. 5b). This circuit is used in the address inverters and in the input/output section of the memory where large capacitive loads are driven. Transistors Q3 and Q5 are depletion-mode transistors, and Q4 and Q6 are enhancement-mode transistors.

The push-pull circuit is three times as fast as a conventional inverter with the same power because of the

![Diagram](image-url)
6. Organization. The RAM employs altogether eight address lines for decoding a memory segment containing 256 bits. The decoding circuits are designed to be shared by all four quadrants, so that addresses are either read or written into simultaneously.

The RAM employs altogether eight address lines for decoding a memory segment containing 256 bits. The decoding circuits are designed to be shared by all four quadrants, so that addresses are either read or written into simultaneously.

It is interesting to compare the speed of a depletion-mode push-pull circuit used in this RAM design with a conventional depletion inverter (Fig. 5b). The two circuits consume identical amounts of power and have identical input capacitances, but the propagation delay of the push-pull stage is one third that of the conventional inverter, which is 120 ns. These calculations are based on typical parameters for the process being used to build the RAMs.

The block diagram of the entire RAM configuration is shown Fig. 6. The TTL-compatible inputs can accommodate a minimum high voltage of 2.2 V and a maximum low voltage of 0.8 V, while the actual trip point is nominally at 1.5 V, near the center band of the TTL range. Leakage current at any input will be less than 10μA.

Using the RAM

The outputs can drive a single TTL load with a parallel 100-pF capacitor. The output will sink 1.6 mA at 0.4 V and source 0.2 mA at 2.6 V. The required power is typically 100 mW for the memory cells and 150 mW for the peripheral circuitry, which results in the total operating power of 250 mW and a standby rating of 100 mW. A standby rating at 40 mW can be obtained with substrate bias and/or lowering of the cell power-supply voltage.

As shown in the block diagram, eight address lines are provided to decode a 256-bit segment of the memory in each of the four quadrants. These X and Y decoding circuits are shared by all four quadrants. Thus, all four addresses are independently but simultaneously either being read from or being written into.

The circuit has two chip-select inputs, which activate the circuit only if both inputs are low. If either chip-select is high, the chip is not selected. And, since the outputs of the chip have three states, an unselected chip is completely disconnected from the data bus.

A power-down signal, which drives the Y decoders, completely disconnects the memory cells in all four
quadrants from the peripheral circuits. In a typical power-down sequence, first a power-down signal is applied, the cells are disconnected when the power-down line goes low, and then all power is removed from the peripheral circuits. The power-down signal can also be tied to the peripheral-power supply, which has the effect of automatically disconnecting the cells.

A problem could develop during the automatic power-down mode by changing the data in a cell already being addressed or in some other cell that may be inadvertently addressed as power goes down. Normally, a memory system provides a signal to anticipate a power-down condition, and this signal can be used to initiate the power-down cycle.

But, since the chip has two power supplies, \( V_{CC} \) and \( V_{DD} \), which supply the peripheral circuits and the memory cells, respectively, the power can be maintained on the memory, even though the periphery is not powered.

Although RAMs are normally operated from 5-V TTL supplies, Fig. 7 illustrates an excellent method for connecting the circuit for battery operation in a standby mode. \( V_{CC} \) supplies power to the memory cells via diode \( D_2 \) and the battery, \( V_{BB} \) is trickle-charged via \( D_1 \) and \( R_1 \), and \( D_3 \) is normally off. When \( V_{CC} \) goes to ground, \( D_2 \) and \( D_1 \) turn off, \( D_3 \) turns on, and \( V_{BB} \) supplies power to the cells. This circuit approach permits data to be stored indefinitely so long as \( V_{DD} \) is held to 4 V or more.

The read-only memory (Fig. 8) is organized as a 512-by-10 array. Its entire circuit was designed with only five basic cells, which are repeated as required; hence, it is possible to use the same cells and change the ROM configuration with little change in chip size or appearance. Indeed, a 16,384-bit ROM (Fig. 1) has been fabricated by means of the standard layout techniques. The array is organized 4,096 by 4 bits and has a chip size of 169 by 174 mils.

**What’s ahead?**

For still larger ROMs, a new technique reduces the silicon area required for a transistor so that circuits can be laid out in a much more compact arrangement than ever before. This technique involves elimination of the usual dimensional tolerances along the width of the gate electrode.

The factors that limit minimum device sizes are photolithographic resolution and imperfect mask alignment. The design rules for circuit layout take this into account by providing overlap between layers. Elimination of this overlap would significantly reduce the circuit area, but, in most instances, no misalignment between layers can be tolerated. In fact, if misalignment occurs at metal delineation so that the gate oxide is exposed, transistor performance is impaired because electrical charges can migrate from the gate electrode onto the exposed gate oxide, causing an unwanted channel. This results in a shunt-current path from source to drain when the MOS transistor is turned off.

Since absolute alignment without overlap is impossible, the only previous solution had been to completely cover the gate oxide with gate electrodes that are significantly wider than the gate oxide. Applied to a ROM, this enlargement of the gate electrode can easily double the area required for each storage transistor. However, an additional ion-implant step can inhibit this unwanted channel formation.

A typical layout of a standard ROM element is shown in Fig. 9(a). In the new ROM layout (Fig. 9b), the gate metal is made the same width as the channel. The exposed gate oxide, which results from the inevitable misalignment of the metal mask, would normally degrade ROM performance.

However, the formation of a conducting channel below the exposed gate oxide is prevented by implanting ions of the same conductivity type as the original substrate. In the n-channel process used for ROM fabrication, a boron implant is used. No additional masking is needed because the metal forms the mask of the implant.

The implanted ions in the exposed thin-oxide regions prevent the formation of uncontrollable conducting paths between source and drain regions normally caused by misalignment, which eliminates the necessity for using an oversize gate electrode to prevent the shunt-current paths.

Indeed, the narrower gate electrode can substantially reduce the area required for a transistor, which, consequently, reduces the size of an entire circuit as shown in the ROM element in Fig. 9(b). The minimum metal width considered practical in processing such a ROM is 0.3 mil. Allowing for misalignment, the active gate width would be 0.2 mil, which is equivalent to the standard drawn device; however, the area required for the minimum-size zero-overlapped device, like the new ROM, is one half that of a minimum-size standard ROM device, even though the two devices are electrically equivalent. Fig. 9(c) shows a misaligned device and the area affected by ion implantation.

The technique has been successfully tested on both single transistors and the 5,120-bit ROM. And since results are satisfactory for performance, yield, and stability, this technique can considerably reduce circuit size.
8. ROM layout. The 512-by-10 array, which is constructed around only five basic cell designs, allows various different read-only memories to be configured with little change in chip size or design. The 16,384-bit RAM has same basic layout.

9. Evolution. By using a narrower gate electrode and a boron implant, a ROM cell can be fabricated that is much smaller (b) than a standard cell (a). In (c), a misaligned device is shown.

without sacrificing performance for ROMs as large as to 64 kilobits, and the technique is being investigated for application to other circuit types, as well.

A still simpler n-channel enhancement/depletion-mode process can be designed by using (111)-orientation silicon instead of the usual (100)-oriented material. Here, it’s possible to take advantage of the natural surface-state change Qss of the (111) crystal face to give better depletion-mode load transistors without a phosphorous implant. On high-resistivity material, depletion-mode thresholds of nominally -1-V can be obtained from Qss alone, so that the need for this second implant is eliminated. An adjustment of the size of the boron-implant dose compensates for the greater Qss in the enhancement devices.

The principal difference in the electrical characteristics of circuits manufactured by this modified process on (111) silicon is a substantially lower gain factor because of lower charge-carrier mobilities. With a gate oxide 1,200 Å thick, an enhancement-mode gain factor of $\beta' = 12 \pm 2$ and a depletion-mode gain factor of $\beta' = 22 \pm 2$ are observed. Because the reduced gain factors degrade circuit speed, this technique can only be used in moderate-performance devices. With this in mind, this laboratory has designed and built a simple 8-bit dynamic shift register using the modified-(111) process.

This device also operates from a single 5-V power supply and TTL-logic levels at a clock frequency of 5 MHz.
The best selling 3½ digit DMM. Now even better.

More new options & accessories. New AC/DC high current option lets you measure 10 Amps continuously or up to 20 Amps momentarily. New low ohms capability with 2 and 20 ohms full scale ranges provides maximum resolution of 0.001 ohms. New RF measurement capability available with low cost probe. The Fluke 8000A Digital Multimeter brought a new standard of excellence and reliability to the low cost field. Today, with expanded capability, the 8000A brings that standard to even more of your measurement applications. And don't forget what you get in the standard instrument. With or without options and extras, the Fluke 8000A is the best digital multimeter for the money. You get a basic dc accuracy of 0.1%. You get 26 ranges to measure ac/dc volts from 100 microvolts to 1200 volts, current from 100 nanoamperes to 2 amperes and resistance from 100 millohms to 20 megohms.

We back the instrument with a guaranteed 20,000 hour Mean Time Between Failures. We expect you'll get 56,000 hours service . . . roughly the equivalent of 15 years everyday use. Or the options already offered. The option list includes in addition to those described above, a rechargeable battery pack, digital printer output, deluxe test leads, 40 kV high voltage probe, 600 ampere ac current probe, two types of carrying cases, dust cover and rack mounts.

The All-In-One, Voltage Invariable, Self-Regulating, Constantly Bright, Money Saving, LED Lamp System.

Under the dome of every Red-Lit series LED lamp is a bipolar IC current regulator that holds the LED's brightness constant through a supply voltage range as wide as 4.5 to 16 volts.

This revolutionary design eliminates current-limiting resistors, individual drive circuits and even supply regulators. That's why you'll save far more than the few pennies the Bright Guys charge for adding the regulator IC. You'll save on design costs, components, board assembly and supplies.

Some neat savings in inventory and spares can be made, too. Since these lamps shine the same at different voltages, there's no need to use different types in panel circuits operating at different voltages.

Customer satisfaction is another benefit. When power supplies fluctuate or batteries droop, these LED lamps don't.

Three types are available: RLC-200 with a constant brightness of 1.2 mcd; RLC-201 at 0.7 mcd; and RLC-210 at 0.6 mcd. The RLC-200 and RLC-201 come in T-1 3/4 lamp size and cost 50¢ in 1K quantity. The RLC-210 in a miniature T-1 package costs 60¢ in 1K quantities.

At these prices, why put all the parts together? Get your all-in-one LED lamp systems at reps and distributors, or right from us.

Digital-IC models for computer-aided design

Part 5: Shift register

Multiple J-K master/slave flip-flop models duplicate the performance of serial-in/parallel-out 4-bit shift register

By John R. Greenbaum, General Electric Co., Syracuse, N.Y.

In this series of articles, computer models have been developed for several basic digital-IC functions. Now these basic functions can be combined to realize more complex digital functions or to simulate complete digital circuits.

Such is the case for the type 9780 4-bit shift register, which consists of a bank of four J-K master/slave flip-flops. The J-K flip-flop model described in Part 2 can be used here to simulate the operation of a shift register.

The type 9780 shift register is a serial-in/parallel-out synchronous device. As shown in Fig. 1, it provides a Q output (Q0, Q1, Q2, and Q3) for each of its four stages, as well as a Q̅ output (QB) at its last stage. Besides a clock input and J and K inputs, there is an overriding asynchronous master reset input. Data entry is synchronous, with an input change of stage after each low-to-high transition of the clock. The asynchronous master reset overrides all other input conditions and clears the register.

Logic information present on the J and K inputs of

any stage, plus information fed back from that stage’s Q and Q outputs, sets the master section of that flip-flop. When the clock input is logic 1, the master section of a given stage is isolated from the slave section. As soon as the clock pulse falls to the clock-threshold level (approximately 0.8 volt), the data on the J and K inputs is entered into the master section.

When the clock is logic 0, the master section is again isolated from the slave section. As the clock pulse begins to rise, the master section is disabled, and, as soon as the clock pulse reaches the threshold level, the logic information at the output of the master section is transferred to the slave section, which controls the flip-flop’s output.

If the data on the J and K inputs of each stage remains stable while the clock is logic 0, that stage’s output will correspond to the truth table shown in Fig. 1 when the clock makes a low-to-high transition. This truth table is for a single stage and applies when the reset signal is logic 0. The electrical characteristics for the entire shift register are also shown in Fig. 1.

The computer model for the type 9780 shift register is drawn in Fig. 2, which also shows the program listings that describe the model. There are two model descriptions—one for the Sceptre (System for Circuit Evaluation and Prediction of Transient Radiation Effects) analysis program, and the other for the Circus-2 (Circuit Simulator) analysis program. The model subprograms shown in the figure, which are applicable to both model descriptions, establish the shift register’s output-signal levels and delay characteristics.

**Doing the simulation**

The model’s signal-input impedances (J, JK, JRS, and JCK) are represented as zero-valued current sources, implying that the impedance of the register’s input-signal terminals is infinite. This is a reasonable first-order approximation, although the inputs of an actual type 9780 device do have measurable varying impedance values that depend on the applied signal level. For greater accuracy in the analysis, the current sources can be modeled as tables of functions of current vs applied voltage.

Each section of the shift register can be considered as an independent flip-flop whenever the correct input signals are applied to any particular stage. The inputs to
the first stage are the signals on the J, K, CK, and RS terminals, while the inputs to the subsequent stages are the same CK and RS signals, but the J and K signals are the Q and Q outputs from the preceding stage.

Examining the model

Since every stage uses the same functions to generate its output signals, only the operation of the first stage needs to be examined. For the first flip-flop, then, the voltage levels associated with dependent voltage sources E1 and E2 are determined by subprogram functions FJK, FJK1, FJK2, and FJK3. These functions are interrelated to simulate the master and slave sections of the model.

Output signals from the master section are stored as defined parameters to simplify the simulation because a number of flip-flops are being interconnected. Defined parameters P11 and P12 are determined by functions FJK2 and FJK3, respectively. These two functions determine the outputs of the master section, while functions FJK and FJK1 establish the outputs of the slave section, which are E1 and E2, respectively. Signals that are greater than or equal to 1.5 V are defined as logic 1, and signals that are less than 1.5 V are defined as logic 0.

Because the switching-delay times for a negative-going (t_{pd0}) transition and a positive-going (t_{pu}) transition differ, two time constants are needed to establish the time delays for each stage. For the first flip-flop, time constants R1-C1 and R2-C2 are adjusted to get the right delay.

If the Sceptre analysis program is used, the time constants are adjusted by varying the capacitor values by means of subprogram FCAP1. The value of capacitance chosen depends on whether the flip-flop’s output is logic 0 or logic 1. Capacitor C1, for instance, is set equal to 300 picofarads when voltage E1 is greater than or equal to capacitor voltage (VC1). If E1 is less than VC1, capacitor C1 becomes 75 pF. The value of capacitor C2 is established in a similar manner for the first flip-flop.

If the Circus-2 analysis program is used instead, the model’s delay characteristics are adjusted by changing the resistor values, rather than the capacitor values. Subprogram RR72 does this, establishing the correct resistor value for a logic 0 or logic 1 signal at a stage’s output.

The output voltage (E3, E6, E9, E12, or E13) of each stage is a function of capacitor voltage (VCL, VC4, VC7, VCA, or VCB, respectively), which is, in turn, related to input-signal conditions. This means that relationships are readily established between all input and output voltages.

The output impedance (R3, R6, R9, R12, or R13) of every stage is set equal to 100 ohms as a reasonable approximation of the register’s output signal level. To simulate the output-impedance variations of an actual type 9780 device, the output resistors can be expressed as functions of the load voltages and load currents.

This article concludes a five-part series on simplified, but accurate, computer models for common digital ICs. The models are based on device terminal behavior, instead of the classical method of modeling each transistor and diode junction in the IC. The NAND gate was covered in Part 1 in the Dec. 6 issue, the flip-flop in Part 2 in the Dec. 20 issue, the monostable multivibrator in Part 3 in the Jan. 24 issue, and the AND-OR-INVERT gate in Part 4 in the Feb. 7 issue.
Germanium power. From first to last, we still make 'em all.

There's no end to germanium power

from Motorola, the power producer.
Pinch load resistors shrink bipolar memory cells

Simple flip-flop memory cell, for which narrow p channels provide high resistances, occupies as little as 9 mil² of chip surface, dissipates only microwatts of power, is basic to 1,024-bit RAMs in IBM 370 systems

by S. K. Wiedmann,
IBM Deutschland GmbH, Boeblingen, Germany

The 10- to 50-nanosecond access times of bipolar chips used to have little appeal to memory designers because those high speeds came along with low packing densities, high power dissipation, and high costs. At the time this cell was conceived, the high-impedance loads that would minimize power dissipation were not being realized in a small area. Space was also wasted by the need to isolate all active elements from each other, so as few active elements as possible seemed desirable.

Advances in technology, however, made it practical to put pinch load resistors on a chip. This kind of resistor exploits the fact that a very narrow conducting channel has a high resistance. By merging two of these resistors with just two npn transistors,1,2 it has proven possible and economical to produce a very small flip-flop storage cell that dissipates little power.

The silicon area of the complete memory cell is only slightly larger than the area of two normal npn transistors—about 9 mil² in the final product. The cell standby power is approximately 20 microwatts. These characteristics explain why the cell is the basic building block of the 1,024-bit random-access-memory chips used in IBM’s Systems 370/145 and 370/135.3

Basic cell design

The basic flip-flop circuit is very simple. It consists of directly cross-coupled npn transistors Q₁ and Q₂, ohmic load resistors R₁ and R₂, and parallel diodes D₂ and D₁ (Fig. 1). However, the sheet resistance of conventional diffused p-type resistors is only 150 to 300 ohms per square, and realizing large resistance values with this technology would make this memory cell unattractively large even though it would keep power dissipation attractively low.

The way out of this dilemma is to turn the shallow p base channel region of the vertical npn transistor into a pinch resistor. Since the resistance is inversely proportional to the thickness of the conducting channel, resis-

1. High tolerance. Flip-flop circuit basic to the memory cell has an output voltage that is highly insensitive to wide variations in resistor values, input supply current, and transistor saturation. Pinch load resistors provide high resistivity in small area. Broken lines indicate that diodes double as part of the npn transistors.

2. Twin halves. Each half of the circuit in Fig. 1 has an identical layout. Narrow path through p base from contact K to transistor base B forms the pinch load resistor, while diode is simply the pn junction between K and collector C. Not shown here are Schottky diode clamps and collector buried layers used in the actual memory.
tivities of 5 to 10 kilohms square can be achieved—30 times higher than standard diffused resistors.

The absolute resistance tolerances are fairly large but, fortunately, the voltage/current characteristic at the flip-flop terminals is relatively unaffected by large tolerances of the load resistors. Deep transistor saturation is avoided, even when Schottky diode clamps are not used at the base-collector junctions. This prevents the parasitic effects of stored base charge, caused by carrier injection into the forward-biased base-collector junction, from occurring and slowing down circuit speed.

The parallel diodes require no separate diffusion step but are identical with the pn junction between the contact for current source, $I_0$, and each transistor's collector. Since the diodes limit the voltage drop across the collector resistor of the on transistor, the voltage across the flip-flop supply terminals does not change much within a fairly large range of the supply current $I_0$. The supply current can therefore be readily increased from a small standby value to a larger value, so that pulse powered operation can be used to reduce average power dissipation still further.

Finally, more space can be saved if current can be supplied to the cell through a series resistor common to many other cells. At small cell currents, the voltage drop across the transistor base and a series resistance is relatively small, and the voltage across the cell is mainly given by the $V_{BE}$ of the on transistor. Consequently, the voltage tracking of two adjacent cells is comparable with the $V_{BE}$ tracking of two transistors, and good current sharing can be obtained with a common series resistor. Deviation from a nominal cell current of less than 100 microamperes is less than 10%.

**Isolation at a minimum**

Two isolation pockets are enough to accommodate the circuit in Fig. 1. That circuit can be split into two identical halves, one of which is shown at the top of Fig. 2. The rest of Fig. 2 explains how the elements of a half-circuit are accommodated within a single pocket of n-epitaxy surrounded by p+ isolation walls. The n-epitaxy itself serves as the collector of transistor $Q_1$ (a low ohmic buried-layer resistance, which reduces the collector resistance, is not shown for the sake of simplicity). Within the n-epitaxy is a homogeneous p-base diffusion partly covered by two $n^+$ type diffusions. The smaller $n^+$ area is transistor $Q_1$'s emitter. The larger $n^+$ diffusion, which overlaps the p base, implements the pinch resistor $R_i$ between contact Q and base contact B.

The beauty of this cell structure lies in the fact that a single diffusion serves more than one circuit function. Thus the $n^+$ diffusion of the pinch resistor may be utilized for contacting the collector C. Also, diode $D_2$ between contact K and collector C is inherent in the $p^+$ junction formed by the p diffusion region contacted at K and the n-epitaxy of the collector. Finally, Schottky-diode base-collector-junction clamps may be implemented simply by opening up the base contact B until it extends over the n-epitaxial region.

Figure 3 shows how the two half-circuits are interconnected to form a complete flip-flop. As a result, the

---

**From cell to main memory**

Structure of the memory used in the IBM 370/145 and 135 and based on the pinch-load-resistor memory cell will be described at the IEEE Intercon 74 by John Gersbach.

Each RAM chip has double-layer metalization and Schottky-diode base-collector gating. It packs 1,024 cells, organized as 32 words of 32 bits, into 117 by 149 mils.

In his article, Gersbach states that the chip dissipates 58 milliwatts in standby, 425 mW when selected. A stable 300-millivolt offset voltage is obtained by having a nominal cell standby current of 20 microamperes flowing through the 15-kilohm loads. Logic level inputs are typical ECL levels of ±400 mV.

Main storage makes use of the IBM 4K standard solid logic technology module that packages four chips into a 1½-in.-by-½-in. module. Chip selection within a large matrix of modules is facilitated by having row and column selects arranged in a two-by-two matrix. All other chip inputs and outputs are common. Typical cycle time is 50 ns.—Joel Dubow

---

3. Paired halves. The half cell of Fig. 2 is interconnected with an identical second section to realize a complete memory cell, which occupies little more area than two individual transistors.

4. Realization. Actual cell built with 3-micrometer epitaxy, 5-micrometer metal line widths, and single-layer metallization measures only 12 mil². Double-layer metallization improves that to 9 mil².
5. Making contact. To address cell, current can be fed into cell nodes (a, b) or taken out of them (c). The addition of Schottky diode clamps aids this process in all three cell versions but is essential only in (b). In (a), information may be transferred either via the collector or, via the emitter path of the coupling transistor. Best tradeoff between read/write performance, cell area, and cell stability is given by (c).

The whole device occupies little more space than two ordinary transistors would.

The photomicrograph in Fig. 4 displays an actual cell, which uses 5-micrometer line widths and a 3-μm epitaxy and occupies 12 mil² with single-layer metalization. With double-layer metalization, the cell as used in the final product occupies 9 mil².

Coupling options

To turn the flip-flop into a full memory cell, it must be coupled to data lines. There are two different ways of transferring data between storage cell and read/write data lines. For both reading and writing, currents can be either pulled out of the cell nodes (Fig. 5a and b) or fed into them (Fig. 5c). Of course, a combination of these two operating modes is also possible to optimize read and write performance at the expense of some circuit complexity—and some waste of space.

In each cell type shown in Fig. 5, however, the coupling elements can be realized in the n-type regions of the npn transistors, thus requiring only little silicon area. Note, too, that any of the cells may employ Schottky diode clamps at the input to the cross-coupled transistors. These clamps have several advantages:

- The cell switches faster, since less charge is stored at the flip-flop nodes.
- The address line drivers operate at a smaller voltage swing so that less power is needed/dissipated and speed is higher.
- The cell nodes are less sensitive to leakage, since the current reaching the base terminal of the on transistor is higher.
- The transistor-coupled cell of Fig. 5a can be addressed in at least two ways, depending on whether the cell information is transferred via the collector or via the emitter of the coupling transistors. The first method has the disadvantage of requiring two additional area-consuming isolation pockets.

In the second approach, on the other hand, the collector of the coupling transistor may be tied to the collector of the opposite flip-flop transistor, requiring only a second emitter to be added to the flip-flop transistor to implement the coupling transistors.4,6 The disadvantage here is that parasitic current in the second emitter may occur unless the emitter-base junction is prevented from going into deep saturation by Schottky diodes, which turn on fully at a lower voltage than the transistor junctions.

The cell circuit in Fig. 5b has practical advantages only with Schottky clamped transistors. Its operating characteristics are similar to those of the circuit in Fig. 5a, except that a smaller sense current is available and thus the cell stability is more critical. (For selecting a memory cell in a word-organized array, a positive pulse of about 1 volt is applied to the upper word line so that the coupling transistors of the selected cell conduct. Since current is pulled out of the cell during reading or writing instead of being fed to it, it is preferable if cell current be increased during addressing in order to improve performance stability.)

The addressing scheme shown in Fig. 5c offers a good tradeoff between cell area, stability, and read/write performance2,7 and was the approach finally adopted. The coupling diodes are preferably realized by Schottky diodes, because they will occupy little space and do not cause parasitic injection currents.

Figure 6 shows a quasi-bit-organized array of such memory cells. All the cells of one address line are supplied via common series resistors $R_A$ and $R_B$. The tracking of memory device characteristics provides sufficiently uniform current sharing between the cells. During standby, the read/write lines are biased so that the coupling diodes do not conduct any current. To address a cell, a negative pulse is applied to its address line and a positive pulse to its Y-address read/write-line pair, so that the read/write-line resistors $R_0$ and $R_1$ are shunted to the cell load devices. Thus the cell current is essentially determined by the lower-resistance read/write line resistors.

For reading, the difference of the voltage drops across these resistors is sensed in the pre-sense amplifier. The delay time of the sense signal is negligibly small, since relatively large currents are chosen for the read/write lines.

For writing a logic 1, the $B_0$ is pulled down so that
only the B₁ line delivers a current to the cell to charge up the corresponding cell node and thus to turn on transistor Q₁. The write operation is somewhat more critical than reading, since the B₁ line current has to be relatively large to pull the collector of Q₁ out of saturation. In fact, at dc conditions, this current has to be \( \beta \) times larger than the base current of Q₁. Moreover, if dynamic switching is used and fast switching is necessary, the read/write-line current will have to be considerably larger, particularly if the on transistor is heavily saturated. This is due to the well-known Miller effect, which entails that during the on-state the effective capacitance between a transistor’s collector and emitter terminals is essentially given by the base-collector capacitance multiplied by the current gain \( \beta \).

It should be mentioned that the write current can be reduced by inserting a small series resistor between collector and cross-coupling points, if necessary.\(^7\)

Figure 7 shows a typical read/write operation sequence for a circuit utilizing the coupling scheme of Fig. 5a and adopting the common collector configuration (flip-flop and coupling transistors sharing a collector). Read time is fast since there are no resistors in series with the access path. As the oscillogram shows, the cell can within 15 ns deliver 50 millivolts of different voltage into a 10-picofarad load at its read/write lines. The delay time for writing is also less than 15 ns.

A program called Focus considerably eases the job of curve fitting, especially if you are working with data that does not approximate a recognizable function. As long as you have sufficient data, Focus will work—without being modified—on a variety of data patterns. It will quickly fit data without having either convergence or accuracy problems.

Focus takes the wrinkles out of otherwise erratic data by using a weighted average. The weights used are \( W_1 = 1, W_2 = 2, \) and \( W_3 = 1. \) Each point \( n, \) which is represented by \( P(n), \) is averaged with its neighbors:

\[
P(n) = \frac{W_1P(n-1) + W_2P(n) + W_3P(n+1)}{W_1 + W_2 + W_3}
\]

Since end points lack enough neighbors, they require special attention. For the first point, \( W_1 \) is set equal to \( 0; \) and for the last point, \( W_3 \) is also set equal to \( 0. \)

The averaging is repeated for each point a specified number of times, which should suit your specific application. But don’t forget that the data begins to lose significance as the averaging continues. Ultimately, you’ll get a straight line for an absolute average.

When using Focus, you are faced only with basic decisions. First, establish which axis should be used to order the points. This decision determines the neighbors that are the heart of the method. Next determine if the data from the remaining axis can be used as a reference, or should the data from both axes be averaged?

After you determine these answers, you can then decide how many times the averaging should take place. It is easy enough to change this number, and perhaps the best solution is to try a few different numbers. And finally, you have the option to remove data through some desired criteria and to do a possible refit.

Two Fortran routines, labeled Focus and FIT2 in the figure, make up the program—subroutine FIT2 is used to control subroutine Focus. They are simple listings that should work on almost any machine. Before FIT2 is called, the independent axis (AB) and the dependent axis (ER) are stored, the coordinate pairs are ordered in increasing values of AB, and obviously bad values of ER are removed.

Focus follows these steps:

- Data to be averaged is stored in ORIG to determine residuals.
- Data points are averaged NFOC times.
- The average residual is calculated.

FIT2 follows these steps:

- A call to Focus averages ER 10 times (IY = 10).
- ER values that are 2.5 times the residual (average difference between original and final points) are removed.
- With this “bad” data removed, Focus is called again.
- The results of the computation are plotted and key fit

---

### Getting an accurate fit

These two Fortran listings make up a curve-fitting program called Focus. (The subroutine FIT2 controls the subroutine Focus.) The program, which fits data by using a weighted average, is fast, as well as accurate. The solid line in Graph 1 shows how accurately Focus can generate a function to fit the data points (dots). If the averaging is repeated too many times, the fitted curve (dashed line) loses accuracy. Graph 2 shows the best fit that can be obtained for the same data points with a least-squares technique.
**GRAPH 1**

FOCUS AVERAGING. 50 TIMES DASHED LINE. 10 TIMES STRAIGHT

**GRAPH 2**

3RD DEGREE SINE FIT (LEAST SQUARES)
values are printed as the output.

The two graphs compare the accuracy of Focus with that of the popular least-squares curve-fitting technique. Both graphs represent an instrument calibration.

Graph 1 shows the results of Focus' weighted-average approach. The data points are represented as dots, while the solid line is the best average fit. The averaging was repeated 10 times, and it required only 5.34 seconds to run. The average difference between the data points and the best-fit curve is 1.076 units. If the averaging is repeated 50 times, the data becomes over-averaged, and the dashed line results.

Graph 2 shows the same data points being fitted by using a least-squares approach. This plot is the best of a series of runs. It required 49.3 seconds on the computer, and the difference error is 3.568 units.

Measuring the use time of interactive terminals

by Thomas A. Lutke
Bunker Ramo Corp., Falls Church, Va.

If you've ever tried to determine the actual use time of an interactive computer terminal, you already know what a troublesome task this can be. But, it's sometimes necessary to know, with reasonable accuracy, how long the terminal is actually being used to assess the load or amount of traffic on the terminal.

Generally, the terminal's use time is greater than the time recorded by the computer's central processing unit, but smaller than the total time that the terminal is on-line with the computer. One way for you to determine this figure is to keep a log sheet by the terminal and hope that it's filled in, rather than forgotten. Another way, one that eliminates the policing required by the log sheet, is to install a time meter that is actuated by a pressure switch in the seat of a chair used by the operator.

An even better method is to use the circuit in the diagram to drive a running-time meter. This circuit is conveniently activated by a 1-millisecond communications pulse or pulse train, which can be taken from the computer's interrupt line.

There is a delay between the time the input to the circuit resets and the time the meter is deactivated. This delay lets the meter run continuously all the while the operator is using the terminal, provided 'that he interrupts the computer often enough to keep the circuit from resetting.

An input pulse at either diode D1, D2, or D3 turns on transistor Q1, which in turn charges the timing capacitor. Now transistors Q2 and Q3 also conduct so that current is supplied to the relay coil, energizing the relay and running the meter.

When the input resets, transistor Q1 turns off, and the timing capacitor discharges through the base of transistor Q2. This reduces the base current to transistor Q3 so that the relay is eventually de-energized. The circuit's timing, which can be varied from 1 to 50 seconds, is controlled by the 2-kilohm potentiometer.

Engineer's Notebook is a regular feature in Electronics. We invite readers to submit original design shortcuts, calculation aids, measurement and test techniques, and other ideas for saving engineering time or cost. We'll pay $50 for each item published.

---

Making an accurate record. Circuit employs running-time meter to determine the actual use time of an interactive computer terminal. A pulse from the computer's interrupt line activates the circuit, so that the reading on the meter is reasonably accurate.
It’s easy to turn an IC timer into an R-S flip-flop

The versatile 555-type IC timer can also be used as an R-S flip-flop, says D.E. Hokanson, a physicist at the Veterans Administration Hospital in Seattle, Wash. The device makes a handy bistable because of its low cost, wide operating voltage range, and an output power large enough to drive indicators or relays.

Wiring the unit is simple—just omit the timing capacitor. The set input pulse is capacitively coupled (1,000 picofarads) into the unit’s trigger input, which is also connected to the supply voltage through a 27-kilohm resistor. The reset input pulse is applied through a switch (push button) that runs from ground to the timer’s reset input. The timer’s threshold and ground terminals are also wired to the grounded side of the switch. (The Vcc supply and output connections are normal.)

The timer flip-flop will be set by the negative-going edge of a pulse applied to its trigger input. Grounding its reset input or momentarily raising its threshold input above ½ Vcc will reset it. If a positive pulse is applied to the threshold input for resetting, the reset input should be tied to the supply to prevent the timer from resetting prematurely. Conversely, if a negative pulse is applied to the reset input to reset the device, the threshold input should be grounded.

Plain sailing over rough spots

Checking out the surface of wafers or thin or thick films is a tough job with most surface-profile measuring systems. The Dektak system from Sloan Technology Corp., however, is easy to use and can plot microscopic step differences as small as 25 angstroms or as large as a million angstroms. Chart speed of the strip recorder can be varied to attain horizontal magnifications ranging from 2x to 5,000x. Accuracy is ±2%, and total traverse capability is 6 cm. Sloan’s address is 535 East Montecito St., Santa Barbara, Calif. 93101.

Where to go for extra training in electronics

Now that electronics is spreading into the automotive, medical, and other industries, many companies are discovering a need to give their own already highly expert and very busy personnel additional training in electronics. One source of this training is the Center for Technical Development Inc., a subsidiary of Kurz-Kasch Inc., which offers five in-depth home-study courses in the design of digital circuits, power supplies, IC logic, MOSFET and JFET circuits, and MOS circuits.

The center’s clients are often corporations, not individuals, and student caliber is high—average age is 36 years, 43% are engineers with degrees, and 57% are technicians with 10 to 12 years of experience. Course completion rate is also very high. Address of the center is 2876 Culver Ave., Dayton, Ohio, 45429; phone number is (513) 296-1020.

Getting a grip on emi control requirements

If you’ve suddenly developed a need to meet Mil Std 461 requirements for controlling electromagnetic interference, a new publication from an emi consulting firm may help. The 130-page book contains complete guides and checklists for the engineer, project and quality control manager, and draftsmen, typists, and others faced with the complex problem. “Simplified emi Control Plan Report 1546, Vol. 1” costs $60 from Hish Associates, 9710 Cozycroft Ave., Chatsworth, Calif., 91311.
Data General introduces the first stereo computer system.
This computer not only looks like a music system. It works in stereo.
Two separate computers play off the same disc.
It's called the Dual Nova.
The Dual Nova is a standard off-the-shelf product. Which means it's fully supported by the operating system. You just plug it in and go to work.
Which is the first time you've been able to do that on a small dual processor system.
If you want to do load sharing, the disc gives you a huge storage area that both computers can use. So both computers can share the same datafiles and programs.
And if you want to use the Dual Nova as a redundant system, the backup computer won't just sit there. You can put it to work on computation, data reduction, or what have you.
And if one of the computers happens to go down, the other one will keep going. One can't hurt the other. Because they're totally separated. Electrically. Mechanically. And physically.
There's three discs to choose from: the quick access Novadisc, a cartridge disc, or big capacity disc pack.
You can use any two computers made by Data General. And as it turns out, every Dual Nova computer has a foreground to do one thing. And a background to do something else.
Just in case you want to go quad.

Data General
The computer company you can understand.
Someone recently asked if we supply 38510 devices.

Yes.

Does Fairchild make MIL and other hi-rel devices?

Do we ever.

Just look over our list of standard components, and chances are you'll find what you're looking for.

Either JAN-MIL-M-38510 devices.
Or Fairchild's own UNIQUE 38510 series for high-reliability applications.

All available now.

Electronics/March 7, 1974
When you order MIL/hi-rel devices it's always nice to have an ally.

Ordering your MIL devices from Fairchild gives you some very clear advantages, too:

You have one of the three largest semiconductor makers in the world on your side.

You'll find Fairchild's complete catalogue—digital and linear—makes your planning simple.

And you can rely on Fairchild to deliver—some devices as quickly as two weeks. Most as quickly as four.

**JAN or UNIQUE.**

Fairchild gives you a cost-saving choice, too.

Either JAN devices—tested to full Military slash sheet specs.

Or economical UNIQUE devices—100% tested to full data sheet specs and to MIL-M-38510/MIL-STD-883 hi-rel screens.

Check the following Class B Test Flow Chart and see for yourself. Then you tell us which spec you really need.

Send for complete information on prices and delivery. Or talk with your Fairchild Sales Office or local Distributor today.

**TEST FLOW CHART (CLASS B) JAN MIL-M-38510 and UNIQUE 38510**

- Preseal 883/2010/B
- Bond Strength Acceptance Seal
- Bake 883/1008/C 24 hrs.

Semiconductor Components Group, Fairchild Camera & Instrument Corp.,
This chip is the world's first SOS processor.

It makes all the stuff on the next page possible.
Silicon-on-sapphire isn't new. The aerospace industry and the military have recognized its high-speed, high-density and high-reliability characteristics for years. But no one was ever able to use it in a computer processor. Until now.

Now General Automation designers have built the world's first commercial processor using SOS technology. They've placed 2000 gates or the equivalent of 4000 to 5000 transistors on a single semiconductor chip. An 800 times size reduction from its predecessor product, the SPC-12.

**The world's first microcomputer.**

That tiny SOS chip has made it possible to bring you the LSI-12/16. A complete digital automation microcomputer with from 1K to 32K bytes of semiconductor memory. We call it the world's first microcomputer because it's the only microproduct available that gives you the performance, the systems features, the reliability and the applications support you would normally expect from a minicomputer.

**More work, less money.**

In the past this kind of size reduction always meant you had to make major concessions in performance. With SOS you make none. The LSI-12/16 has an instruction execution cycle time of 2.64 microseconds. It’s faster than any microprocessor on the market.

**Breakthroughs across the board.**

The LSI-12/16 is the first microproduct to successfully put all of the following on a single board: A processor, power fail/auto restart, remote cold start, 16 bit parallel I/O interface and up to 2K bytes of semiconductor memory. But we didn't stop there. GA engineering has also overcome the problems associated with semiconductor memory. Like loss of data in the event of power failure. We handled that by developing an auxiliary battery backup system that will activate immediately upon loss of power and will retain the contents of memory for up to 15 hours.

In case you’re interested in more memory, we’ve designed a piggyback board that will give you an additional 2K of RAM or 8K of ROM.

And if there’s ever an error in ROM programming, it can be corrected. The LSI-12/16 has a unique built-in ROM patch that lets the user retrofit new instructions to any ROM.

**Custom tailoring.**

There’s one more advantage the LSI-12/16 has that no other microproduct can offer: It’s the systems backup and application expertise that General Automation gives you. Helping solve customer problems has always been our long suit. It still is.

We can customize I/O boards and match the LSI-12/16 exactly to your requirement. Our microcomputer is available in one of two different configurations: As a board-only system, packaged with memory, control console and processor on a single 7-3/4 by 10 inch printed circuit board. Or the same board packaged in an enclosure with power supply, battery backup for semiconductor memory and card slots for additional I/O boards.

For more information, write...

**GENERAL AUTOMATION**

A new generation of computer processors is beginning. All because of this.

See the LSI-12/16 in the Computerworld Caravan...
We have a keyboard to fit every need and every budget.

At MICRO SWITCH, we have the world's most complete line of solid-state keyboards. Which means unmatched design flexibility for you.

Our application engineers will custom tailor a keyboard to your exact specifications. Whether from our time-proven SW series or our new low-profile SD series.

Choose from keys offering over 8,000 legends, 30 colors, and 60 shapes, including standard, sculptured or re-legendable keys.

Or create new keys to fit your needs. Even lighted and two-level keys are available.

MICRO SWITCH keyboards are available with features like MOS, TTL and DTL encoding, and with two-key or N-key rollover. Your choice of arrays include standard touch typing and point-of-sale.

Working with MICRO SWITCH, you draw on our extensive solid-state experience. We've been designing reliable keyboards for hundreds of applications since 1968 and are presently producing over 1,000 units a week. Each offering a 1% AQL and two-year warranty. This means we can supply you quickly at lower unit prices.

So whatever your needs, and whatever your budget, we'd like to supply a keyboard to fit. Contact a MICRO SWITCH Branch Office for complete information.
New products

Exhibitors stress hard-sell at IEEE Intercon 74

Instrument-dominated show, March 26–29 at New York Coliseum, to focus on applications-oriented equipment available now for automatic testing, exercising high-speed logic families, checking communications links and terminals, and servicing industrial, commercial, and consumer systems. Following are some of the significant products to be introduced at Intercon 74

Digital meters use new a-d conversion technique

In a major assault on the instrumentation market, United Systems Corp., Dayton, Ohio, will be losing more than 20 new products on the IEEE show. Called the HT (for high-technology) Series, the line includes counters, printers, digital multimeters, digital panel meters, comparators, and precision calibrators.

Technologically, perhaps the most significant are the company's model 2780 DPM and its model 2210 DMM. Both are 4½-digit (20,000-count) machines, and both are built around the same LSI circuit, which performs analog-to-digital conversions by means of a patented new technique. The major advantages of the new integrating conversion scheme are high input impedance and low bias current, low cost, and minimized digitizing error, through the use of synchronized data transfer. The single reference voltage source eliminates half the adjustments that might otherwise be needed in a bipolar machine, and also does away with special drift problems around zero—no additional cost to the purchaser.

Price of the model 2780 panel meter, which United Systems is marketing under its Digitec tradename, is $219. An additional $40 buys a TTL-compatible parallel BCD output. The meter comes in four dc voltage ranges and five dc current ranges. The former include full-scale values of 1.9999 v, 19.999 v, 199.99 v, and 1,000.0 v. The 2-v scale is electronically protected against overloads of up to ±200 v; all other ranges can withstand up to ±1.2 kV. Input resistance exceeds 1,000 megohms on the lowest range, and equals 10 megohms on all others. Polarity is automatically detected and displayed on all ranges.

In designing the new meter, efforts were clearly made to keep accuracy commensurate with resolution. Maximum error on the dc voltage ranges is specified as ±(0.01% of reading + 1 count) at an ambient temperature of 23 °C ±1 °C. For the current ranges the 0.01% figure becomes 0.05%.

The meter's worst-case temperature coefficient is ±0.001% of full scale per degree centigrade for the zero offset, and 0.002% for the full-scale offset. In addition, the external multiplier (or shunt) resistors supplied by United Systems cause a maximum temperature-related error of ±0.0025% of reading/°C. Alternatively, the user can supply his own external resistors.

The 2780 is designed to fit into the 3.75-by-1.72-in. panel cutout that seems to be becoming an industry standard. It can run off standard line voltages or a 5-v supply. The line-voltage model can take either 115 or 230 vac at any frequency.
New products

from 50 to 400 Hz, and it has a maximum power consumption of 4 volts-amps. The 5-v version draws a maximum of 750 mA. Price for both types is the same $219.

The model 2210 DMM has the same dc voltage ranges as the panel meter; in addition, it measures ac voltage and resistance. Current measurement cannot be made.

Ac voltage measurements can be made over the same span as dc measurements, covering the frequency range from 45 Hz to 20 kHz. Input impedance on ac is 10 megohms in parallel with 40 pF, and maximum error is ±0.25% of reading + 5 counts). The temperature coefficient for ac is ±0.001% of reading +0.001% of full scale)/°C.

Maximum response time for the multimeter to come to its rated accuracy is 1 second for dc volts, and 5 seconds for ac volts and ohms. The 2210 is line-operated only and consumes a maximum of 5 W. Price is $525.

Tektronix launches calculator-based instrument line

In a move that most industry observers have expected ever since the company's introduction of its models 21 and 31 calculators, Tektronix Inc., Beaverton, Ore., has entered the field of calculator-based instrumentation systems. Called the models 21/53 and 31/53, depending upon which calculators they use, the new systems make extensive use of the company's TM500 line of modular measuring instruments.

Unlike many other automatic test systems that have been designed to exercise units under test by detecting and diagnosing their faults, the two new systems are aimed primarily at applications involving data acquisition and analysis. Only measurement modules—not signal-producing modules—from the TM500 line are meant to be used with the new systems.

Not counting the measurement modules themselves, which are selected by the user for the particular task he has to perform, the basic systems carry price tags of $2,895 for the 21/53, and $3,995 for the 31/53. These prices include a calculator, a mainframe power supply, a plug-in interface unit for connecting the calculator with the instrument modules, an interface cable, and two software packages for data acquisition and reduction.

The attractiveness of these new systems is in their relatively low cost, their flexibility, and their considerable data-reduction power. The software packages are supplied as tape cartridges. One contains routines for the simple acquisition of data. With these routines, the user decides how often a measurement should be made, what limits it must fall between, how many measurements should be made before the testing is stopped, and so on. The acquired data itself is stored in the calculator's registers, or may be listed by an optional printer.

The second software package contains some much more powerful routines. Instead of saving the original raw data, it processes it as the data is acquired and stores the results of its analyses. Some of the results it can provide are calculations of the mean, variance, and standard deviation of a single input variable. It can also look at two input variables—such as two voltages or a voltage and a time interval—and calculate their covariance and correlation coefficient.

Further, the routines can calculate the best-fit straight line for a collection of data and can also provide the outputs needed to construct a histogram. For obtaining a graphical presentation of the data automatically, the model 4661 digital plotter is available.

The new systems will be available after March 15.

Tektronix, Inc., P. O. Box 500, Beaverton, Ore. 97005 [382]

GR network analyzer runs 200 tests a second

Up to 200 tests a second—each of 5 milliseconds duration—can be conducted by an automatic network analyzer, the model 2260 developed by General Radio. The versatile rf test system includes a digitally swept frequency synthesizer, GR's model 1062, which provides a frequency range of 200 kilohertz to 500 megahertz, with 0.1-hertz resolution.

Since the synthesizer is accurate to one part per million, a spokesman says the operator knows what frequency he is getting down to 10 digits, an important feature in testing filters used in communications applications. Phase noise of the synthesizer is 60 decibels down, low enough to test very-narrow-band devices. Also, when testing narrow-band devices, the 2260 can be programmed to wait for the device to settle after each frequency change. Dynamic range is greater than 100 decibels; interface is provided by kits that determine operating im-
Cutler-Hammer has responded strongly to the new emphasis on styling in appliances and other equipment with fresh new design in switches.

Our unique rocker and paddle type switches have a new look. They're not only the finest in performance, but smartest in styling compared to traditional toggle and rotary operators.

From a simple one pole Rockette® switch to a specifically designed unit combining a variety of features, Cutler-Hammer can solve your special problem. Illuminated, snap-in-, nest-, sub-panel- or flush-mounted, sealed miniature, multi-pole, you name it. AC and DC ratings. Up to 20 amps. The choice has to be Cutler-Hammer!

And when you need an extra special special design, we'll work with you to make just what you want.

Call your Cutler-Hammer Sales Office or Stocking Distributor. Or write for full-line catalog LD 110A.
pedance, which can be 50 ohms, 75 ohms, or 50 and 75 ohms mixed.

A programmable attenuator associated with the synthesizer provides the 1-decibel-level output steps, and an offset generator provides the local-oscillator signal, 80 kilohertz from the test frequency. DC bias up to ±20 volts in 40-millivolt steps for additional tests is supplied by a dual programmable power supply.

Transmission and reflection measurements are made by an rf module that amplifies the synthesizer output, splits it into two channels, and switches it to and from the device under test and the measuring circuits.

The test sequence, equipment-control settings, and port interconnections are all controlled by the processor, a Digital Equipment Corp. PDP-8/E with 20,000 12-bit words of core memory. A typewriter provides control via instructions punched on paper tape and loaded into the processor by a high-speed tape reader. Instruction sets, one for each type of device test, are written in a simple language developed by GR. Once the instruction set is written, the push of a button initiates the measurements and tests, and the routine can be modified by changing instructions. Instruction sets are stored in a dual magnetic-tape unit.

Test results are displayed on an 8.5-by-11-inch oscilloscope, which can plot up to four characteristics simultaneously. Digital, hard copy, and bright-light outputs are also provided, giving anything from a simple go or no-go indication to a detailed account of each test.

Nearly any active or passive one- or two-port device can be tested, including amplifiers, filters, couplers, relays, and antennas. Characteristics tested include transmission, reflection, magnitude, gain, and bandwidth.

GR says the 2260 can be used both in the laboratory and on the production line, and it can be operated by semi-skilled personnel. A typical configuration including display scope, processor, storage, typewriter, and line printer will cost about $100,000. Delivery time for the system is four to six months.

General Radio, 300 Baker Ave., Concord, Mass. 01742

Logic scope records at 200 megahertz

As the speed-power performance of logic families swings upward, so does the need for faster logic scopes. Among the latest to enter this test field is Biomation Corp., with a digital waveform recorder that can handle ECL speeds while displaying eight channels of input simultaneously. The $15,000 model 8200 digital logic recorder, says Roy Tottingham, product manager, “is to the digital designer or trouble-shooter what the large-bandwidth oscillator is to the analog designer.”

The complex test requirements of such technologies as MSI, LSI, and high-speed ECL, require a faster means of testing, says Tottingham. The 8200, which can accept and display eight input signals simultaneously, compares the digital signals against two threshold levels. When the instrument is in a sample mode, it displays a 0 if the sample is below the threshold level and a 1 if it is above.

The second mode of comparison is called latch, which detects noise pulses that may occur on a signal between clock pulses. The 8200 records at 200 megahertz, storing the binary signals at the rate of one digit every 5 nanoseconds, and it is capable of storing 2,048 words in each of the eight channels.

The solid-state recorder, says Tottingham, “looks like an oscilloscope and acts like one, but stores in digital form and displays digital information.” The display, using a conventional cathode-ray tube, provides a timing diagram, and each signal is represented as a square-type wave line that shows the high and low states with respect to time from left to right.

The 8200 will allow designers to test ICs, components and systems. Production will begin this spring.

At Intercon 74, Biomation will
The whole works on one single PC board with every chip a plug-in!

Plug in to a TTY or any RS232 printer for hard copy when you need it!

**OUR CRT HAS LESS GUTS... AND FEWER BELLYACHES**

Teleray users call it the Uptime Terminal because it rarely gets sick. If it ever does, the cure is simple. We replace one single plug-in board that contains ALL logic, character generation, drives, interface, the works. Just about anything that can go wrong is on that board and is plug-in replaceable, right down to every chip. Teleray is so quickly and easily repaired, you can do it yourself with our easy-to-understand service manual — or we’ll do it for you. MSI circuitry and top-grade components have drastically cut down the number of Teleray parts that can go wrong, and that brings down your cost, too. Our price is competitive, but we’re different on the inside... we’re “healthier.”

**FEATURES**
- RS232-C, TTL, 20 ma current loop signal connections
- ASCII coding; 96 characters generated, 64 displayed
- Data rates to 2400 baud
- Displays of 960, 1728 or 1920 characters
- Full or half duplex, switch selectable
- Local or remote modes, switch selectable
- Non-contacting solid-state keyboard (read-only if you want)
- Direct TTY replacement without interface or software changes

**OPTIONS**
- Switchable baud rates
- Switchable line formats
- Numeric keypad adapter
- RS232 output to any printer
- 50/60 Hz, 115/230 VAC power
- Remote keyboard
- Slave up to 5 video repeaters

Call collect (612) 941-3300 and ask for Teleray! It’s a “gutless wonder”! (We have a warranty that’s different, too!) Circle 151 on reader service card

**TELERAY 3300**
TI's new 1024-bit Schottky® PROMs give you the capability to complete your custom designs or new designs faster—when your customers want them.

Whether you're implementing random logic, code converters, micro-programmers, or software emulators—virtually anything you can express in binary symbols can be programmed into these PROMs. Immediately and permanently. At your facility or at a TI authorized Distributor Programming Center near you.

Programmability is enhanced by the incorporation of additional fusing circuitry that is tested during manufacture. And, reliability is assured through TI's experience in Schottky technology and an in-house PROM QA test qualification program.

The SN74S287 and the SN74S387 are second generation electrically programmable read-only memories in the industry standard 74187 ROM pin configuration.

With 100 to 999-quantity pricing of $19.20 for industrial plastic DIPs, PROMs are becoming an economical option for more and more designs.

Order any of these Schottky PROMs from your local authorized TI distributor.

For a copy of a new 28-page brochure *Designing with TI TTL PROMs and ROMs*, Bulletin CB-162, write: Texas Instruments Incorporated, P.O. Box 5012, M/S 308, Dallas, Texas 75222.
New products

also introduce two other products: the model 805 waveform recorder and the model 815 A/D, a video analog-to-digital converter.

Biomation Corp. 10411 Bubb Rd., Cupertino, Calif. 94301 [384]

Lab-grade scope is priced at $425

Tagged at $425, the Simpson model 459 features a wide range of sweep speeds adjustable from 0.5 second/centimeter to 0.2 micro-second/cm in 20 calibrated steps, and a 5-power magnifier can be used to extend sweep speed to 40 nanoseconds/cm. Automatic, normal, or free-running sweep modes can be selected, and special TV-horizontal and TV-vertical settings allow users to lock on to a television’s line- or frame-synchronizing signals.

Vertical sensitivity ranges from 10 mV/cm to 20 mV/cm in 11 calibrated steps. Input impedance is 1 megohm ±5% in parallel with 35 picofarads, and an optional 15-pF probe is available at $15.

X- and Y-vector inputs are on the front panel, and Z-axis modulation input is on the rear. Also accessible from the front of the unit are three separate calibration signals—1-kilohertz square-wave signals of 5 V, 0.5 V, and 50 mV peak to peak—for vertical calibration. The low-level signal outputs are useful for external circuit testing and calibrating the optional probe.

Power-supply voltages, including high voltages, are regulated to ensure that trace amplitude, time base, brightness, and focus are stable with line-voltage variations of ±10%. The 115-V ac, 50/60-Hz scope is also available in a 230-V ac model at $435.

Simpson Electric Co., 853 Dundee Ave., Elk Grove, Ill. 60120. [385]

Counter operates up to 18 GHz

As any engineer who’s ever made a precision X-band frequency measurement knows, it’s not easy. As frequency increases, noise goes up and power goes down for any given signal-generating technology. Unfortunately, microwave frequency counters of the transfer-oscillator type, which can deal well with low-power signals, tend to be intolerant of fm noise. On the other hand, heterodyne-type counters, which can tolerate a lot of residual fm noise, are not noteworthy for their sensitivity.

Recent progress in counter technology has largely overcome this dilemma for frequencies up to 4 gigahertz. Above that, however, no solution has been available until EIP Inc.’s introduction of its 350D series Autohet frequency counters. These counters, which will be exhibited at the IEEE Show at the Weinschel Engineering Co. booth, have a worst-case fm tolerance specification of 40 megahertz peak to peak, and a worst-case sensitivity of -20 dBm. Frequency coverage is either

DIT-MCO
THE DIFFERENCE IN TESTING!

DIT-MCO's
SYSTEM 810B

Basic System: Computer, interface logic assembly, paper tape reader, dual/disk drive, electric typewriter I/O, program library, CRT display/editing station.

Basic Software: Wiring analyzer control, system control, background editor, self program, and others as required.

System Options: Card reader, magnetic tape transport, paper tape punch, line printer, communications modem link.

Software Options: APH/810-2 auto programming, UM/810 disk memory diagnostic.

• Multiprogrammed operation—simultaneous multi-channel control and file changes.
• Provides a central 8 channel control for remotely located satellite station wiring analyzers and numerically controlled machines.
• Complete computer programs library with edit capabilities.
• All software furnished and maintained by DIT-MCO.

Reliability! Speed! Versatility! Give Us A Test Problem And We'll Show You How To Control It.

DESIGN ENGINEERS: Custom’s Capacitors have what you need

Do you deal with specifications like these in your work:

- capacitance over 40 pf up
- frequencies in MHz
- voltage over 10,000 VDC

Then reconstituted mica capacitors are what you need.

Do you work with energy density of 0.05–0.25 joules/in.³ at high voltage?

Reconstituted mica capacitors will best fill your requirements.

Looking for high voltage in small packages?

You need reconstituted mica capacitors!

Another of the many advantages of reconstituted mica capacitors is excellent performance under environmental extremes.

Custom can meet your needs better, because each process in our capacitor production begins and ends with quality control to avoid failure in the field. Let us show you how we can fill your requirements.

See our page in Electronic Buyer’s Guide and EEM and write for FREE product sheets today.

P.S. Oil exploration personnel: Custom can help you with your logging tool problems.

20 hertz to 12.4 gigahertz, for the model 350D, or 20 Hz to 18 GHz, for the model 351D. Prices for the two units are $4,700 and $5,100, respectively.

Since the 40-MHz fm-tolerance figure is cited as a worst-case specification regardless of rf frequency, signal level, or modulation rate, best-case conditions are considerably better. And in fact, peak-to-peak deviations of over 200 MHz can be tolerated under ideal conditions. Similarly, sensitivity is actually –25 dBm over the broad frequency range from 1.1 GHz to 12.4 GHz, with a typical figure closer to –30 dBm over most of that range. A $100 option guarantees –30 dBm sensitivity from 1.1 to 6.5 GHz.

Both instruments employ 11-digit LED readouts grouped into four sections—GHz, MHz, kHz, and Hz. The need for annunciators and decimal points is thus eliminated. When full 1-Hz resolution is not required, reading speed can be considerably increased by blanking up to six of the least significant digits in the display. As the resolution is decreased in decade steps, the counter’s gate time is also decreased in decade steps from a maximum of 1 second to a minimum of 1 millisecond.

Accuracy of the counters is ±(time-base stability + 1 count).

The standard time base supplied with the units has an aging rate of less than 3 parts in 10⁷ per month, and a short-term maximum drift of less than 1 part in 10⁹ rms for a one-second averaging time. Temperature-induced variations are less than 2 parts in 10⁶ over the range 0°C to 50°C.

Three time-base options are offered for the 350D counters. The most expensive of these costs $600 and has an aging rate of less than 5 parts in 10¹⁰ over a 24-hour period after a 72-hour warm-up. Short-term stability is better than 1 part in 10¹⁰, and temperature stability over the 0 to 50°C range is better than 3 parts in 10⁸.

Many other options, including BCD output, remote programming, i-f offset, and YIG preset are also available. The YIG preset option allows the user to set the frequency at which the counter’s YIG-tuned filter will begin its sweep. This shortens the measurement process for applications in which the user knows that the frequency to be measured is above a definite number.

The counters require 80 watts of operating power at either 115 or 230 Vac. Line frequency may be anywhere from 50 to 60 Hz.

EIP Inc., Subsidiary of Datalab, 3130 Alfred St., Santa Clara, Calif. 95050 [386]

12-bit converter uses little power

Hybrid Systems’ contribution to this year’s IEEE show is the ADC-575-12, a low-power analog-to-digital converter that operates from a single power supply. The 12-bit a-d device is packaged in a small module 2 by 0.4 inches with a pinout compatible with dual in-line packages.

Designed specifically to need little power, the ADC-575 uses a single source of +12 volts to +15 V and consumes only 30 milliwatts of power. Hybrid claims this is significantly lower than most 12-bit a-d
New from Cinch: compact, easy interconnection

for switching and test panels, programming boards, and other patch cord systems

Originally developed and successfully used for telecommunications applications, this Cinch CCB circuit concentration system may now be the answer to your complex interconnection problems. One side of the panel assembly is wirewrappable, for automatic, semi-automatic or hand wiring. The other side accepts polarized, positive detent, single through six-pin, color-coded patch cord plugs for rapid circuit changes.

Color coded panels have raised, high-visibility, replaceable marker strips. Contacts are on 0.200" centers and individual contact modules can be replaced in seconds. The compact CCB system is remarkably easy to install, modify and maintain.

For detailed information call TRW/Cinch Connectors at (312) 439-8800 or write TRW/Cinch Connectors, an Electronic Components Division of TRW Inc., 1501 Morse Ave., Elk Grove Village, Ill. 60007.
Airpax manufactures "passive" analog and "active" digital transducers (pick-ups) to provide the most effective and accurate means of converting mechanical motion into usable voltage control signals...without mechanical linkage. These magnetic pick-ups operate by accurately detecting moving ferrous discontinuities. Want to know more about pick-ups?...How is the selection made? How does the gear or discontinuity affect the pick-up output?

These questions are answered

 converters which may consume as much as 10 times that much power. A Hybrid spokesman notes that some a-d converters reduce their average power drain by shutting off the analog section when the device is not in use; the ADC-575 is never shut off.

The heart of the ADC-575-12 and the key to the minimal power drain is the use of delta-sigma modulation, which is provided by the Deltaverta, a product recently introduced by Hybrid Systems. The Deltaverta converts its input to an output pulse rate by maintaining a charge balance across an integrating capacitor. The pulse rate, in turn, controls the amount of charge that is applied to achieve balance. The Deltaverta eliminates the need for a power- and space-hungry ladder network through high-quality integration, even though this raises the conversion time of the device to 100 milliseconds.

By a simple change in its pin-terconnections, the ADC-575 can be made to convert either unipolar (0 to +10 V) or bipolar (-10 to +10 V) input signals. The unit can also provide corresponding C-MOS-level binary or offset binary output codes to within ±½ count linearity (0.02%).

The device contains an internal dc-to-dc converter that provides the necessary bipolar offset.

The minimum input impedance is 10 milliohms for unipolar signals and 400 kilohms for bipolar signals.

The gain stability in relation to temperature is 30 parts per million per °C, and offset drift is 5 ppm/°C. Specified temperature range is 0 to 70°C.

Hybrid Systems' ADC-575-12 is designed for such battery-powered applications as portable instrumentation and for point-of-measurement conversion of remote transducer outputs. It is also suitable for measuring many geophysical and oceanographic parameters.

The ADC-575-12 converter is priced at $199 each in quantities of one to nine.

Delivery time for the unit is two weeks.

Hybrid Systems Corp., 87 Second Ave., Burlington, Mass. 01803. [387]
Honeywell had a perfectly good main frame connector.
What in the world made them change it?

A copper alloy called CA 725. Now they use it for new main frame connector springs.
Honeywell’s experience with CA 725 has been outstanding. Since bare CA 725 solders readily, resists corrosion and tarnishing, it was possible to eliminate costly gold plating over most of the contact spring.
This allowed Honeywell to get more gold where it is needed— at the contact point. More gold at the contact point increased connector life ten times; made possible by CA 725.

Honeywell’s connector manufacturer, Winchester Electronics, knows that CA 725 has a lot to offer in the way of good mechanical properties and excellent fabricability. CA 725 is a standard material available from many copper and brass sources.
Why don’t you consider a change for the better? For more detailed facts about CA 725, write The International Nickel Company, Inc., Dept. 3373, One New York Plaza, New York, New York 10004.

Honeywell’s new main frame connectors are manufactured by Winchester Electronics.

INCO
THE INTERNATIONAL NICKEL COMPANY, INC.
That's the way to increase the legibility of your display. With our CRTs you can have a flat surface as large as 22" superior brightness, exceptional contrast and an optional dual persistence capability as well. That means you can display such rapidly-moving information as aircraft identification labels and position symbols next to the display of low repetition-rate video — without confusion. Phosphor persistence and color can be selected by voltage switching to present radar targets in one color and to write computer-generated characters and air routes in another color.

By varying the voltage of a single electron beam scanning a multiphosphor screen, we've achieved outstanding brilliance and contrast. And resolution that's comparable to that of high quality monochrome CRTs.

For complete information on our color CRTs, circle the appropriate number on the reader's service card, or contact us directly.

Schottky-TTL controller put on a chip

Four-bit microcontroller can do job of 24 TTL MSI packages and uses less power; it emulates midicomputer systems with a fraction of the DIP count

by Laurence Altman, Solid State Editor

**Large-scale integration**, until recently a technology of benefit only to MOS-circuit manufacturers, has been adapted to bipolar data-processing circuitry—with significant results. Monolithic Memories, Sunnyvale, Calif., has built a bipolar microcontroller—a complete 4-bit Schottky LSI processor slice on a single chip. It can do the job of 24 TTL MSI packages and save 6 watts of power in the process. Indeed, with a gate complexity of 1,000 (the largest bipolar processor chip available), the 5701/6701 microcontroller with only 28 packages can emulate a Nova-level computer, whereas a typical Nova’s CPU board requires 175 packages.

Dale Williams, marketing manager, claims that the 6701 is “ideal for upgrading or replacing existing computers because no new software is needed, and it’s extremely flexible. Since the microcontroller is 4-bit expandable, machines in all classes can be emulated with a minimum number of packages—from 8-bit single-chip MOS processors, such as Intel’s 8080, to the higher-performing 8-bit multichip minicomputers, right up through the 16-bit midimachines. Even the 32-bit maxis, such as the IBM-360 types, are in the 6701 range.”

The 6701 microcontroller contains an impressive array of circuitry; bit shifters, a multiport 16-by-4 RAM, control registers, multiplexers, arithmetic/logic unit, and 352 bits of ROM, in addition to clocks and output-control drivers. A total of 256 instructions is possible, providing full arithmetic, logic, and shifting capabilities. There are 16 directly addressable two-port general-purpose accumulators, and a separate accumulator-extension register.

The two-address capability of the 6701 (ability to work on two accumulators simultaneously) and the powerful microinstructions permit design of hard-wired central processors having sub-microsecond cycle times or the efficient emulation of conventional machines through use of read-only memories for microprogramming. The microcontroller will handle the data-flow section of

---

Low count. Typical special-purpose microprocessor has four 4-bit controllers, five 6301 ROMs, two H6241 ROMs, four TTL shift registers
"Forget it. I'm not paying to have MOS circuits designed outside when we can do it ourselves. What we need is a company that can produce our circuits."

Now for the good news:

We now have a separate Customer Tooling Department. It's set up to deal directly with companies that have their own design departments or work with engineering consultants. You provide us with the tooling; we provide you with high volume production and broad process capabilities. It's another first-rate service from the Number One MOS company. For complete information, including our new brochure, write to Bill Robson, American Microsystems Inc., 3800 Homestead Road, Santa Clara, CA 95051.
Phone: (408) 246-0330. Or ask your distributor.
Our Customer Tooling Service is for companies with designs of their own.

We've already worked with enough big firms to know that we've got what they need: an ability to produce large quantities of circuits in a wide variety of processes. Now we're ready to work with you, starting at any stage you want. We can take the designs from your own engineering department and run them. We can act as an interface between you and an outside MOS design firm. Or we can work with you all the way from the concept through the finish.

Which is the best process for you?

When you come to AMI, you get a complete choice. P-Channel, High Voltage, Metal Gate; P-Channel, Low Voltage, Metal Gate; P-Channel, Ion Implanted, Metal Gate; P-Channel, Silicon Gate; P Channel, Ion Implanted, Silicon Gate; N-Channel, Silicon Gate; and Complimentary MOS.

Each process has its trade-offs in terms of cost, speed, power consumption, chip size, noise immunity, flexibility etc. So, between us, we can pick the one that will do the job for you most efficiently and economically.

Read all about it in our new brochure.

We spell out how we work and exactly what we have to offer in this new Customer Tooling booklet. It tells you about such things as our Design Workshop, our standard interface procedures, product testing, work scheduling, and background on the company. In short, it sums up most things you might want to know about AMI's capabilities, experience and services.

Your local AMI distributor has copies on hand. Or contact us direct and we'll stick one in the mail. And you won't get stuck paying for more MOS services than you need.

New products

most computers, since it is expandable to handle any word length in increments of 4 bits without significant speed degradation (look-ahead outputs are available). The 16 on-chip general-purpose accumulators give the microcontroller the type of central processor usually found only in high-performance 16-bit microcomputers and 24- or 32-bit computers.

The microcontroller can be thought of as a general-purpose 4-bit register and arithmetic/logic unit with separate A operand, B operand, and data-in and data-out ports. Additional accumulators or registers can be added by tying off-chip packages to the microcontroller's data-in pins.

When compared with its TTL MSI equivalent, the single-chip microcontroller has 350 fewer input-output pins and 19 are replaced—14 16-pin packages and five 24-pin packages. In board area, this saves about 40 square inches. To emulate the Nova-class minicomputer, for example, would require only four 6701 controllers, 14 ROMs or programmable ROMs, say of the 5301/6301 type, four or five registers, three gates, and two multiplexers—a total package count of only 27 or 28.

Besides package reductions, instruction times in 6701 systems are reduced, as well—following from the 6701's speedy 150-ns cycle time. A jump, for example, is done in two microcycles that take 400 ns, compared to Nova 800's 800-ns jump time. Jump-to-subroutine takes 3 microcycles or a total of 600 ns, compared to Nova's 800 ns, Monolithic Memories says.

"Aside from emulating existing machines," asserts Williams, "the 6701 will also be useful in new applications, such as tape and disk controllers, point-of-sale terminals, process-machine control, word-processing and navigation systems, intelligent terminals, game machines, and traffic-control systems—anywhere high computer performance is required in small space using a minimal number of packages." Deliveries will begin in July.

Monolithic Memories Inc., 1165 East Arques Ave., Sunnyvale, Calif. 94086 [339]

Nickel-boron plating may replace gold

Plating for connectors, printed-circuit boards is one tenth the price; it's corrosion-resistant, solders well with rosin fluxes and wire bonds

by Stephen E. Grossman, Packaging & Production Editor

Gold plating on connectors and printed-circuit boards costs more than $100 million a year, but researchers at Du Pont have developed a nickel-boron substitute that they say rivals gold in performance for a tenth the price. The new material, called Sylek 201, consists of a nickel plating solution that weighs only 1% as much as boron.

For packaging engineers, the nickel-boron plating means they may be able to replace the costly metals that now house semiconductors with a relatively inexpensive nickel-boron-plated steel. Nickel-boron may make this substitution possible because the plating, besides being relatively immune to corrosion, solders with rosin fluxes and wire-bonds quite well. The plating may also replace gold on the contact fingers of printed-circuit boards.

Despite the moves toward leadless designs and tin-alloy contacts [Electronics, Feb. 1, 1973, p. 86], gold plating is still used almost universally. This is because it forms virtually no surface films and, when two gold contacts mate, the resistance across the interface is low—on the order of 5 milliohms. Equally important, the resistance of a gold-plated contact remains low when subjected to all kinds of hostile environments.

While the contact resistance of Sylek 201 is somewhat higher than gold—about 15 milliohms—it is satisfactory for virtually all connector applications, according to Harold E. Bellis, laboratory manager of Sylek plating products. Bellis also states that the contact resistance of Sylek 201 remains low through a whole battery of environmental tests such as humidity, hydrogen sulfide, and high temperature (250°C). Even salt spray fails to raise the contact resistance above 25 milliohms, he says.

In addition, Sylek 201 plates out at about the same rate as gold—250 microinches per hour. And, since the solution is autocatalytic, it requires no electroplating setup, and thus can be used to plate nonconductive materials such as plastic and ceramic. Du Pont says Sylek 201 wears as well as chromium, yet it is ductile enough to survive flexing and deformation without cracking. The plated surface costs about $40 per square foot-mil.

Industrial Chemicals Dept., Du Pont Co., Wilmington, Del. 19888 [403]
Plug this in, and you've just designed a custom data acquisition interface.

Nothing to it. Just plug in a few modules and tap in your instructions. The new PDM70 programmable data mover will sample your sources, transmit your data in serial ASCII to a remote computer, and return control instructions to local devices. If you want, it can also communicate interactively, without computer intervention, between sources and local peripherals.

Off-the-shelf modules connect the PDM70 to any computer, to analog and digital input devices, and to such computer peripherals as Teletypes, X-Y recorders, storage oscilloscopes, printers, modems, and LED displays.

System prices start at $2000.

Write, and we'll tell you more. We're Digital Equipment Corporation, Logic Products Group, Maynard, Mass. 01754. (617) 897-5111, extension 2785.

In Canada: P.O. Box 11500, Ottawa, Ontario, K2H 8KR. (613) 592-5111.

We think interfacing is so important, we've devoted an entire department to it.
Carpenter soft magnetic alloys. Uniform. Profitable. All the time.

Carpenter soft magnetic alloys are specially tailored for fabricating techniques: stamping, etching, deep-drawing, spinning, hydroforming, machining, forging, cold heading, blanking and forming. You specify which you use.

Got a question? Call your Carpenter Service Center for effective answers.

Every grade, form and size you'd ever need. You can handle any job.

Consistent, uniform quality keeps production up and costs down.

Top quality from surface to core. Beautiful to work with.

You can get everything. High permeability grades. Silicon core-irons. Nickel-iron alloys . . . and the purest commercial iron high flux density alloys . . . available.

Get prompt, personal attention on all your soft magnetic alloy requirements. Call your nearest Carpenter Service Center today for complete information. Or write Carpenter Steel Division, Carpenter Technology Corporation, Reading, Pa. 19603. European Office: 51, Square Vergote, 1040 Brussels, Belgium.

For shielding, you can't beat Carpenter Hipernom®.

Components

Paper capacitors take high power

Extra leads shut off
Mylar-paper devices if they overheat

Mylar-paper capacitors aren't known for their ability to withstand high voltages, but a variation of a proven component of that type specifically designed for high-voltage circuits will make its bow in Booth 1216 at the IEEE Intercon 74.

That's where Electro-Motive Corp., a subsidiary of International Electronics Corp., will show the newly designed El-Menco type MPCE four-lead device, which offers safe high-voltage operation in such applications as the high-voltage horizontal oscillator circuit of color-TV sets. Two-lead versions might cause fire, explosion, or melting of circuits and components after prolonged overloading.

In the four-lead version, when the capacitor is wired into a circuit, overheating will cause one or more of its four terminal connections to increase in dc resistance so that the capacitor shuts down. Shutdown can also be triggered by excessive vibration.

As with its two-lead forerunner, the four-lead unit is non-inductively wound with Mylar and paper, and it is vacuum-impregnated with mineral oil. The sections are enclosed in an impervious ceramic tube and sealed with a specially developed epoxy and fill.

The conventional two-lead El-Menco type MPCE capacitors have demonstrated excellent ac and pulse characteristics. They are used in TV-flyback circuits (15 kilohertz), power converters (400 Hz to 50 kHz), fluorescent-light circuitry (100 kHz), and in noise-filter circuits with peak currents of several amperes.

El-Menco type MPCE capacitors range from .001 microfarad to 1 µF. Dc-rated voltages of 1,000, 1,600, and 2,000 V are designed for the temperature range -40°C to +85°C. They offer capacitance tolerances of ±10% and ±20%.

In the 1,600-V dc range (the range in which the four-lead critical safety component is presently being manufactured), .001 µF capacitors measure 1.187 inch by .41 in.; .056 µF capacitors are 1.875 in. by .8 in.

International Electronics Corp./El-Menco, 316 South Service Rd., Melville, N.Y. 11746

Lighted switches can be made into a keyboard

Users can make their own keyboard or data displays with a series of ½-inch push-button switches featuring independent lamp circuitry. Single-pole single-throw through double-pole double-throw functions are offered with ratings of 30 volts dc or 115 V ac, 2 amperes resistive, 1 A inductive. Minimum life is 100,000 operations. The series 61 is also available in momentary or alternate action with nominal operating pressure from 9 ounces.

Electro-mech Components Inc., 1826 North Floradale, S. El Monte, Calif. 91733

Subminiature slide switch inhibits flux contamination

Designated the Mini-Mike model 23-021-303, a subminiature slide switch is a double-pole double-throw unit with insert-molded ter-
New products

minal pins specifically designed to inhibit solder and flux contamination. The use of thermoset plastic and gold-over-nickel-over-brass plating also provides low energy usage for pc-board applications, with minimal contact resistance. Quantity price is less than $1.

Chicago Switch Inc., 2035 Wabansia, Chicago, Ill. 60647 [347]

Liquid-crystal filters offer
51.2-MHz center frequency

A line of liquid-crystal filters, designated the 6918LA, offers a center frequency of 51.2 megahertz. Other specifications include a 3-decibel bandwidth of 28.4 MHz minimum, a shape factor of 1.5:1 at 30/3 dB, and an operating temperature of -10° to +65 °C. The filters, priced at under $50 in lots of 100, are available in low-pass, high-pass, bandpass, band-reject or in combination configurations.

Damon Corp., Electronics Division, 80 Wilson Way, Westwood, Mass. 02090 [346]

Program relay performs multiple functions

The model P-69 program relay, using 12 in-line microswitches, performs multiple switching functions and is said by the company to fill the gap between complex relay gating and solid-state circuitry. The 12 microswitches are independently activated by interchangeable cam bars held in 12 slots around the periphery.
Digital readouts. Ubiquitous in calculators and instrumentation. And the coming thing in all kinds of consumer gear. Appliances. Hi Fi. Cars. You name it. You know it. We know it. So what? So, for starters, we can give you what nobody else can. All (that's right, all) of the standard character heights in the most commonly used digit combinations. With the best resolution in the business (because of our unique mask construction). And in easy to read, orange-red.

We call it DiaDigit™. A differently designed, single envelope package, multi-digit gas discharge display. You don't need other package combinations to get what you want. It's IC compatible. Mechanically you handle it like other components in your system: leads like an IC, mounts directly to your PC board, no fancy sockets to buy. It also has low power requirements. Super reliable. Sounds good, right? But by now you may be wondering just what our qualifications are. Good question. We're well known as the leader in innovative packaging to the semiconductor industry. (You guessed it. Logically, our package is based on DIP construction techniques. The processes used are our own patents.)

Bonuses: We're fast on specials. We can give you many combinations of letters, symbols and digits. Because we're geared to handle the unusual, and the simplicity of our design lets us deliver what you need.

Now, if you're hooked on the possibilities, but worrying about the price. Don't. We're competitive. After all, we think the name of the game is numbers. And we want everybody to play.

We can't spell out all the details here. And you probably have our competitor's specs. All we ask is you compare ours. (Along with price and delivery.)

Diacon, Inc., 4812 Kearny Mesa Road, San Diego, California 92111. Or phone 714/279-6992.

ery of a rotating cylinder. In each of the 12 operating positions, reached through an ac- or dc-powered stepping mechanism, any one of more than 1,000 combinations may be programmed. When two or more relays are connected in series or parallel, the number of permutations multiplies accordingly.

Global Marketing & Management Inc., 947 Beau Drive, Des Plaines, Ill. 60016 [348]

Infrared lamp emits from 0.4 to 5 µm

An infrared lamp source, called the model CM8-3968, emits a spectrum wavelength from 0.4 to 5 micrometers. The device also operates on a total power input of 33 watts at 12 volts ac or dc and offers a life expectancy averaging in excess of 5,000 hours at rated voltage. The lamp is designed primarily for use in automotive-exhaust analyzers and other pollution-detection equipment.

Chicago Miniature Lamp Works, 4433 N. Ravenswood, Chicago, Ill. 60640 [349]

Heat sinks cool T0-116 devices

Dual in-line heat sinks are available in four styles to cool T0-116 and similar devices without taking up extra board-space. The models 141 and 142 measure 0.40 by 0.75 inch, the models 143 and 144 measure 0.25 by 0.75 in., and the model 145 is 0.21 by 0.75 in. The models 141 and 142 can also be used on ½-inch-wide microcircuit packages.

Aham, 968 W. Foothill Blvd., Box 909, Azusa, Calif. 91702 [350]

Electronics/March 7, 1974
America's romance with energy is cooling off. We're running out of steam, out of waterfalls, out of electricity from any source. And as our power becomes less available, brownouts and blackouts become more likely. (Just ask your computer.) Fortunately, there's still time to install an Elgar Uninterruptible Power Source. It will protect your computer system against voltage dropouts and brownouts (regulation to ±2%; up to 40 dB line transient reduction) and give 10 minutes of backup power in the event of a blackout. Write or call for details today...while you still have the energy.

Elgard Uninterruptible Power Sources are available in 500 VA to 15kVA models. They supply up to ten minutes of instantaneous reserve in case of power failure; and they have self-contained, maintenance-free batteries. Ideal for IBM Systems 3 and 7, DEC PDP Series, Burroughs Banking Systems, and Litton/Sweda P.O.S. Systems. Priced from $1,895.

Instruments

Analyzer boasts tuning accuracy

Spectrum-measuring unit operates in either frequency or time domain

Spectrum analyzers suffer from sensitivity problems and tuning uncertainties that make it difficult to use them on very weak signals, especially in the presence of stronger ones. To detect a very weak signal, a very narrow i-f bandwidth must be used—but a very narrow i-f passband must be positioned with great accuracy to ensure its being centered on the weak signal. This means that excellent tuning accuracy and low frequency-jitter are necessary for the acquisition of weak signals.

Rohde & Schwarz has therefore incorporated a very fast-responding varactor-tuned local oscillator, and a series of i-f filters with extremely steep skirts into its latest analyzer. Called the Analyskop EZF, the instrument is said to provide 1,000 to 10,000 times the tuning accuracy of more conventional instruments. The unit spans the frequency range from 6 kilohertz to 170 megahertz in four overlapping bands. With its add-on uhf tuner, model EZFU, the instrument’s frequency range is extended to 2.7 gigahertz in two additional ranges.

Input sensitivity of the analyzer over a 1-kHz i-f bandwidth varies from about 0.5 microvolts to about 1 µV, depending upon frequency. The 1-µV figure applies at the top of the uhf tuner’s range—2.7 GHz. The bandwidth can be made as small as 50 Hz with an accompanying improvement in sensitivity of three to five times.

In addition to functioning in the frequency domain as a normal spectrum analyzer, the Analyskop can also make time-domain measurements. In this mode, the frequency scan is stabilized at a selected point in the displayed band, and the frequencies passed by the i-f filter then in use are fed to either an a-m demodulator or an fm discriminator. The waveform that results is then displayed in the time domain by a time base that is synchronized with the input signal to provide a stationary display. When stabilized, the analyzer’s local oscillator has approximately 1 Hz of residual fm noise on it.

With the uhf tuner, frequency is indicated from 0 to 2.7 GHz by means of a seven-digit counter. Tuning accuracy is within 1 kHz to 10 kHz, depending on range, while frequency resolution varies from 10 Hz to 1 kHz.

The basic Analyskop EZF is priced at $18,485, and the uhf tuner adds $8,070 to the price.

Three plug-ins added to 60-MHz scope family

Two amplifier plug-ins, models 5A38 and 5A45, and a time-base plug-in, model 5B40, have been added to the 5400-series of 60-megahertz oscilloscopes. The model 5A38 is a dual-trace amplifier with a 35-MHz bandwidth. It is intended for applications requiring more than the 2-MHz bandwidth of the company’s 5100-series amplifiers but not requiring the full 60-MHz bandwidth of the 5A48 dual-trace amplifier. For applications requiring a wider bandwidth, but needing only a single channel, the 5A45 amplifier plug-in offers a 60-MHz bandwidth with a sensitivity rating from 5 millivolts per division to 10 mV/division. The 5B40 timebase unit provides sweep generation and an external amplifier. Sweep rate ranges from 5 seconds per division to 10 nanoseconds per division. Price for the 5A38 is $350; the 5A45 is priced at $250, and the model 5B40 is $275.

Recorder delivers copy at 90 lines per minute

With a speed of 30 sweeps a second or 90 lines of data per minute, the model 600 Push-to-Print recorder employs a facsimile technique on electrosensitive paper. The instrument is meant to work with conventional terminals using bistable storage tubes. TV or CRT terminals can also be interfaced with the recorder directly through a scan converter. Paper advance is 100 lines per inch, and 400 frames can be provided on a 200-foot roll of paper. Price of the recorder is $2,500,
AVX's development of a new, exclusive technique for applying silver, nickel and gold terminations on ceramic chip capacitors is another example of AVX technical leadership.

AVX ceramic chip capacitors with NiGuard can speed your assembly and improve dramatically your production yields.

Nobody makes more ... or better multilayer capacitors than AVX. This combined with AVX technical leadership means you can depend on AVX to deliver consistent quality chip after chip after chip. Available in a wide range of sizes. Meets all standards including EIA, and high reliability MIL C-55681A specifications. Whether you need chips in ½ pf to 50 mfd ranges or higher, AVX can supply them. Need applications assistance, it's yours for the asking.

For complete information, request a copy of the AVX Short Form Catalog. Write AVX Ceramics, P.O. Box 867, Myrtle Beach, S.C. 29577. Telephone: (803) 448-3191. TWX: (810) 661-2252. Or D.I.A.L. EEM toll-free (800) 645-9200 (In N.Y. State, call (516) 294-0990).
COMPUTER-COMPATIBLE PROGRAMMABLE ANALOG FILTER 16 CHANNELS

SYSTEM 816

- DIRECT INTERFACE WITH COMPUTER, PROGRAMMER OR SWITCH CLOSURES
- PLUG-IN CARDS PROVIDE UP TO 16 INDEPENDENT FILTER CHANNELS IN 5¼" HIGH PANEL
- LOCAL, REMOTE, AND ON-CARD PROGRAMMING OF CUTOFF FREQUENCY
- CUTOFF FREQUENCY RANGE: 0.01 Hz to 150 KHz
- FUNCTIONS: Low pass, high pass, bandpass, band reject
- ATTENUATION SLOPE: 48 db/octave/channel
- ATTENUATION CHARACTERISTICS: Butterworth, Bessel
- DYNAMIC RANGE: 80 db
- PASSBAND GAIN: 0 db
- OUTPUT SIGNAL: 20 volts p-p
- IMPEDANCES: 1 Meg input, 50 ohm output

SOME APPLICATIONS:
- BAND LIMITING ANALOG SIGNALS PRIOR TO A/D CONVERSION (ANTI-ALIASING)
- NOISE ELIMINATION IN DATA CHANNELS
- TRANSDUCER OUTPUT FILTERING
- FAST FOURIER ANALYSIS

Fm/a-m modulation meters measure narrow deviations

The model 2300B fm/a-m modulation meter measures narrow deviations. The instrument uses a tuned local oscillator that reduces internal fm noise and almost eliminates microphonics. Fm deviation as high as 500 kilohertz can be measured at carrier frequencies to 1,200 megahertz, and a-m depth can be measured to 95% at carrier fre-
When the questions are about enclosures, Optima has beautiful answers.

Whether packaging small, digital multimeters or a huge, communications center, you need enclosures with structural integrity, access, and versatility. Doing their job and doing it well.

How do you get them? Consider the alternatives... job shop... in-house construction? ... a manufacturer? To decide, it is important to ask the right questions and get the right answers.

Sales Appeal

The first ten seconds of display for an electronics unit focus simply on its style, color and finish. They won’t break a sale—the equipment inside does that. But they can sure help make one.

- Is an industrial designer with packaging skills involved?
- Can you get the superior vinyl finishes so much in demand today? Or woodgrains? Or special textures?
- Is a total range of designer colors on hand?

Versatility

An important sales tool is the ability to adapt to the changing needs of a client.

- Does a source offer hundreds of configurations to choose from? If, for instance, your client is thinking vertical rack, but wants the operator seated, can you offer a console-desk?
- Does a client need a ventilating grille? a blower? stabilizers? Wouldn’t drawer slides help his operations? What about writing surfaces, storage areas, drawers, casters? Are they in production, on line and ready to go?

Customer Service

Are your own needs being served?

- Can you get personal service from engineers, designers, and production people?
- Can you get special applications assistance?
- Does your source have a knowledgeable customer-service representative?

The Optima Line

Our line of enclosures for electronics is the product of finding good answers to tough questions. Whether your question is component access, cooling, special applications or new product development and even safe shipping—we’re ready!

Ready with Small Cases in 24 sizes from 133.6 to 1445.4 cubic inches; Instrument Cases and Racks in 124 sizes for 19- and 24-inch panels; Desk Consoles which are adaptable systems of instrument housing, counter and storage space; and the unique combination of chassis and case—Optima 17.

Computer scheduled manufacturing assures you of top quality control. We finish each unit inside and out with rugged vinyl and assemble them for final inspection—including most options and accessories—right at the plant.

Optima is the best answer. No question about that.

Write Optima Enclosures, 2166 Mountain Industrial Blvd., Tucker, Ga. 30084 or call (404) 939-6340.

Electronics/March 7, 1974
If the timing diagram says your logic should look like this...

...now you can see if it does.

Introducing the Glitch Fixer: Biomation's new 810-D Digital Logic Recorder makes any scope a data stream display.

Analyzing a complex logic circuit—especially asynchronous logic—used to be a tough assignment. No longer. Not if you put Biomation's new Glitch Fixer—the 810-D Digital Logic Recorder—between your troubled circuit and any oscilloscope. It lets you record up to eight digital signals simultaneously. Presents them in the same format you're used to seeing on data sheets. And lets you expand the 250-bit data line (x5) to get a closer look at what you've got.

Best of all, it features an input latch that grabs hold of any random logic pulse—the glitch you're looking for—as narrow as 30 nanoseconds.

Here are some other features to mull over: records 8 logic channels using 1 MΩ inputs, selectable logic thresholds, including TTL and EIA levels, synchronous clock input to 10 MHz or internal clocking selection from 20 Hz to 10 MHz, storage of selected data ahead of trigger, digital output for computer analysis or mass storage.

The Glitch Fixer is a new basic piece of diagnostic instrumentation designed for (and at the request of) logic circuit designers and troubleshooters. If you work with logic circuits, our 810-D Digital Logic Recorder will do the job. For $1950 (without display). Get the product literature and see for yourself. Write, wire, or phone Biomation at 10411 Bubb Road, Cupertino, CA 95014, (408) 255-9500, TWX 910 338 0226.

New products

Digital impedance meter is accurate to 0.25% plus 1 digit

The model 275 digital impedance meter, which has an error of 0.25% plus one digit, makes four-terminal measurements of capacitance, inductance, resistance and conductance. In addition, lead resistance, leakage impedance, stray field effects, and temperature and humidity problems are said to be eliminated through the use of redundant circuitry. An external guard signal is available on the front panel to keep stray shunt impedance from influencing the measurements; only function and range need be set. Indicator lamps tell the operator which functions are being used. Price is $990.

Electro Scientific Industries, 13900 N.W. Science Park Dr., Portland, Ore. 97229 [357]

Slotted lines measure from 2 to 26.5 GHz

The type 5240-series of slotted lines provide measurements over a range of 2 to 26.5 gigahertz of standing-wave ratio or impedance of instruments equipped with SMA connectors. To achieve the lowest residual SWR, the measuring connector is mounted directly to the slotted-line
When you need short- to medium-run drilling at mass-production rates — and incidentally, almost eliminate template costs — consider Excellon's new 1218 Quad-Drill. This four-spindle machine offers both precision drilling of pc stacks and an adjustable, semiautomatic drilling cycle by a template-following stylus. An exceptionally flat, rigid, dimensionally stable working surface is created by a massive granite surface plate on a granite base.

Machine takes, in addition to template, four stacks of 12.5" x 18.5" boards. Despite the variable factors in hit rates, a conservatively estimated production rate of one million holes per day per machine can be achieved.

Very short loading/unloading cycles and extremely high registration accuracy are achieved through unique bushing-and-slot tooling plates. The 1218 maintains ± 0.001" accuracy indefinitely. Template-making or short production runs can be accomplished directly from circuit art. In fact, the cost of templates made this way is so low, it can be virtually ignored in relation to hole-production cost. That's no small savings in itself.

All in all, it's fast, it's neat, and it gets the job done economically. For more on the 1218 Quad-Drill, call Dick Hogan, Sales Manager, at (213) 325-8000. Or write.

MOE Crystal Oscillator
Elements provide a complete controlled signal source from 6000 KHz to 60 MHz

The MOE series is designed for direct plug-in to a standard dip socket. The miniature oscillator element is a complete source, crystal controlled, in an integrated circuit 14 pin dual-inline package with a height of 1/2 inch. Oscillators are grouped by frequency and temperature stability thus giving the user a selection of the overall accuracy desired. Operating voltage 3 vdc to 9 vdc.

Milliohm digital multimeter measures over 13 decades

The 3½-digit model 164 multimeter measures resistance over 13 decade ranges with an over-all sensitivity of 10 microhms to 2,000 megohms by means of a dc constant-current method. The 28 ranges of the 164 include resistance measurement from 10 microhms to 2,000 megohms, a voltage span of 1 microvolt to 1,000 volts dc, and over-all dc current sensitivity of 0.1 nanoampere to 1 ampere. Other features include analog output for recorder monitoring, 1,000-volt overload protection, 500-V floating capability, 80 dB normal-mode and 120 dB common-mode ac rejection, and 100% overranging on all except the 1,000-V range. Price is $995.

Electronics/March 7, 1974
"Hey, Angel," we said, "lots of engineers need a very small relay (like with all terminals on .1" grid for PC boards) but they want it to carry a big load (like up to 50 amps)."

"Easy," said the Guardian Angel.

"Wait," we said, "this relay must be very dependable (like for computers and business machines) but must be very low cost (like for the competitive appliance business)."

"Not so easy," allowed the Angel.

"There's more," we told her. "Engineers want this relay in dozens and dozens of variations (like 5 to 50 amps, SPST to DPDT and everything in between). Oh, and AC or DC."

The Guardian Angel looked at us like we were nuts.

"And while you're at it," we went on, "give it a temperature range $-45^\circ C$ to $+70^\circ C$... life span over 10,000,000 operations... and bring it in at about an ounce."

The poor kid just started to cry.

"Look," says we, "you're supposed to be THE Guardian Angel of engineers, so let's see you do your stuff. PASS US A MIRACLE, BABY!"

DID THE GUARDIAN ANGEL SUCCEED?
Or did she fall on her pretty patoot?

Semiconductors

Calculator chip has 8 functions

IC for business, scientific machines also offers full memory control

Calculator manufacturers—those who make commercial and scientific machines—want to pack as many functions into one chip as possible. The newest calculator chip from MOS Technology Inc. does just that; it offers eight functions with full memory control.

Donald L. McLaughlin, engineering vice president, says that the chip operates a maximum of 30 keys. The user implements his calculator simply by electrically connecting his keyboard to the chip according to MOS Technology’s instructions. While he doubts many users will want the full 30-key capability, “the flexibility is there if he needs it,” McLaughlin says.

The eight basic functions provided by the MPS 2541-007 are add, subtract, multiply, divide, percentage, square root, reciprocal, and square. McLaughlin notes that the square-root function, the most complex, was included by reprogramming one of the company’s existing 512-word calculator chips with an algorithm written to add in both the square root and the full memory control.

Seven memory-control keys can be implemented with the chip, beginning with the simple “clear memory” function, moving to the “recall memory” step, which transfers the contents of the memory register to the entry register without modifying data stored in memory, and on to five others. The “memory total” function transfers the contents of the memory register to the entry register and clears the memory register. The “memory add” operation adds the number displayed to the memory register without changing the display, while the “memory subtract” step subtracts the displayed number from the memory contents without altering the display.

There are also “memory plus/equal” and “memory minus/equal” operations available. The former executes a prior stored command and adds the result to the contents of the memory register, transferring the new value to the display; the latter does the same thing in the subtract mode.

McLaughlin says that the eight functions plus seven memory-control operations represents just about any combination a commercial or scientific calculator maker could require short of slide-rule complexity. The chip also incorporates an internal clock generator, direct segment drive for a LED display, a low-battery detection circuit, and display-cutoff circuit, minimizing the need for external components.

The price in 100,000 quantities is $12.75 each; prototypes will be available this month, with full production by late April.

MOS Technology, 950 Rittenhouse Rd., Norristown, Pa. 19401 [411]

Multiplexing technique packs 4-kilobit RAM in 16-pin DIP

Staking its new claim in the 4,096-bit RAM market on a substantial savings in memory-system real estate, Mostek Corp. has shrunk its random-access memory. Using a novel input-multiplexing scheme, Mostek fits the 4,096-bit part into a standard 16-pin dual-in-line package, an approach that should save considerable space in printed-circuit-board layouts. “We’ve also looked at pc-board-layout rules and automatic insertion equipment, and, taking conservative layout rules, we see that the 22-pin version takes 56% more space,” says Bob Cook, applications manager.

The chip, which measures 157 by 185 mils, uses a single-transistor-cell design. A special self-aligned polysilicon interconnect enables elimination of all contacts from the memory matrix for increased manufacturing yields [Electronics, Dec. 18, 1972, p. 30]. To obtain the 16-pin configuration, Mostek breaks the 12 bits necessary to address the chip into two 6-bit bytes—the first 6 address one of 64 rows and the second, one of 64 columns.

Because the timing is more complex, the MK 4096, as it is called, requires two external clocks. But the chip’s clock inputs are directly TTL-compatible, which eliminates the need for high-level drivers. In addition, clock-input capacitance is only 5 picofarads.

A multiplexer is keyed to the clocks to present to the chip either the row portion or the column portion of the address, in that order. The chip is selected as the column-address strobe goes negative. “But since a 2:1 multiplexer is necessary for memory-refresh of the 22-pin RAM, the complexity we’re asking for in the controller design is that the multiplexer be 3:1,” Cook points out.

Access time of the memory, which uses power supplies of +12, +5, and -10 volts, is 350 nanoseconds, and read and write cycles are 500 ns. Active power dissipation is less than 100 microwatts per bit; standby power is less than 2.5 µW per bit. The part, in quantities of 100, is priced at $45. Mostek expects a second source to be announced next month.

Mostek Corp., 1215 W. Crosby Rd., Carrolton, Texas 75006 [404]

1,024-bit RAMs provide 30-nanosecond access

A pair of bipolar 1,024-bit random-access memories developed by Signetics have typical access time of only 30 nanoseconds. The two ver-

New products

sions being introduced are the 82S10, which has open-collector output, and the 82S11, which has tri-state output. The latter is apparently the first 1,024-bit memory to provide this feature. Both have the common 1,024-bit pin layouts and are compatible with Signetics' already announced 82S08 1,024-bit RAM with its power conserving "power-down" mode.

The RAMs are fully TTL-compatible. Signetics has used the same process to obtain the Schottky effect in earlier products, including 256-bit RAMs. The new RAMs, which are organized 1,024 by 1 bit, can be easily combined to make larger memories. The open-collector version is more commonly required, but the tri-state part is good for driving a capacitive line.

Both should find applications in buffer and scratch-pad memories, and Signetics predicts they will be competitive in high-speed mainframe applications by 1975. The RAMs are also suitable for writable control storage. "They will get down to the 1-cent-per-bit level at the same time that the smaller 256-bit RAMs do," says Harry Neil, marketing manager for bipolar products. The present price in quantities of 100 is $63.20 each, which Neil says is cost-competitive with other bipolar memories of the same capacity.

Each RAM requires a single +5-volt supply and typically consumes 120 milliamperes at 5.25 v. Maximum power-supply current at that voltage is 160 ma.

All specifications are quoted for the range of 0 °C to 75 °C. A characteristic include maximum address access time of 45 nanoseconds and maximum chip-enable access time of 30 ns. Both parts are supplied in 16-pin dual in-line packages.

Signetics Corp., 811 East Arques Avenue, Sunnyvale, Calif. 94086

Voltage-level translator handles C-MOS devices

Solitron Devices Inc., San Diego, Calif., has introduced a voltage-level translator that handles C-MOS circuitry. Called the CM4104A, the quad unit translates logic levels from a low-voltage system to a higher-voltage system. The company says this function has not been available in integrated form for C-MOS until now, but could previously be accomplished only by using discrete transistors.

The CM4104A is useful in applications where C-MOS devices must be interfaced to the outputs of TTL when the C-MOS system is operating at a higher voltage, in bus-oriented systems, or in systems where high-frequency C-MOS oscillators are operated at low voltages to conserve power, but must drive higher-voltage logic or output devices used in the system.

Each unit consists of four translators, each with a true/complement output. Each translator shares a common enable input to provide a high-impedance output when the enable input is low. Output impedance is 700 ohms, output leakage is 5 nanoamperes, and input leakage is 100 picoamperes. Propagation delay from low to high is rated at 170 nanoseconds, and the figure from high to low is 350 ns. Power dissipation is 100 microwatts. Packaged in a 16-pin dual in-line package, the epoxy-encapsulated device is priced at $3.45 each in 100-lots.

Solitron Devices Inc., Box 23157, San Diego, Calif. 92123 [413]

256-bit SOS memory cycles in 180 ns

Using silicon-on-sapphire technology, a 256-by-1 random-access memory, designated the model INS4200S, offers a read-cycle time of 180 nanoseconds and a write-cycle time of 140 ns. Quiescent power dissipation is 40 microwatts, and operational power dissipation is 26 milliwatts. Input capacitance is rated at 6.5 picofarads at 25 °C, and supply voltage ranges from 5 to 15 v. Other features of the device include a three-state-compatible output, full address decoding and bipolar-compatible pin-outs in a 16-pin dual in-line package. A minimum of

Need a DMM with a difference? ...Keithley's got 'em!

Tired of "general purpose" Digital Multimeter performance? Want that something extra that'll make your job easier? Then we've got the Multimeters for you. Take our new 5-1/2 digit, 10 μV resolution, $750, ac/dc Model 190...or our new 5-function, 32-range Model 165. It's even got a built-in 1 mA source for semiconductor testing. Then there's our model 171 ...a real do-it-all DMM. 4½ digits, 1 μV resolution, dc volts, ac volts, ac/dc amps, ohms too.

But the Keithley family doesn't end there. We can give you resolution to 30 nanovolts, or let you measure currents of 10^-15 amp, or resistances to over 10^14 ohms...we've even got a DMM that has the readout in a probe.

If you have a job that needs a DMM and then some, we can help. Send for our Digital Multimeter selector guide or call for a demo now. Phone (216) 248-0400.

Our latest "How sweet it is" proclamation is on a marble base paperweight. It's free when you request a DMM demo. Get one now!

The Color Guard comes on strong in color control.

Get the brights, with a rainbow of Silikrome® color filters that slip easily over clear miniature lamps, automotive lamps, even potted lamps... to make them any color you want. The interchangeable, field-replaceable silicone rubber boots stay colorfast and pliant, even after 1000 hours at 500°F, so you can put color to work when you want it, where you want it, as long as you want it.

And for applications where light is critical, they come on strong two ways—as a seal of safekeeping against light leakage, and as shockmounts for sensitive lamps. All this, with no plastic caps to melt or crack, no coated bulbs to fade or chip, no mounting hardware needed.

Find out more—write or phone today for free literature, price information and samples: APM-Hexseal, 44 Honeck St., Englewood, N.J. 07631; (201) 569-5700.

NEW PRODUCTS

The HS-200S... a wire memory offering speed, capacity, cost and reliability of ample proportions.

This is our latest wire memory. It gives you access time of 180 ns and cycle time of 250 ns. Memory elements, of course, consist of our own special development, magnetic wires. Non-destructive read-out is featured. HS-200S means maximum reliability at minimum cost. In fact, you get a 65 kilo-byte assembly with an MTBF figure of 10,000 hours. HS-200S is a component precisely matched to computers of the new age.

Wire Memory System HS-200S Specifications
1. Memory elements Non-destructive read-out
2. Storage capacity 8 kwords/80 bits, 16 kwords/40 bits, 32 kwords/20 bits
3. Access time 180 nanoseconds
4. Cycle time Write-in Read-out 250 nanoseconds
5. Interface levels TTL logic...
6. Dimensions 500 x 300 x 112mm (Basic unit capacity is 65 Kbytes. Expansion to one megabyte is possible.)
7. Required power +30V, +15V, +5V, -15V

Please contact our sales department if you have special requirements.

Divide-by-N counter
has four decades on chip

A four-decade divide-by-N C-MOS counter, designated the model CD4059AD, uses LSI techniques, which allow all four decades to be placed on a single chip. The counter is programmable and can divide a clock frequency by any number from three to 15,999. Three mode-select controls are used for programming. The device operates on 3 to 15 volts, and its output has the capability to drive TTL levels. Price in 1,000-lots is $13.60 each.

RCA, Solid State Division, Route 202, Somerville, N.J. 08876 [415]

FET-input op amp delivers 1,000 V / μs

The model 825 FET-input operational amplifier, which delivers 1,000 volts per microsecond, comes in a hermetic hybrid package that meets military standards. Full-power bandwidth is 10 megahertz, and the device can handle a 100-milliampere load current for video...
Sangamo makes recorders with enough channels for space science and enough economy for hospital labs.

If you need 48 channels of data, we build the only IRIG all-band tape recorder on the market—the Sabre IV.

If you are in the life sciences and need an efficient economical recorder for less than $5,000, you can buy a Sangamo/Tandberg TIR model that does almost everything a $16,000 recorder can do. And it’s no bigger than a breadbox.

Between the two extremes are the Sabre III, the all-band 7 and 14 channel portable, featuring laboratory quality, and the Sabre V, the most advanced portable 28 or 32 channel recorder/reproducer available.

That’s a wide range of capabilities. An even wider range of prices. The one thing that never varies is the quality. Sangamo recorders do the best job on every job. Including yours.

For details write: Sangamo Electric Company, Data Systems, P.O. Box 3347, Springfield, Illinois 62714, or call (217) 544-6411/Telex 406-421.

THE INNOVATORS IN TAPE INSTRUMENTATION
High Voltage Multipliers

High-voltage multipliers are available for CRT display systems, electrostatic power supplies, TV receivers, and other high-voltage applications.

The series includes doublers, triplers, and quadruplers in a wide range of voltages. They are designed for reliability, maximum stability and high temperature operation. For example, the Series MH 919 Tripler (with focus tap) for color TV has a nominal output voltage of 24 kV with 8kV peak-to-peak maintained. Cases are UL SEO rated.

A wide variety of package sizes and connectors is available. Custom design service for your particular applications is also available.

New products

IC preamplifier is aimed at chopper replacement

Designed to replace chopper amplifiers, the model LM121 integrated-circuit preamplifier, when used with a conventional operational amplifier, is said to eliminate the problems, like a limited supply voltage, associated with choppers. The device is also said to improve the dc input characteristics of the op amp, as well as increase loop gain, thus ensuring over-all accuracy, since the dc gain error is decreased. The LM121 is designed to give zero drift when the offset voltage is nulled to zero, and operating current is programmable by the value of the null-network resistors.

National Semiconductor Corp., 2900 Semiconductor Dr., Santa Clara, Calif. 95051

Fetron kits replace tubes in instruments

Fetron kits make it possible to substitute solid-state devices for the vacuum tubes in the Hewlett-Packard model 400 voltmeter and the Tektronix CA oscilloscope plug-in module. The Fetron duplicates vacuum-tube performance with a hybrid JFET circuit that plugs directly into the tube socket, but without the drift, screen grid or support power needed and found in tubes. The H-P kit, priced at $48 in small quantities, replaces all five meter-circuit tubes. The CA oscilloscope plug-in kit, which replaces 15 tubes, is priced at $110. Both are available from stock and distributors.

Teledyne Semiconductor, 1300 Terra Bella Ave., Mt. View, Calif. 94043 [418]
TYPE - 256 x 1 Static SOS/CMOS Ram
NUMBER - INS4200
READ CYCLE TIME - 180 nS
WRITE CYCLE TIME - 140 nS
QUIESCENT POWER DISSIPATION - 40 μW @ 10 V
INPUT CAPACITANCE - 6.5 pF
SUPPLY VOLTAGES - 5 to 15 volts
OUTPUT - Three-state TTL compatible, full address decoding and bipolar compatible pin-outs.
PACKAGE - 16 pin dual-in-line
PRICE - Mil Range (100-999) $38.00
Comm. Range (100-999) $21.00

Only Inselek makes the lowest power, highest speed 256x1 Static SOS/CMOS RAM currently available. And the price is only $38.00 in the military range and $21.00 for the commercial version (100-999). Excellent prices when you consider the added benefits you’re getting with our proven SOS technology...exceptional reliability, high speed and low power. With an Inselek INS4200 Ram, a minimum number of additional components are required due to the 3 chip select inputs, especially when employed with large memory arrays. For the applications minded engineer or manager, you’ll be glad to know that they’re perfect for use in point-of-sale systems, mini & micro computers, computer peripherals, calculators & portable electronic systems. One more point. The Inselek INS4200 Ram is fully compatible with other CMOS and TTL devices. Check the specs above and then contact Bob Burlingame, your applications engineering specialist at Inselek. Bob will be glad to discuss your specific requirements. Call Bob collect at (609) 452-2222, or write him at INSELEK, Inc., 743 Alexander Road, Princeton, New Jersey 08540.
Hitachi offers patent license on translucent aluminum oxide: 
an easily-formed, alkali-resistant material with excellent optical and electrical properties.

Hitachi’s new translucent aluminum oxide (U.S. patent No. 3,711,585) offers conspicuous advantages over translucent ceramic materials.

Developed to eliminate difficulties encountered in the blacking of luminous tubes for high pressure sodium vapor discharge lamps, Hitachi’s translucent aluminum oxide may be broadly applied as a substrate material for electronic devices and as a translucent material for high-temperature optical devices.

The outstanding advantages of Hitachi’s translucent aluminum oxide, particularly the low temperature it requires for forming, its high alkali resistance, and its excellent optical and electrical properties may be easily discerned by reference to the above table.

For further information, please write us at the address indicated.

Tokyo 100, Japan.
From the beginning, we have preferred concentration to diversification. We don't supply everything that attaches to your computer. But the things we do supply are the best.

What do we supply?

Drum plotters. We're the world's leading supplier of both hardware and software.

Flatbed plotters. Several years ago, we saw a need and an opportunity to expand the plotter's uses. The flatbed plotter allows a variety of materials to be substituted for paper; and it has expanded the market for computer graphics, as well.

Microfilm plotters. Here, we got bigger by getting smaller. With microfilm. Our 1675 COM plotter/printer and our 2100 COM printer deliver the best price/performance in the industry.

Disk memory equipment. This was our second area of concentration. In a remarkably short time, we have become the leading independent supplier.

Tape systems. We've recently begun to concentrate on tape. The result is that our new 1040 Tape Drive combines the features of others with our own experience. We intend to be a leader in this field.

The point is we have not grown by accident. Thirteen years after our beginning, we have become a leader in computer peripherals.

For information on peripheral products, call your local CalComp office, or contact California Computer Products, Inc., EM-M3-74, 2411 West La Palma Avenue, Anaheim, California 92801. (714) 821-2011.

We have an addition to our 600 Series! It's the Model 686 Core Memory System with a basic module capacity of 16K x 18. Like all 600 Series models, the 686 combines off-the-shelf availability with reliable performance and minimum cost. Modular constructed, ferrite core memories permit operation of up to eight core modules in a single enclosure.

Developed for a wide variety of data storage applications, the entire 600 Series is completely compatible with TTL logic. So, check the specifications, then specify the 600 Model that best fits your application.
DIVA'S COMPUTROLLER, PDP 11, AND 3330 TYPE DISC DRIVE UNITE.
AN INCREDIBLE MARRIAGE.

An Episode in the True Chronicle of the DIVAS, Proudest Peripheral Family in the Computerworld.

The computerworld stares in awe at the incredible wedding scene which has unfolded before them. The bride is minicomputer PDP 11, offspring of the illustrious maxi-computer clan, begat of Abacus. The bridegroom is DIVA COMPUTROLLER, scion of this proud, most respected peripheral family. Officiating at the ceremony is Duke DIVA Disc Drive, direct descendant of IBM compatible 3330 disc drives.

Realizing the great impact this interfacing will have on the computerworld, our happy guests monitor the wedding with joyous solemnity.

"Mated," Interdata 70 whirs, "PDP 11 will have access to 100 million bytes of data on a single spindle or 200 million bytes on a dual spindle disc drive unit within an average access time of 32 msecs."

"And with COMPUTROLLER providing a buffering sector, data will be transferable at the rate of 645,000 bytes/sec," marvels Nova II.

"And keep in mind," interrupts a breathless TI 980A, "that with COMPUTROLLER controlling eight drives, mini will have access to 1.6 billion 8-bit bytes of data!!"

But, hush! Listen to Duke DIVA repeating those always-inspiring words: "With the data stored in me, and with provided interconnecting cables and distribution panel, I now pronounce you linked in holy matrimony."

Resounding cheers befitting the occasion arise from the crowd. "A toast! A toast! A toast!" they roar. As is the custom, the proud parents, mini processor and DIVA controller, propose the toast to the dazzling couple: "To the most splendid and significant union in all our memories."

"Vive, DIVA! Vive, DIVA! Vive, DIVA!" Everyone unwinds.

But even as we listen to the clink of ceremonial glasses and the exuberant laughter, we sense an underlying sadness. Those unchosen minis — do they count for nothing now? Will they not be able to enter the world of high speed data storage/access and low cost/bit performance? And why — throughout this entire festivity — has COMPUTROLLER remained hidden under his purple robe? Is there more to COMPUTROLLER than meets the eye? Be sure to join us for the next episode in the True Chronicle of the DIVAS when we will hear the horrendous accusation: "Bigamy! BIGAMIST!"

In the meantime, learn COMPUTROLLER'S inside story. Find out about the free implementation and training courses, the software packages, and warranties that go with each disc system. All you PDP 11 users call George Roessler at 201-544-9000 for cost and delivery information.

Data handling

**Cassette head has long life**

10,000 hours claimed for read-after-write unit at tape speed of 8.7 in./s

Generally, West German companies don't flock to U.S. electronics exhibitions like Intercon with bags full of new devices because many of them consider the American market too competitive to begin with.

One of the exceptions at Intercon 74 will be Wolfgang Bogen GmbH, a West Berlin firm specializing in magnetic heads for consumer and commercial applications and reportedly Europe's biggest company in this field.

Among its exhibits will be a half-track magnetic head that at tape speeds of 8.7 inches per second has an operating life of about 10,000 hours—five times more than that of conventional units. It also achieves completely uniform resolution at a tape bit density of 556 bits per inch.

The result of two years of development, the DZ 1791 is a read-after-write head intended for commercial applications in Philips' compact digital cassettes. It is designed according to standards specified by the European Computer Manufacturing Association, the counterpart of the ANSI in the U.S.

The head's long life, says Bogen's marketing manager, Michael Limburg, derives from a core made of a special metal alloy. The alloy's abrasive characteristics are adapted to those of the carrier material, and that, Limburg says, "makes the head as longlasting as the equipment in which it's used."

Since crosstalk between a head's write and read portions can be a problem in read-after-write applications, a special precision shielding was designed that reduces crosstalk voltage considerably—typically to 3% of the read voltage.

A high resolution is achieved by a 2-micrometer gap width between the head's read and write portions. At that width, a resolution of 100% is obtained with tape storage densities of 556 bits per inch, of 85% with 800 b/in., and of 70% with a 1,600 b/in. Limburg adds that since the write and read gaps are of equal widths, the write portion can be hooked up so as to perform the read function—a feature which makes for fast data search operations.

The DZ 1791 operates on a write current of 6 milliamperes peak-to-peak and has a read sensitivity of 14 millivolts p-p, both values referenced to a bit density of 556 b/in., a tape speed of 8.7 in./s, a rise time of 10 microseconds, and a read bandwidth of 100 kilohertz.

The head is available as the clamp version shown in the photo, but is also sold as a unit that can be mounted on a precision base plate. Unit prices, Limburg says, range between $25 and $30.

The head's core material comes from Vacuumschmelze GmbH, a metals producer near Frankfurt. It's a permalloy material enriched with small amounts of titanium and niobium. After subjection to a special annealing process, it exhibits a crystal structure that is highly resistant to abrasion by the tape.

For its DZ 1791 and other non-consumer magnetic heads, Bogen expects a big sales push to come from the market gap left by Philips Gloeilampenfabrieken, reported to be getting out of the commercial magnetic-head business. Commenting on the U.S. market, Limburg says that experts predict the share of read-after-write heads to reach 20% on the digital cassette market. According to Bogen's marketing man-
New products

ager, forecasters further expect that by 1975 such cassettes will account for about 60% of the market for small data-storage terminals, whereas cartridge units and floppy disks will have shares of approximately 22% and 18%, respectively.

Wolfgang Bogen GmbH, 1 West Berlin 38, Potsdamer Chaussee 80, Germany [361]

Printer operates at 600 lines a minute

Designed for computerized management reports and financial data, a high-speed line printer developed by Vogue Instrument Corp. can be coupled to telephone lines and provide printouts from remotely located computers.

Designated the Vogue model 400C, the machine prints at up to 600 lines per minute, completing a full page in 6 seconds. It can produce from one to six clean copies without penetration controls or adjustment. A novel ribbon-reversing system makes it possible to print more than 300,000 lines using a standard commercially available ribbon. The model 400C is compatible with all major minicomputers, as well as with the Bell System's 201 and 202 modems and their equivalents.

An eight-channel, vertical-format unit saves computer and print time by enabling the 400C to vertical-tab to any position on a form. Vernier controls permit horizontal and vertical placement of forms while the machine is running.

Paper feed is actuated by a simple stepper motor that drives fan-fold, sprocketed paper up to 6-ply. All operator functions are accomplished through the front door of the cabinet, and the compact integrated logic circuits are contained on removable cards.

Price of the 400C ranges from $9,800 to $13,800, depending on system configuration. Delivery time is 60 days.

Vogue Instrument Corp., 131st St. and Jamaica Ave., Richmond Hills, N.Y. [374]

Flexible-disk recorders handle 250,000 bytes

An IBM 3740 compatible flexible-disk recording unit called the model 145 is field-upgradable from a single-disk to a dual-disk unit. Aimed at the OEM market, the unit uses 8-inch Mylar diskettes that handle to 250,000 bytes on each side. A side sensor mounted in the recorder detects the operational side of the disk and forwards this information to the status line. The two heads are mounted on a common positioner driven by a stepper motor. Each step of the motor indexes the heads by one track. Average access time for a random seek is 176 milliseconds or 2.5 ms track-to-

low cost circuit protection against high voltage/high energy surges

Stackpole Special Purpose Resistors (SPRs) help protect systems where high energy surges and high voltages would destroy valuable equipment. Check these characteristics:

- Best solution for protecting against high voltages in limited space.
- Unlike wire-wound resistors, SPRs are non-inductive, can be made in rods, rings, discs, or sleeves with wire leads or metal contacts.
- SPRs do not fuse out; they return to nominal value after absorbing the energy surge.
- Maximum voltage gradient 10 kilovolts/in., resistivity range from 2 ohm-cm. to 10,000 ohm-cm.

Write on your letterhead for samples to test in your next system design. Stackpole Carbon Co., Electronic Components Div., St. Marys, Pa. 15857.

Phone: 814-781-1234. TWX: 517-693-4511.

Electronic desktop calculator solves engineering problems

The model 1920 electronic desktop calculator for engineering applications provides full register arithmetic in all 10 storage registers. The display format is said to eliminate errors by permitting the engineer to work with units of his or her choice. A total of 18 engineering functions are hardwired, and parentheses up to three levels can be nested. In addition, there are 11 working registers, a floating minus sign, and leading and trailing zero suppression.

Optical character reader has facsimile capability

The model OCR/FAX combines the capabilities of optical character recognition and facsimile in a single unit, so that an operator can scan and transmit full page documents. In the OCR mode, input can be from a standard typewriter and typical typewriter pages are scanned, compacted to 8 bits per character and transmitted in 8 seconds over standard telephone lines. In the facsimile mode, input can be any kind of document, which is scanned, compressed and transmitted in 1½ minutes over telephone lines. Input terminals are priced from $32,700, and output terminals from $5,500.

New products

Disk system provides up to 80 megabytes storage

Two disk systems for use with most minicomputers provide either 40 or 80 megabytes capacity. Called the 7,000 series, the units come in five-disk packets. Rotational speed is 2,400 or 3,600 rpm, access time is 30 milliseconds average, and data transfer rate is either 6.5 megabits per second or 9.67 megabits per second. The mode of transfer used is data channel. Price of the 40-megabyte unit is $14,500; the 80-megabyte system, $16,800.

Xebec Systems Inc., 566 San Xavier Ave., Sunnyvale, Calif. 94086 [368]

Key-to-disk system stores 2.5 million bytes

An eight-station key-to-disk system with 2.5 million bytes of disk storage is designated the System IV/70 model 7008. The unit is intended for keypunch users seeking an economical introduction to shared-processor data entry and for key-to-disk users desiring more power from their systems. The system can store up to 20,000 80-character records, reducing the need for frequent disk purging. Stations use 12-inch video terminals for entry of records of variable lengths up to 192 charac-

need an inductor? check these facts about ferrites

FACT 1: cost of ceramic ferrites is 1/10 of steel alloys for low frequency applications, yet ferrites offer extremely high resistivity and coercive force.

FACT 2: for power applications, ferrite cores can operate at higher frequencies than laminated steel with better permeability and higher Q.

FACT 3: higher perm ceramic ferrite inductors require fewer turns, resulting in lower distributed capacity, material savings, and improved performance.

FACT 4: as the country’s largest producer of ceramic ferrite material, Stackpole offers unique mold-to-size capability, numerous tooled shapes, and its Ceramag® family of materials for frequencies from 1.0 KHz to 400.0 MHz and permeabilities from 7.5 to 7500.

Disk systems store up to 10 million 16-bit words

The series 4091 Univac 1616 disk system is composed of a disk fmatter, computer adapter, up to four magnetic-disk units, and interconnecting hardware for installation in standard 19-inch cabinets. Storage capacities up to 10 million 16-bit words per controller are offered, with an access time averaging 40 milliseconds at 2,400 rpm. Each drive has one fixed and one removable disk. Bit density is 2,200 bits per inch, and transfer rate is 156 kilohertz words per second. Price for a system starts at under $11,000.

Datum Inc., 1363 S. State College Blvd., Anaheim, Calif. 92806 [369]

Magnetic-tape terminal links Selectric and computer

An optional port for the IBM Communicating Mag Tape Selectric Typewriter (MCST) has been added to the MDRS-9 terminal to provide an off-line interface between the MCST and computers. The MDRS-9 will accept information sent by MCST stations over the dial-up network and record it on computer-compatible magnetic tape, while computer-prepared magnetic-tape data can be sent by the MDRS-9 to MCST stations. Line discipline is the same as when MCST stations are communicating with one another. Code conversion is available. The MDRS-9 terminal can also be used as a central pooler for a wide range of asynchronous terminals in the 110- to 1,200-baud range.

Mitron Systems Corp., 5026 Herzel Place, Beltsville, Md. 20705 [370]

a new choice in Plug-In Rotaries

Start with Stackpole's exclusive environment proof rotary. Then add terminal pins facing front or rear, ready to plug in instantly to your PC board. Or design in a Stackpole PC board rotary switch with 12 terminals ending at a common junction point for vertical or horizontal mounting or mating to an edge-board connector.

Eliminate wiring harnesses, hand wiring errors, costly intermediate assembly. Pin termination switches are available as standard off-theshelf switches as well as with binary codes and special switching sequences. Yet they cost less than $2.00.

Call Stackpole. They're plugged in to your needs. Stackpole Components Company, P.O. Box 14466, Raleigh, N.C. 27610. Phone: 919-828-6201.
ANNOUNCING
THE NEW NEG
REFRESH-DRIVE
PLASMA DISPLAY PANEL

Now! Bright, stable, accurate alphanumeric and graphic display!

Name your number, letter or pattern, and NEC's new plasma display panel will display it—brightly, stably, accurately.

The new panel effectively utilizes the refresh-drive technique, but with a difference: instead of conventional gold or silver electrodes, transparent tin-oxide film deposited in a special structure is applied. The happy result is sharp, clear display with directly visible discharging dots.

Whatever your application, NEC's new plasma display panel offers you these features and others, such as high contrast, wider operational voltage range and long life.

It's new from Acme Electric Corporation... a programmable solid state load device.
The PS²L load tests DC power supplies and batteries faster, more efficiently and with greater
accuracy than conventional test equipment. It's ideal for incoming test, quality control and lab work. The PS²L saves
set-up time and eliminates recalibration and maintenance
that's necessary with conventional test equipment.
Most other load testing devices use a resistive load.
They heat up. Need constant adjustment.
Lose efficiency.
None of this happens with the PS²L. It can be
programmed to simulate the load. This means no heating
up and no load fluctuations. So down goes your test time,
up goes your efficiency. The PS²L dissipates up to
1000 watts within a voltage range of 2 VDC to 50 VDC
and a maximum current of 110 amps when de-rated
per the power dissipation curve provided. It's equipped
with two modes of operation: 1) constant current and 2) constant
resistance. For dynamic loading, the PS²L is provided with a program input
for external connection of a pulse or signal generator. Two models
available: 500 and 1000 watts. For more information, write for our
PS²L brochure: Acme Electric Corporation, Cuba, New York 14727.
The Hanover Fair for 9 days

Highlight of the year for
electro-engineering

For 9 days the Hanover Fair is the world centre for the electro-engineering industry. The range of products on offer extends from micro-building elements to large transformers and from laying out a control loop up to planning complete national grids. In Hanover you obtain a panoramic view and detailed information in the shortest possible way.

Due to the fact that Hanover is such an important event 84 % of buyers regard the visit to the Hanover Fair as essential *). They collect information and ideas not only from their own particular branch but also from other sections of industry such as automation, internal combustion engines, gears, transmissions and drives.

Plan your stay in Hanover. The world class range of products on display at Hanover ensure that your visit will be a success — after all, the fair only takes place once a year and there is only one Hanover Fair in the world.

*) refer to the brochures entitled "The transparent market".

Information, ideas
Hanover Fair '74
Thursday, April 25 to Friday, May 3

For planner and buyers
- Electric energy, plant and equipment
  - Electric power generation and conversion: Electrical machines, Transformers, Static converters, Primary and secondary power sources, Heavy-current capacitors.
  - Electric power distribution: High-voltage switchgear, Low-voltage switchgear, Conductors and wiring, Cables, Cable fittings and line fittings.
  - Electro-chemical and electro-physical processing: Electrical apparatus for manufacture and operation.
- Electric and electronic instrumentation and automation
  - Individual apparatus, Equipment and systems: Apparatus and equipment (classified by measured quantities), Apparatus and equipment (classified by measuring methods)
- Electronic components
  - Active components, Passive components, Electro-mechanical components, Assemblies and subassemblies.
  - Lamps and light fittings
  - Illumination engineering: Light fittings, Incandescent lamps, Discharge lamps.
  - Electrical installation: Installation equipment, Electric conduit
  - Telecommunications
    - Communication by wire, Communication by radio, Signalling and security, Timing apparatus
    - Leisure electronics/Audio-visual apparatus/Domestic installations and wiring

Licon takes the “butterflies” out of holding patterns.

By putting its double-break, double reliable Butterfly® switches to work in today's modern aircraft.
Waiting to touch down. Critical moments for a jet flying a tight holding pattern in heavy air traffic. No room for ordinary switching performance. Which is why Licon® patented double-break Butterfly switches are on board so many jettiners today. Performing with beautiful precision.
Even if you're not designing jumbo jets, you can be sure of the same quality and dependability throughout the entire Licon switch line. Basic Switches, Lighted Pushbutton Switches, Keyboards. Shorten your design time — put Licon's engineering know-how to work for you. Your Licon representative or distributor has a switch solution for you.

DIGISCOPE:  
Eight channels of simultaneous digital logic at 50 MHz

"1973 will be remembered as the year of the Logic Scope . . . It is remarkable that since their introduction last spring, logic scopes have already evolved to their second generation. The first of these second generation instruments is the AMC 1320 Digiscope."

—Michael Riezenman, ELECTRONICS Magazine, 12/20/73

"In the world of analog test and measurement, there’s no doubt that the oscilloscope reigns supreme. But if you’re working with digital signals — as more and more people are — you’re probably more interested in looking at the simultaneous time relationships of multiple signals. And that’s where the AMC 1320 Digiscope comes in."

—Stan Runyon, ELECTRONIC DESIGN Magazine, 1/18/74

"The Digiscope is a test instrument designed expressly for the debugging and maintenance of digital electronic equipment . . . (it) permits the ready implementation of many features long desired in testing digital systems: Features like Simultaneous display of many channels in true time relation Negative trigger delay Triggering on a logical combination of the inputs Multi-channel recording of fast, one-shot events."

—Bill Furlow, EDN Magazine, 1/18/74

"A radically new logic state analyzer from E-H Research gives you the equivalent of an 8 or 16 gun, 50 MHz, real time scope display of logic timing. It lets you ‘see’ such analog parameters as glitches, ringing, rise and fall times, and voltage levels."

—Jerome Lyman, ELECTRONIC PRODUCTS Magazine, 1/19/74

The editors have had their opportunity to preview the Digiscope, and now it’s time you discovered all the ways in which this new digital test instrument can help you save time and error in designing, producing, and trouble-shooting digital circuits and equipment. Our new brochure is ready for mailing to all engineers with an application for a compact instrument that offers, among other features:

- 50 MHz bit rate
- Double-threshold comparison
- Up to 100 bits of look-back before trigger
- High impedance active probes (10 megohm, 8 pf)
- Simple operation and clear, plain-English screen display of test parameters for photographic recording.

Write today for full particulars.

Packaging & production

Dry process cuts cost of masks

Plasma dry etcher/stripper
for chrome masks increases yield and resolution

Emulsion masks have one big advantage—at about $1 per finished mask they are inexpensive. But they suffer from poor resolution and a relatively short life, since the contact method used to print them contaminates them and makes it necessary to clean them after every use. Hard masks such as chrome have double or more the life of emulsion masks, require thinner photoresist coatings during wafer processing, and offer higher resolution. But at $20 to $50 per finished mask using wet chemical processing, they appeal to only about 5% to 10% of the total mask market.

The LFE Corp., Waltham Mass., hopes to change all that with the introduction of its new PCrE/PDS-501 plasma dry etcher/stripper for chrome masks. It expects the etcher/stripper will bring the cost of processing the chrome masks down to that of emulsion masks. It also claims the unit increases yields, improves resolution, gives a finer edge acuity, and bypasses many of the problems of multi-step wet processing techniques.

The unit has three cycles: photoresist descumming, chrome etching, and photoresist stripping. The “flash strip” photoresist descumming cycle, which takes about 45 seconds, uses an oxygen-buffered gas to remove the layer of scum and residue left on the chrome after the photoresist is developed. (Hard masks have not been as easy to clean as emulsion masks, and, if descummed with only oxygen, have suffered from impaired resolution because the etch mask was removed as well as the underlying chrome.)

In the etch cycle, the unwanted chrome is volatilized by a composite halogenation process from which chlorine gas is absent. Unlike wet chemicals, which lose stability with use and thus must be replaced frequently, the plasma remains stable and reproducible. The etch rate for multiple masks is set at about 100 angstroms per minute, considerably less than the several hundred angstroms per minute of wet processing.

With wet chemicals, too, excessive undercutting may occur at high-resolution high-density geometries. But, since average distance between collisions of atoms in the gas plasma is controllable, LFE can etch vertical walls as the geometry of the mask commands. Moreover, no post-processing, with deionized water rinsing and drying after etching, is needed after plasma etching. Also, the action of the plasma stops instantly when rf energy is removed, whereas wet chemicals continue to react with the chrome even after the mask is removed from the acid bath.

The final strip step removes all photoresist at an average stripping rate of 500 to 1,000 angstroms per minute. LFE claims the special gas used here actually hardens the chrome, making it more durable than wet-processed chrome, without affecting the finish.

All gases used are nontoxic, noncorrosive, and nonflammable and require no special plumbing and handling. Gas is admitted automatically to the reaction chamber. The operator can select single functions or run through the three steps automatically. Temperature in the chamber reaches a maximum of 150° to 200°C.

LFE believes that the market for...
Many customers remember us for the "extras" engineered and built into our microwave cavities, e.g., our potted anode bypass assembly. But some may not be aware that today MCL also offers one of the industry's largest and most diverse power oscillator, amplifier and systems lines.

The same extra margin of reliability and performance customers have learned to expect from our cavities is also a feature of our instrumentation products.

For a recommended solution to your high power testing problem—without obligation—write us today.

MCL, Inc., 10 North Beach Avenue, La Grange, Illinois 60525.
Or call (312) 354-4350.

Chrome plasma-etching will grow rapidly and that it will replace other etching methods, as well as other hard-mask materials.

A PCE/PDS-501 with a 12-inch-diameter chamber for 5-in. masks costs $25,000. Other sizes of chamber will be available. Price includes a supply of the three gases. Delivery time will be 30 days, starting in April.
LFE Corp., Process Control Division, 1601 Trapelo Rd., Waltham, Mass. 02154 [391]

Sputtering system has valve to limit pump contaminants

In a sputtering system, a source of thin-film impurities is the backstreaming of contaminants from the diffusion pump as it evacuates the sputtering chamber. But in a multiple-target sputtering system from Varian Associates, this problem is considerably reduced by a programmed vacuum valve. Moreover, the pump works about six times as fast as conventional diffusion pumps, and the sputtering mechanism more than doubles target life, according to the company.

The vacuum valve counters backstreaming in two ways. First, it is programed to operate automatically at pressures up to 200 micrometers with a cycle that minimizes backstreaming. Second, the valve automatically adjusts itself in response to the gas load in the chamber and in this way reduces break-

Panasonic's new R-relay makes a lot of sense. It's the smallest reed-type relay you can buy with a latching function (memory). And it's available in a form C (SPDT) contact closure.

When we set out to build our logical relay, we decided not to refine old ideas. Instead we invented (and patented) a relay of revolutionary design and construction with features no other relay has. We used an easily manufactured plastic bobbin instead of the expensive glass capsule used in every other reed relay. We included a barium ferrite permanent magnet to provide latching (logic) function. And we molded it together in one piece of hermetically sealed heat-resistant epoxy resin that occupies less than one-sixth of a cubic inch. Our relay has a mechanical life of over a billion operations performed as rapidly as 500 Hz. It operates with an extraordinarily wide range of currents—from a few microamps up to a full amp. It's even available in a two-coil bi-stable configuration.

Do you need to mount a relay on a circuit board with a high parts density? Do you need a relay that needs no maintenance over an extra long life? One with higher sensitivity in low power semiconductor circuits? Or one that can withstand currents up to a full amp? Perhaps you need a relay with negligible contact bounce, rapid response, and high operational frequency. If you do, send for more information about Panasonic's unique R-relay. It's the logical thing to do.

System controls, records wafer diffusion processes

A diffusion-process-control system built for Western Electric Co. has evolved into a standard system for process-management and -control of diffusing semiconductor wafers that is now being offered by the Lindberg division of Sola Basic Industries. Built around a Digital Equipment Corp. PDP-11/40 with 16,384 bits of memory and a Teletype terminal, the system is able to monitor and control as many as 100 diffusion tubes, notes Richard Rock-
Everybody talks about the weather.

EMR is doing something about it...

For the National Oceanic & Atmospheric Administration

NOAA's new SMS/GOES Synchronous Meteorological Satellite will usher in a new era in satellite borne weather instrumentation. Once in orbit NOAA will commence processing and distributing weather data from the new Visible/Infrared Spin-Scan Radiometer (VISSR), which produces improved pictures of the earth's cloud cover. At the heart of VISSR are eight EMR Integrated Photoelectric Sensors. On earth the data from VISSR is processed by EMR Digital Interface Electronics using the latest PSK demodulation and bit synchronization techniques.

For NASA

NASA is responsible for launching SMS/GOES into orbit. EMR-Telemetry systems at the Kennedy Space Center and various tracking stations throughout the world will gather vitally needed data.

For Philco-Ford

Philco-Ford's WDL Division is building this advanced meteorological satellite. Critical data is being processed through EMR PCM Bit Synchronizers, PCM Decommutators and Displays during development and pre-launch checkout.

For the Bureau d'Etudes Meteorologiques Spatiales

France is typical of the many worldwide users of SMS/GOES who will use EMR Digital Interface Electronics to process vital weather data.

We're not only talking about the weather... we're doing something about it!

Now... what are we going to do for you?

hill, system design supervisor. Besides economically replacing individual gas-sequencing systems for each diffusion tube, the system contains a wafer-lot-tracking capability to insure proper processing sequence. Process-control panels linked to the computer and furnaces prevent operators from using the wrong tubes. Timing on the programable sequence system is accurate to within 1 second; the system can control eight timed events and can monitor eight additional binary inputs, such as contact closures.

The management end of the system will print out complete yield reports by lot, by device, or by operation, and it also exercises complete inventory control and reports system status, Rockhill says. Options include temperature and gas-flow monitoring and control, either supervisory or direct digital, as well as outputs from a CRT and keyboard printer.

Typically, a 24-tube system sells for $52,000, while a 64-tube controller carries a tag of about $72,000. Part of the system, the programable sequence controller, is available separately at $30,000 for a 24-tube installation and $50,000 for a 64-tube installation. Delivery time is six months to a year.

REPLACEABLE CARTRIDGE LITES

Now only 40¢ to 86¢*

IMMEDIATE DELIVERY ON MANY LENS COLORS & LAMPS

Low-cost RCL Series Cartridge Lites are offered in 3 lens styles, 10 lens colors, a full range of voltages and incandescent or neon lamps. Clear anodized aluminum body is also available in other colors and finishes— including iridite—on special order.

Devices mount in panel with spring steel clip, lead wire connectors or solderless cartridge holders shown below. Lens may be imprinted with up to two symbols. Stainless steel terminals are offset to provide neon lamp polarity and to align legends in holders.

*Each in 100-499 quantities.

PRICES ALSO REDUCED ON CARTRIDGE LITE HOLDERS

Save 33% to 67%... RCLH Series Holders now priced from 25¢ to 70¢. Available in front- and rear-mounted versions, solder cup and turret lug terminals and printed circuit board mounting.

Desoldering system won’t damage sensitive circuits

The model SX-211 Ped-A-Vac desoldering system is a vacuum system using shop air that can be attached to a soldering station for production...
What's DAFL stability?  
1 ppm/24 hrs.

The Model 6201 Signal Generator offers you a new experience in precision testing over the 61-kHz to 1024-MHz range. Simply set your desired frequency on the six-digit counter, flip the lock switch, and enjoy the confidence of a locked, crystal-stable output signal. That's what DAFL — Digital Automatic Frequency Lock — is all about. It means 1 ppm stability, all day, all night.

You can use this signal generator with the assurance that it will take your toughest tests in stride. Output power is continuously adjustable and metered over a 166-dB range, high enough (20 dBm) for saturation data and low enough (−146 dBm) for critical sensitivity measurements. And it's a clean signal with broadband noise at least 130 dB down in a 1-Hz bandwidth. Residual FM is less than 5 Hz peak.

We invite you to treat yourself to DAFL stability and discover a new era in signal generators. Send for more information now. Contact Singer Instrumentation, 3176 Porter Drive, Palo Alto, Calif. 94304. Phone (415) 493-3231.
HARNESS THE POWER OF THE adam

You've only got so much time and energy to spend breadboarding and testing new circuit designs. Adam gives you, in one compact portable package, everything you need to go from circuit concept to working hardware in 1/3 the time (and energy!) of ordinary breadboarding methods.

It's a complete, modular circuit design lab with power supplies (five (6 of them!), metering, logic readouts, function and pulse generators, switching, and solderless circuit design using the E&L SK-10 solderless component socket. Write today for full details.

desoldering and repair and rework. There are no electrical spikes so the unit won't damage sensitive circuits.

The system is particularly suited for use with multipin devices and other types of miniaturized circuit components regardless of lead configuration. The foot-controlled unit causes room-temperature air to be drawn up through a plated hole across pads and around leads as soon as the tool tip has melted the solder. In this way, the solder is removed and the area cooled to prevent resweating of the lead.

The standard power supply is a minor consideration... until it fails.

One little power supply can put a big piece of equipment out of commission. And, that’s when “bargain-level power” can get very expensive.

Besides downtime and repairs, the cost of ‘unreliability’ may also include some loss of reputation.

That’s why it will pay you to take a good look at North. We’ve been the leading producer of custom power units for over 40 years. And our standard modules get the same reliability treatment—including rugged life tests, EMI analysis plus shock, vibration and humidity tests.

If reliability is worth more to you, send for a bulletin, or call your North Standard Power Manager at 419/468-8874.

Listed here are the more popular models—many other voltages are available.

Wire stripper requires no air for operation

Featuring all-solid-state control, the model EW S-10K wire stripper operates without air. Measuring 18 by 20 by 20 inches, the unit will cut and strip 5,000 six-inch-long wires per hour. Strip lengths from 0 to 1.5 inches in 0.1-inch steps, and wire lengths from 2.5 to 99.9 inches in 0.1-inch steps can be handled. Wire and strip length are controlled by gating the number of steps of the two motors that feed in the wire.
O.K. Machine and Tool Corp., 3455 Conner St., Bronx, N.Y. 10475 [394]

Connector withstands over 20,000 mating cycles

A graphite coating technique enables the hermaphroditic contacts of the miniature model Dualatch connector to withstand over 20,000 cycles of mating and unmating without the plating wearing through. The coating is also said to reduce mating and unmating force, since the connector requires only three ounces of pressure per contact mating, and 0.1 ounce for unmating. These qualities, the company says, make the connector a suitable substitute for higher-cost, more complex zero-insertion-force connectors in many applications.
Amp Inc., Harrisburg, Pa. 17105 [395]

Hybrid analog switches from DICKSON

These versatile Dickson analog switches may be just the circuits you need for your system. They offer a variety of switching functions in standard 6, 10 and 12 lead packages. Ideal for use in multiplexing, sample and hold circuits, A/D and D/A conversion.
Models DAS2126, DAS2132, DAS2133, DAS2136 and DAS2137 operate from DTL, RTL or TTL logic. Model DAS2110 operates from a 0 to 15V drive signal.

All of these standard Dickson units provide fast switching speeds, handle AC signals through 1 MHz, and have the quality and dependability you expect from a leading supplier of high-reliability semiconductors. Shipments are being made from stock. Custom analog switches are also available.

Mary Lou, Martha, Mollie and Judy are sold on the AO STEREOSTAR® Zoom Microscope.

Here's why.

The AO STEREOSTAR Zoom stereoscopic microscope was specifically designed for convenience, working ease and optical performance. Zoom controls are located on both sides for convenience. It eliminates awkward reaching when changing magnification. The high resolution optical power pack may be rotated 360° to accommodate most any assembly or inspection situation. Full optical equipment offers a magnification range of 3.5x through 210x. Working distance of 4.0 inches is maintained at all magnifications in basic models, and if that's not enough, add a 0.5x auxiliary lens to make it 5.7 inches. STEREOSTAR Zoom microscope assures a wide field of view, up to 2.25 inches with the 10x high eyepoint eyepieces. It also features an extremely efficient illuminator that stays cool even after long hours of continuous use. See for yourself. Contact your AO dealer or sales representative for a convincing demonstration.

OUR ANGLE:
The FIRST Digital Phase Angle Voltmeter

... This NEW DPAV provides complete analysis of complex AC waveforms at discrete frequencies and displays the results on a high readability 4½ digit display. Parameters measured are Total, Fundamental, In-Phase, and Quadrature voltage plus Phase Angle. Phase angle is displayed directly in degrees from 0° to 360° with a resolution of 0.1°.

The Model 220 operates phase-sensitively at a single factory-set frequency from 30 Hz to 32 KHz. The Model 225 has the capability of operating with two to four pre-specified frequencies. Both models have a total voltage measuring capability from 30 Hz to 100 KHz.

The DPAV can be used on the bench or in Automatic Test (ATE) applications. Remote programming, 10MΩ input isolation auto ranging, and BCD output options allow for complete hands-off operation necessary in automated test consoles. Priced from $2950.00.

Let our sales engineering representative demonstrate our NEW angle to you. Call toll-free (800) 645-9200 for his name and address.

New products/materials

A thermally and electrically conductive grease compound is a silver-silicone base containing no graphite or carbon fillers. The one-part non-setting material resists moisture and operates between -65 and +450°F. One of its uses is to conduct heat from high-voltage, high-current SCRs. One-pound jars and two-ounce tubes are available at below $4 per ounce in quantity.

Technical Wire Products Inc., 129 Dermody St., Cranford, N.J. 07016 [476]

A copper-epoxy-glass laminate for the construction of hybrid microcircuits and for high-line-density multilayer circuit boards consists of an epoxy-glass substrate clad on one or both sides with a 0.0001-inch-thick copper layer. Gold or nickel fine-line conductor patterns are plated on, the copper cladding serving as a plating electrode. The copper is then removed by immersion in a suitable etchant.

Mica Corp., 10900 Washington Blvd., Culver City, Calif. 90230 [477]

A solvent and cleaner for printed-circuit applications and for general bench work is a degreaser conforming to military specifications. The material has no flash or fire point, low residue, low toxicity, and good solvency. Called CD-240, the degreaser is available in a 16-ounce aerosol can for $2.10. It has no effect on other materials except poly styrene.

shows you how to save costs
SUPERIOR NO. 30 FLUX prevents corrosion when soldering
Ideal for printed circuit boards

Why take chances that corrosion from soldering will cause rejects and unnecessary expense? Use the same flux that hundreds of our customers all over the world are using—Superior No. 30 NON-CORROSIVE SOFT SOLDER LIQUID FLUX. We'll sample it to you at no cost to prove that it will end corrosion problems! It's positively non-corrosive. No zinc, ammonium chloride, resin or gum. Non-hygroscopic, non-conductive...no fumes or disagreeable odors. Residue is water soluble. Makes soldering easier and faster! Send coupon below or check reader service card for free sample now. After you've tested it, you'll be mightly glad you did.

SO SUPERIOR THAT IT IS PATENTED

Data General Corp. — the mini-computer star — really packs its PC boards. Typical is this 15" x 15" edition with 126 integrated circuits, 12 levels of logic, 15 time states.

Most test system companies just shook their heads. So Data General has been handling all its own circuit testing.

Until recently.

DGC brought 80 of these boards to us. Many doctored to incorporate particularly tough combinations of particularly troublesome faults. We ran them using the MIRCO 410 Logic-Circuit Test System and a test program developed with FLASH Test Generation Software.

Result: fault isolation, on the average, in 1/24th the time.

DGC bought. MIRCO Systems and Software. Wouldn't you? Shouldn't you?

The board nobody could test BUT Data General. And now us... in 1/24th the time.
OPEN-LINE REED RELAYS

Quality Engineered at Low Cost
Broad Line... From Distributor Stock
An exceptionally high quality line of Form A and Form C open frame reed relays — with up to 6 contacts (Form A) and 4 contacts (Form C) per relay! Available in standard coil voltages 5 to 48 VDC... Capable of switching up to 1/2 amp, 250 VDC (Form A) or 1/4 amp, 28 VDC (Form C). Only .360" high by 1.125" long, with terminals on .1" or .15" grid spacing. Electrostatic and electromagnetic shielding optional. Top performance at low cost... Tailored to fit your cost/environmental requirements.

Phone, wire or write.

New literature

**Rf transmission.** Decibel Products Inc., 3184 Quebec, Dallas, Texas 75427. A booklet titled "About Rf Transmission Lines" is aimed at people involved in two-way radio communications. The booklet discusses the application of transmission lines and how they affect systems. Circle 421 on reader service card.

**SCR selection.** The method of selecting SCRs for single-phase dc motor drives is the topic of an applications note from International Rectifier Corp., Semiconductor division, 233 Kansas St., El Segundo, Calif. 90245. [422]

**Pc connectors.** Continental Connector Corp., 34-63 56th St., Woodside, N.Y. 11377, has issued a 16-page technical catalog describing a group of receptacle-type printed-circuit connectors with 0.025- and 0.045-inch-square terminations for wiring. [423]

**Miniature connectors.** From B&SW Associates Inc., 21 B Street, Burlington, Mass. 01803, comes a six-page catalog, which covers miniature precision coaxial and strip transmission-line connectors and includes specifications on semirigid, flexible and stripline versions of the connectors. [424]

**Trimmer capacitors.** A bulletin on ceramic trimmer capacitors from Sakata International Inc., 651 Bonnie Lane, Elk Grove Village, Ill. 60007, describes the rotary design of the units, which use an optically flat...
Norplex multilayer laminates—the heart of today’s high-density circuitry.

In applications where space is critical, multilayer circuits can replace two or more single boards, allowing you to increase circuit density without sacrificing finished exterior dimensions.

Norplex glass laminates and prepregs are available with either epoxy or polyimide resin. They continually meet (and generally exceed) all customer specifications. We provide not only the materials but the technical services to go with them, working closely with you to attain maximum benefits for your product line and increased finished product yield.

We have a separate group devoted exclusively to the manufacture of multilayer materials, working with specialized Norplex-designed equipment for optimum production capability and quality assurance.

No one else can offer you the in-depth experience and technical expertise of Norplex, where laminate manufacture has been our only business for more than 25 years.

Send coupon for our new brochure which explains the advantages of Norplex multilayer laminates. Or phone: 608/784-6070.

INTRODUCING
THE LATEST ROCKWELL
MOS/LSI ADVANCE...
AND NEW VERSATILITY
IN MACHINE DESIGN:
NEW PPS.

What it does
Our new Parallel Processing System (PPS) has the potential of cutting the cost of many machines—professional and programmable calculators, business machine terminals and system controllers. Even for small volume applications, PPS circuit costs will be in the range of volume-produced circuits. That's because the entire PPS system—except for one circuit—is predesigned to work in all these machines. Only one circuit is unique to your machine—and, once you've mastered microprogramming, you can design it yourself, with no Rockwell design involvement.

Even if you're already using MOS/LSI, you should evaluate our new PPS. The “Characteristics” chart at right shows you its design advantages. And here's another advantage: Rockwell has ready for you a complete package of design aids: a time-tested program for Microprogramming through Tymshare... special equipment for microprogram assembly and ROM emulation... evaluation board for prototype testing... programmer's reference manual, and all required documentation.

What it is
The PPS performs the arithmetic and logic functions of a four-bit parallel microprocessor. It's based on a powerful one-chip CPU controlled by ROM microprogramming and possessing its own discrete I/O capabilities. The other building blocks are predesigned compatible ROM/RAM, ROM, RAM and I/O circuits plus a crystal-controlled clock generator circuit. The smallest PPS is a 2-chip set capable of executing 704 eight-bit program instructions and storing 76 four-bit words. It can be expanded into a 30-circuit system without need for additional buffering or drive circuitry.

As a digital processor, the PPS can readily be interfaced with a variety of sensors—card readers, keyboards, displays, etc.

What you should do about it
Just drop us a line on your company letterhead and we'll send additional information so you can make your own microprocessor comparison. Marketing Services, Microelectronic Device Division, Rockwell International, P.O. Box 3669, Anaheim, Ca. 92803, U.S.A.

Miniature
Relay Type
MPM-100

• Available for various voltages AC & DC.
• Both 4PDT and DPDT contact switching requiring minimum driving power is available.
• Highly economical.
• Incorporates anti insulation fatigue device which prevents short-circuits.
• Uses UL-approved resin bobbin.

Digital Line Printer LP-108

• Compact size with simplified mechanism.
• Up to 18 columns.
• 14 characters per column.
• High reliability.
• Red/black printing.
• Print rate of 2.5 to 3.0 lines/sec.
• Low cost

Miniature
Motor Timer
Type UT-500

• Smart surface design. Plug-in type terminal.
• Economical due to simplified pointerless mechanism.
• Available in a variety of types ranging from 10 seconds to 24 hours, surface-mounted or flush-mounted.

Whichever way you take the measure of TEC control instruments you’re getting top value. They work longer; give you more reliable performance for your money.

New literature
providing information on the model 415A digital-communications oscillator. [432]

Capacitors. A data sheet describing voltage-variable capacitor models IN5461 through IN5476 is available from Codi Semiconductor division, Codi Corp., Pollitt Drive South, Fair Lawn, N.J. 07410. [433]

Substrates. Electronic Slicing and Dicing Inc., 10 Railroad St., Lawrence, Mass. 01841, has made available a specifications and price sheet for a line of 96% alumina substrates. [434]

Disk memory. Engineered Data Peripherals Corp., 1701 Colorado Ave., Santa Monica, Calif. 90404, has issued a booklet designed to aid computer users and manufacturers in evaluating and selecting disk-memory devices. The "Disc Memory Buyers Guide" deals with choosing the right medium, such as core or tape, and includes a discussion of fixed-and moving-head and floppy-disk drives. [435]

Reed relays. A four-page bulletin describes the series 46 miniature reed relays available from North American Philips Control Corp., Cheshire, Conn. 06410. Mercury-wetted, dry-reed and magnetic-latching types are discussed, and specifications, dimensional drawings and performance curves are provided. [436]

Heat sinks. Aham, Box 909, 968 W. Foothill Blvd., Azusa, Calif. 91702, is offering an applications handbook...
Seizure of Nominal Value Deviations –
considering previous events

What caused the anomaly? Which variable quantities are effected? How long does the nominal value deviation last? What eliminated it eventually? – Questions, needing answers to make an exact fault analysis possible. OSCILLOSTORE® helps you to answer such questions. Because OSCILLOSTORE can monitor all continuous processes which can be represented through electrical signals up to 10 kHz. OSCILLOSTORE simultaneously registers, depending on task, up to 32 measurement values for milliseconds or minutes.

OSCILLOSTORE reacts as soon as the monitored measurement value exceeds its limits: A connected recording device is switched on to record the delayed measurement value – a few undisturbed periods, then the process of the entire disturbed measurement value and finally the recurrence of the nominal value.

Would you like to know more about OSCILLOSTORE? Where this modular system has been applied successfully in electrical power stations or processing systems?

New literature

on heat sinks. A guide to thermal engineering, the 152-page book provides graphs, photos, and answers to problems that often arise in this field. [437]

Oscillator kit. A data sheet from Statek Corp., 1233 Alvarez Ave., Orange Calif. 92668, is also an ordering form that includes descriptions and applications for a low-frequency oscillator kit. [438]

Transistors. A 32-page catalog describing a line of hermetic transistors made by Raytheon Semiconductor, 350 Ellis St., Mountain View, Calif. 94042, includes information on beam-lead chips, military devices, and wireless-bond semiconductors. [439]

Message withholder. A method of monitoring and controlling message traffic through data-communications storage devices is explained in a data sheet from Plantronics, 385 Reed St., Santa Clara, Calif. 95050. The publication discusses the operation of the model 1160 Message Withhold unit in communications networks. [373]

Printed circuits. The Institute of Printed Circuits, 1717 Howard St., Evanston, Ill. 60202, has released two publications; "Specifications for Double-Sided Flexible Wiring with Interconnection" and "Specifications for Single-Sided Flexible Wiring." [375]

Displays. Liquid-crystal displays are discussed in a manual available from Hamlin Inc., Lake and Grove Sts., Lake Mills, Wis. 53551. The eight-page brochure explains the fundamentals of these displays, types available, and their advantages and disadvantages for various applications. [376]
If you thought you had to give up performance to get a two pen XY recorder, run the HP 7046 through a few tight curves.

If your job is to capture fast changing input signals, you need the two-pen XY recorder that's built for speed and accuracy. It's called the HP 7046A. And it gives you an unsurpassed y-axis acceleration of 2,500 in/sec² and a slewing speed of 30 in/sec with virtually no overshoot and accuracy of ±0.2% of full scale.

Working with this kind of speed means you've got to have a writing system equal to the test. So HP starts with fiber tipped pens with a crossover separation of only 0.05 in. With reliability proven in our high-speed one-pen recorders, these disposable pens make replacement and color changes quick and clean.

Autogrip solid state electrostatic hold down has no moving parts and silently grips the plotting paper to a smooth writing surface.

The 7046 is a rugged machine. A heavy-duty aluminum casting means the recorder can take hard knocks without misaligning the axes. Inside, the continuous-duty servo motors have no complicated slip clutches.

The price is $2,650 (domestic USA price only) and a long list of options lets you customize the 7046A to your special applications. You can have internal time base, event marker, retransmitting pots, TTL remote control and a rear connector, to name a few.

Get details on the XY recorder that gives you two-pen capability without giving up performance. See your HP field representative or write Hewlett-Packard, 1501 Page Mill Road, Palo Alto, California 94304.
**VECTOR FITS IT ALL TOGETHER, BETTER**

**CMA SERIES**
Strong, rugged all aluminum units supplied assembled for slide-in EFP modules in 3½", 5¼", 7" and 8¾" heights and up to 15¾" deep.

**EFP MODULES**
Sleek aluminum cases with slide-off side covers, extruded top and bottom rails hold cards 2.73", 4.5" and 7.98" wide and 4.5", 6.5", 9.6" and 11.31" long. 59 models available in widths from 1" to 4½".

**CARD FILES AND CAGES**
Rugged all aluminum, card height adjustable card files supplied assembled ready for connectors which mount on 4-way adjustable struts. The cages are designed for cards with width ranges of 1.0" to 2.73", 2.73" to 4½", 6.2" to 7.98", and lengths up to 9.6". Plastic or metal guides available. Continuous extruded aluminum plate style has 106-0.075" wide continuous grooves on 0.150" centers for cards allowing maximum flexibility.

Visit INTERCON Booth 1221

**MULTI-USE CAGE KITS**
Supplied unassembled in 11 different models for maximum flexibility to house cards and/or modules. Order card and module guides separately. Slotted side walls and bracket-mounted connector mounting struts provide wide adjustability. Available in 3½", 5¼", 7" and 8¾" heights and 9", 12", and 15¾" depths. All parts and hardware of any Vector cage are available separately. For custom card or module cages, request our "design your own" form.

**Easy Access At Newest Plant Site In Rochester, New York**

The Outer Loop Industrial Park is right next to a freeway system that connects you with the New York State Thruway and the World. Expressways also lead you straight to the profitable Rochester market.

Neighboring companies know the benefits of this fine location on Rochester's west side. Some of them are Eastman Kodak, Bendix Corporation, 3M Company, General Motors, and Ragu Foods.

Railroad service is available on-site and an airport served by three major airlines is minutes away via the freeways. The Port of Rochester, a few miles to the north, has deep water accommodation for ocean-going vessels.

For more information, contact Robert J. Hall, Director of Area Development, Rochester Gas and Electric Corporation, 89 East Avenue, Rochester, New York 14649 or call (716) 546-2700, ext. 2466.

We know more about sites in our nine-county area than just about anyone else. Contact us for information on available facilities from 10,000 to 800,000 square feet.

---

**The Brush 222 battery operated portable recorder.**

The Brush 222 is a self-contained 2 channel recorder. It comes complete with signal conditioners, internal battery supply and charger. The battery supply gives you up to 12 hours of continuous operation. There's pressurized ink writing and linearity guaranteed to 99½%.

Write Gould Inc., Instrument Systems Division, 3631 Perkins Avenue, Cleveland, Ohio 44114. Or Kouterveldstraat Z/N, B 1920 Diegem, Belgium.
Integrating man's creativity with a computer's speed and memory isn't easy. But Gerber has done it with an interactive system which can create and plot drawings as complex as the operator can imagine... all at the touch of a button.

Think what this can mean in your department. Drafting drudgery eliminated. More accurate drawings, faster. More time for designers to think and create. Lead time drastically reduced to give you a competitive edge in bringing new products to the marketplace.

Translated into dollars, this means more profits from your engineering department profit center. More profits whether you make automobiles, aircraft, electronic equipment, machine tools. Or anything else that requires drafting.

The Gerber interactive system is delivered complete and ready to go to work for you. And, of course, the entire system is designed, built and serviced by Gerber Scientific, the internationally recognized pioneering leader of the industry.

Find out how the Gerber Interactive Design System can produce for you. A note or phone call will bring a prompt response.

**Push Button Drawing.**
Bausch & Lomb StereoZoom 7 Microscope with Coaxial Illuminator is the answer to your need for full field, full aperture illumination; full color, high contrast imaging and better resolution.

This unique form of incident illumination eliminates surface glare from highly reflective surfaces and also effectively illuminates low contrast objects.

You zoom over a magnification range of 15X through 280X. Field diameter ranges from 0.55 in. through 0.03 in. Working distance is 3.0 in. – 0.56 in.

Send today for our catalog 31-15 and our FREE DEMONSTRATION offer.

A broad range of special purpose piezoelectric ceramics is offered by one of the nation’s oldest and largest sources of such items as thin discs, spheres, rings, bars, and cylinders. Available from stock or by special order to customer specifications.

- Lead Zirconate
- Barium Titanate
- ADP Crystals

Ceramic Application Notes and product data sheets will be sent upon request.

New ac/dc high current option lets you measure 10 A continuously or up to 20 A momentarily. New low 2 and 20 Ω scales give 0.001 Ω resolution. Low cost RF probe offers new capability.

Other options include rechargeable battery pack, digital printer output, deluxe test leads, 40 kV high voltage probe, 600 A ac current probe, carrying cases, dust cover and rack mount.

Basic “best buy” $299 DMM feature dc accuracy of 0.1%. Measure ac/dc volts from 100 µv to 1200 v, current from 100 nanoamperes to 2 A, and resistance from 100 milliommhos to 20 megohms. Guaranteed 20,000 hour MTBF.

"When work began on the AN/TPX-42A, we started looking for an interconnection system that offered high reliability and design flexibility, without sacrificing lower initial costs or low field maintenance.

"Our program staff ran detailed reliability and cost analyses of the four basic interconnection systems under consideration: P.C. boards, multilayering, welded wire-stitching, and wire-wrapped plug-in panels.

"The system meeting all of our requirements was wire-wrapped plug-in panels. We compared several manufacturers of socket panels and selected the Augat panel based on overall quality, range of products, and their willingness to respond to our needs.

"Our findings were incorporated into our proposal to the Air Force. But as the wire-wrapped plug-in panel concept was comparatively untried in U.S.A.F. equipment, they requested additional testing. So we ran a series of in-depth reliability and stability studies and tests as part of our systems qualification and reliability demonstration program.

"After 13,200 test hours, we experienced no mechanical failure or intermittence with the Augat system.

"Electronic Systems Division of U.S.A.F. accepted these findings and approved the Augat system.

"We now have used substantial production quantities of Augat panels without a single contact failure."

Augat first pioneered the socket-panel concept in 1965, and the exclusive precision-machined tapered-entry contact has made Augat the reliability standard for the plug-in interconnection industry.

A.I.L.'s record of not a single contact failure is one of the reasons why Augat supplies more panels than all other manufacturers combined.

As the world's leading manufacturer of wire-wrapped panels and other IC interconnection products, Augat is ready and willing to help with all your interconnection requirements.

Call or write today for free brochure and complete product information. Augat, Inc., 33 Perry Ave., Attleboro, Mass. 02703. Represented and distributed internationally.

"Augat's interconnection system appeared to have more advantages for use in the AN/TPX-42A Air Traffic Control System.

"Our extensive testing confirmed it."

New books

Talk about not telling a book by its title! Although the title and cover will probably sell many volumes, the electronic components this volume deals with are discrete field-effect transistors and unijunction transistors, and that's about all. The text is strongly oriented towards applications, treats the device physics only perfunctorily, and doesn't even mention the use of a computer in circuit design.

Nevertheless, the book covers its limited subject matter quite well. It is a good exposition of practical design techniques for discrete unijunction- and field-effect-transistor circuits. The author's method is to present a basic circuit, then discuss individual component and bias selection, using few equations but giving lots of practical design tips. He finishes up with a design example.

A treatment of these devices as they are used in integrated circuits would have been helpful, however. For example, the author might have described the advantages and disadvantages of monolithic versus discrete gates for small-scale integration.

Individual design rules are discussed, along with component selection and biasing tips. Designers will find many hints about practical problems they may run into.

Clearly, the result is not a text for circuit designers, but an aid to engineers or anyone else who wants to build a unijunction or FET circuit for a test setup without becoming a circuit-design expert. But that fact is not at all apparent from the title, which does a disservice to the book's potential readers.

—Joel DuBow

Components Editor

Prof. Brigham, of the University of Texas, has taken a rather unusual approach in explaining the nature and applications of the fast-Fourier-transform (FFT). He first introduces an intuitive description of the FFT,

Electronics/March 7, 1974
Open a Savings Account with our new megapower SCRs

When you invest in IR's new Megapower SCR Family Savings Plan you start earning dividends three important ways.

First, you can eliminate over 70% of the devices and parts normally needed (see the 3-phase converter "savings account" below for full details). That gives you a lower total system cost, plus more reliability.

Second, having fewer parts cuts assembly time sharply, increases reliability and makes your field servicing that much easier, too.

Third, Megapower SCRs give you more production power with only a minimum change in your equipment size.

If you want to parallel Megapower SCRs, there's a special bonus. Our epitaxial process yields SCRs of virtually identical switching characteristics, so you eliminate expensive current balancing equipment. It also produces the high voltage SCRs you need. Specifically: 700A(ave) 500 to 2100V; 850A(ave), 500 to 2000V; 1000A(ave), 500 to 1500V, and 1600A(ave), 500 to 1200V.

There is also an extra dividend in overall productivity because Megapower SCRs will keep your equipment on line longer. Their surge capability is so high, they can ride through massive overloads without resorting to protective fuses.

Electronics/March 7, 1974
NEC's Models 2P05M, 2P1M, 2P2M, & 2P4M are P-gate all-diffused mold thyristors with an average on-state current of 2 Amps. ($T_c = 54^\circ C$).

Surface treatment of the pellets with glassivation technique guarantees a high degree of reliability.

With their miniature size and thin electrode leads, these thyristors are easy to install, while lowered holding current distribution offers endless design variation.

Adequate stock is on hand now, so rapid delivery can be guaranteed. Likewise, bulk orders are no problem.

NEC America, Inc.
Head Office: 277 Park Avenue, New York, N.Y. 10007, U.S.A.
Los Angeles Office: Tishman Airport Century Bldg. (TAC-3), 9841 Airport Boulevard, Los Angeles, Calif. 90045, U.S.A.

New books

then supports it by a simplified but sound mathematical treatment, and finally presents examples to review and expand the concept.

It is a noble effort, and the book, by and large, is worth buying and studying; but it is definitely not the kind of book to be read in an easy chair, feet propped up on an ottoman, in front of a roaring fire. The reader must definitely be able to keep the esoteric relationships and symbols sorted out or he quickly gets lost. Even with the postponement of proof until later chapters, this reviewer wonders if a plainer—if perhaps longer—explanation would not have been possible in words instead of equations.

The intuitive description is presented largely in the form of mathematical equations backed up by drawings and plausibility arguments, rather than by rigorous proofs. Included here is a chapter discussing the relationship of the Fourier transform to convolution and correlation, as well as another chapter on the Fourier transform and sampled waveforms.

Sampled waveforms lead directly to the discrete Fourier transform, which is shown to be merely a special case of the general Fourier transform. A full chapter is devoted to applications of the discrete transform.

After nine chapters of prologue comes a specific discussion of the FET. It is first presented intuitively and then with mathematical rigor. In its simplest and most straightforward form, the number of waveform samples to which the FET is applied is a power of 2; in Chapter 12, Brigham shows how, even though the power-of-2 samples save much computation time, still more expeditious computation is possible under certain circumstances when some other number of points is used, provided the number is highly composite—that is, many factors.

Finally, Brigham describes in detail the use of the FET in convolution and correlation, as well as an approximation to the Fourier transform of other continuous functions.

Wallace B. Riley
Computers Editor
THE ENERGY CRUNCH IN '74:
CAN YOU AFFORD TO SIT IT OUT WHERE YOU ARE?

With all aspects of the '74 outlook weighed and carefully evaluated—the energy crisis, increased distribution costs, decreased labor availability—many companies simply cannot afford to remain stationary and absorb escalating operating costs.

But there is a positive note. Expansion into Georgia could offset anticipated drops in corporate profits.

The reasons are simple:

FUEL RESOURCES

Nationwide, heavy fuel oil shortages could reach an average of 38% unless rationing is initiated in 1974, so the National Petroleum Council indicates. As freezing winter conditions persist, power reserves dwindle, forcing many businesses to curtail production.

In Georgia, the vast majority of electric power is generated by coal, lessening the demand for oil, and putting Georgia in an excellent position to provide energy for new and expanding plants.

Moreover, Georgia has such a mild climate that less fuel is needed than in cooler regions. A typical average temperature for the month of January in northern Georgia is 40.9°F; in southern Georgia 51.9°F. In July, the average for northern Georgia reaches 78.3°F, while readings maintain an 81.1°F average in southern Georgia.

TRANSPORTATION RESOURCES

Nationwide, the availability of fuel for transportation has reached a level lower than at any time since World War II. Airlines are faced with a 15%-20% short-run flight cutback due to decreased fuel allotments.

In Georgia is based the second busiest airport in the world, transacting in 1973 an average of 1,176 operations daily. A 20% cutback in air flights in Georgia would still provide better shipping opportunities than a 20% cutback in a less active transportation center. In addition, the Georgia Ports Authority operates two deep-water ports, one of which is the most modern on the East Coast. We also have 5,636 miles of railway, and over 500 motor carriers to transport your goods and production materials.

LABOR RESOURCES

Nationwide, although employment among fuel-related businesses has declined, statistics show that factory jobs in most industries have increased. Employers are still searching for workers who produce an honest day's work for an honest day's pay. In Georgia, labor is always available. And Georgia will train your workers free through the Quick Start Program, operated in conjunction with the state's vocational technical schools. There are 26 such facilities strategically located throughout the state. Geographic coverage is so complete that 9 out of 10 people in Georgia are within 25 miles of a vo-tech school. Some schools have extended hours from 8:00 a.m. until 11:00 p.m. so as to provide education to more working adults. With the Quick Start Program, you need not face production delays that might ordinarily be incurred while training laborers. And with Georgia's mild climate, absenteeism due to inclement weather is almost nonexistent. Finally, one of the most important considerations is the fact that Georgians still take pride in their work, earning their wages with a decent day's output.

Contact our Georgia Department of Community Development for the 1974 Industrial Survey of Georgia. And find out more reasons why you shouldn't just sit it out where you are.

EMPLOYMENT OPPORTUNITIES

Boeing Aerospace Company has openings in the following specific fields:

Radio Systems — Both narrow and wide band transmission.

Intercoms and multiple subscriber switching subsystems.

Communications Equipment and Systems—transmitters/receivers, modems, multiplexers, teletype systems, data and audio distribution systems.

Communications Techniques — modulation/ demodulation, multiplexing/demultiplexing, encryption/ decryption coding.

BSEE or comparable experience required.

Please send your resume to The Boeing Company, P.O. Box 3707-MB, Seattle, WA 98124.

An equal opportunity employer.
We bridged the forward surge gap.
For extra protection.

Our bridge rectifier ratings for DC output and forward surge capacities are substantially greater than those of competitive devices. Even though our physical dimensions are the same.

So, our single phase and three phase bridge rectifiers provide important added safety at normal operating levels.

You no longer have to take the chance of using a marginally rated bridge rectifier and running the chance of expensive down time and replacement costs.

Wagner single and three phase bridge rectifiers as well as center tap rectifiers come in standard size packages. Only our current ratings and forward surge ratings are higher.

B-10 Series. DC rating-30A @ 75°C Case. Forward Surge rating-400A @ rated load. B-10 Series replaces look-alike bridges rated up to 25A and from 50 to 1,000 PRV per leg.

B-40 Series. DC rating-15A @ 75°C Case. Forward surge rating-300A @ rated load.

B-50 Series. DC rating-10A @ 75°C Case. Forward surge rating-300A @ rated load.

For additional information on Tung-Sol® bridge rectifiers, write to: Tung-Sol Division, Wagner Electric Corporation, 630 West Mt. Pleasant Avenue, Livingston, New Jersey 07039.

Wagner makes other quality products in volume for the electronics industry, including vacuum fluorescent readouts, power supplies and subsystems, silicon rectifiers, resistors, miniature lamps and status indicators. And Wagner offers contract manufacturing.

NEYETCH COMMUTATORS AND SLIP RINGS...

are made of solid, wrought, non-porous noble alloys which afford low noise and extremely long life with no possibility of base metal contamination. In contrast to conventional printed circuit commutators, which are electroplated with thin layers of noble metal, extremely low tolerances can be held with Neyetch. And, too, the fabrication cost is reduced to a minimum by the elimination of machining or stamping operations.

Neyetch commutators and slip ring assemblies have proved superior for both commercial and military applications and are widely used in potentiometers, video tape recorders, radios, encoders, aircraft instruments, sonar, timers, switches, marine instruments and such. Ney plays a leading part in many products with low energy electrical precision contact components including switch assemblies, welded and staked assemblies, wire forms, flat spring contacts, plastic molded brush and contact assemblies, rivet head contacts and complete assembled components. For our catalogue, write The J. M. Ney Company, Bloomfield, Connecticut 06002.
Glamorous, mysterious liquid crystals.

We make them.

Behind the mystery and glamour: Those who could reasonably be expected to phone Mr. Grau are probably interested in making display devices ranging from mass-marketed consumer goods to some of the more ambitious reaches of the engineering imagination.

Liquid-crystal technology has blazed up after smoldering quietly for most of the time since 1888. Organic chemists get to collaborate with electronic engineers through the medium of the marketplace, if not personally. For now, Kodak has set up its booth on the chemical side of the street.

The present generation of electronic engineers catch on fast to subjects they didn't necessarily concentrate on in school. In liquid-crystal work, one deals with the different forms and degrees of orderedness among molecules, ranging between the randomness of an ordinary isotropic liquid and the periodic architecture when it freezes to a crystal. Only certain compounds assume this mesomorphic state. Molecules of such compounds have a generally elongated shape.

The most highly ordered kind of liquid crystal, called smectic, where the molecules tier up in layers and the layers can only slide against each other, can be seen when water sits in contact with a bar of soap. In a nematic liquid crystal there are no tiers, but the molecules stay parallel. Possibilities exist for controlling their alignment. And this alignment controls what they do to light passing through. And that's what the action is mostly about in industry circles.

Field effect, one approach used to create a visible pattern in a thin layer of nematic material between patterned, transparent electrodes, amounts to electrically tuned birefringence. (We hope you didn't cut the lecture on birefringence in Physics 1.) Contrast between "on" and "off" is attained through various arrangements of light polarizers and quarter-wave retardation plates. Where and when the field is off, the molecules must line up parallel to each other and to the cell walls. This is called "homogeneous" alignment. Surface treatment to make it happen is protected by patents or trade secrecy.

Dynamic scattering is the other approach. Here, in the "off" state, the alignment can be either homogeneous or perpendicular to cell walls. The latter is "homeotropic" in the lingo of the art. Either way, light passes straight through, and the layer looks clear. Where field is applied, then regardless of previous orientation, all the molecules strive for parallelism to the wall. But ions that have been incorporated in the mixture migrate, colliding with them to knock them every which way. The resulting optical inhomogeneity scatters light. These turbid areas can be made to look either darker or lighter than the clear areas, depending on directions of illumination and viewing. Appearance of the pattern is more sensitive to angle of view than with field effect. Power drain is more, because of the turbulence to be maintained. But you don't have to find (or license from somebody) a way to align the molecules. You just use EASTMAN 14099.

Say, if you've read this far you are probably interested enough to ask Dept. 412-L, Kodak, Rochester, N.Y. 14650 for EASTMAN Organic Chemical Bulletin, Vol. 45, No. 2 (1973), where four scientists of the Kodak Research Laboratories, who write more like scientists than engineers, will take you farther into this than you'd want to go for just recreation. It has a 76-item bibliography. For our 2,281-item Liquid Crystal Bibliography (Kodak Publication JJ-193) on microfiche, make that Dept. 454 and send $25 (plus applicable state and local taxes).
