<table>
<thead>
<tr>
<th>REVISION</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>A (04-26-82)</td>
<td>Manual released. This manual reflects NOS Version 2 at PSR level 562. This manual documents parameter-prompting procedures and the following new commands: ALTER, CFG, DELETE, Detach, DNB, DROP, DUP, GO, LIBTASK, MOVE, PAUSE, QCET, READ, SCOPY, SETFS, SETJOB, UFPROC, WHATJSN, WRITE, WRITEN.</td>
</tr>
<tr>
<td>B (01-27-83)</td>
<td>This manual reflects NOS 2.1 at PSR level 580. This revision incorporates the MFLINK, MFQUEUE, SHELL, and new terminal definition commands; menu-generating procedures and new procedure directives; support of 865-42 disk drives; as well as numerous usability changes. Because of extensive changes to this manual, change bars and dots are not used. This manual obsoletes all previous editions.</td>
</tr>
<tr>
<td>C (10-11-83)</td>
<td>This manual reflects NOS 2.2 at PSR level 596. This revision incorporates the following features: enhanced system security; service class assignment by users; a multihost network; full screen editing; screen mode input for procedures and other applications; an expansion of online help, including online manuals; equipment status table expansion; project prologues and epilogues; SCOPE 2 station; and the Interactive Transfer Facility (ITF). Because of extensive changes to this manual, change bars and dots are not used. This revision obsoletes all previous editions.</td>
</tr>
<tr>
<td>D (10-05-84)</td>
<td>This manual reflects NOS 2.3 at PSR level 617. This revision incorporates the following features: 836 disk subsystem support; 639 magnetic tape unit support; PSU printer support; PSE enhancements; NOS procedure commands, and the following new system commands: BLOCK, EFFECT, ERRMSG, LISTLIB, RECLAIM, REDO, SHOW, and TDU. This manual obsoletes all previous editions.</td>
</tr>
<tr>
<td>E (03-28-85)</td>
<td>This manual reflects NOS 2.4.1 at PSR level 630. This revision documents the KEY command and the following new features: support of CYBER 180 Models 840, 850, and 860; 895 disk subsystem support; 5870 Non-Impact Printer support; NOS/VE dual-state support; and NOS procedure enhancements.</td>
</tr>
<tr>
<td>F (12-16-85)</td>
<td>This manual reflects NOS 2.4.3 at PSR level 647. This revision documents the APPSW command, the RC terminal definition command, and the following features: support of CYBER 180 model 990; support of 836 disk subsystem; enhancements to 533/536 printer support; support of CDCHET version 1; disk error recovery enhancements (ENQUIRE output); AUTO command internal 0003 byte processing.</td>
</tr>
<tr>
<td>G (09-30-86)</td>
<td>This manual reflects NOS 2.5.1 at PSR level 664. This revision documents the XMODEM and DROPDS command and the following features: support of print train images, security enhancements, and miscellaneous technical corrections.</td>
</tr>
<tr>
<td>H (04-23-87)</td>
<td>This manual reflects NOS 2.5.2 at PSR level 678. This revision documents support for the Teletype terminal and the 585 printer, new user messages related to enhancements to tape error recovery, changes to several procedure directives, and the addition of the .SET directive and the STR, STRB, and STRD functions.</td>
</tr>
<tr>
<td>J (09-23-87)</td>
<td>This manual reflects NOS 2.5.3 at PSR level 688. This revision documents support of magnetic tape as an alternate storage medium for permanent files, the 537 printer, and drops documentation of the Mass Storage Subsystem (MSS).</td>
</tr>
<tr>
<td>K (04-05-88)</td>
<td>This manual reflects NOS 2.6.1 at PSR level 700. This revision documents CHARGE enhancements, a new PASSROW parameter, the LVL function, the .F7 directive, the LIBEDIT directive (*), new RECLAIM options, and STORNET, a new type of extended memory.</td>
</tr>
<tr>
<td>L (12-08-88)</td>
<td>This manual reflects NOS 2.7.1 at PSR level 716. This revision documents support of CYBER 180 Models 960 and 994, support of the 9853 disk subsystem, enhancements to the CATLIST, PURGALL, TDU, and TDU commands, new RECLAIM options, new permanent file command (FTP), new diagnostic messages, and miscellaneous technical corrections.</td>
</tr>

This manual describes the CONTROL DATA® Network Operating System (NOS) Version 2. NOS can operate on the following computer systems:

CDC® CYBER 180 Computer Systems
Models 810, 830, 835, 840, 845, 850, 855, 860, 870, 960, 990, 994, and 995

CDC CYBER 170 Computer Systems
Models 171, 172, 173, 174, 175, 176, 720, 730, 740, 750, 760, 815, 825, 835, 845, 855, 865, and 875

CDC CYBER 70 Computer Systems
Models 71, 72, 73 and 74

6000 Computer Systems

AUDIENCE

Volume 1, Introduction to Interactive Usage (60459660), is written for the novice.

Volume 2, Guide to System Usage (60459670), is written for the applications or systems programmer who is unfamiliar with NOS.

Volume 3, System Commands (60459680), is written for all NOS users.

Volume 4, Program Interface (60459690), is written for the experienced COMPASS applications programmer or systems programmer.

The reader of each volume should have a knowledge of the material contained in the previous volumes.

ORGANIZATION

The NOS reference set describes the external features of NOS 2. This reference set comprises four separate volumes.

Volume 1, Introduction to Interactive Usage, shows a user at an interactive terminal how to enter, run, and correct programs, and how to create, retrieve, and maintain permanent files. Other topics covered include physical terminal connection, and login/logout procedures.

Volume 2, Guide to System Usage, describes the general concepts of NOS and some of the utilities used with NOS. Topics included are job processing, file concepts, procedures, magnetic tape processing, Modify, and file loading. This volume is a learning tool and does not contain comprehensive descriptions of all NOS commands.
Volume 3, System Commands, describes the system commands that form the user interface to NOS.

Volume 4, Program Interface, describes the COMPASS program interface to NOS. Detailed descriptions of function processors and macros available to COMPASS user programs are included.

SUBMITTING COMMENTS

The last page of this manual is a comment sheet. Please use it to give your opinion on the manual’s usability, to suggest specific improvements, and to report any errors. If the comment sheet has already been used, you can mail your comments to:

Control Data
Technical Publications ARH219
4201 Lexington Avenue North
St. Paul, MN 55126-6198

Additionally, if you have access to SOLVER, an online facility for reporting problems, you can use it to submit comments about the manual. Declare your problem type as DOC and use NS2 as the product identifier.

Address questions about physical packaging and/or distribution of printed materials to Literature and Distribution Services at the following address:

Control Data
Literature and Distribution Services
308 North Dale Street
St. Paul, MN 55103-2495

or you can call (612) 292-2101. If you are a Control Data employee, call (612) 292-2100.

CYBER SOFTWARE SUPPORT HOTLINE

Control Data's CYBER Software Support maintains a hotline to assist you if you have trouble using our products. If you need help beyond that provided in the documentation or find that the product does not perform as described, call us at one of the following numbers and a support analyst will work with you.

From USA and Canada: (800) 345-9903

From other countries: (612) 851-4131

CONVENTIONS

REFERENCES TO OTHER MANUALS IN THE NOS REFERENCE SET

Throughout this manual, references to Volumes 1, 2, and 4 of the NOS Reference Set are in the form: refer to section n, (volume name). If a volume number is not specified, the reference is to Volume 3.
180-CLASS MAINFRAMES

Some of the CYBER 170 Computer Systems share many of the functional and architectural attributes of the CYBER 180 Computer Systems. Specifically, CYBER 170 Models 815, 825, 835, 845, and 855 fall into this category. It is sometimes convenient to refer to the CYBER 180 models and these CYBER 170 models collectively. This manual uses the term 180-class mainframes to refer to this collection.

EXTENDED MEMORY

Extended memory for the CYBER 180-class machines and models 865 and 875 is unified extended memory (UEM) and may also include extended core storage (ECS), extended semiconductor memory (ESM), or STORNET. Extended memory for model 176 is large central memory extended (LCME) and may include ECS, ESM, or STORNET. Extended memory for all other NOS computer systems is either ECS, ESM, or STORNET.

In this manual, ECS refers to ECS, ESM, and STORNET. Extended memory refers to all forms of extended memory unless otherwise noted. However, when referencing extended memory in the context of an ECS multimainframe complex, distributive data path (DDP), or low-speed port (LSP) access, UEM and LCME are excluded. ECS, ESM, and STORNET are the only forms of extended memory that can be shared in ECS multimainframe complex and can be accessed by a DDP or LSP. For CYBER 180-class machines, only UEM may be accessed directly from CPU programs as extended field length; similarly, on the model 176, only LCME may be accessed directly from CPU programs. The other forms of extended memory are supported only as mass storage devices on these machines.

Programming information for the various forms of extended memory can be found in the COMPASS Version 3 Reference Manual and in the appropriate computer system hardware reference manual.
CYBER 70 COMPUTER SYSTEMS REFERENCES

References to the CYBER 70 Computer Systems pertain only to models 71, 72, 73, and 74.

CONTROL STATEMENT

The manuals of many NOS products use the term control statement instead of the term command. This manual uses the term command almost exclusively. You can consider the two synonymous.

EXAMPLES

The following conventions apply to examples that appear in this manual:

- Examples of actual terminal sessions that appear in this manual were produced on a display terminal in NORMAL character mode unless otherwise specified. Uppercase characters represent terminal output; lowercase characters represent user input unless otherwise noted. (However, user input that is displayed within the text of this manual is shown in uppercase characters). The vertical spacing in examples does not necessarily coincide with the spacing that appears on your terminal.

- Program examples are written either in FORTRAN 5 or BASIC 3 (hereafter referred to as just BASIC).

- This manual uses commas to delimit command parameters and periods to terminate commands. For clarity, however, commands that appear in text use an opening parenthesis for their initial delimiter and a closing parenthesis for their terminator.

COMMAND FORMAT

Interpret uppercase characters within command formats literally. Lowercase characters are variables and are described immediately following the line that shows the command format.

SPECIAL KEYBOARD ENTRIES

This manual uses special notation to represent certain keyboard entries:

- @ denotes the message transmission key on the keyboard. Depending on the terminal class, this key may be the RETURN, CR, CARRIAGE RETURN, NEW LINE, SEND, or ETX key. For some terminal classes, the RETURN or NEW LINE key also denotes a message terminator, but the message is kept in the terminal buffer until the corresponding SEND or ETX key is pressed, sending all messages in the buffer to IAF. Appendix K supplies more information. IAF and the network respond to the @ by positioning the carriage to the first character position on the next line.

- —designates the backspace character.

- The notation CTRL/x directs you to press the control key (which is labeled CTRL, CNTL, CNTRL, or similar characters) on the terminal and, while holding this key down, press the key specified by x. For example, CTRL/H means press and hold the control key while you press the H key.
RELATED PUBLICATIONS

You may want to consult the following Control Data manuals for information related to topics discussed in this manual. For your convenience, these manuals are listed by category: CDCNET manuals, hardware manuals, NOS 2 manuals, and optional product manuals.

If you need a brief description of the NOS product commands and their parameters, refer to the NOS Version 2 Applications Programmer's Instant (60459370). In addition, brief descriptions of all NOS operating system and NOS product set manuals are available in the NOS System Information manual. You access this online manual by logging into NOS and entering the EXPLAIN command.

Control Data manuals are available through Control Data sales offices or through Literature Distribution Services:

NOS is capable of several concurrent processing modes. The following are the processing modes available.

- Local batch.
- Remote batch.
- Transaction.
- Interactive.

The network processing modes (remote batch, transaction, and interactive) operate through the Network Access Method (NAM) communications software. These processing modes are implemented, respectively, by the following NAM applications: Remote Batch Facility (RBF), Transaction Facility (TAF), and Interactive Facility (IAF).

The primary emphasis of this manual is interactive and local batch processing. For the other processing modes, consult the appropriate manuals listed in the preface.

NOS, like all operating systems, is the interface between you and the capabilities of system hardware components. The remainder of this section describes the hardware and software that make up a NOS-controlled computer system. In most cases, you need not understand the operation of system hardware or the internal operation of system software. This manual describes these topics only as general background for understanding NOS commands.

SYSTEM HARDWARE

NOS can operate within the CYBER 180, CYBER 170, CYBER 70, and 6000 Computer Systems (refer to the preface for an exhaustive list of model numbers). The primary hardware components of each system are the following.

- Central processor unit(s).
- Central memory.
- Extended memory (optional).
- Peripheral processors.
- Peripheral equipment.
CENTRAL PROCESSOR UNIT

The central processor unit (CPU) executes instructions and manipulates and stores data retrieved from central memory. The number and type of CPUs within a mainframe vary with the machine model. As a result, some models can execute additional instructions. These model differences do not affect applications written in higher level languages.

CENTRAL MEMORY

The primary functions of central memory (CM) are:

- To buffer data to and from the peripheral processors.
- To transfer instructions and data to and from the CPU.

Job Field Length

The job field length is the portion of central memory that is assigned to your job. Several jobs can reside in CM simultaneously. Each job is assigned a starting CM address (its reference address or RA) and is allocated an initial field length (the CM words in which the job resides and executes). The field length is adjusted during job execution as described in section 3. Figure 1-1 shows a job field length within CM.

A reference to an address outside the job's field length range causes a hardware error condition and job termination.

The maximum field length depends on the CM size and installation parameters used to control memory usage. The system assigns the CPU to jobs requiring CPU activity. Rapid switching of CPU control between jobs enables them to execute concurrently. The exact amount of time allowed for each job depends on system activity and system parameter settings. Thus, the time required to complete a job may vary from run to run, although the actual CPU execution time is similar.

When a job completes, aborts, or rolls out (that is, its execution is suspended), the field length is released, cleared, and made available to another job.
Central Memory Resident

The portion of CM reserved for system use is called central memory resident (CMR). It contains system tables, directories, and the CM portion of the system monitor (CPUMTR).

EXTENDED MEMORY

Extended memory for NOS computer systems (refer to preface), can be used for the following purposes.

- As a directly accessible memory device via FORTRAN or COMPASS statements for extended memory data storage and retrieval (refer to the FORTRAN 5 Reference Manual or appendix D of Volume 4, Program Interface).
- As storage for frequently accessed small files (refer to ASSIGN command in section 7 and Permanent File Commands in section 9).
- As an alternate system device for storing copies of frequently used routines.
- As a link between mainframes in a multimainframe configuration.†

You must be authorized to use extended memory (refer to LIMITS command in section 7).

†Model 176 cannot use extended memory to link mainframes.
PERIPHERAL PROCESSORS

The peripheral processors (PPs) process communications between CM and individual peripheral devices. They also perform system control functions. A peripheral processor can:

- Read and write CM.
- Read and write extended memory indirectly via CM or directly via the distributive data path (DDP) or low-speed port (LSP).
- Transfer data to and from peripheral devices through the data channels.

NOS supports a variety of PP configurations. Each computer system supports a different range of configurations. To determine the configurations supported by your computer system consult the appropriate system hardware reference manual listed in the preface.

PERIPHERAL EQUIPMENT

Peripheral equipment varies among installations but usually includes card readers and punches, line printers, mass storage devices, and magnetic tape units. NOS supports the following equipment models.

- 405 Card Reader
- 415 Card Punch
- 533/536 Printer
- 537 Printer
- 580-12, 580-16, and 580-20 Line Printers
- 585 Printer
- 5870 Non-Impact Printer
- 834/836 Disk Storage Subsystem
- 844-21 Disk Storage Subsystem
- 844-41/44 Disk Storage Subsystems
- 885-11/12 Disk Storage Subsystems
- 885-42 Disk Storage Subsystem
- 887 Disk Storage Subsystem
- 895-1/2 Disk Storage Subsystem
- 819 Disk Storage Subsystem
- 9853 Disk Storage Subsystem
- 7990 Mass Storage Extended Subsystem (MSE)
- 639, 667, 669, 677, 679, and 698 Magnetic Tape Units
SYSTEM SOFTWARE

Software executed within a computer system can be divided between software that is built into the system during system initialization and software that executes as jobs within the running system. Software present when the system begins running includes the operating system and products such as compilers, CYBER Loader, and CYBER Record Manager.

USER PROGRAMS

A user program is a group of CPU instructions that perform a certain task or calculate a result. A user program can be written in a language at any of three levels.

- Compiler languages provide you with a language suited to your particular needs. The program statements are translated by the appropriate compiler (FORTRAN, COBOL, ALGOL, and so on), which generates assembler language or machine language instructions. Programs written in compiler languages may be machine-independent.

- Assembler languages provide a one-to-one relationship between instructions and machine operation. Mnemonics are provided for each instruction. These languages are machine-dependent. Much of the NOS system is written in COMPASS, the assembler language of the CYBER 180, CYBER 170, CYBER 70, and 6000 Computer Systems.

- Hardware instructions are interpreted directly by the computer. Each hardware instruction is a binary number. Most users are rarely concerned with instructions written at this level except when program debugging requires interpreting memory dumps.

OPERATING SYSTEM

NOS is a group of programs that supervise and coordinate the operation of system hardware and the execution of products and user programs. The following lists some of the functions of NOS.

- Loading and scheduling of user programs.
- Job validation and accounting.
- Command translation.
- File retrieval, manipulation, routing, and storage.
- Job input and output.
- Normal and abnormal job termination.
- Memory dumps.
CYBER Loader

CYBER Loader prepares programs for execution. Following your directions, it allocates memory for a program, loads the program modules into their appropriate locations, generates a load map, and initiates program execution. It can load subdivided programs for more efficient use of memory. Refer to the CYBER Loader Reference Manual for more information.

CYBER Record Manager

CYBER Record Manager (CRM) is the interface between program input/output (I/O) functions and NOS physical I/O functions. NOS commands do not use CRM. Some of the products that use CRM are COBOL 5, FORTRAN Extended 4, FORTRAN 5, Sort/Merge 5, PL/I (Programming Language I), and DMS-170.

The functions of CRM are divided between the Basic Access Methods (BAM) and Advanced Access Methods (AAM). BAM handles sequential and word-addressable file organizations; AAM handles indexed sequential, direct access, and actual key file organizations. Refer to the appropriate CYBER Record Manager manual listed in the preface.
A file is a collection of information addressable by name. All NOS data processing involves operations performed on files. Files can be differentiated by their name, structure, or file type or by whether they are assigned to a job (NOS jobs are described in section 3).

FILE NAMES

A file name consists of a unique string of seven or less alphanumeric characters. Although NOS allows file names that begin with a digit, many of its products (FORTRAN 5 and COBOL 5, for example) do not support such file names. Refer to the product reference manual listed in the preface for details.

Examples:

A A1 TAPE DUMP12 COMPILE

NOS uses many internal scratch files. Most of these scratch files have names beginning with the letters ZZ or SCR. Avoid using a name starting with these letters for any of your files.

The following file names are significant because they are associated with system-managed files that are assigned to your job.

INPUT OUTPUT PUNCH PUNCHB P8

Refer to the description of File Types for more information.

FILE STRUCTURE

A file consists of a well-defined set of data. Its physical representation varies markedly with the device upon which it resides. For instance, the physical structure of a file on magnetic tape is only remotely similar to its physical structure on disk. To facilitate the manipulation of file data by user and system programs, the system imposes a logical structure on a file that does not vary with device residence.

A logical file consists of a contiguous series of data (physically, the data is not always contiguous). A file always has a beginning of information and an end of information. It can be subdivided into a maximum of three levels. Figure 2-1 illustrates the structure of a file with one, two, and three levels of subdivisions. NOS and its products (refer to section 1) all use this basic structure for a logical file.

†There are differences in logical structure that depend on device residence, but these differences are of interest only to a COMPASS programmer. These differences are described in Volume 4, Program Interface.
NOS and some of its products do differ in both the levels of file subdivision they recognize and the names of the subdivisions. One of the most prominent of these products is CYBER Record Manager (CRM). It handles input and output for some widely used products like FORTRAN 5 and COBOL 5. The next two subsections contrast the treatment that NOS and CRM give a logical file.

![Figure 2-1. Logical Structure of Files](image)
CYBER RECORD MANAGER FILE STRUCTURE

CRM recognizes all three levels of file subdivision. It calls a first-level subdivision a partition, a second-level subdivision a section, and a third-level subdivision a record. Through CRM, you can specify a file organization, a blocking type, and a record type for your data. The file organization determines how records are accessed, the blocking type determines how CRM records are grouped on their storage media, and the record type defines the smallest unit of data CRM can retrieve. Refer to the CRM manuals listed in the preface for a detailed description.

NOS FILE STRUCTURE

NOS recognizes only two levels of file subdivision, the first and second levels. NOS calls a first-level subdivision a file and a second-level subdivision a record. The record is the smallest recognizable unit for both CRM and NOS but the term does not always refer to the same subdivision for the two processors. Figure 2-2 illustrates the differences in terminology.

Figure 2-2. NOS and CRM File Terminology

Since NOS terms a first level subdivision a file, a NOS file can contain more than one logical file; if it does, it is called a multifile file. A multifile file begins at beginning-of-information (BOI) and ends at end-of-information (EOI). A file within a multifile file begins either at BOI or after the end-of-file (EOF) of the preceding file. It ends at its EOF.

Each file consists of zero or more logical records of information. A record is zero or more 60-bit CM words. A record begins at the BOI, after an EOF, or after the end-of-record (EOR) of the preceding record. It ends at its EOR. The following is the structure of a single-record file.

BOI data EOR EOF EOI

or

BOI data EOR EOI

Most simple files, like text files, have one of these two formats.

†This is true for NOS commands but, at the program level, NOS does recognize third-level subdivisions.
The following is the structure of a multirecord, multifile file.

BOI data EOR data EOR EOF data EOR data EOR EOF EOI

The last EOF in a file may or may not be present depending upon the program used to create the file.

PHYSICAL FILE STRUCTURE

When NOS stores a file, it automatically converts the file to a structure that will conform to the physical characteristics of the storage medium. The logical file and record marks are converted to physical BOI, EOR, EOF, and EOI indicators.

The basis of all physical file structures is the physical record unit (PRU), the minimum amount of data that can be read or written in a single device access. Table 2-1 lists the PRU size, and record and file mark indicators for each supported storage device.
<table>
<thead>
<tr>
<th>Device</th>
<th>PRU Size</th>

<td>None.</td>
</tr>
</tbody>
</table>

†For more information, refer to appendix F.
††The 6/7/9 card is not recognized in a remote batch job. In an RBF job the end-of-file marker is a card with a 7/8/9 punch in column 1 and a level number of 17g in columns 2 and 3. RBF/HASP can also use a card with /*EOR in columns 1 through 5 and a level number of 17g in columns 6 and 7.
†††In the case of multivolume tape files, BOI is the HDR1 label of the first volume. In the case of an ANSI multifile, BOI is the HDR1 label associated with the beginning of the multifile.
†††††For more information, refer to section 12 and appendix G.
††††††For more information, refer to appendix F.

For more information, refer to appendix F.
Card Files

The physical file and record indicators in a card file are shown in figure 2-3 and listed in table 2-1. Although card decks do not have a defined PRU size, a card is the minimum data unit. NOS can read and punch cards in coded (Hollerith), binary, and absolute binary formats as described in appendix F. Coded cards are punched in 026 or 029 keypunch mode. The system uses the installation default keypunch mode (chosen by the installation) for reading cards unless a 26 or 29 is punched in columns 79 and 80 of a job, EOR, or EOF card, indicating that the subsequent cards are punched in that mode. NOS can punch up to 80 characters on a coded card and up to 150 characters (15 CM words) on a binary card.

![Figure 2-3. Sample Card File Structure](image)

Mass Storage Files

Mass storage files are stored on disk or extended memory.

To use NOS, you do not need to know the physical structure of mass storage; you do need to know its logical structure, which contains the concepts of logical devices and logical tracks. A logical device is one or more physical disk units known to the system as a single device. A logical track is a file allocation unit determined by the device type.

† Keypunch mode selection is not supported for jobs entered through a 200 User Terminal or similar remote batch terminal except for HASP.
Each permanent file on mass storage is accessed via a catalog track containing the permanent file catalog of its owner. Indirect access files (refer to Permanent Files) must reside on the same device as their catalog; direct access files may reside on another device. Space is allocated for mass storage files in units called reservation blocks. An indirect access file reservation block is always 64 words (one PRU). A direct access file reservation block is a logical track. The maximum size of your mass storage file is determined by your validation limits (refer to LIMITS Command in section 6).

Magnetic Tape Files

You may write information on magnetic tapes in either coded mode or binary mode. Coded mode operations involve data conversion from NOS-supported character sets to external character sets as shown in table 2-2. Coded mode is applicable largely for S and L tape formats. Binary mode operations copy files with no character set conversion and can be used for any tape format.

The term coded mode should not be confused with coded line. A coded line is defined as a line of 160 characters or less, terminated by a zero byte. Similarly, coded and binary mode should not be confused with coded and binary files. A coded file is a NOS system file coded in 6-bit display code, 6/12-bit display code, or 7-bit ASCII code. A binary file is simply a file containing binary information. Coded files can be copied in coded or binary mode; binary files can be copied only in binary mode.

The only NOS commands recommended for coded mode operations are COPY, FCOPY, and TCOPY. Any of the copy commands can be used for binary mode copies. For CYBER Record Manager (CRM) files, the CM parameter on the FILE command is used to select coded or binary mode. For FORTRAN programs, use the BUFFER OUT(n,1) statement to select binary mode and the BUFFER OUT(n,0) statement to select coded mode. For COBOL programs, use either the RECORDING MODE IS BINARY statement or the RECORDING MODE IS CODED statement.

The representation of data in memory and on tape depends on the number of tracks (seven or nine), the recording mode (binary or coded), and the specification of the CV=CV parameter on the LABEL command. Table 2-2 shows how the data representation varies with these factors.

Table 2-2. Data Representation on Magnetic Tape

<table>
<thead>
<tr>
<th>Number of Tracks</th>
<th>Binary Mode</th>
<th>Coded Mode</th>
</tr>
</thead>
</table>
| 9                | 1. Odd parity.  
|                  | 2. Groups of four 6-bit characters in memory are written without conversion on three-frame units on tape. | 1. Odd parity.  
|                  |                | 2. Each 6-bit character in memory is translated into an 8-bit equivalent on tape. You can choose EBCDIC or ASCII by specifying CV=EB or CV=AS on a LABEL command. |
| 7                | 1. Odd parity.  
|                  | 2. Each 6-bit character in memory is written without conversion. | 1. Even parity.  
|                  |                | 2. Each 6-bit character in memory is translated to its BCD equivalent on tape. The % character is lost in the translation. |
Tape Density

You can select 200- (read only), 556-, or 800-characters-per-inch (cpm) density for seven-track tapes or 800-, 1600-, or 6250-character-per-inch (cpm) density for nine-track tapes, provided these densities are available with the site hardware. NOS automatically processes tape parity errors and end-of-tape conditions unless you select other processing options (refer to Processing Options in section 12). You can also control error processing by using the EO parameter on a FILE command.

Tape Labels

Tape labels identify and delimit tape volumes and tape files. Tape marks begin and end most tape labels. A tape mark is a special bit sequence written and recognized by a tape unit.

NOS processes ANSI standard and nonstandard labeled tapes. Nonstandard labeled tapes are those whose format or content do not conform to the ANSI standard described in appendix G. NOS skips to the first tape mark when reading a nonstandard labeled tape if the tape assignment statement specifies the LB=NS parameter (refer to section 12). All information after the first tape mark is then handled as data. Any tape marks occurring after the first tape mark are handled as appropriate for the tape format (refer to table 2-1).

Figure 2-4. Use of ANSI Labels
ANSI standard labels as defined by NOS are those that conform to the American National Standard Magnetic Tape Labels for Information Interchange X3.27-1969 standard. NOS can create or verify ANSI labels if the LABEL command assigns the tape file. Label verification ensures that the correct volume has been mounted. ANSI labels separate multifile set files and indicate if a file continues on another volume.

The ANSI label EOF indicates end-of-information for a file within a file set. The use of ANSI labels to delimit files within file sets is illustrated in figure 2-4.

An ANSI-labeled tape must have the following labels. Other optional labels are described in appendix G.

<table>
<thead>
<tr>
<th>Label</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>VOL1</td>
<td>Beginning of volume.</td>
</tr>
<tr>
<td>HDR1</td>
<td>Beginning of information. If the file continues on to another volume, the HDR1 label is repeated. It must follow the VOL1 label and precede the continuation of the file information.</td>
</tr>
<tr>
<td>EOF1</td>
<td>End of information.</td>
</tr>
<tr>
<td>EOV1</td>
<td>End of volume (required only if the file continues on another volume).</td>
</tr>
</tbody>
</table>

Appendix G gives the tape label formats.
**Tape Data Formats**

NOS can read and write data on magnetic tape in any of the following formats.

<table>
<thead>
<tr>
<th>Format</th>
<th>Mnemonic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Internal (NOS default)</td>
<td>I</td>
</tr>
<tr>
<td>System internal†</td>
<td>SI</td>
</tr>
<tr>
<td>Stranger</td>
<td>S</td>
</tr>
<tr>
<td>Long block stranger</td>
<td>L</td>
</tr>
<tr>
<td>Foreign</td>
<td>F</td>
</tr>
</tbody>
</table>

These data formats differ in their PRU (block) size and in their record and file mark indicators (refer to table 2-1). Other format differences are as follows:

<table>
<thead>
<tr>

</table>

†NOS/BE system default tape format (binary mode only).
††Tape blocks read that are smaller than the noise size are discarded. An attempt to write a block smaller than the noise size produces an error message. Refer to the NS=ns parameter of the LABEL command.
†††Specification of coded mode aborts the job step; refer to TCOPY Command in section 9.
††††I/O mode bit is ignored.
†††††I/O mode on write for F format is specified in the control word and is returned in the control word on read.
NOS terminates all blocks on I format tapes and all blocks that are not a full PRU on SI format tapes with a 48-bit block (PRU) terminator. The terminator contains the total number of 12-bit bytes in the block (including the terminator itself), the number of blocks since the last HDRl label, and the level number of the block. This terminator enables read operations on I format tapes to check whether the number of bytes read and the block number expected match the byte count and block number in the terminator. If either does not match, the system attempts to recover the missing data. This feature prevents dropped or fragmented blocks and provides a higher degree of reliability than other data formats.

Tapes should be read with the same format specified as when they were written. Data is then recovered in its original form. For some formats, NOS writes extra bits which are discarded when the tape is read. I format nine-track tapes are always written with an even multiple of 12-bit bytes per block. SI format nine-track tapes may have an extra 4 bits written per block to preserve the lower 4 bits of a CM word. (A 60-bit CM word would be written in eight frames, 8 bits per frame.)

All nine-track tapes are written with odd parity. Binary seven-track tapes have odd parity; coded seven-track tapes have even parity. If a parity error is detected on an F format seven-track tape, the recording mode (binary or coded) is automatically switched to allow reading of mixed mode tapes.

Volume 4, Program Interface, describes tape formats in greater detail.
FILE TYPES

The system maintains several tables for each job. Every file assigned to a job has an entry in one or more of these tables. A table entry for a file includes the file name, the device on which the file resides, file type, and its current position and status.

The system assigns one or more of the following file types to files associated with a job:

- Input file type
- Queued file type
- Local file type
- Primary file type
- Direct access file type
- Library file type

INPUT FILES

An input file is also called a job file because it contains user-supplied commands and data for a job (refer to section 3). Initially, input files exist on mass storage in the input queue. A file enters the input queue directly when a local or remote batch job enters the system or indirectly when a user job submits another job via an LDI, ROUTE, or SUBMIT command. The input file for an interactive job is normally assigned to the terminal and is used by an interactive job to read data entered at the terminal into the program. A user job refers to its input file by the file name INPUT (refer to Input File Control in section 3).

QUEUED FILES

A file is queued as a result of one of the following events:

- Generally, whenever you enter a LDI, OUT, ROUTE, MFQUEUE, or SUBMIT command. Refer to the description of each individual command for cases where the command fails to queue a file.
- Job termination. The system automatically queues files named OUTPUT, PUNCH, PUNCHB, and PB; deferred routed files; and other system-reserved output files if they are assigned to the job. In interactive jobs, however, the files OUTPUT, PUNCH, PUNCHB, and PB are not automatically queued.

A queued file can have one of five dispositions:

- Input
- Plot
- Print
- Punch
- Wait
Your job's origin type determines the default processing of your queued job output. Jobs originating at a central site card reader are queued to a line printer with the same system-defined identifier as the card reader. Similarly, the system queues remote batch output to the remote batch terminal where the job originated. The system gives each remote batch terminal a unique terminal identifier (TID) when it logs in and uses this TID for queueing files originating from the terminal. You can determine the default destination of batch output for your jobs by using the ENQUIRE command and specifying either the JSN=jsn or UJN=ujn parameter. ENQUIRE shows the default destination in the DS field of its display. RB indicates remote batch routing and BC indicates routing to the batch devices at the central site.

You can override the default queueing of job output with the LDI, QGET, ROUTE, SETJOB, or SUBMIT command (refer to section 7).

Queued files with an input disposition wait until they are scheduled for execution. The service class of the job determines the scheduling priority of an input file.

For queued files with plot, print, or punch dispositions, their priority grows as they wait in the queue. Such files are processed when the appropriate device becomes available and when the file's priority is higher than all other files queued to that device. Refer to the ROUTE command in section 9 for an enumeration of disposition codes for plotting, printing, and punching.

A file with a print disposition must be formatted for line printing. Most system utilities format file OUTPUT for printing, but you must include the appropriate printer control characters when you create a file to route to a printer (refer to the COPYSBF command and to appendix H). Files with uppercase and lowercase characters require special processing (refer to the FCOPY command). Appendix D contains the printer output from a sample job.

A queued file with a wait disposition awaits further specifications from you. The system queues output from detached interactive jobs with a wait disposition unless you specify a different disposition. You can explicitly queue files with a wait disposition with the LDI, ROUTE, SETJOB, and SUBMIT commands.

A file remains queued on mass storage until one of the following occurs:

- The system resource it requires becomes available and the file's priority is the highest of all queued files with the same disposition.
- You remove the file with the QGET or DROP command.
- Site personnel remove it if it resides in the queue too long (site-determined).

You can get a list of your queued files with the ENQUIRE command (refer to section 7).

LOCAL FILES

Files of local file type are temporary files. Although all files assigned to a job are considered local to the job, the local file type includes only those files assigned to your job that are not given one of the other file types.

You can create a local file in many ways. The following list shows some implicit methods of creating a local file:

- Name the file for the first time in a copy command or in a read or write command within a program. A local file created in this manner always resides on mass storage.
• Name the file for the first time in an ASSIGN or REQUEST command that assigns the local file to mass storage or to an interactive terminal or name the file in an ASSIGN, LABEL, or REQUEST command that assigns the local file to magnetic tape.

• Name the file in a GET command generating a local mass storage file.

• Name the file as the output file in a compiler-or assembler-call command.

• Name the file as the list or output file in one of the file editing commands (MODIFY or EDIT, for example).

To save the contents of a local mass storage file, you issue a SAVE or REPLACE command to copy the local file to a permanent indirect access file or an APPEND command to copy the local file onto the end of an existing permanent indirect access file. Data written on a local file assigned to magnetic tape is written on the tape for later access. Local files are released upon job completion.

PRIMARY FILES

The primary file is a temporary mass storage file designated as the primary file by a PRIMARY, NEW, or OLD command. Only one primary file can exist for a job at a time. Some commands use the primary file as the default file when a file name is not specified. NOS rewinds the primary file before each job step.

DIRECT ACCESS FILES

You assign a direct access permanent file to your job by issuing an ATTACH or DEFINE command. When you define the file or when you attach the file in a mode permitting file modification, you can write on the permanent file. Refer to Permanent Files in this section.

LIBRARY FILES

A library file is a read-only file that several users can access simultaneously. This file type should not be confused with system library programs or with public permanent files stored under user name LIBRARY. Refer to Libraries in this section for a description of the uses of the term library in NOS.

You must be authorized to access a library file.

If authorized, you can read a library file after naming it in a COMMON command.

PERMANENT FILES

Your permanent files reside on mass storage until you purge them or until your site archives them (contact your computer center for their archiving procedures). The system maintains a separate permanent file catalog for each user name and it contains entries for all of your permanent files created under the user name you are using to access the system. A catalog entry includes the file name, its location on mass storage, its length, permission modes, and access history. Unless another user name is specified, the system directs all permanent file requests to the files of the user specified on the last USER command (or specified in the login of an interactive job).
User names (refer to Validation in section 3) that contain asterisks represent users with automatic read-only permission to files in the catalogs of other users. The user name must match the other user name in all characters not containing asterisks. For example, the user with user name *AB*DE* can access the catalogs of the following users.

- UABCDEF
- UABDDEE
- MABCDEI

The device residence of permanent files and their backup copies are described under Mass Storage File Residence in this section.

The two types of permanent files, indirect access permanent files and direct access permanent files, are described in the following paragraphs.

**INDIRECT ACCESS PERMANENT FILES**

You access an indirect access permanent file by naming it in an OLD or GET command. The system copies the permanent file from mass storage to a temporary file (primary or local file type). To alter an indirect access permanent file, you make the changes to the temporary copy and then enter the REPLACE command which writes the temporary copy over the indirect access permanent file. You create an indirect access permanent file by naming a temporary file in a SAVE or REPLACE command.

Mass storage for indirect access permanent files is allocated in 640-character blocks (64 CM words). Because of its small allocation block size, indirect files are most economical for relatively small files.

The maximum size of an indirect access file is determined either by your validation limits (refer to the LIMITS command), or by the device limitations described in Mass Storage Files in this section.

**DIRECT ACCESS PERMANENT FILES**

You access a direct access permanent file directly, not through a temporary copy. Data is written directly on the permanent file.

You create a direct access permanent file with a DEFINE command, which determines its name and residence and the default access mode available to other users. Other users may, if you permit, access the file with an ATTACH command. A number of users can attach the file concurrently, but only one user at a time can change the file. To change the file, you must attach it in modify, update, append, or write access mode. If you attach the file in write mode, no other user can attach that file concurrently.

Even if a file is currently attached to a job, you can purge the file from the permanent file catalog with a PURGE command. However, the purged direct access file remains attached to the job until it is released by a RETURN, CLEAR, UNLOAD, OLD, or NEW command or until the job ends.
Mass storage for direct access permanent files is allocated in large blocks; the block size depends on the mass storage device type on which the file resides (refer to Mass Storage Files in this section). Because of their large allocation block size and the write interlock feature, direct access files are often used for database files.

The maximum size of a direct access file is determined by your validation limits (refer to LIMITS Command in section 7), or by the device limitations described in Mass Storage Files in this section.

MASS STORAGE FILE RESIDENCE

For most mass storage file operations, you need not be concerned about the specific device on which your file resides. However, under certain circumstances, you may wish to override the default device residence for local or permanent files.

With the ASSIGN command, you can assign a local file to either a specific device or to a device category if you are so authorized.

Every permanent file you create resides either in your family of permanent file devices, on an auxiliary device, or on alternate storage. Unless you specify otherwise, all permanent files are saved in your family. Refer to the NOS 2 Analysis Handbook for further details.

FAMILY DEVICES

A family consists of a set of mass storage devices. Normally, a system has only one family (the default family) of permanent file devices. However, because families are interchangeable between NOS systems, several families may be active on one system, or a system may be part of a multimainframe system. For example, consider an installation with two systems, A and B. System B provides backup service to system A. If system A failed, its family of permanent file devices could be introduced into system B without interrupting current operations on system B.

You identify your family by supplying a one- to seven-character family name. You can specify a family name on the USER command. If you are authorized to use secondary USER commands (refer to the USER command), you also specify a family name on a USER command in interactive jobs. If your family is the system’s default family, you may, but need not, supply the family name. When the family name is omitted, the system uses the system default family name. If your family has been introduced into another system, you must supply your family name.

If you choose to save files on family devices, you have the option of either using the system default device type or specifying another type of permanent file device.
AUXILIARY DEVICES

An auxiliary device is a supplement to the mass storage provided by family devices. It is identified by a one-to-seven-character pack name. An auxiliary device is not necessarily a disk pack that can be physically removed as the pack name implies. Rather, an auxiliary device can be any mass storage device supported by the system and defined as such by the installation. Each auxiliary device is a self-contained permanent file device; all direct and indirect access files represented by the catalogs on the device reside on the device. Auxiliary devices may be defined as public or private. Anyone who supplies the appropriate pack name can create, replace, and access files on a public device. Only one user, the owner, can create and replace files on a private auxiliary device, but others may access or replace those files as permitted by the owner.

ALTERNATE STORAGE

Disk is the usual residence of permanent mass storage files. However, your site may choose to move some files from disk to alternate storage (either to a cartridge alternate storage subsystem such as MSE or to tape alternate storage). Alternate storage is well suited for the storage of files that are accessed infrequently. Accessing a file residing on alternate storage takes extra time, because the file must be retrieved and copied (staged) to disk. You can specify the preferred residence of your permanent files with the PR parameter on the DEFINE, CHANGE, or SAVE commands. You can ascertain the residence of your files with the CATLIST command. In the CATLIST output, file names surrounded by parentheses indicate that these files reside on alternate storage rather than on disk.

Usually, when attaching a file from alternate storage, the system suspends the job until the file has been staged and assigned to the job. (You can determine the status of your staging request for an alternate storage file with the ENQUIRE or CE command.) However, if you specify the RT parameter on the ATTACH, GET, or OLD command, the job will be allowed to continue processing while the file is being staged to disk. You must then issue a second ATTACH, GET, or OLD command to assign the file to your job after staging. If you specified the RT parameter you can then check whether the file has been attached by using either the FILE function (refer to section 6) or a LENGTH or ENQUIRE command.

If a permanent file is lost or destroyed, site personnel can recover the file by loading its backup copy. Generally, sites perform regular dumps of permanent files to magnetic tape to serve as the permanent file backup. By specifying the BR parameter on the DEFINE, CHANGE, or SAVE command, you can choose to have a tape backup copy of your file kept even if the file resides on alternate storage. You also can choose to have the alternate storage file copy serve as a backup, or you can require no backup copy of your file.
LIBRARIES

As defined in the glossary (appendix C), the term library has several meanings. The applicable meaning for the term must be determined from its context. The following describes some NOS libraries.

USER NAME LIBRARY

Files stored under user name LIBRARY need not be libraries themselves. An installation saves programs or text as files under user name LIBRARY so that authorized users can access them from a centralized location. You can access those files by specifying the file name and the alternate user name LIBRARY on their permanent file request or by issuing a LIB command for indirect access files.

PROGRAM LIBRARIES

A program library is a collection of compressed source deck images stored in Modify or Update format. You access these compressed source decks through MODIFY or UPDATE commands (refer to section 15).

USER LIBRARIES

User libraries are the files named in the LIBRARY, SATISFY, LIBLOAD, or LDSET loader command or in program binaries. These files are searched by CYBER Loader to satisfy external references within a program it is loading. They contain compiled or assembled routines. The first record of a user library is a ULIB record; the last record is an OPLD record. Section 15 describes commands that create, catalog, and manipulate user libraries.
The primary job types are batch and interactive. A batch job is a file of commands and data. Its first record, called the command record, contains lines of text that specify NOS commands. Every batch job begins with a Job command and a USER command. The end of the command record is marked by an EOR (or an EOI if there is no data in the job).

If records follow the command record, they contain program, data, or directive input for the commands. As each command requiring user input is processed, the system reads the next record in the input file (unless the command specifies otherwise). These records must be in the same order as the commands that use them.

For example, figure 3-1 illustrates a job file. In this job file, the first two commands are processed by system routines that require no additional user input. The third command, FTN5(G0), requests the compilation and execution of a FORTRAN 5 program. The compiler reads the FORTRAN 5 source program from the second record of the input file. After successful compilation, the system executes the program. Because the program reads data from the input file, it takes input data from the third record of the input file. Normal job termination occurs when the system reads the command record EOR (the first 7/8/9 card).

You can also consider an interactive job to be a file of commands and data. You do not submit the file to the system as a unit, but enter input one command at a time from a terminal. Generally, the system processes each command as soon as you enter it. However, you may group commands in a procedure and those commands are executed together when you call the procedure.

**JOB INITIATION AND TERMINATION**

The methods of job entry and termination differ for interactive and batch jobs.

**BATCH JOBS**

You can enter a batch job in the following ways:

- Enter a job file through a local card reader.
- Enter a job file through a remote batch terminal.
- Enter a job file using the HELLO7, LDI, MFQUEUE, ROUTE, or SUBMIT command from an interactive or another batch job.

To enter a job file through a remote batch terminal, you must use the Remote Batch Facility (RBF). Consult the Network Products Remote Batch Facility Version 1 Reference Manual for details. Section 7 describes the LDI and SUBMIT commands. Section 9 describes the MFQUEUE and ROUTE commands.

Unless abnormally terminated, your batch job ends after the system executes the last command in the command record of your job file.
INTERACTIVE JOBS

To enter an interactive job, you must use the Interactive Facility (IAF). Volumes 1 and 2 of this reference set give a more detailed description of login and logout procedures for interactive jobs. Section 16 describes terminal and input/output conventions.

Login

Before you can login to a host computer, you must establish a connection with the network software. If you need information on how to connect, refer to Volume 2, Guide to System Usage. If your network uses CDCNET, refer to the CDCNET Access Guide.

Once you have established a network connection, you can begin the login sequence.
The following example shows an abbreviated login sequence.† Your entries appear in lowercase characters.

```
WELCOME TO THE NOS SOFTWARE SYSTEM.
COPYRIGHT CONTROL DATA 1978,198X.
YY/MM/DD. HH,MM,SS TO2A57
NETWORK OPERATING SYSTEM NOS 2
FAMILY: ,usernam,passwd,iaf
YOUR PASSWORD WILL BE EXPIRED YY/MM/DD
JSN: AEYT, NAMIAF
READY.
```

The second line of the login sequence gives the original copyright date of NOS software and the copyright date of your version of NOS. The third line gives the current date and time, and the name of your terminal.

After the system validates your user name and password, it assigns your job a job sequence name (JSN). The JSN in this example is AEYT.

If you have recoverable jobs in the system, the system initiates a recovery dialogue with you immediately after it logs you in.

**NOTE**

Using a network to recover a job other than the one you were using before the job was disconnected may not always work. For this reason, we recommend that you always use the same network to recover a job.

†This manual assumes that your system does not require the entry of a personal identifier. For more information about the personal identifier refer to Volume 2 of the NOS 2 Reference Set.
The following example shows a login sequence where you have recoverable jobs.† Again, your entries appear in lowercase characters.

WELCOME TO THE NOS SOFTWARE SYSTEM.
COPYRIGHT CONTROL DATA 1978, 198X.

YY/MM/DD. HH.MM.SS T01A75
NETWORK OPERATING SYSTEM NOS 2
FAMILY: usernam,passwd,iaf
YOUR PASSWORD WILL BE EXPIRED YY/MM/DD

JSN: ADYE, NAMIAF

RECOVERABLE JOB(S)

<table>
<thead>
<tr>

<td>AN2A</td>
<td>SUSPENDED</td>
<td>28 MIN.</td>
</tr>
</tbody>
</table>

ENTER GO TO CONTINUE CURRENT JOB,
RELIST TO LIST RECOVERABLE JOBS,
OR DESIRED JSN: go
READY.

Additionally, some sites may require you to enter charge information during login (refer to CHARGE command in section 7).

Logout and Application Switching Procedure

When you have finished using IAF, you can either log out or switch to another application. The logout procedure disconnects you from the host. Application switching ends your session with IAF but allows you to continue processing under the control of another application (such as RBF).

To terminate your terminal session, enter one of the following:

GOODBYE or BYE or LOGOUT

The system responds by printing:

UN=username LOG OFF hh.mm.ss.
JSN=jsn SRU-S s.sss
CHARACTERS=xxxxxxxxKCHS
IAF CONNECT TIME hh.mm.ss.
LOGGED OUT.

This display is followed by additional logout information provided by network software.

†This manual assumes that your system does not require the entry of a personal identifier. For more information about the personal identifier refer to Volume 2 of the NOS 2 Reference Set.
The following is a description of the variable items in the logout display:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>User name you entered during login.</td>
</tr>
<tr>
<td>hh.mm.ss.</td>
<td>The first occurrence of hh.mm.ss. indicates the time of logout. The second occurrence indicates the length of time your terminal was connected to IAF.</td>
</tr>
<tr>
<td>jsn</td>
<td>Your job sequence name.</td>
</tr>
<tr>
<td>s.sss</td>
<td>A measure of the system resources used while connected to IAF.</td>
</tr>
<tr>
<td>xxxxxxxx</td>
<td>A count of the total number of input and output characters read from, or written to, your terminal.</td>
</tr>
<tr>
<td>ct</td>
<td>The network control character for your terminal. (The network control character for specific terminal models are listed in Table J-1.)</td>
</tr>
<tr>
<td>had</td>
<td>The host availability display (HAD). The HAD appears if you have enabled it with the HD terminal definition command (refer to appendix J) or if you are operating in a multihost environment.</td>
</tr>
</tbody>
</table>

IAF automatically logs out the terminal if no activity has been registered in a site-defined timeout period (the default is 10 minutes), unless you have a no-timeout terminal status. Refer to the discussion of the LIMITS command for further information.

When IAF logs out a dial-up terminal to the system, the system automatically disconnects the terminal after a site-determined period of time (2 minutes is the default). You may wish to log out without disconnecting the terminal. To log out of the system and reinitialize the login sequence, enter:

HELLO

or

LOGIN

IAF logs out the current job, issues the normal logout messages, and then causes the network to initiate a new login sequence. Any terminal characteristics, such as page width or terminal class set in the previous job, remain in effect.
If you wish to leave the IAF application but remain connected to the network and use another application, you can enter one of the following:

BYE, application
GOODBYE, application
HELLO, application
LOGIN, application
LOGOUT, application

In these commands, the term application means a product that uses the network for terminal communications. Other applications include TAF, MCS, TVF, PNI, and RBF (refer to the BYE command in section 8). Other site-provided applications may also be available. All terminal characteristics in effect under IAF remain in effect under the new application.

After you enter one of the above commands, the system prints the logout message and disconnects the terminal from IAF. If the site has authorized you to access the application, the system connects the terminal to the named application. If the named application is not present or if the site has not granted you access to this application, the system issues an error message and the prompt:

terminalname - APPLICATION:

where terminalname is the name the network has given your terminal.

You can again enter the name of an application, or you can enter BYE or LOGOUT to log out or HELLO or LOGIN to reinitiate the login sequence.

SUBMITTING JOBS TO REMOTE HOSTS

Some sites use multiple host network configurations in which you can log in to a host mainframe and then submit jobs to other mainframes (remote hosts) in that computer system. There are various ways in which sites can configure these computer systems, and the means by which you submit jobs to a remote host depend on your system configuration, the type of remote host, and the nature of the jobs. In all cases, however, you must have special authorization to submit such jobs (refer to the LIMITS command in section 7).

In general, you can submit a batch job to a remote host by specifying the remote host with the ST=lid parameter of the Job command or the ROUTE command. If the remote host is a SCOPE 2 system and the batch job requires interactive input or output, use the HELLO7 command. If the remote host is connected through the Queued File Transfer Facility (QTF) and the batch job has special routing requirements (requirements not provided by ROUTE parameters), use the MFQUEUE command. If you want to retrieve or change the attributes of permanent files on such a remote host, you need not submit a complete batch job. You can use the MFLINK command from a job on your host mainframe.

If you want to connect your interactive terminal to a Virtual Storage Operating System (operable on a CYBER 200 computer system), select the Interactive Transfer Facility (ITF) during login or with the BYE, GOODBYE, HELLO, LOGIN, or LOGOUT command.

In a dual-state system, you can submit a batch job from the NOS system to the NOS/VE system using the ROUTE command. The ROUTE ST=lid parameter routes a NOS file to the NOS/VE batch input queue. The file must be written in 6/12-bit display code.
Figure 3-2 summarizes the methods of submitting jobs to remote hosts.

<table>
<thead>
<tr>
<th>Command/Application</th>
<th>Type of Job Being Submitted</th>
<th>Special Host Type/Connection Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job Command (ST=clid parameter) ROUTE Command (ST=clid parameter)</td>
<td>Batch</td>
<td>No special requirements.</td>
</tr>
<tr>
<td>HELLO7 Command</td>
<td>Batch (with interactive I/O)</td>

</tr>
</tbody>
</table>

Figure 3-2. Submitting Jobs to Remote Hosts
JOB ORIGIN TYPES
When a job enters the system, the system determines the job origin type according to the means used for job initiation. Its origin identification remains with the job throughout job processing. The job origin type determines how the job is handled and how it exits from the system.

The four origin types and their system symbols are as follows (system symbols are described in section 6):

<table>
<thead>
<tr>
<th>Origin Type</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>SYO</td>
</tr>
<tr>
<td>Interactive</td>
<td>IAO</td>
</tr>
<tr>
<td>Local batch</td>
<td>BCO</td>
</tr>
<tr>
<td>Remote batch</td>
<td>RBO</td>
</tr>
</tbody>
</table>

System origin jobs originate at the system console, interactive jobs all enter through IAF, local batch jobs enter through central site batch devices, and remote batch jobs enter through RBF.

If you are so authorized (refer to the LIMITS command), you can also initiate jobs using the HELLO7, MFQUEUE, LDI, ROUTE, or SUBMIT commands. Depending on how you specify the parameters of these commands, the resulting jobs can either be local batch or remote batch in origin type.

JOB SERVICE CLASSES
Every job in the system is assigned a service class. This service class determines the job's scheduling priority as the job flows through the system. You can make this service class assignment or you can let the system assign it a default service class based on the job's origin type and your validation limits (the privileges your site has granted you).

Unless changed by your site, the system has the following 14 service classes:

<table>
<thead>
<tr>
<th>Service Class</th>
<th>Two-character Mnemonic</th>
<th>One-character Mnemonic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deadstart</td>
<td>DS</td>
<td>A</td>
</tr>
<tr>
<td>System</td>
<td>SY</td>
<td>S</td>
</tr>
<tr>
<td>Local batch</td>
<td>BC</td>
<td>B</td>
</tr>
<tr>
<td>Remote batch</td>
<td>RB</td>
<td>R</td>
</tr>
<tr>
<td>Interactive</td>
<td>TS</td>
<td>T</td>
</tr>
<tr>
<td>Detached interactive</td>
<td>DI</td>
<td>D</td>
</tr>
<tr>
<td>Network supervisor</td>
<td>NS</td>
<td>N</td>
</tr>
<tr>
<td>Subsystem</td>
<td>SS</td>
<td>X</td>
</tr>
<tr>
<td>Maintenance</td>
<td>NA</td>
<td>M</td>
</tr>
</tbody>
</table>
The scheduling priority associated with each service class is site-determined. You can ascertain how your site has prioritized the service classes you are authorized to use for each origin type by using the CLASS command. To determine the service class of a job, use the ENQUIRE command. The system denotes the service class with a one-character mnemonic in the SC field of the ENQUIRE output.

Your site allows you to use only a subset of the service classes. The LIMITS command shows you which service classes you can use. Further, your site can restrict the use of certain service classes to jobs of certain origin types. The CLASS command displays this information.

You can assign a service class to a job in the following ways:

- Use the CHVAL command to specify default assignments for your jobs according to origin type. The system uses one of these default assignments if you do not otherwise make a service class assignment in a job. The LIMITS command shows what your default service class assignments are for each origin type.
- Use the SC=class or P=priority parameter of the Job command for batch jobs.
- Use the CLASS command to change the service class of your current job.
- Use the SCL=scl parameter of the ROUTE command for jobs to be initiated by that command.

### JOB NAMES

Every job in the system receives a job sequence name (JSN) and a user job name (UJN). This includes not only your job file, but files you explicitly route for disposal during your job, such as files routed to a line printer. These job names are the primary job identifiers for both the system and you. Many system commands use the JSN and UJN as parameters. You can get a list of the JSN and UJN of all your active jobs by using the ENQUIRE command.

### JOB SEQUENCE NAME (JSN)

The system assigns every job a unique JSN. Each JSN consists of four alphabetic characters. The banner page of batch output prominently displays the job's JSN: the JSN appears as the last four characters of the eight characters in block letters (refer to appendix D for a sample banner page).

<table>
<thead>
<tr>
<th>Service Class</th>
<th>Two-character Mnemonic</th>
<th>One-character Mnemonic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communication task</td>
<td>CT</td>
<td>C</td>
</tr>
<tr>
<td>Installation class 0</td>
<td>I0</td>
<td>0</td>
</tr>
<tr>
<td>Installation class 1</td>
<td>I1</td>
<td>1</td>
</tr>
<tr>
<td>Installation class 2</td>
<td>I2</td>
<td>2</td>
</tr>
<tr>
<td>Installation class 3</td>
<td>I3</td>
<td>3</td>
</tr>
</tbody>
</table>
USER JOB NAME (UJN)

The UJN is for your convenience. You can select a meaningful name (a maximum of seven characters) by which to identify your jobs. For batch jobs, you can set the UJN with the SETJOB or ROUTE command. If not otherwise specified, the UJN for batch jobs defaults to the UJN specified on the Job command. For interactive jobs, you can specify the UJN with the SETJOB command. The UJN for interactive jobs defaults to the user index hash (refer to the ENQUIRE command).

VALIDATION

In batch jobs, the USER command follows the Job command and is used to identify you as an authorized user. If you are an authorized user, a set of control values associated with your user name is used by the system to control all system requests from your job. If you are not permitted to perform specific functions (such as access nonallocatable devices) and you attempt to use them, your job will be terminated.

To get a listing of resources at your disposal and of special permissions you possess, enter the LIMITS command. To change your resource allocation or to get additional permissions, contact installation personnel.

ACCOUNTING

The unit of accounting for the system is the system resource unit (SRU). The SRU is a composite value of central processor time, I/O activity, and memory usage. SRU operations are initiated at the beginning of a job and reinitiated whenever another CHARGE command is encountered. SRU information includes:

- Central processor time
- Mass storage activity
- Adder activity (fixed charges for some system requests whose resource requirements are highly variable and beyond your control)
- Magnetic tape activity
- Permanent file activity
- Central memory and extended memory usage
- SRU value
- Matrix Array Processor (MAP) activity
- Application account charges†

This information is written to the job’s dayfile at the end of the job or whenever this job’s service class changes. You may request SRU information to be written to your output file at any time during the job by issuing the ENQUIRE command. The format of SRU information written in the dayfile is given under Job Completion in this section.

†Not currently supported by the system but reserved for future use.
JOB SCHEDULING

When a job enters the system, it is queued for input and waits for the required system resources to become available or its priority to grow. The job's priority depends on its service class. The system priorities are system-defined and can be altered only by the system operator. The scheduling priority of the job is advanced as the job waits. The priority ages to a system-defined limit. The job scheduler periodically scans the queued jobs and active jobs to determine whether action is necessary to ensure that the highest priority jobs are being serviced. This action may include rolling out low priority jobs or rolling in higher priority jobs. The job scheduler is also activated to analyze the system status whenever there are changes (for example, when the field length of a job is released, a job is queued, or a job completes).

Once a job is scheduled for execution, normal command processing begins. The general flow of the command processing is illustrated in figure 5-1.

JOB CONTROL

While the job is executing, the system exercises the following controls over the job.

FIELD LENGTH CONTROL

The system controls the field length (central memory) assigned to a job, adjusting it according to the requirements of each job step. CYBER Loader further adjusts the field length during both program loading and program execution. Memory may be added or removed as the needs of the program change. Refer to the description of the REDUCE command in the CYBER Loader Reference Manual. You can further influence the field length assigned to your job by using the CM parameter of the Job command and the MFL and RFL commands.

The maximum field length for a job (MAXFL) is set at the smallest of the following values.

- The value of the CM parameter of the Job command if specified
- Maximum field length you are authorized to use
- Maximum field length available for user jobs (dependent on machine size)

For any job step, the maximum field length is the smaller of MAXFL or the value you specified with the MFL command.

The running field length (RFL) is initially set to zero, indicating system control of field length. The RFL command changes RFL. RFL cannot exceed the current MFL.

To set the initial field length for a job step, the system uses the first value set by one of the following.

- Predefined initial field length for a system routine or on a global library set (RFL = special entry point).
- Highest high address (HHA) from EACP loader table (54 table) (refer to the CYBER Loader Reference Manual).
The following example shows a command record, the MAXFL, MFL, and RFL settings, and the actual field length (expressed in octal) used to process each command.

<table>
<thead>
<tr>

</tr>
<tr>
<td>RELPROG</td>
<td>60000</td>
<td>50000</td>
<td>0</td>
<td>50000</td>
<td></td>
</tr>
</tbody>
</table>
INPUT FILE CONTROL

Batch jobs, when initiated, have a file named INPUT (input file type). This file contains
the commands and other input records required for job execution. INPUT is a locked file.
As a result, you may read from it and reposition it, but the system does not allow you to
write on it. If for some special reason you need to write on a file named INPUT, you should
first issue a RETURN(INPUT) command. This command changes the name of the file from INPUT
to INPUT* and leaves it assigned to your job. You may then write on file INPUT. The change
of name caused by the RETURN command applies only if the file has an input file type (refer
to File Types in section 2).

For interactive jobs, file INPUT* is present at the beginning of the session and cannot be
returned with a RETURN command. You can create and manipulate a file called INPUT at any
time, although various products, such as the Full Screen Editor, require special processing
in order to handle files named INPUT or OUTPUT as data files.

TIME LIMIT CONTROL

The system sets a default time limit for each job step unless the Job command or the SETTL
command specifies a job step time limit. This time limit is the amount of central processor
time that any one job step is allowed. You cannot increase the limit beyond that for which
you are authorized.

While a job is using the central processor, the CPU time is accumulated and checked against
the time limit for each job step. If the job's origin type is not interactive, the job in
execution terminates or enters exit processing when the time limit is reached. Interactive
jobs are suspended, after which you can increment the time limit and resume execution from
the point of suspension (refer to SETTL Command for an example). In the case of a detached
interactive job, the system suspends or terminates the job according to the parameter values
of the SETJOB command. You cannot resume jobs suspended in this fashion from the point of
suspension; they enter exit processing.

SRU LIMIT CONTROL

The system sets a limit on the number of system resource units (SRU) that a job step or an
account block can accumulate. An SRU includes central processor time, central memory usage,
permanent file activity, and mass storage and tape I/O. An account block is that portion of
a job from one CHARGE command to the end of the job or to another CHARGE command. You may
alter these limits through the SETJSL and SETASL commands or macros; however, you may not
set either limit beyond that for which you are validated.

While a job is in the system, SRUs are accumulated and checked against the SRU step and
account block limits. If either limit is reached, the system treats the job as if it
exceeded its time limit for a job step, which is described in the preceding subsection.

COMMAND LIMIT CONTROL

The system sets a limit on the number of commands you can enter in a job. You can ascertain
this limit by entering the LIMITS command. If your job exceeds this limit, the system so
informs you and allows you seven additional commands before terminating your job. The
ENQUIRE,U command gives the number of commands you have entered in your job.
ROLLOUT CONTROL

Each executing program is allowed to reside in CM for a certain amount of time before relinquishing its space to another program. When this CM time slice is exceeded, the program may be rolled out. This means that the contents of the job field length (both CM and extended memory), the job control area, and the control registers (exchange package) are written to mass storage. The program remains on mass storage until it is rolled back into memory. Execution resumes from the point where rollout occurred. The amount of time the job is allowed to occupy CM is called the central memory time slice. The central memory time slice is a system parameter that can be changed only by the system operator; time slices vary for each origin type. Whether a job is rolled out when its time slice expires depends on several factors.

- Whether there are jobs waiting for execution.
- Whether the jobs that are waiting have a higher priority.
- Whether jobs that are waiting require more field length than would be available if all jobs of lower priority were rolled out.

When a job is rolled out, it is assigned a priority. The priority assigned is a system parameter that depends on a job's service class and can be changed only by the system operator. The job's priority increases while the job waits. Normally, all other factors being equal, the job with the highest priority is selected to be rolled in.

ERROR CONTROL

When job step activity ceases, the system must determine the next command to process. If activity ceased due to normal termination, the next command processed is the next command in sequence. If an error caused activity to cease, the system issues the appropriate dayfile message and exits from the job.

Errors may be detected by system software or hardware. When the system hardware detects an error condition, NOS issues two or more dayfile messages. The first message gives the address where the error was detected; the second and following messages give the types of errors that occurred. NOS then dumps the exchange package for the job either to OUTPUT, for local batch and remote batch origin jobs, or to local mass storage file ZZZDUMP, for interactive jobs (refer to section 14). ZZZDUMP is not rewound before or after the dump.

After issuing the appropriate dayfile message(s) for the error(s), the system searches for an EXIT command. If an EXIT command is found, processing continues with the command following EXIT. If an EXIT command is not encountered, the system terminates the job. (Exit processing is further described in section 5.) If a NOEXIT command is in effect, the system does not search for an EXIT command on subsequent errors, and processing continues with the next command.

You can specify the error exit mode on which the system is to abort a job step with the MODE command. For example, you can specify that address out of range, operand out of range, and/or indefinite operand errors are allowed and program execution continues (refer to section 6). The default error exit mode specifies that all errors terminate the job.

The EREXIT, RECOVR, REPRIEVE, and MODE macros control error processing in COMPASS programs. The SETLOF macro specifies file completion procedures when a job step abort occurs. These macros are described in Volume 4, Program Interface.

*Not applicable to model 176.*
SECURITY FEATURES

A NOS computer system provides extensive protection of information contained in your jobs and files. Most notably, it protects the central memory associated with your active jobs and it enforces job and file access controls.

MEMORY PROTECTION

A job cannot dump or directly change the contents of the job field length immediately after a protected command or a user program. The following is a list of protected commands and a list of load/dump memory commands:

**Protected Commands**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

In an interactive job, you cannot enter a load/dump memory command individually or as the first command of a procedure. If you attempt to change or dump protected memory, the system issues an informative message to the dayfile and terminates the job step.

This form of memory protection does not apply if the job is of system origin or if you have system origin privileges and debug mode has been set at the system console.

SYSTEM AND FILE ACCESS CONTROLS

NOS operates in either secured or unsecured mode, depending on the option selected by your site. On an unsecured system, the primary control of system access is based on user names and user passwords. NOS may also require certain users to enter a personal identifier in addition to their user name and password to gain system access. Additionally certain users may also be restricted to a single terminal session at a time.

†This applies to EXECUTE when used as a loader command. It does not apply to EXECUTE when used to select the execute subsystem in an interactive job.
The system further restricts the use of certain system resources (for example, applications and special commands) to those explicitly granted that privilege by your site. NOS enforces file access controls based on user names, file passwords, and permissions granted by the owner of the file. The controls based on file passwords and permissions are discretionary; they are set at the discretion of the file owner.

In a secured system, NOS enforces an additional set of access controls based on security access levels and categories. These controls limit access to information based on the user’s validated clearance level and need-to-know categories versus the security access level and category markings associated with each file. These mandatory controls take precedence over the discretionary controls, which also remain available.

You must be validated to use one or more security access levels and zero or more security access categories. Every file on a secured system has a single security access level and may have one or more access categories associated with it. To access a file, the user job must be validated for the file’s security access level and for all of the file’s access categories.

SECURITY ACCESS LEVELS

A security access level limits the disclosure of sensitive information to persons who are authorized to access information at the level of sensitivity indicated by that access level. A secured system supports up to eight security access levels. The number of access levels to be used, the names of those levels, and the degree of sensitivity associated with each level are selected by your site. The access levels are ordered so that the most sensitive information is associated with higher access levels. (The access levels have numerical values of 0 through 7; the corresponding released default names are LVLO through LVL7.) You are validated for a set of security access levels (normally a contiguous range of levels, such as LVLO through LVL4).

The system associates a set of access levels with each job. This set is the intersection of your validated set of access levels, the range of levels currently valid for the system, the range of access levels allowed for your job’s origin type, and, if specified by the system, the range of access levels allowed over your communication line to the computer. For interactive jobs, your job’s initial access level is the lowest level in the set of access levels for your job. For batch jobs, the initial access level is the access level of the local file that initiated the job.

Example 1: You are validated to use levels LVLO through LVL5, the system is currently validated for levels LVLO through LVL7, your job origin type has an access level range of LVL1 through LVL4, and your communication line has an access level range of LVLO through LVL3. As shown in table 3-1, your job will have an access level set of LVL1 through LVL3 and the job’s initial access level will be LVL1. If this job is initiated via a ROUTE or SUBMIT of a local file with access level LVL2, that will be the job’s initial access level.
Each file has a security access level. Unless you specify otherwise, each file you create will have the same access level as your job at the time you create the file. You can always raise the access level of your files (refer to the SETFAL and SETPFAL commands) to any level for which your job is validated, but you must have special permission to lower the access level of your files. However, the access level of direct access files or tape files cannot be changed while they are assigned to your job. If the access level of such a file is lower than that of your job, you can always read information from the file but can only write information to it if you have special authorization. The access level of a local file is automatically raised to the current job access level whenever an operation is performed on the file (this includes your primary file).

Your job's access level is automatically raised whenever you read information from a file that has a higher access level than your job's current access level (within your job's validated set of access levels). You can always raise your job's access level using the SETJAL command to any level for which your job is validated, but you must have special permission to lower the access level of your job.

Example 2: In the job referred to in example 1, you attach a file that has access level LVL3 and read information from that file. The access level of your job is immediately raised from LVL1 to LVL3.

Example 3: In the same job, you attempt to set your job's access level to LVL5 using the SETJAL command. This attempt fails because LVL5 is not in your job's validated set of access levels.

Unless you are specifically validated, a secured system does not allow you to write information from a file with a higher access level into a file with a lower access level.

Example 4: You attempt to copy a portion of a file whose access level is LVL2 to a file whose access level is LVL3. A secured system allows this operation.

Example 5: You attempt to copy a portion of a file whose access level is LVL3 to a file whose access level is LVL2. A secured system does not allow this operation (unless you possess special validation).
On an unsecured system, you may set access levels on your files (for informational purposes), but the system does not use those levels to restrict access to the files, nor does it propagate those levels to your job or to other files. No job has an access level on an unsecured system.

SECURITY ACCESS CATEGORIES

A secured system supports up to 32 security access categories. The number of categories to be used and the names of those categories are selected by your site. The access categories have numerical values of 0 through 31; the corresponding released default names are CAT00 through CAT31. Each user is validated for subset of the site-defined access categories. Your job's access category set is the intersection of this subset and the set of categories currently valid for the system.

When you create a permanent file (using the SAVE or DEFINE command), the file is automatically assigned all of the access categories in your job's access category set. You have the choice to explicitly assign all, any, or none of these categories to each of your permanent files (refer to the SETPFAC command). Access categories restrict the access of your permanent files to those users who are validated for all of the categories you have set for the files.

Example 6: You are validated for the categories CAT01, CAT06, CAT18, and CAT22. Using the SETPFAC command, you assign the categories CAT06 and CAT22 to permanent file ABC, which has an access level of LVL3. You then make file ABC public. Any user in your family who is validated for access level LVL3 and the categories CAT06 and CAT22 can then access file ABC.

On an unsecured system, you may assign access categories to your permanent files for informational purposes, but the system does not use those categories to restrict access to the files.

RESPONSIBILITIES FOR DATA SECURITY

In a secured system, security access levels and categories are checked whenever a user accesses a file, begins a job, or attempts to alter the security parameters of a file or job. This ensures that only those persons who are validated for the access levels and categories you have assigned to your files can access them. A secured system thus provides continuous protection of your data.

Although the system will automatically assign an access level and an access category set to each file you create, you are responsible for ensuring that the access level and access category set assigned to each of your files is appropriate. Your site should provide guidelines for the use of the different access levels and categories it has established.

All of the NOS security mechanisms depend on the protection of your user password. NOS provides the following mechanisms to help protect your password during interactive login:

- You should always use the secure login procedure (described in section 8) to ensure that you are communicating with the system-supplied login mechanism.
• If possible, you should set your terminal to full duplex and enable echoplex mode (refer to the EP terminal definition command). The network temporarily disables echoplex when you enter your password during login. If you use the abbreviated login sequence, all fields in the line containing your password will be masked. This NOS security feature prevents display of your user password at your terminal.

• A warning message stating when your user password is going to expire is displayed at your terminal and is issued to the job dayfile.

Although NOS encrypts your user password after login, the programs you execute can affect the security of your files and validation information. When you execute a program, it can access the command record of your job. It is possible that a program belonging to another user can obtain privileged information like your user name and charge numbers.

SECURITY CONFLICT PROCESSING

When your job attempts to perform an operation that could violate system security, the system identifies the operation as a security conflict and issues a SECURITY CONFLICT message. A security conflict causes the job step to be aborted and decrements your security count (you are given a specific security count by the site security administrator). If your security count is decremented to zero, your current job or interactive session is terminated without EXIT processing. You are not allowed any additional jobs or logins until the security administrator resets your security count.

On an unsecured system, a security conflict occurs in the following cases:

• An incorrect secondary USER command.

• A job file submitted with a SUBMIT or ROUTE command has an incorrect USER command.

On a secured system, a security conflict arises in the following cases in addition to those listed above:

• An attempt to set an invalid access level on a file or job.

• An attempt to access one of your permanent files from a job that is not validated for the access level or access category set of the file.

• An attempt to write data on a tape file or an attached direct access file when the access level of your job is higher than the access level of the file.

• An attempt to set an access level for a file or job which is lower than the current access level of the file or job.†

JOB COMPLETION

When there is no more activity at a control point, no outstanding central processor requests, and no commands to process, the job is completed in the following manner.

1. All CM assigned to the job is released.

2. Extended memory assigned to the job is released.

†This action does not constitute a security conflict if you have special authorization to do so (refer to the LIMITS command).
3. All equipment assigned to the job is released.

4. All library files attached to the job are released.

5. All scratch (local) file space used by the job is released.

6. All direct access permanent files attached to the job are released; the status information for these files is updated.

7. The following summations of job activity are added to the end of the job dayfile. This information is also issued to the associated account dayfile for site usage.

   - Adder activity in kilounits (incremented by USER commands, CHARGE commands, and resource assignments).
     \[ hh.mm.ss.UEAD, \ xxxxxx.xxxKUNS. \]

   - Permanent file activity in kilounits:
     \[ hh.mm.ss.UEPF, \ xxxxxx.xxxKUNS. \]

   - Mass storage activity in kilounits:
     \[ hh.mm.ss.UEMS, \ xxxxxx.xxxKUNS. \]

   - Magnetic tape activity in kilounits:
     \[ hh.mm.ss.UEMT, \ xxxxxx.xxxKUNS. \]

   - Accumulated central processor time in seconds:
     \[ hh.mm.ss.UECP, \ xxxxxx.xxxSECS. \]

   - SRU value in units for total job usage including CPU time, I/O activity, and memory usage:
     \[ hh.mm.ss.AESR, \ xxxxxx.xxxUNTS. \]

   - Matrix Array Processor (MAP) III accumulator:
     \[ hh.mm.ss.AEMP, \ xxxxxx.xxxUNTS. \]

   - Application activity:
     \[ hh.mm.ss.UEAC, \ xxxxxx.xxxUNTS. \]

†If the installation defines a CPU multiplier value, the value given is the product of the actual CPU seconds and the multiplier. The installation may assign a different CPU multiplier value to each CPU within a dual-processor machine (refer to the NOS 2 Administration Handbook).
8. The following information is printed at the end of files queued for printing.

- Lines printed in kilolines:
  
  \[ hh.mm.ss.UCLP, \ mi,es, \ xxxxx.xxxKLNS. \]

  or

  \[ hh.mm.ss.UCLV, \ mi,es, \ xxxxx.xxxKLNS. \]

  mi  Machine identifier.

  es  Equipment status table (EST) ordinal of the output device.

  The UCLV summation is issued if the V carriage control character was used (refer to appendix H).

9. The following information is issued to the account dayfile only.

- Cards punched in kilocards:

  \[ hh.mm.ss.jen. \ UCPC, \ mi,es, \ xxxxx.xxxKCDS. \]

10. For batch jobs, the job dayfile is copied to the end of file OUTPUT. If OUTPUT does not exist or if it is a deferred routed file with EC=A9 specified, the dayfile is copied to another file that the system queues for printing.

11. All deferred routed files are queued for disposal. The files named OUTPUT, PUNCH, PUNCHB, and P8 are also queued for disposal in batch jobs. The system does not automatically queue files OUTPUT, PUNCH, PUNCHB, and P8 in interactive jobs.†

†This step is done only if job output is to be queued. You can prevent the queueing of job output by specifying the appropriate parameter on the SETJOB, ROUTE, SUBMIT, or LDI command.
A NOS procedure is a sequence of NOS commands, residing in a separate record or file, that performs a specific task or sequence of tasks. A procedure header directive identifies the file as a procedure file, and a number of other procedure directives allow you to control additional procedure processing options.

Once you have created a procedure and stored it in a permanent file, the procedure is available to you at any future time. To execute the procedure, you must call the procedure using an appropriate form of the BEGIN command, which we describe later in this section. Procedures that you create yourself can be called from a local file, a permanent file (direct or indirect access), or from a local or global library set. Your site may also provide procedures of general use that you can call from system libraries or from user name LIBRARY. A procedure can be called from another procedure up to a maximum of 50 nested procedures.

A procedure called from a batch job functions much like a program subroutine. You can pass parameters to the procedure on the procedure call (BEGIN command). The procedure accepts any data passed to it, performs its processing functions, and returns control to the calling job or procedure.

When called from an interactive job, a NOS procedure functions like a user-defined system command. Once you have made the procedure file local to your job, you can execute the procedure simply by entering the procedure or file name, followed by any parameters you may have defined for the procedure.

Although NOS supports both interactive and noninteractive procedure formats (noninteractive procedures are also called passive procedures), any NOS procedure can be called from either a batch or interactive job. The interactive procedure formats described in this section differ from the noninteractive format (described in Appendix L) in that the interactive formats provide the end user with various types of interactive help and parameter prompts.

The major features of NOS interactive parameter formats are:

**Two Interactive Formats**

As the procedure writer, you can choose between the parameter-prompting (*I) or the menu (*M) interactive formats. The parameter-prompting format prompts the user to enter required parameter values. The menu format displays a list of possible parameter values and prompts the user to select one of the values by number.

**Procedure Prompting**

If the user fails to enter a required parameter value, or enters an invalid value, the system prompts the user to enter a correct value.
Interactive Help

Both interactive formats give the user easy access to system-generated, as well as procedure-defined help for a procedure and its parameters.

Parameter Validation

The interactive formats provide an easy way of defining the types of parameter values that can be entered for any particular parameter. The system will not execute an interactive procedure until the user has entered a valid value for each required parameter.

PROCEDURE FILE RESIDENCE AND SEARCH ORDER

A procedure is stored as a separate record on a file. Several procedures, or a collection of procedures and programs, can exist on the same file. Procedures can be stored on local files, indirect access or direct access permanent files, system libraries, or user name LIBRARY. Procedures can also reside on magnetic tape as well as mass storage.

The procedure search order is dependent on the form of the BEGIN command used to call the procedure. For more information on the search order, refer to the BEGIN command description in this section.

PROCEDURE STRUCTURE

A procedure file can be divided into five sections, as shown by the example in Figure 4-1. The first four sections comprise the procedure itself (the procedure begins with the procedure header (.PROC) directive and ends with a REVERT command at the end of the command section). The fifth (Data) section may contain programs, procedures, or other data to be referenced by the procedure.

The first line or lines of a procedure is the procedure header, which consists of a single procedure header (.PROC) directive. The procedure header names the procedure, indicates whether the system will prompt for required parameter values, defines what the prompts will consist of, and defines any restrictions on the types of values that can be entered for each parameter. The .PROC directive and all other procedure directives are listed in summary form in Table 4-1 and are described in detail under Procedure Directives in this section. Procedure directives are identified by the period (.) before the directive name.

The formatting section contains directives which alter the default text and format of user prompts. This section of the procedure body is optional, as the system does provide default text and format for all prompts. If you do specify directives in this section, the formatting directives must immediately follow the procedure header directive.

The help section contains directives and text which define the help to be provided for procedure parameters and for the procedure itself. This section of the procedure is optional, as the system can generate help from the information in the procedure header. If you do specify any directives in this section, you must include a .ENDHELP directive to end the section.
**Figure 4-1. Procedure File Structure**

The command section consists of procedure directives and system commands you want to be executed. Most system commands are allowed within a procedure. The exceptions are primarily the commands restricted to entry from interactive terminals (refer to section 8).

The data section consists of information you want written to a local file or files so that you can reference it while the procedure executes. You can also reference the data section in the procedure header. A separate .DATA directive identifies each local file to be created.

**PROCEDURE PROCESSING**

The system performs interactive procedure processing in three stages:

- Interactive parameter entry
- Procedure expansion
- Execution of the command record
INTERACTIVE PARAMETER ENTRY

During interactive parameter entry, the system processes the procedure header directive and all directives in the formatting and help sections.

The system prompts the user for all required parameter values as specified in the procedure header. Each value the user enters is verified against the validation requirements specified in the procedure header. If any value fails to meet the validation requirements, the system prompts the user to enter a corrected value.

The correction prompt and other interactive prompts can be modified by directives in the formatting section.

If the user requests help for the procedure or for a parameter (by entering a ? following the procedure call or following a parameter prompt), the system displays the applicable system default help text, if any, followed by procedure-defined help text.

The interactive parameter entry portion of procedure processing is completed when the user enters a carriage return after having correctly entered all required parameter values. If the user correctly enters all required values on the procedure call, no formatting or help directives (except .NOTE and .NOCLR) are processed, and procedure expansion begins immediately.

PROCEDURE EXPANSION

Procedure expansion is performed only on the procedure command and data sections. During procedure expansion, the system:

- Processes all directives in the command and data section.
- Substitutes parameter values specified by the user, or by the .PROC directive, for each occurrence of the corresponding parameter keyword in the command and data sections.
- Creates a scratch file, called the procedure command record, which contains the NOS commands from the procedure command section as modified by directive processing and parameter substitution.
- Creates a separate local file for each .DATA directive processed during expansion of the procedure.

At completion of expansion processing, the calling user’s job has assigned to it a scratch file (the procedure command record), containing NOS commands ready to be executed, and a local file for each .DATA file referenced in the command record.

The procedure command record created during expansion processing is simply the sequence of NOS commands to be executed. Although procedure directives are used to define and create the command record, directives themselves do not appear in the command record since they are not executable system commands.

The procedure command record may not include all system commands from the procedure command section. This is determined by processing of the .IF, .ELSE, and .ENDIF directives. The .IF directive functions similarly to the IF command. In the same way that the IF command determines whether the following sequence of commands will be executed, the .IF directive determines whether the following sequence of commands is written to the procedure command record. In other words, if the expression in the .IF directive is true, the commands placed between .IF and .ELSE or .ENDIF are written to the command record; if the expression is
false, these same commands are not written to the command record. To see the results of the .IF directive, look at figures 4-2 and 4-3. These figures show the command records resulting from valid and invalid entries for the procedure in figure 4-1.

Note that at the end of processing in either figure 4-2 or 4-3, a listing of the user's local jobs would show a file called APPL. This file is created as a result of the .DATA directive in procedure TESTPN from figure 4-1.

---

**Procedure Command record:**

```
RETURN, LISTFIL, LG0.
FTN5, I=APPL, L=LISTFIL, B=LG0.
LG0.
REVERT, NOLIST.
```

**Dayfile:**

```
testpn, prj/2201
APPL COMPLETE
/dayfile, fr=testpn, op=m
10.18.53. TESTPN, PRJ/2201.
10.18.54. RETURN, LISTFIL, LG0.
10.18.55. FTN5, I=APPL, L=LISTFIL, B=LG0.
10.18.55. 62700 CM STORAGE USED.
10.18.55. 0.009 CP SECONDS COMPILATION TIME.
10.18.55. LG0.
10.18.56. END APPL
10.18.56. 14300 MAXIMUM EXECUTION FL.
10.18.56. 0.007 CP SECONDS EXECUTION TIME.
10.19.21. DAYFILE, FR=TESTPN, OP=M
USER DAYFILE PROCESSED.
```

Figure 4-2. TESTPN with Valid Entry

---

**Procedure Command record:**

```
NOTE./INVALID PROJECT NUMBER/
REVERT, NOLIST.
```

**Dayfile:**

```
testpn, 888
INVALID PROJECT NUMBER
/dayfile, fr=testpn, op=m
10.19.51. TESTPN, 888.
10.19.51. NOTE./INVALID PROJECT NUMBER/
10.20.03. DAYFILE, FR=TESTPN, OP=M
USER DAYFILE PROCESSED.
```

Figure 4-3. TESTPN with Invalid Entry
Following are some tools you can use to further control procedure expansion:

- **.EXPAND Directive**
- **Inhibit Character**
- **Concatenation Character**
- **.EX Directive**

**.EXPAND Directive**

The `.EXPAND` directive allows you to suspend expansion processing for one or more lines of a procedure. Inserting a `EXPAND,OFF` directive suspends directive processing and parameter substitution for subsequent lines of the procedure until the end of the procedure or until a `EXPAND,ON` directive appears.

An especially useful application of the `.EXPAND` directive is to inhibit expansion of a procedure in a `.DATA` file. Normally, calling a procedure file initiates expansion of the entire file, including the data section. However, if the data section contains another procedure file, you may not want the `.DATA` file to be expanded until it is called by a BEGIN command. Inserting a `EXPAND,OFF` directive before the `.DATA` directive prevents the creation of the `.DATA` file. Inserting a `EXPAND,OFF` directive immediately after the `.DATA` directive causes the `.DATA` file to be created but remain unchanged by expansion of the original procedure.

**Inhibit Character**

Like the `.EXPAND` directive, the inhibit character also inhibits parameter substitution or directive processing during procedure expansion. In general, the scope of the inhibit character is more limited than that of the `.EXPAND` directive. The default inhibit character is `#` (or `%` if you are using a CDC graphic character set). You can define a different inhibit character using the `.IC` directive.

Usage rules for the inhibit character are:

- The inhibit character placed before a parameter keyword in the command or data section inhibits substitution of that keyword.
- The inhibit character placed before a procedure directive (including a `.DATA` directive) in the command or data section inhibits expansion processing of that directive.
- The inhibit character placed before a concatenation character inhibits processing of the concatenation operation; the concatenation character remains intact. In this case, the inhibit character does not prevent parameter substitution of a keyword following the concatenation character.
- The inhibit character placed before a second inhibit character causes the second inhibit character to remain intact and not be recognized as an inhibit character. In this case, parameter substitution of a keyword following the second inhibit character is not prevented.
• Expansion processing strips all inhibit characters from the procedure command record except for those appearing in a sequence of two or more inhibit characters. When they appear in sequence, only the odd numbered inhibit characters in the sequence are acted upon and omitted from the procedure command record.

The inhibit character is often used to allow use of the same character string for both a parameter keyword and value. For example, if an input file parameter is written as #I=I, procedure expansion removes the #, leaves the first I intact, and performs normal substitution on the second I.

If a keyword or directive is subject to expansion processing more than once, you can control when it is processed by inserting one or more inhibit characters before the keyword or directive. In the following example, expansion of procedure PROC1 creates one local file called DATA1 and strips the # from the second .DATA directive. Since the # character is no longer present when PROC2 is executed, PROC2 expansion creates local file DATA2.

```
.PROC,PROC1*I.
  
  .DATA,DATA1.
  .PROC,PROC2*I.
  
  .DATA,DATA2
```

Following is an example of inhibit character usage.

In this example, procedure INHIBIT resides on file PROCFL.

```
.PROC,INHIBIT*I,I=(N=TEST).
  GET,I.
  FTNS,I=I,L=0
  LGO.
  COMMENT. I, #I, #I, #I.
```

If procedure INHIBIT is called by the command:

```
begin,inhibit
```

The resulting dayfile segment is:

```
10.31.00.BEGIN,INHIBIT.
10.31.00.GET,TEST.
10.31.00.FTNS,I=TEST,L=0
10.31.00. 56000 CM STORAGE USED.
10.31.00. 0.011 CP SECONDS COMPILATION TIME.
10.31.00.LGO.
10.31.01. STOP
10.31.01. 5600 FINAL EXECUTION FL.
10.31.01. 0.000 CP SECONDS EXECUTION TIME.
10.31.01.COMMENT. TEST, I, TESTI, II.
10.31.01.$REVERT.CCL
```
Concatenation Character

The concatenation character allows parameter substitution for a substring of a character string. The default concatenation character is _ (or ▶ if you are using a CDC graphic character set).

Usage rules for the concatenation character are:

- Expansion processing removes all concatenation characters from the procedure file except those included in a $-delimited literal string and those preceded by a # character.
- After removal of a concatenation character, the preceding and following character strings are concatenated by shifting the remainder of the line one character to the left. For example, if PROG is a parameter keyword for which the user enters a value of NEW, the string PROG_B becomes NEWB after expansion processing.

Following is an example of concatenation character usage.

Procedure LINK resides on file FILE1.

```
.PROC, LINK*I, SUFFIX="FOR COPY"=(*N=, BF, BR, CF, CR, EI, SBF, X), LFN1=(*F), LFN2=(*F).
REWIND, LFN1.
COPY_SUFFIX, LFN1, LFN2.
```

In the following example, the first BEGIN command does a COPYSBF of file PLAN to file SCHEME. The next BEGIN command does a COPYEI of file MAZE to file TAXES. Each resulting dayfile follows the BEGIN command.

```
begin, link, file1, suffix=sbf, lfn1=plan, lfn2=scheme.
08.00.17. $BEGIN, LINK, FILE1, SUFFIX=SBF, LFN1=PLAN, LFN2=SCHEME.
08.00.18. REWIND, PLAN.
08.00.18. COPYSBF, PLAN, SCHEME.
08.00.18. EOI ENCOUNTERED.
08.00.18. $REVERT, CCL

begin, link, file1, suffix=ei, lfn1=maze, lfn2=taxes.
08.03.23. $BEGIN, LINK, FILE1, SUFFIX=EI, LFN1=MAZE, LFN2=TAXES.
08.03.23. REWIND, MAZE.
08.03.24. COPYEI, MAZE, TAXES.
08.03.24. EOI ENCOUNTERED.
08.03.24. $REVERT, CCL
```
.EX Directive

The .EX directive immediately terminates expansion processing and executes the command included in the directive. No further expansion processing is performed, and the procedure command record is not executed.

The most common use of .EX is to initiate immediate processing of a menu procedure option as shown in the following example:

```
.PROC,APROC*M
,PARM=
(1"OPT1",
2"OPT2",
3"OPT3"
).
.EX.BEGIN,PARM,LIBFILE.
```

EXECUTION OF THE COMMAND RECORD

At completion of expansion processing, the system increments the procedure nesting level count and begins execution of the procedure command record.

When all commands in the procedure command record have been processed, the system executes a system- or user-supplied REVERT command, decrements the procedure nesting count, and returns control to the calling job or procedure.

PROCEDURE DIRECTIVES

Procedure directives have these general syntax features:

- They all have a period as a prefix character.
- You can use a comma or an opening parenthesis as a separator within directives.
- You can use a period or a closing parenthesis as a terminator. You must use a period or closing parenthesis as a terminator if you append comments to the directive.
- A procedure directive can span more than one line. No line can contain more than 150 6-bit characters and each line to be continued must either end with a nonblank separator or the succeeding line must begin with a nonblank separator.
- Unless otherwise stated, the system reads the characters you enter in directives as 6-bit display code (uppercase characters only). You can enter the text for help information and prompts in uppercase and lowercase characters (6/12-bit display code).

†This value can be changed during installation.
The detailed descriptions of the procedure directives later in this section include any exceptions to the general syntax features just cited.

Procedure directives can be grouped by function into six basic types. The directives are listed by type in table 4-1.

Table 4-1. Procedure Directives

<table>
<thead>
<tr>
<th>Directive Type</th>
<th>Directive</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Procedure header</td>
<td>.PROC</td>
<td>Specifies the procedure name, defines parameters, and enables parameter prompting.</td>
</tr>
<tr>
<td>Formatting</td>
<td>.CORRECT</td>
<td>Specifies the prompt to follow an incorrect parameter entry.</td>
</tr>
<tr>
<td></td>
<td>.ENTER</td>
<td>Specifies the prompt to appear before a parameter entry is made.</td>
</tr>
<tr>
<td></td>
<td>.Fn</td>
<td>Specifies a label for programmable function key Fn.</td>
</tr>
<tr>
<td></td>
<td>.NOCLR</td>
<td>Inhibits the automatic clearing of the screen while the procedure executes.</td>
</tr>
<tr>
<td></td>
<td>.NOTE</td>
<td>Specifies a message to appear on the screen while the procedure executes.</td>
</tr>
<tr>
<td></td>
<td>.PAGE</td>
<td>Specifies the string to precede the page number on the screen.</td>
</tr>
<tr>
<td></td>
<td>.PROMPT</td>
<td>Specifies the text for the general request for input.</td>
</tr>
<tr>
<td>Help</td>
<td>.ENDHELP</td>
<td>Marks the end of the help section of the procedure.</td>
</tr>
<tr>
<td></td>
<td>.HELP</td>
<td>Specifies help text for the procedure or a parameter.</td>
</tr>
<tr>
<td>Expansion</td>
<td>.CC</td>
<td>Specifies the concatenation character to be used in the procedure body.</td>
</tr>
<tr>
<td>Control</td>
<td>.ELSE</td>
<td>Terminates skipping initiated by a matching .IF or initiates skipping until a matching .ENDIF is found.</td>
</tr>
<tr>
<td></td>
<td>.ENDIF</td>
<td>Terminates skipping initiated by a matching .IF or .ELSE.</td>
</tr>
<tr>
<td></td>
<td>.EX</td>
<td>Submits a single command to the system for immediate execution.</td>
</tr>
<tr>
<td></td>
<td>.EXPAND</td>
<td>Terminates or restores procedure expansion for subsequent lines of the procedure.</td>
</tr>
<tr>
<td></td>
<td>.IF</td>
<td>Allows conditional expansion of the procedure body.</td>
</tr>
<tr>
<td></td>
<td>.IC</td>
<td>Specifies the inhibit character to be used in the procedure body.</td>
</tr>
<tr>
<td>File</td>
<td>.DATA</td>
<td>Creates a local file.</td>
</tr>
<tr>
<td></td>
<td>.EOF</td>
<td>Inserts an end-of-file mark in a (.DATA) file created by the procedure or in the procedure command record.</td>
</tr>
<tr>
<td></td>
<td>.EOR</td>
<td>Inserts an end-of-record mark in a (.DATA) file created by the procedure or in the procedure command record.</td>
</tr>
<tr>
<td>Comment</td>
<td>.*</td>
<td>Identifies comments in the procedure.</td>
</tr>
</tbody>
</table>
PROCEDURE HEADER (.PROC) Directive

Every procedure begins with a procedure header (.PROC) directive. The .PROC directive names the procedure, controls parameter prompting, and defines any restrictions on values that can be entered for the parameters.

The .PROC directive must be the first line of the procedure and must begin in column 1. It can be continued on one or more succeeding lines by ending the continued line, or beginning the continuation line, with a non-blank separator character. The .PROC directive must end with a period (.)

This section describes the interactive and menu formats of the .PROC directive. The noninteractive format is described in appendix L.

Interactive Format

This directive enables interactive processing of a procedure call (refer to Requesting Help on Procedure Calls later in this section). The directive:

- Designates procedure parameters as optional or required.
- Designates permissible values and correct syntax for each parameter through a checklist.
- Describes each parameter to be used in prompting the procedure caller.

Format:

```
.PROC,pname*I"title",P1,P2,...,Pn.ck.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Specifies the procedure name. pname can be one to seven alphanumeric characters. The procedure name should begin with an alphabetic character. You must append *I to the procedure name to enable parameter prompting.</td>
</tr>
<tr>
<td>title</td>
<td>Specifies the procedure title. The system assumes that your title is in 6/12-bit display code, which supports uppercase and lowercase characters. The title string can be a maximum of 40 lowercase (12-bit) characters, 80 uppercase (6-bit) characters, or any combination of lowercase and uppercase characters that does not exceed 480 bits. The title field can be null (&quot;&quot;) or omitted. If omitted, the default title used in the screen mode parameter display is the procedure name pname. The system displays the title whenever the procedure is called and required parameters are not supplied.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Pi</td>
<td>Specifies optional parameters. The maximum number of parameters is 50. Each parameter $p_i$ has the following form:</td>
</tr>
</tbody>
</table>

- `keywrd"description"=(checklist)`
- `keywrd'description'=(checklist)`

  - **keywrd** Specifies the keyword of the parameter. `keywrd` can be a string of 1 to 10 alphanumeric characters. The occurrences of `keywrd` in the procedure body are replaced by a value that conforms to the specifications made in the checklist. This value is specified by a parameter on the procedure call or by default according to checklist specifications.†

  If `keywrd` is surrounded by dollar signs ($keywrd$), any dollar symbols that surround or are contained within the parameter value are retained as a part of the value. Note that when the user is prompted for the value in screen mode, the value entered is treated as a literal value even if it is not surrounded by dollar symbols. If the specified value is not surrounded by dollar signs, the system converts it to a literal format (by appending prefixing and suffixing dollar signs and replicating any dollar signs that occur within the value) before substituting the value in the body of the procedure.

  - **description** Specifies an optional text string that the system displays when prompting for a parameter. The title string can be a maximum of 40 lowercase (12-bit) characters, 80 uppercase (6-bit) characters, or any combination of lowercase and uppercase characters that does not exceed 480 bits. In screen mode, the system displays a maximum of 40 characters. The description field may be null or omitted.

    You must enclose the text string in quotation marks or apostrophes. If you use quotation marks, the default prompt for the parameter $p_i$ has the following format:

    Enter keywrd description?

    If you use apostrophes, the system uses only your description string in the prompt:

    description?

    Two examples of these prompting formats appear under the description of the .HELP directive.

  †There is a seven-character restriction on the length of the keyword if the name call format of the BEGIN command is to be used, the keyword is to be specified on the call, or the procedure is a local file.
**Parameter**

checklist  Specifies a list of the acceptable values and syntax for $p_i$. The checklist must be enclosed in parentheses. The value specified for a parameter in a procedure call is compared to each of the entries in the checklist in left to right order and a match must occur for a value to be acceptable. If more than one match occurs, the first match determines the substitution.

If the checklist is omitted, the system assumes that any 0- to 40-character value is valid. The detailed description of acceptable checklist entries is in the following paragraphs.

**ck**

Specifies a 1- to 10-character comment keyword. The keyword must be immediately preceded and followed by periods with no intervening spaces. This is an optional parameter. The system substitutes comments specified on the procedure call for the comment keyword in the procedure body. The system substitutes a null value for the comment keyword if no comments are on the procedure call. If you do not specify a comment keyword, the system ignores comments made on the procedure call.

Note that the system treats the comment keyword ck as a contiguous string upon substitution. If ck is concatenated to another long string in the procedure body, this substitution could produce a line that exceeds the line length limit (150 6-bit characters).

A comma must separate .PROC and the procedure name. The separator between the procedure name and the procedure parameters can be a comma, reverse slant (/), or slant (/). Reverse slants and slants have special significance as described under Parameter Matching Modes later in this section.

**CHECKLIST ENTRIES**

Entries in the parameter checklist are of three types: simple values, equivalenced values, and checklist patterns. A single checklist can contain any combination of entry types and multiple entries of the same type.

A simple value is an entry of the form:

\[ pstring \]

where pstring is any 0- to 40-character string. If pstring contains nonalphanumeric characters other than asterisks (*), it must be enclosed in literal delimiters ($). A simple value specifies that if the user enters a value of pstring on the BEGIN command, pstring is substituted for the parameter keyword in the procedure body.
An equivalenced value is an entry of the form:

\[ \text{pstring}=\text{pvalue} \]

where pstring and pvalue are 0- to 40-character strings. If either pstring or pvalue contains nonalphanumeric characters other than asterisks (*), it must be enclosed in literal delimiters ($$). An equivalenced value specifies that if the user enters a value of pstring on the BEGIN command, pvalue is substituted for the parameter keyword in the procedure body.

There are several patterns that can be used in the checklist. Each pattern defines a set of restrictions to be placed on values entered by the user. The checklist patterns are summarized in figure 4-4 and are described in detail on the following pages.

Most checklist pattern have three forms:

- \( *p \)
- \( *p= \)
- \( *p=pvalue \)

where p is a character identifying the checklist pattern and pvalue is any 0- to 40-character string. If pvalue contains nonalphanumeric characters other than asterisks (*), it must be enclosed in literal delimiters ($$).

The \( *p \) form specifies that a parameter value entered by the user is substituted for the parameter keyword if the value meets the requirements defined by \( *p \).

The \( *p= \) form specifies that a null substitution occurs if the value entered by the user meets \( *p \) requirements. In other words, all occurrences of the parameter keyword are omitted from the procedure command record.

The \( *p=pvalue \) form specifies that pvalue is substituted for the parameter keyword if the value entered by the user meets the requirements of the \( *p \) pattern.

Special Values

There are three special values that can be specified in an equivalenced value entry in a \( *p=pvalue \) checklist pattern. These special values are:

<table>
<thead>
<tr>
<th>Special Value</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>#DATA</td>
<td>Specifies the name of the local file created by an unlabeled .DATA directive (that is, a .DATA directive on which the lfn parameter is omitted). Note that there can be no more than one unlabeled .DATA directive in a procedure. The actual file name used is ZZCCLAA, ZZCCLAB, ZZCCLAC, or so on, depending on the nesting level of the procedure.</td>
</tr>
<tr>
<td>#FILE</td>
<td>Specifies the file containing this procedure.</td>
</tr>
<tr>
<td>#PRIMARY</td>
<td>Specifies the primary file.</td>
</tr>
<tr>
<td>Checklist Pattern</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>*Am..n↑</td>
<td>Allows entry of any character string up to 40 characters. The string replaces keyword.</td>
</tr>
<tr>
<td>*Am..n=value↑</td>
<td>Entry of character string replaces keyword with value.</td>
</tr>
<tr>
<td>*Am..n=value↑</td>
<td>Entry of character string replaces keyword with value.</td>
</tr>
<tr>
<td>*Fm..n↑</td>
<td>Allows entry of valid NOS file name. File name replaces keyword.</td>
</tr>
<tr>
<td>*Fm..n=value↑</td>
<td>Entry of a file name replaces keyword with value.</td>
</tr>
<tr>
<td>*Fm..n=value↑</td>
<td>Entry of a file name replaces keyword with value.</td>
</tr>
<tr>
<td>*K</td>
<td>Allows keyword to be entered as a value. No substitution results.</td>

</tr>
<tr>
<td>or *Sm..n/k=value↑</td>
<td>Entry of allowable characters replaces keyword with value.</td>
</tr>
<tr>
<td>pstring</td>
<td>Entry of string pstring replaces keyword with pstring.</td>
</tr>
<tr>
<td>pstring=value</td>
<td>Entry of string pstring causes a null substitution.</td>
</tr>
<tr>
<td>pstring=value</td>
<td>Entry of string pstring causes pvalue to replace keyword.</td>
</tr>
</tbody>
</table>

↑The specification m..n is optional and defines the minimum and maximum length of the character string or file name that can be entered for the parameter value. Valid ranges are 0 to 40 for *A, 1 to 7 for *F and *P, and 1 to 40 for *S. If only a single length value is specified, it is assumed to be the maximum. For example, *A10 allows entry of any string from 0 to 10 characters long.

Figure 4-4. Summary of Checklist Entries
### Checklist Patterns

<table>
<thead>
<tr>
<th>Checklist Pattern</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Am..n=value</td>
<td>Specifies the substitution for keywrd regardless of the specifications for ( p_1 ) on the procedure call. ( m..n ) specifies the minimum and maximum values for the length of the entry on the procedure call. The default value for ( m ) is 0 and for ( n ) is 40. The maximum value for ( n ) is 40. If *Am..n=value is in the checklist, value replaces keywrd in the procedure body regardless of what is specified on the procedure call. You can specify any string of 0 to 40 uppercase characters for value. You must delimit special characters, other than asterisks (*), with dollar signs. If value is #DATA, all occurrences of keywrd in the procedure body are replaced by the name of the data file created by the .DATA directive (refer to .DATA Directive for the name of this file). If value is #FILE, all occurrences of keywrd in the procedure body are replaced by the name of the file that contains the procedure. Any data read from this file begins with the record immediately following the record that houses the procedure. If the procedure resides on a library and is called by a name call form of the BEGIN command, keywrd is replaced by a null value. If value is #PRIMARY, all occurrences of keywrd in the procedure body are replaced by the current primary file. If *Am..n= is in the checklist, a null value replaces keywrd. If *Am..n is specified, whatever is specified on the procedure call replaces keywrd. If you specify some form of the <em>A entry more than once in a single checklist, the system uses the leftmost entry. Example: .PROC,EBOC</em>I,P1=(*A5),P2=(*A10..15),P3=(*A20..). In this procedure header directive, P1 allows entry of a character string 0 to 5 characters long, P2 allows a string 10 to 15 characters long, and P3 allows a string 20 to 40 characters long.</td>
</tr>
<tr>
<td>*Fm..n=value</td>
<td>Specifies that the parameter entry for ( p_1 ) on the procedure call be a file name that conforms to the operating system format for a local file name. ( m..n ) specifies the minimum and maximum length of the file name. The default value for ( m ) is 1 and for ( n ) is 7. If *Fm..n=value is in the checklist, value replaces keywrd in the procedure body when a file name is specified on the procedure call. You can specify any 0- to 40-character string for value. You must delimit special characters, other than asterisks (*), with dollar signs.</td>
</tr>
</tbody>
</table>

---

The default value for \( m \) is 0 and for \( n \) is 40. The maximum value for \( n \) is 40. If \*Am..n=value is in the checklist, value replaces keywrd in the procedure body regardless of what is specified on the procedure call. You can specify any string of 0 to 40 uppercase characters for value. You must delimit special characters, other than asterisks (*), with dollar signs. If value is \#DATA, all occurrences of keywrd in the procedure body are replaced by the name of the data file created by the .DATA directive (refer to .DATA Directive for the name of this file). If value is \#FILE, all occurrences of keywrd in the procedure body are replaced by the name of the file that contains the procedure. Any data read from this file begins with the record immediately following the record that houses the procedure. If the procedure resides on a library and is called by a name call form of the BEGIN command, keywrd is replaced by a null value. If value is \#PRIMARY, all occurrences of keywrd in the procedure body are replaced by the current primary file. If \*Am..n= is in the checklist, a null value replaces keywrd. If \*Am..n is specified, whatever is specified on the procedure call replaces keywrd. If you specify some form of the *A entry more than once in a single checklist, the system uses the leftmost entry. Example: .PROC,EBOC*I,P1=(*A5),P2=(*A10..15),P3=(*A20..). In this procedure header directive, P1 allows entry of a character string 0 to 5 characters long, P2 allows a string 10 to 15 characters long, and P3 allows a string 20 to 40 characters long.
Checklist Pattern | Description
--- | ---
If value is #DATA, all occurrences of keywrd in the procedure body are replaced by the name of the data file created by the .DATA directive (refer to .DATA Directive for the name of this file). If value is #FILE, all occurrences of keywrd in the procedure body are replaced by the name of the file that contains the procedure. Any data read from this file begins with the record immediately following the record that houses the procedure. If the procedure resides on a library and is called by a name call form of the BEGIN command, keywrd is replaced by a null value. If value is #PRIMARY, all occurrences of keywrd in the procedure body are replaced by the current primary file.

If *Fm..n= is in the checklist, a null value replaces keywrd. If *Fm..n is specified, the file name specified on the procedure call replaces keywrd.

If you specify some form of the *F entry more than once in a single checklist, the system uses the leftmost entry.

Example:

Procedure EXEC is on local file EXEC:

```
.PROC,EXEC*I,I=(*F4..7),B=(*N=LG0,*F),L=(*F=OUTPUT).
FTN5,#I=I,#B=B,#L=L.
```

EXEC is called:

```
EXEC,I=CARDS,L=PRINT.
```

The procedure body becomes:

```
FTN5,I=CARDS,B=LG0,L=OUTPUT.
```

Specifies the substitution for keywrd when the parameter entry for Pi on the procedure call is only the keyword keywrd or if the keyword is entered in response to an interactive prompt. If *K=value is in the checklist, value replaces keywrd in the procedure body. You can specify any string of 0 to 40 uppercase characters for value. You must delimit special characters, other than asterisks (*), with dollar signs.

If value is #DATA, all occurrences of keywrd in the procedure body are replaced by the name of the data file created by the .DATA directive (refer to .DATA Directive for the name of this file). If value is #FILE, all occurrences of keywrd in the procedure body are replaced by the name of the file that contains the procedure. Any data read from this file begins with the record immediately following the record that houses the procedure. If the procedure resides on a library and is called by a name call form of the BEGIN command, keywrd is replaced by a null value. If value is #PRIMARY, all occurrences of keywrd in the procedure body are replaced by the current primary file.
Checklist Pattern Description

If *K= is in the checklist, a null value replaces keywrdrd. If *K is in the checklist, no substitution occurs.

Specifying some form of the *K entry more than once in a single checklist is an error. However, you can specify another pattern that is equivalent. Refer to procedures SUBN1 and SUBN2 in the following examples.

Examples:
Procedure KEY is on local file PROCFIL.

.PROC,KEY*I,P1=(*K),P2=(*K=X),P3=(*K=).
COMMENT. #P1=P1, #P2=P2, #P3=P3

KEY is called:

BEGIN,KEY,,P1,P2,P3.

The procedure body becomes:

COMMENT. P1=P1, P2=X, P3=

The following calls to procedures SUBN1 and SUBN2 illustrate the left-to-right checking of the checklist and the use of equivalent patterns. Procedures SUBN1 and SUBN2 are on local files by those same names and have the following lines, respectively:

.PROC,SUBN1*I,P1=(*K=KEYWORD,P1=STRING,*N=DEFAULT).
NOTE.+#P1=P1

.PROC,SUBN2*I,P1=(*N=DEFAULT,P1=STRING,*K=KEYWORD).
NOTE.+#P1=P1

Procedure SUBN1 is called:

subn1,p1

The system writes:

P1=KEYWORD

Procedure SUBN2 is called:

subn2,p1

The system writes:

P1=STRING
A *K checklist pattern applies only when the keyword is entered by itself, or in response to an interactive prompt. It does not apply when an equivalenced value matching the keyword is entered as shown in the following call to procedure SUBN1:

```
subn1, P1=p1
```

The system writes:

```
P1=STRING
```

*N=value Specifies the substitution for keyword when there is no parameter entry for \( p_1 \) on the procedure call. If \( *N=value \) or \( *D=value \) is in the checklist, value replaces keyword in the procedure body. You can specify any string of 0 to 40 uppercase characters for value. You must delimit special characters, other than asterisks (*), with dollar signs.

If value is \#DATA, all occurrences of keyword in the procedure body are replaced by the name of the data file created by the .DATA directive (refer to .DATA Directive for the name of this file). If value is \#FILE, all occurrences of keyword in the procedure body are replaced by the name of the file that contains the procedure. Any data read from this file begins with the record immediately following the record that houses the procedure. If the procedure resides on a library and is called by a name call form of the BEGIN command, keyword is replaced by a null value. If value is \#PRIMARY, all occurrences of keyword in the procedure body are replaced by the current primary file.

If \( *N= \) or \( *D= \) is in the checklist, a null value replaces keyword.
If \( *N \) or \( *D \) is in the checklist, no substitution occurs.

If no format of the \( *N \) or \( *D \) entry is in the checklist, \( p_1 \) is a required parameter and interactive prompting occurs when it is omitted from the procedure call. However, if the only entry in the checklist is a form of \( *N \) or \( *D \), any value supplied for it on the procedure call is ignored and interactive prompting does not occur. Specifying some form of the \( *N \) or \( *D \) entry more than once in a single checklist is an error.

Example:

Procedure SUB is on local file PROCFIL.

```
.PROC, SUB+1, P1=(*N), P2=(*N=X), P3=(*N=).
COMMENT. #P1=P1, #P2=P2, #P3=P3, P4
```

SUB is called:

```
BEGIN, SUB.
```

The procedure body becomes:

```
COMMENT. P1=P1, P2=X, P3=, P4
```
Checklist Pattern | Description
--- | ---
*N and *D values are displayed under different conditions. *D values are always displayed when screen mode interactive prompting is required and a non-null value has not been entered for the parameter. *D values are always accepted if entered. *N values are displayed in screen mode only when they are valid according to another checklist pattern which has no replacement value. If an *N value matches more than one checklist pattern, the first checklist pattern determines whether the value is displayed.

*Pm..n=value

Specifies that the parameter entry for p_i on the procedure call may be a file name that does not begin with a digit and that conforms to the operating system format for a local file name. m..n specifies the minimum and maximum length of the local file name. The default value for m is 1 and for n is 7. If *Pm..n=value is in the checklist, value replaces keywrd in the procedure body when a file name is specified on the procedure call. You can specify any 0- to 40-character string for value. You must delimit special characters, other than asterisks (*), with dollar signs.

If value is #DATA, all occurrences of keywrd in the procedure body are replaced by the name of the data file created by the .DATA directive (refer to .DATA Directive for the name of this file). If value is #FILE, all occurrences of keywrd in the procedure body are replaced by the name of the file that contains the procedure. Any data read from this file begins with the record immediately following the record that houses the procedure. If the procedure resides on a library and is called by a name call form of the BEGIN command, keywrd is replaced by a null value. If value is #PRIMARY, all occurrences of keywrd in the procedure body are replaced by the current primary file.

If *Pm..n= is in the checklist, a null value replaces keywrd. If *Pm..n is specified, the file name specified on the procedure call replaces keywrd.

If you specify some form of the *P entry more than once in a single checklist, the system uses the leftmost entry.

Example:

Procedure EXEC is on local file EXEC:

```
.PROC,EXEC*I,I=(P4..7),B=(N=LG0,P),L=(P=OUTPUT).
FTN5,#I=I,#B=B,#L=L.
```
EXEC is called:

EXEC, I=CARD5, L=PRINT.

The procedure body becomes:

FTN5, I=CARD5, B=LGO, L=OUTPUT.

*R

Specifies that the parameter entry for p± on the procedure call is restricted and is not to be displayed in the job or system dayfiles. When *R is part of the checklist, any value supplied for p± is removed from the command before it is placed in the dayfile.

*Sm.n(chars)=value

Specifies that the parameter entry for pi on the procedure call may consist of a string of characters selected (in any order) from the set of characters represented by chars or from the set of characters represented by k. m..n specifies the minimum and maximum values for the length of the string entered on the procedure call. The default for m is 1 and for n is 40. The maximum value for n is 40. chars represents a set of up to 40 uppercase alphanumeric and/or special characters. Special characters other than asterisks must be $-delimited. k selects one of the following sets:

<table>
<thead>
<tr>
<th>k</th>
<th>Characters</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>All alphabetic characters</td>
</tr>
<tr>
<td>B</td>
<td>All octal characters</td>
</tr>
<tr>
<td>D</td>
<td>All decimal characters</td>
</tr>
<tr>
<td>AB</td>
<td>All alphabetic and octal characters</td>
</tr>
<tr>
<td>AD</td>
<td>All alphabetic and decimal characters</td>
</tr>
</tbody>
</table>

To include one or more asterisks as members of the set, append an asterisk to the mnemonic. For example, AB* specifies all alphabetic and octal characters and asterisks are allowed.

If *Sm.n(chars)=value or *Sm.n/k=value is in the checklist, value replaces keyword in the procedure body when 1 to n characters from chars are specified on the procedure call. You can specify any string of 0 to 40 uppercase characters for value. You must delimit special characters, other than asterisks (*), with dollar signs.

If value is #DATA, all occurrences of keyword in the procedure body are replaced by the name of the data file created by the .DATA directive (refer to .DATA Directive for the name of this file). If value is #FILE, all occurrences of keyword in the procedure body are replaced by the name of the file that contains the procedure. Any data read from this file begins with the record immediately following the record that houses the procedure. If the procedure resides on a library and is called by a name call form of the BEGIN command, keyword is replaced by a null value. If value is #PRIMARY, all occurrences of keyword in the procedure body are replaced by the current primary file.
Checklist Pattern

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Sm..n(chars)= or *Sm..n/k=</td>
<td>If *Sm..n(chars)= or *Sm..n/k is in the checklist, a null value is substituted for keyword. If *Sm..n(chars) or *Sm..n/k is in the checklist, the parameter entry for p± on the procedure call replaces keyword.</td>
</tr>
</tbody>
</table>

Example:

Procedure COPIL is on local file COPI:

```
.PROC,COPIL*I,0"OLD FILE NAME"=(*F,*N=OLD),
  R"REPLACEMENT FILE NAME"=(*F,*N=LGO),
  N"NEW FILE NAME"=(*F,*N=NEW),
  L"LAST RECORD"=(*F,*N=),
  F"FLAG"=(*S4(ARTE),*N=).
COPYL,O,R,N,L,F.
REVERT.
```

COPIL is called:

```
BEGIN,COPIL,C0PI,0=0LD,R=MODIFID,
  N=NEW,F=AE.
```

The procedure body becomes:

```
COPYL,OLD,MODIFID,NEW,AE.
```

Procedure COPIL will accept one to four letters for the F parameter. More than one set may be specified for a parameter. For example, procedure SET has two sets specified for the P parameter.

```
.PROC,SET*I,P=(*S3(ABC),*S3/D).
```

Parameter entries could include P=BB, P=BCA, or P=901 but not P=XZY, P=AZ, P=P or P=A2.

Null sets are not allowed. For example, all the set entries for Pl in the following procedure header are in error.

```
.PROC,ERROR*I,Pl=(*S,*S(),*S3).```
### Checklist Pattern

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pstring=pvalue</strong></td>
<td>Specifies the substitution for keywrd when the parameter entry for ( p_i ) on the procedure call matches pstring. pstring must be 0 to 40 uppercase characters. Special characters must be $-delimited. If pstring=pvalue is in the checklist, pvalue replaces keywrd in the procedure body when pstring is specified on the procedure call. You can specify any string of 0 to 40 uppercase characters for pvalue. You must delimit special characters, other than asterisks (*) with dollar signs. If pvalue is #DATA, all occurrences of keywrd in the procedure body are replaced by the name of the data file created by the .DATA directive (refer to .DATA Directive for the name of this file). If pvalue is #FILE, all occurrences of keywrd in the procedure body are replaced by the name of the file that contains the procedure. Any data read from this file begins with the record immediately following the record that contains the procedure. If the procedure resides on a library and is called by a name call form of the BEGIN command, keywrd is replaced by a null value. If pvalue is #PRIMARY, all occurrences of keywrd in the procedure body are replaced by the current primary file. If pstring= is in the checklist, a null value replaces keywrd. If pstring is in the checklist, pstring replaces keywrd.</td>
</tr>
<tr>
<td><strong>pstring</strong></td>
<td>If pstring= is in the checklist, a null value replaces keywrd. If pstring is in the checklist, pstring replaces keywrd.</td>
</tr>
</tbody>
</table>

#### Example:

Procedure LABL on a global library file:

```plaintext
.PROC,LABL*I,FN"FILE NAME"=(*F),
  VSN "VSN OF TAPE"=(+A),
  WRITE "YES OR NO"=(YES=W,N0=R).
.LABEL,FN,#VSN=VSN,#PO=WRITE,WRITE.
.REVERT.
```

Procedure LABL is called:

```plaintext
LABL,FN=STATS,VSN=TAPE24,WRITE=N0.
```

Procedure body becomes:

```plaintext
LABEL,STATS,VSN=TAPE24,PO=R,R.
```

### Menu Format

This format of the .PROC directive generates a menu when you call the procedure and make no menu selection, when you make an incorrect selection, or when you request help information (refer to Requesting Help on Procedure Calls). The presence of the NOLIST parameter on the .HELP directive suppresses the menu display when you request .HELP information.
Format:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Specifies the procedure name. pname must be a 1- to 7-character string of alphanumeric characters. Make the first character of pname an alphabetic character to avoid inadvertent editing of the primary file on name calls to procedures. You must append *M to pname to enable menu generation.</td>
</tr>
<tr>
<td>title</td>
<td>Specifies the menu title. The title string can be a maximum of 40 lowercase (12-bit) characters, 80 uppercase (6-bit) characters, or any combination of lowercase and uppercase characters that does not exceed 480 bits. The title field can be null (&quot;&quot; ) or completely omitted. If you omit title, the system uses the procedure name pname as the title when the procedure is called in screen mode. The title appears whenever the system displays the menu.</td>
</tr>
<tr>
<td>keywrd</td>
<td>Specifies the keyword in the procedure body for which the system substitutes one of the selections. keywrd can be a string of 1 to 10 alphanumeric characters.</td>
</tr>
<tr>
<td>selections</td>
<td>Defines the menu selections. A maximum of 50 selections can be defined for a menu. The definitions must have the following format: num1&quot;descript1&quot;,... ,numn&quot;descriptn&quot;</td>
</tr>
<tr>
<td>num1</td>
<td>Defines an integer number that identifies the menu selection in the screen display. num1 can be any integer up to 10 digits in length. Menu selections appear in the screen display in the order they are defined in the .PROC directive, not necessarily in the order defined by the selection numbers.</td>
</tr>
<tr>
<td>descript1</td>
<td>Describes the menu selection. The description can be a maximum of 40 lowercase (12-bit) characters, 80 uppercase (6-bit) characters, or any combination of lowercase and uppercase characters that does not exceed 480 bits. In screen mode, the system will display a maximum of 40 characters. You can also specify a null description (&quot;&quot; ) or omit this field. This description appears whenever the system displays the menu.</td>
</tr>
<tr>
<td>ck</td>
<td>Specifies a 1- to 10-character comment keyword. This is an optional parameter. A period must follow the comment keyword. The system substitutes comments specified on the procedure call for the comment keyword in the procedure body. The system substitutes a null value for the comment keyword if no comments are on the procedure call. If you do not specify a comment keyword, the system ignores comments made on the procedure call.</td>
</tr>
</tbody>
</table>

Note that the system treats the comment keyword ck as a contiguous string upon substitution. If ck is concatenated to another long string in the procedure body, this substitution may produce a line that exceeds the line length limit (150 6-bit characters).
A menu has the following format:

```
title
num_1. descrip_1
num_2. descrip_2
...
num_n. descrip_n

SELECT BY NUMBER OR TYPE Q TO QUIT?
```

where title, num_i, and descrip_i conform to the descriptions given them previously. You can specify the prompt for a selection using the .PROMPT directive. If you do not, the system uses a default prompt as just shown. Additionally, the system centers all lines when in screen mode.

The Q option aborts the procedure call and initiates a search for an EXIT command in the procedure. If the procedure was called from another procedure, the EXIT commands in the calling procedure or procedures are also processed.
FORMATTING AND HELP DIRECTIVES

Along with the procedure header, the formatting and help directives further define the parameter prompts and help information that appears at the terminal. The formatting directives, if present, must follow the procedure header. Comment directives (beginning with .*) may be interspersed among the formatting directives. Help directives and help text follow the formatting directives. Comment directives placed in the help section are considered a part of the help text.

.CORRECT Directive

The .CORRECT directive specifies the first field of the prompt that follows a set of incorrect parameter entries. When the system prompts the procedure caller for corrections to an incorrect entry, the prompt has the following three fields:

```
text parameter description
```

This directive specifies the text field.

Format:

```
.CORRECT,text.
.CORRECT=text.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Specifies a 1- to 80-character text string that appears on the screen. The system interprets your string in 6/12-bit display code, which supports uppercase and lowercase characters.</td>
</tr>
</tbody>
</table>

   In the first format, any alphanumeric or special characters may be used except a period or right parenthesis (., or ). Special characters need not be enclosed in $ signs.

   In the second format, any characters may be used (including a period or right parenthesis), but special characters must be enclosed in $ signs.

   In screen mode, the default text string is:

   Please correct

   In line mode, the default string is:

   Correct

In screen mode, if the prompt is too long, the system truncates the prompt and indicates the truncation with an ellipsis (no truncation occurs in line mode). You can suppress display of the parameter field of the prompt by using apostrophes rather than quotation marks around the description in the procedure header. In screen mode, the prompt appears left-justified on the top line of the screen.

This directive does not apply to menu procedures.

†The description field does not appear in screen mode.
.ENDHELP Directive

The .ENDHELP directive specifies the end of the help section of the procedure body. You must include an .ENDHELP directive if there are any help directives in the procedure. Only one .ENDHELP directive is allowed in a procedure.

Format:

.ENDHELP.

.ENTER Directive

The .ENTER directive specifies the text for the initial prompt for a parameter. When the system initially prompts the user for a parameter, the prompt has the following three fields:

| text       | parameter | description |

This directive specifies the text field.

Format:

.ENTER, text.
.ENTER=text.

Parameter | Description
---|---
text | Specifies a 1- to 80-character text string that appears on the screen. In the first format, any alphanumeric or special characters may be used except a period or right parenthesis (, or ). Special characters need not be enclosed in $ signs.

In the second format, any characters may be used (including a period or right parenthesis), but special characters must be enclosed in $ signs.

The system interprets your string in 6/12-bit display code, which supports uppercase and lowercase characters. The default for the screen mode is:

Please enter

The default for line mode is:

Enter

In screen mode, if the prompt is too long, the system truncates the prompt and indicates the truncation with an ellipsis (no truncation occurs in line mode). You can suppress display of the text and parameter fields of the prompt by using apostrophes around the description in the procedure header. In screen mode, the prompt appears left-justified on the top line of the screen.

This directive does not apply to menu procedures.
.Fn Directive

The .Fn directive specifies a label for one of the six programmable function keys (F1 through F6) you can use with screen mode parameter displays.

Format:

```
.Fn, text.
.Fn=text.
```

where n is one of the integers 1 through 6.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Specifies a label string of not more than eight characters. You can specify lowercase and uppercase characters.</td>
</tr>
</tbody>
</table>

In the first format, any alphanumeric or special characters may be used except a period or right parenthesis (. or )). Special characters need not be enclosed in dollar signs ($).

In the second format, any characters may be used (including a period or right parenthesis), but special characters must be enclosed in dollar signs.

The function and default label of each of the programmable function keys are given in table 4-2.

.F7 Directive

The .F7 directive enables you to use function key 7 (F7) instead of the NEXT or RETURN key to execute screen mode parameter displays and menu selections. When you specify this directive, the system displays the F7 key along with the other programmable keys. If you do not label the key, the system labels it EXECUTE.

Format:

```
.F7.
.F7, text.
.F7=text.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Specifies a label string of not more than eight characters. You can specify lowercase and uppercase characters.</td>
</tr>
</tbody>
</table>

If you enter the first format and omit text, EXECUTE is displayed (refer to table 4-2).

In the second format, any alphanumeric or special characters may be used except a period or right parenthesis (. or )). Special characters need not be enclosed in dollar signs ($).

In the third format, any characters may be used including a period or right parenthesis, but special characters must be enclosed in dollar signs.
Table 4-2. Programmable Function Keys for Procedures

<table>
<thead>
<tr>
<th>Key</th>
<th>Default Label</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>F1</td>
<td>FWD</td>
<td>Pages forward through screens of parameters or menu selections.</td>
</tr>
<tr>
<td>F2</td>
<td>BKW</td>
<td>Pages backward through screens of parameters or menu selections.</td>
</tr>
<tr>
<td>F3</td>
<td>HELP FWD</td>
<td>Pages forward through screens of .HELP text.</td>
</tr>
<tr>
<td>F4</td>
<td>HELP BKW</td>
<td>Pages backward through screens of .HELP text.</td>
</tr>
<tr>
<td>F5</td>
<td>HELP</td>
<td>Displays .HELP text at the bottom of the screen.</td>
</tr>
<tr>
<td>F6</td>
<td>QUIT</td>
<td>Aborts the procedure call and initiates search for an EXIT command in the current procedure and (if nested) in the calling procedures.</td>
</tr>
<tr>
<td>F7</td>
<td>EXECUTE</td>
<td>Initiates execution of the procedure if all required values are supplied.</td>
</tr>
</tbody>
</table>

.HLP Directive

The .HELP directive indicates that the text that follows is information about the procedure itself or its parameters. The procedure caller can access this information by entering a question mark as a parameter in a procedure call or by appending a question mark to the procedure name or a parameter name. When the system encounters a question mark in a procedure call, it stops processing the call and starts help processing. Therefore, anything entered after the question mark is not read. Refer to Requesting Help on Procedure Calls later in this section. If specified, .HELP directives must immediately precede the .ENDHELP directive.

Formats:

- .HELP.
- .HELP,,NOLIST.
- .HELP, parm.
- .HELP, parm,NOLIST.

Parameter | Description |
----------|-------------|
NOLIST    | Suppresses display of some .HELP text during help processing. |
parm      | Specifies one of the parameter keywords in an interactive procedure (*I) or specifies one of the menu selections (choice_i) in a menu procedure (*M). |

The first and second formats indicate the text that follows the directive describes the procedure. For interactive procedures in line mode, the NOLIST parameter suppresses the display of a parameter list when the caller requests information about the procedure. For menu procedures, the NOLIST parameter suppresses the display of the menu in line mode.

For interactive procedures, the third and fourth formats indicate the text that follows the directive describes the parameter associated with the keyword parm. The NOLIST parameter suppresses the display of acceptable parameter values as given in the parameter's checklist.
For menu procedures, the third and fourth formats indicate that the text following the directive describes the specified menu selection. The NOLIST parameter suppresses the display of the menu after the display of the .HELP text.

The text information starts on the line following the .HELP directive. The text can span multiple lines and must end with either another .HELP directive or an .ENDHELP directive. Parameter substitution does not occur within the .HELP text.

The system assumes that your .HELP text is in 6/12-bit display code, which supports uppercase and lowercase characters. In batch jobs, the system displays .HELP text in uppercase only.

Interactive (*I) Help

When you request help information about an interactive procedure, the system displays the following:

- The text following the procedure's .HELP directive.
- The parameters that follow the procedure name on the .PROC directive unless suppressed by the NOLIST parameter of the .HELP directive (.HELP,,NOLIST).
- A prompt for a value. The prompt includes the descriptive string specified with the parameter in the .PROC directive.

When you request information about a particular parameter of an interactive procedure, the system displays the following:

- Parameter values that are acceptable according to the parameter's checklist (the presence of NOLIST on the parameter's .HELP directive suppresses the display of these values).
- The text that follows the parameter's .HELP directive.
- The current value, if any, of the parameter.
- A prompt for a value. The prompt includes the descriptive string specified with the parameter on the .PROC directive.

Menu (*M) Help

When you request help information about a menu procedure, the system displays the following:

- The text following the procedure's .HELP directive.
- The menu unless suppressed by the NOLIST parameter of the .HELP directive (.HELP,,NOLIST).
- A prompt for a menu selection.

When you request information about a particular menu selection, the system displays the following:

- The text following the .HELP directive for that menu selection.
- The menu unless suppressed by the NOLIST parameter of the .HELP directive.
- A prompt for a menu selection.
Line Mode Example:

Procedure PRINT (on file PRINT) verifies that the selected file is local before it routes the file to a printer.

**NOTE**

The .HELP text uses lowercase and uppercase characters.

```
.PROC,PRINT*F,"FILE NAME"=(*F),
DC"DISPOSITION CODE"=(*N=LP,LP,PR,LR,LS,LT).
HELP.
This procedure routes a permanent file to the selected line printer.
HELP,F.
The name of the permanent file to be routed.
HELP,DC.
The disposition code. DC accepts only the line printer options.
ENDHELP.
IF,FILE(F,.NOT.LO),PF.
GET,F.
ELSE,PF.
REWIND,F.
ENDIF,PF.
COPYSBF,F,Z.
ROUTE,Z,#DC=DC.
REVERT,NOLIST.
```

To get a description of procedure PRINT, either append a question mark to the file name or enter a question mark as the first parameter. If PRINT is a local file, you can get such a description by entering any of the following:

```
PRINT?
PRINT,?
BEGIN,PRINT,PRINT?
BEGIN,PRINT,PRINT,?
```

If PRINT is not local, enter any of the following:

```
BEGIN,PRINT,PRINT?
BEGIN,PRINT,PRINT,?
GET,PRINT
PRINT,?
GET,PRINT
PRINT?
```
The following is a sample of the dialogue generated by the .PROC and .HELP directives:

```
/begin,print,print?
This procedure routes a permanent file to the selected line printer.
PARAMETERS FOR PRINT ARE F, DC
ENTER F FILE NAME? ?
ALLOWABLE VALUE(S)
MUST BE A FILE NAME
The name of the permanent file to be routed.

ENTER F FILE NAME? datafil
ENTER DC DISPOSITION CODE? ?
ALLOWABLE VALUE(S)
LP
PR
LR
LS
LT
PARAMETER MAY BE OMITTED
The disposition code. DC accepts only the line printer options.

ENTER DC DISPOSITION CODE? pr
```

To illustrate the effect of enclosing the description string for a parameter in apostrophes instead of quotation marks, we use the same procedure as in the previous example and replace the quotation marks with apostrophes:

```
.PROC,PRINT*1,F'FILE NAME'=(F),
DC'DISPOSITION CODE'=(N=LP,LP,PR,LR,LS,LT).
```

Note the difference in the prompts.

```
/begin,print,print?
This procedure routes a permanent file to the selected line printer.
PARAMETERS FOR PRINT ARE F, DC
FILE NAME? ?
ALLOWABLE VALUE(S)
MUST BE A FILE NAME
The name of the permanent file to be routed.

FILE NAME? datafil
DISPOSITION CODE? ?
ALLOWABLE VALUE(S)
LP
PR
LR
LS
LT
PARAMETER MAY BE OMITTED
The disposition code. DC accepts only the line printer options.

DISPOSITION CODE? pr
```
Screen Mode Example:

If you are at a terminal supported by the full-screen display products and your terminal is in screen mode, the system can use full-screen displays to prompt you for parameters and to provide you with help information.

The following screen results if you call procedure PRINT (as defined in the previous example):

```
PRINT

F FILE NAME: 
DC DISPOSITION CODE: LP

Specify values and press NEXT when ready

F5 HELP F6 QUIT
```

If you press the HELP key while the cursor is positioned in the input field for first parameter, you get the following screen:

```
PRINT

F FILE NAME: 
DC DISPOSITION CODE: LP

Specify values and press NEXT when ready

ALLOWABLE VALUE(S)
MUST BE A FILE NAME
The name of the permanent file to be routed.

F5 HELP F6 QUIT
```
If you press the HELP key while the cursor is positioned in the input field for the second parameter, you get the following screen:

```
PRINT
F FILE NAME: __________
DC DISPOSITION CODE: LP

Specify values and press NEXT when ready

ALLOWABLE VALUE(S)
PR
LR
LS
LT

PARAMETER MAY BE OMITTED
The disposition code. DC accepts only the line printer options.
```

To get help information about the procedure itself, you can append a question mark to the name of procedure on the call or press the HELP key again after you get help for any of the parameters.

```
PRINT
F FILE NAME: __________
DC DISPOSITION CODE: LP

Specify values and press NEXT when ready

This procedure routes a permanent file to the selected line printer.
```

Refer to Volume 2 for a detailed description of calling procedures in screen mode.
.NOCLR Directive

The .NOCLR directive inhibits the system from automatically clearing the screen at the end of the procedure call (once all required parameters are supplied). You can also specify a message to appear at the top of the screen. Unless specified to do otherwise, the system clears the screen at the end of the call, and the screen is blank until the procedure completes execution or sends output to the terminal.

The .NOCLR directive must be placed before any .HELP directives in the procedure.

Format:

```
.NOCLR,message.
.NOCLR==message.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>Specifies a 1- to 40-character text string that appears at the top of the screen. You can use uppercase and lowercase characters in the string.</td>
</tr>
</tbody>
</table>

In the first format, any alphanumeric or special characters may be used except a period or right parenthesis (. or )). Special characters need not be enclosed in dollar signs ($).

In the second format, any characters may be used (including a period or right parenthesis), but special characters must be enclosed in dollar signs.

This directive applies only if the procedure is executed in screen mode.

.NOTE Directive

The .NOTE directive specifies the message that appears on the screen and in your dayfile at the end of the procedure call (once all required parameters are supplied). Unless specified to do otherwise, the system clears the screen at the end of the call (refer to the .NOCLR Directive), and the screen is blank until the procedure completes execution or sends output to the terminal.

Format:

```
.NOTE,message.
.NOTE==message.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>Specifies a 1- to 40-character text string that appears on the screen and in your dayfile. You can use uppercase and lowercase characters in the string.</td>
</tr>
</tbody>
</table>

In the first format, any alphanumeric or special characters may be used except a period or right parenthesis (. or )). Special characters need not be enclosed in dollar signs ($).

In the second format, any characters may be used (including a period or right parenthesis), but special characters must be enclosed in dollar signs.

This directive applies only if the procedure is executed in screen mode.
.PAGE Directive

The .PAGE directive specifies the string that precedes the page number for procedure displays that require more than one screen.

Format:

```
.PAGE,text.
.PAGE=text.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Specifies a 0- to 40-character text string. You can use uppercase and lowercase characters in the string. The default is: Page</td>
</tr>
</tbody>
</table>

In the first format, any alphanumeric or special characters may be used except a period or right parenthesis (. or )). Special characters need not be enclosed in dollar signs ($).

In the second format, any characters may be used (including a period or right parenthesis), but special characters must be enclosed in dollar signs.

.PROMPT Directive

When a procedure is called in screen mode, the .PROMPT directive defines the last line of the screen, assuming no .HELP text is being shown. By default, this line tells the procedure caller how to proceed. For menu procedures, the input field immediately follows this prompt. In line mode, this directive applies only to menu procedures, where the system produces a screen-like display.

Format:

```
.PROMPT,text.
.PROMPT=text.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>Specifies a 0- to 40-character text string that appears as the prompt on the screen. The text string can be a maximum of 40 lowercase (12-bit) characters, 80 uppercase (6-bit) characters, or any combination of lowercase and uppercase characters that does not exceed 480 bits.</td>
</tr>
</tbody>
</table>

In the first format, any alphanumeric or special characters may be used except a period or right parenthesis (. or )). Special characters need not be enclosed in dollar signs ($).

In the second format, any characters may be used (including a period or right parenthesis), but special characters must be enclosed in dollar signs.
If the text parameter is omitted, the system issues the following prompts:

<table>
<thead>
<tr>
<th>Mode and Procedure Format</th>
<th>Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Screen mode</strong></td>
<td></td>
</tr>
<tr>
<td>Interactive procedure</td>
<td>Specify values and press NEXT when ready.</td>
</tr>
<tr>
<td>Menu procedure</td>
<td>Select from the list above and press NEXT.</td>
</tr>
<tr>
<td><strong>Line mode</strong></td>
<td></td>
</tr>
<tr>
<td>Interactive procedure</td>
<td>(Not applicable)</td>
</tr>
<tr>
<td>Menu procedure</td>
<td>SELECT BY NUMBER OR TYPE Q TO QUIT.</td>
</tr>
</tbody>
</table>

**EXPANSION CONTROL DIRECTIVES**

The expansion control directives allow you to control certain aspects of procedure expansion. These directives allow you to inhibit expansion of portions of a procedure, to change the inhibit and concatenation characters, and to skip portions of the procedure when writing lines to the procedure command record.

**.CC Directive**

The `.CC` directive specifies the character used to concatenate character strings during procedure expansion. The new concatenation character remains in effect until the procedure terminates or until you enter another `.CC` directive. The default concatenation character is the ASCII character `__` or the CDC graphics character `\`. The `.CC` directive can be placed anywhere in the procedure.

**Format:**

```
.CC(n)
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Specifies the new concatenation character.</td>
</tr>
</tbody>
</table>

**.EXPAND Directive**

The `.EXPAND` directive terminates or restores procedure expansion for subsequent lines of the procedure. The `.EXPAND` directive can be used anywhere in the procedure following the formatting and help directives.

**Format:**

```
EXPAND,option
```
Parameter | Description
---|---
ON | Specifies that subsequent lines of the procedure are expanded normally. This is the default value.
OFF | Specifies that no parameter substitutions or directive processing is performed on subsequent lines. In other words, any subsequent commands or procedure directives are written to the command record just as they appear in the procedure file.

**.IC Directive**

The .IC directive specifies the character used to inhibit parameter substitution or directive processing during procedure expansion. The new inhibit character remains in effect until the procedure terminates or until you enter another .IC directive. The default inhibit character is the ASCII character # or the CDC graphics character □. The .IC directive can be placed anywhere in the procedure.

Format:

```
.IC(n)
```

**Parameter**

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
</table>
| n | Specifies the new inhibit character.

**.SET Directive**

The .SET directive allows you to build new parameters using strings and substrings created by the STR, STRB, and STRD functions and concatenation operations, which are described in section 6.

Format:

```
.SET, keywd1=strexp1,..., keywdn=strexp
```

**Parameter**

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
</table>
| keywd1 | Defines a new keyword or references an existing keyword, either from the .PROC header or from an earlier .SET directive. keywd1 can be substituted in subsequent statements as if it were a formal parameter in the .PROC header.

If keywd1 is an existing keyword, it is prefixed with an inhibit character to avoid unwanted substitution of the existing value.

If keywd1 is enclosed in dollar signs, values substituted for keywd1 in subsequent statements remain in or are converted to the literal format (by appending prefixing and suffixing dollar signs and replicating any dollar signs that occur within the values).

| strexp1 | May be any valid CCL expression, usually but not necessarily an expression that produces a string result. If the result of strexp1 is not a string but a value, the value is left-justified and considered a string. The resulting string in either case is substituted for any occurrences of keywd1 in subsequent statements of the procedure. |
Example 1:

```
.PROC,CATTER*I,P1=(*A),P2=(*S3/D).
.SET,K9=STR($P1$,1)/STRD(P2,-1).
.IF,$K9$.EQ.$GOOD1$,GO.
.ELSE,GO.
.REVERT,EX.DISPLAY,STR($SORRY, K9 IS NOT GOOD1$).
.ENDIF,GO.
```

In this example, two substrings were concatenated to produce one string in the .SET expression. Every occurrence of keyword K9 in the lines following the .SET directive is replaced by the string resulting from the concatenation of substrings Pl and P2. If GOODY and 101 were supplied as values for Pl and P2, the value of K9 would be set to GOOD1. (For a detailed explanation of how the STR and STRD functions operate, refer to section 6.) The subsequent .IF statement would be true, causing the NOTE command to be included and executed. If BADNEWS were substituted for Pl, the .IF statement would be false, resulting in the execution of the REVERT command and then the DISPLAY command.

Example 2:

```
.SET,V1=STRD(P1+P2),V2=STRD(P1*P2),V3=STRD(P1**P2).
.IF,V1=V2=V3.NOTE./SUM, PRODUCT AND POWER ARE EQUAL.
.NOTE./THE SUM OF P1 AND P2 IS V1.
.NOTE./THE PRODUCT OF P1 AND P2 IS V2.
.NOTE./P1 TO THE POWER OF P2 IS V3.
```

As this example demonstrates, the .SET directive along with the STRD function can create new keywords that make it possible to include arithmetic values as strings in subsequent commands and directives.

Example 3:

```
.NOTE./ #P1(P1) #P2(P2) #P3(P3) #P4(P4)
.SET,$P3$$GHI$,$P4$$JKL$.
.NOTE./ #P1(P1) #P2(P2) #P3(P3) #P4(P4)
.REVERT. LITKW COMPLETED.
```

Execution of procedure LITKW using a BEGIN command produces:

```
07.16.51.BEGIN.,LITKW,ABC,DEF.
07.16.52.NOTE./ P1(ABC) P2($DEF$) P3(333) P4(444)
07.16.52.NOTE./ P1(ABC) P2($DEF$) P3(GHI) P4($JKL$)
07.16.52.NOTE./ P1($ABC$) P2(DEF) P3($GHI$) P4(JKL)
07.16.52.REVERT. LITKW COMPLETED.
```

This example illustrates the creation of keywords not previously defined, redefinition of existing keywords, and changing the literal keyword characteristics of existing keywords.

FILE DIRECTIVES

The file directives either create local files during procedure expansion time or place file marks in the procedure command record.
.DATA Directive

A .DATA directive in a procedure marks the beginning of a sequence of data lines to be written to a separate file when the procedure is called. The data file can contain program source code, other NOS procedures, or any other type of data.

Format:

.DATA,lfn.

Parameter Description
lnf Specifies the name of the file on which the data lines are to be written. If a file named lnf is already assigned to the job, it is returned, and new local file lnf is created. You cannot specify INPUT for lnf. If lnf is not specified, the .DATA file can be referenced in the procedure header using the special symbol #DATA.

The default for lnf depends on the nesting level of the procedure. At the first procedure level, the system calls this file ZZCCLAA; at the second procedure level, it is ZZCCLAB; and so on.

You can use the .IF, .ELSE, and .ENDIF directives within the data lines following the .DATA directive to conditionally include lines in the data file.

File marks generated by .EOR and .EOF directives can subdivide the lines written to the data file into records or files. The sequence of data lines is terminated by one of the following:

- Another .DATA directive.
- An end-of-record (not an .EOR directive) in the procedure file.
- An end-of-file (not an .EOF directive) in the procedure file.
- An end-of-information in the procedure file.

The data file created does not include the .DATA directive. Keyword substitution continues within the data file unless you insert a .EXPAND directive to suspend expansion processing. After the data file is written, it is rewound.
The following examples show three different ways of inserting a FORTRAN 5 program into a procedure.

Example 1: Procedure accesses program data with .DATA directive

The following procedure is on an indirect access permanent file named DATAFIL.

```
.PROC, ALPHA*I,
P1=(*F, N=#DATA),
LSTFILE=(*F, N=FTNOUT).
FTN5, I=P1, L=LSTFILE.
LGO.
REPLACE, LSTFILE.
.DATA

PROGRAM APROG

statements

END
```

The following BEGIN command in a command record of the job accesses procedure ALPHA on file DATAFIL.

```
BEGIN, ALPHA, DATAFIL.
```

A sample of a resulting dayfile is:

```
11.07.59. BEGIN, ALPHA, DATAFIL.
11.07.59. FTN5, I=ZZCCLAA, L=FTNOUT.
11.08.00.  61000 CM STORAGE USED.
11.08.00.  0.015 CP SECONDS COMPILATION TIME.
11.08.00. LGO.
11.08.00. STOP
11.08.00.  5600 FINAL EXECUTION FL.
11.08.00.  0.000 CP SECONDS EXECUTION TIME.
11.08.00. REPLACE, FTNOUT.
11.08.01. $REVERT, CCL
```

All input after the .DATA directive (the FORTRAN 5 source program) is written onto the default temporary file ZZCCLAA. Parameter substitution is performed on the FORTRAN program prior to its being written to ZZCCLAA.
Example 2: Procedure accesses program data with #FILE

The following procedure is on an indirect access permanent file named PFILE. The record immediately following procedure BETA contains the program data. The #FILE default tells the FTN5 compiler to search for input from the next record on file PFILE.

```
.PROC,BETA*I,
P1=(*F,*N=#FILE),
LSTFILE=(*F,*N=FTNOUT).
FTN5,I=P1,L=LSTFILE.
LGO.
REPLACE,LSTFILE.
-EOR-

PROGRAM BPROG
-
 statements
-
 END

```

The following call accesses procedure BETA on file PFILE.

```
BEGIN,BETA,PFILE.
```

The following is a segment of the resulting dayfile. Parameter substitution occurred within the procedure but not within the FORTRAN 5 program.

```
11.08.35.BEGIN,BETA,PFILE.
11.08.36.FTN5,I=PFILE,L=FTNOUT.
11.08.36.61000 CM STORAGE USED.
11.08.36.0.013 CP SECONDS COMPILATION TIME.
11.08.36.LGO.
11.08.37.STOP
11.08.37.5600 FINAL EXECUTION FL.
11.08.37.0.000 CP SECONDS EXECUTION TIME.
11.08.37.REPLACE,FTNOUT
11.08.37.$REVERT.CCL
```
Example 3: Procedure accesses program data from another file

A procedure may access data outside of the procedure file. The following procedure is in
the default file PROCFIL. It uses a GET command to access the program data on file TEST and
writes the binary output.

```fortran
PROC,GAMMA*I,P1=(*F),X=(+N=FTNOUT).
GET,P1.
FTN5, I=P1, L=X.
LGO.
REPLACE, X=LISTFIL.
```

The following call accesses procedure file GAMMA.

```
BEGIN,GAMMA,,P1=TEST.
```

Parameter substitution occurs within the procedure but not within the FORTRAN 5 program, as
shown in the following dayfile segment.

```
11.06.48.BEGIN,GAMMA,,P1=TEST.
11.06.48.GET,TEST.
11.06.49.FTN5, I=TEST, L=FTNOUT.
11.06.50. 61000 OM STORAGE USED.
11.06.50. 0.013 CP SECONDS COMPILATION TIME.
11.06.50.LGO.
11.06.51. STOP
11.06.51. 5600 FINAL EXECUTION FL.
11.06.51. 0.000 CP SECONDS EXECUTION TIME.
11.06.51.REPLACE,FTNOUT=LISTFIL.
11.06.51.$REVERT.CCL
```
.EOF (or .EOP) Directive

The .EOF (or .EOP) directive generates an end-of-file on the data file created with a .DATA directive. Wherever an .EOF appears, an actual end-of-file is recorded when the data file is written on the file specified in the .DATA directive. The system always writes an end-of-record at the end of a data file. If you want an end-of-file also, you must end the file with an .EOF directive. The .EOF directive is valid only after a .DATA directive. The .EOP directive may be used interchangeably with the .EOF directive.

Format:

.EOF.
.EOP.

.EOR (or .EOS) Directive

The .EOR (or .EOS) directive is used to separate records in a data file created with a .DATA directive. Wherever an .EOR is placed, an actual end-of-record is recorded when the data file is written on the file specified in the .DATA directive. The system always writes at least one end-of-record at the end of a data file, whether or not you specify an .EOR directive. The .EOR directive is valid only after a .DATA directive. The .EOS directive may be used interchangeably with the .EOR directive.

Format:

.EOR.
.EOS.

BRANCHING DIRECTIVES

The branching directives provide conditional inclusion of commands, other directives, or data lines in the procedure. The function of the .ELSE, .ENDIF, and .IF directives is much like that of their command equivalents. The branching can appear in any of the four sections of the procedure body.

.ELSE Directive

The .ELSE directive in conjunction with the .IF directive either terminates or initiates the skipping of lines in the procedure body.

Format:

.ELSE,label.

Parameter Description

label Specifies a 0- to 10-character alphanumeric string. The string must begin with an alphabetic character unless it is a null string.

If the condition in the matching .IF directive is true, the .ELSE directive initiates the skipping of the lines between itself and the next matching .ENDIF directive (two directives match only if their label parameters are identical). If the condition in the matching .IF directive is false, the .ELSE directive terminates the skipping that the .IF directive initiated. An .ELSE directive cannot terminate the skipping initiated by another .ELSE directive.
.ENDIF Directive

The .ENDIF directive terminates skipping initiated by a matching .IF or .ELSE directive (directives match only if their label parameters are identical).

Format:

```
.ENDIF,label.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Specifies a 0- to 10-character alphanumeric string. The string must begin with an alphabetic character unless it is a null string.</td>
</tr>
</tbody>
</table>

.EX Directive

The .EX directive submits a single command to the system for immediate execution. The system performs keyword substitutions in the command before executing the command. No further procedure directives are normally processed. Although .DATA files are created, the command record is never executed. Since the command record is not executed, the procedure nesting level of your job is not incremented.

Format:

```
.EX.command.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
<td>Any valid command. The length of the expanded command cannot exceed 80 characters.</td>
</tr>
</tbody>
</table>

If the command entered by .EX aborts, the system responds as though the command had been entered from the calling job or procedure. For example, assume that procedure A calls procedure B and that procedure B contains a .EX directive. If the command entered by the .EX directive is erroneous, the system immediately suspends command processing and begins searching for an EXIT command in procedure A.

The .EX directive is most often used in menu procedures in which the command executed by .EX is a call (BEGIN command) to another procedure. Since the purpose of the menu procedure is merely to prompt for a single item of user input, the most efficient way of calling the resulting procedure is in a .EX directive.

Example:

The following menu procedure initiates one of three nested procedures, (EXEC1, EXEC2, or EXEC3) depending on the menu item selected.

```
.PROC,FIX*M,P=
(1"OPTION 1",
 2"OPTION 2",
 3"OPTION 3").
.EX,BEGIN,EXEC_P,PFILE.
REVERT,NOLIST.
```
.IF (or .IFE) Directive

The .IF directive conditionally writes lines from the procedure body to the procedure command record or the file associated with the .DATA directive. The .IF directive is to the procedure command record as the IF command is to the job command record (refer to the IF command). Before evaluating the conditional expression, the system performs parameter substitution for the portion of the directive that follows the .IF. Since the system processes the .IF directive at procedure expansion time, the .IF directive cannot depend upon the effects of commands in the procedure body.

Formats:

- .IF, expression, command.
- .IF, expression, label.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Specifies an expression that is either true or false (refer to Command Syntax in section 6). The separator following expression in the first format must be a terminator.</td>
</tr>
<tr>
<td>command</td>
<td>Specifies any valid system command.</td>
</tr>
<tr>
<td>label</td>
<td>Specifies a 0- to 10-character alphanumeric string. The string must begin with an alphabetic character unless it is a null string. An identical string must appear in a subsequent .ELSE or .ENDIF directive.</td>
</tr>
</tbody>
</table>

If expression is true, the first format writes command in the procedure command record while the second format processes all lines between the .IF directive and the first matching .ELSE or .ENDIF directive (two directives match only if their label parameters are identical).

If expression is false, the system does not write command in the procedure command record (for the first format) nor does the system write and process the lines between the .IF directive and the first matching .ELSE or .ENDIF directive (for the second format).

**NOTE**

When using the first format (.IF, expression, command.), values for .command. that match a relational, logical, or string operator (such as .EQ. or .OR.) are interpreted as operators, causing the procedure to abort. To write a valid .IF directive when .command. matches an operator, terminate the expression or command with a right parenthesis instead of a period.
COMMENT (.* ) Directive

The .* directive enables you to document a procedure with internal comments. These comments do not appear in the dayfile when the procedure is processed. The comment, which follows the .*, can contain any combination of characters.

Format:

.*comment

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>Represents your comments.</td>
</tr>
</tbody>
</table>

The comment directive can appear anywhere in the procedure body. However, a comment directive inserted in the help section is considered as part of the help text.
CALLING A PROCEDURE (BEGIN COMMAND)

The BEGIN command initiates execution of a procedure. When a BEGIN command is entered, the system begins executing the specified procedure and continues until a REVERT command is entered. The REVERT command causes the system to return to the command record of the calling job or procedure. The system then continues execution with the first command following the BEGIN command. Procedures can be nested up to a level of 50 nested procedures.

Figure 4-5 shows a diagram of a procedure call from a batch job and from an interactive job. The interactive example also diagrams a first level nested procedure call.

![Diagram of Procedure Call from Batch Job and Interactive Command](image-url)
You can alter the contents of a procedure by passing parameters to the procedure through the
BEGIN command. The system substitutes the parameter values into the procedure body according
to the rules specified in the procedure header (refer to .PROC Directive earlier in this
section).

The system allows you to input the parameters from a full-screen format if the following
conditions are true:

- Your terminal supports full-screen input for procedures.
- Your terminal is in screen mode (refer to the SCREEN command).
- The procedure is interactive; that is, the .PROC directive contains a *M or *I.
- You do not supply all the required parameters on the procedure call.

Formats:

BEGIN,pname,pfile,p1,p2,...,pn,comment
or
-pname,pfile,p1,p2,...,pn,comment
or
pname,p1,p2,...,pn,comment
or
pfile,p1,p2,...,pn,comment

The first format is the full BEGIN command format that can be used in either batch or
interactive jobs. When you use this format, the system uses the following search order when
attempting to locate file pfile:

- local files
- indirect access files in your permanent file catalog
- direct access files in your permanent file catalog
- indirect access files under user name LIBRARY
- direct access files under user name LIBRARY

The second format can be used only from an interactive job. It uses the same search order
as the first format.

The third and fourth formats are the name call formats in which the command name BEGIN can
be omitted.
The third format can be used from a batch or interactive job if one of the following is true:

- `pname` is a procedure within a record in a file called `pname`. The system locates this procedure record and executes it.

- `pname` is a procedure in a global library set.

- `pname` is a procedure in the system library.

The fourth format can be used from a batch or interactive job. `pfile` is the name of a local file. The system executes the first procedure on `pfile`.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pname</code></td>
<td>Specifies the procedure name from the procedure header directive. If <code>pname</code> is omitted from the first format, two consecutive commas must be specified. The default procedure is the record at the current position of <code>pfile</code>. If <code>pfile</code> is at its end-of-information, the system rewinds <code>pfile</code> and uses the first procedure on <code>pfile</code>. If <code>pfile</code> is INPUT, the file is not rewound.</td>
</tr>
<tr>
<td><code>pfile</code></td>
<td>Specifies the name of the file containing the procedure. The file name <code>pfile</code> must be inserted as the second parameter in the first format. Its omission is indicated by two consecutive commas following <code>pname</code>. To get a description of the procedure <code>pname</code>, you can append a question mark to <code>pfile</code> (refer to Requesting Help on Procedure Calls later in this section). File <code>pfile</code> is not automatically returned after the procedure executes. If <code>pfile</code> is omitted from the first format, the installation-defined default file name is used (PROCFIL is the default).</td>
</tr>
<tr>
<td><code>Pi</code></td>
<td>Specifies an optional parameter that may affect the substitution to be made for a keyword used in the procedure. The value you specify is compared to the appropriate checklist specified for this parameter in the procedure header. The checklist entries are checked in a left-to-right fashion and the first match determines the substitution. Refer to the &quot;PROC Directive in this section for more details on parameter substitution. The specific formats for <code>Pi</code> are described later in this subsection. If you are using the third or fourth format of the BEGIN command as previously shown, there is a 7-character restriction on both the keyword portion and the value portion of the parameter <code>Pi</code>.</td>
</tr>
<tr>
<td><code>comment</code></td>
<td>Specifies the value associated with the comment keyword (ck) on the procedure header. The value consists of any characters you specify following the terminator. If the ck keyword appears on the procedure header, the system substitutes your comment for the comment keyword ck in the procedure body. Otherwise, the system ignores this comment.</td>
</tr>
</tbody>
</table>
For interactive procedures (*I), optional parameters $p_i$ can have the following formats:

<table>
<thead>
<tr>
<th>Format</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>keywrd</td>
<td>Specifies a parameter identical to a keyword on the procedure header. Substitution is controlled by the *K entry in the checklist for the parameter.</td>
</tr>
<tr>
<td>keywrd?</td>
<td>Specifies interactive BEGIN processing (refer to Requesting Help on Procedure Calls later in this section).</td>
</tr>
<tr>
<td>keywrd=</td>
<td>Removes keywrd in the procedure body (null substitution) unless overridden by a checklist specification.</td>
</tr>
<tr>
<td>keywrd=val</td>
<td>Allows order-independent substitution (refer to Parameter Matching Modes in this section). $val$ replaces keywrd in the procedure body unless the associated checklist specifies otherwise. $val$ can be a 1- to 40-character symbolic name or value. Section 6 describes symbolic names. $val$ can contain special characters (nonalphanumeric) if they are delimited by dollar signs. Asterisks are the exception; they can appear without dollar sign delimiters.</td>
</tr>
</tbody>
</table>

This parameter format has the following valid variations:

<table>
<thead>
<tr>
<th>Format</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>keywrd=val</td>
<td>Substitutes the string $val$ for keywrd.</td>
</tr>
<tr>
<td>keywrd=val+</td>
<td>Substitutes the decimal value of $val$ for keywrd.</td>
</tr>
<tr>
<td>keywrd=val+D</td>
<td>Same as keywrd=val+.</td>
</tr>
<tr>
<td>keywrd=val+B</td>
<td>Substitutes the octal value of $val$ for keywrd.</td>
</tr>
</tbody>
</table>

When calling a procedure, a keyword can be named more than once if the keywrd=val parameter format is used each time. The system issues a message informing you that a keyword is named more than once on the command. It uses the value specified with the last occurrence of the keyword.
**val**

Unless overridden by a checklist specification, assigns this 0- to 40-character (uppercase only) symbolic name or value to the keyword whose position in the procedure header parameter list matches the position of this parameter in the BEGIN command parameter list (refer to Parameter Matching Modes in this section). Special characters (nonalphanumeric), other than asterisks (*), must be delimited by dollar signs. This parameter format has the following variations:

<table>
<thead>
<tr>
<th>Format</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>Substitutes the string val itself.</td>
</tr>
<tr>
<td>val+</td>
<td>Substitutes the decimal value associated with val.</td>
</tr>
<tr>
<td>val+D</td>
<td>Substitutes the decimal value associated with val.</td>
</tr>
<tr>
<td>val+B</td>
<td>Substitutes the octal value associated with val.</td>
</tr>
</tbody>
</table>

**NOTE**

If you specify a parameter \( p_i \) on a name call to a local file, neither the keyword keywrd nor the value val can exceed seven characters.

For menu procedures \( (*M) \), the procedure call can contain only one substitution parameter \( p_i \). On such calls, \( p_i \) can have one of the following formats:

<table>
<thead>
<tr>
<th>( p_i )</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>choice</td>
<td>Specifies a menu selection that appears on the procedure header. The menu selection must be an unsigned integer.</td>
</tr>
<tr>
<td>choice?</td>
<td>Specifies interactive help processing (refer to Requesting Help on Procedure Calls later in this section).</td>
</tr>
</tbody>
</table>

If you omit \( p_i \), the system displays the menu and prompts for a menu selection.

**Example:**

The following procedure is accessed by a sequence of BEGIN commands in the command record of the job.

```
.PROC,TEST1*I,FK.
COMMENT. FK
```
The resulting dayfile shows each BEGIN command and the substitutions made. The relevant segment of the dayfile is as follows:

```
10.15.26.BEGIN,TEST1,FKTEST,20.
10.15.27.COMMENT. 20
10.15.27.REVERT.CCL
10.15.27.SET,R2=100.
10.15.27.BEGIN,TEST1,FKTEST,FK=R2+. 20
10.15.28.COMMENT. 100
10.15.28.REVERT.CCL
10.15.28.BEGIN,TEST1,FKTEST,FK=R2+0.
10.15.29.COMMENT. 100
10.15.29.REVERT.CCL
10.15.29.BEGIN,TEST1,FKTEST,FK=R2+B.
10.15.30.COMMENT. 144
10.15.30.REVERT.CCL
10.15.30.BEGIN,TEST1,FKTEST,FK.
10.15.31.COMMENT. FK
10.15.31.REVERT.CCL
10.15.31.BEGIN,TEST1,FKTEST,FK=.
10.15.32.COMMENT.
10.15.32.REVERT.CCL
10.15.32.BEGIN,TEST1,FKTEST,VALUE.
10.15.33.COMMENT. VALUE
10.15.33.REVERT.CCL
10.15.33.BEGIN,TEST1,FKTEST,$VALUE-2$.
10.15.34.COMMENT. VALUE-2
10.15.34.REVERT.CCL
10.15.34.BEGIN,TEST1,FKTEST,*.
10.15.35.COMMENT. *
10.15.35.REVERT.CCL
```

**REQUESTING HELP ON PROCEDURE CALLS**

After you call a procedure interactively but before the system executes the specified procedure, you can have a dialogue with the system about the procedure. This is possible only if the procedure writer appended the *I or *M to the procedure name in the procedure header (refer to the .PROC directive described in this section). You can do any of the following:

- Request help information about the procedure itself.
- Request help information about a procedure parameter.
- Supply omitted parameters.
- Reenter parameter values that are in error.

If the parameter specifications in the procedure call are incorrect or incomplete, the system initiates the dialogue. You can also initiate the dialogue by requesting a description of the procedure or parameters in one of the following ways:

- Append a question mark to the procedure file name.
- Append a question mark to the name of a procedure parameter for *I procedures or to a menu selection for *M procedures.
• Enter a question mark as a parameter on the procedure call.
• Enter a question mark in response to an interactive prompt.
• Press the HELP key any time after you call the procedure if your terminal is in screen mode.

If you omit required parameters or if any parameter is in error on the procedure call, the system prompts you for the required parameters and those in error. If the system prompts you for a parameter that need not be specified and you want to use the default for that parameter, enter a carriage return. If the format of a parameter entry is not correct or the parameter entry is not specified on the procedure header directive, you are reprompted for the parameter. Prompting for parameters terminates when:

• You satisfy all parameter requirements.
• You enter a parameter followed by a terminator (a period or a right parenthesis), or enter just a terminator. If all required parameters have been entered, the system executes the procedure. Otherwise, the system continues prompting until all required parameters are satisfied.
• It is a menu procedure executing in line mode and you enter Q. The system does not execute the menu. For nested menu procedures, entering Q causes the system to discontinue expansion of the current procedure and begin searching for an EXIT command in the calling procedure.
• Your terminal is in line mode and you enter the termination or interruption character for your terminal (refer to appendix J). The BEGIN command processing ends and the system does not execute the procedure. For nested procedures, terminating the dialogue in this way causes the system to search for an EXIT command in the calling procedure.
• Your terminal is in screen mode and you press the QUIT key. The system does not execute the procedure. For nested procedures, terminating the dialogue in this way causes the system to search for an EXIT command in the calling procedure.

As with all commands, you can always append a comment after the terminator on the call. Additionally, you can append a comment to a parameter entry made during a parameter-prompting dialogue. Still, the comment must follow a terminator (refer to the last example in this subsection).
The procedure calls in table 4-3 illustrate the various methods of requesting help on procedure calls. For convenience, we show the name call format of the BEGIN command.

<table>
<thead>
<tr>
<th>Procedure Call</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>**Interactive Procedure (<strong>I)</strong></td>
<td>**Menu Procedure (<strong>M)</strong></td>
</tr>
<tr>
<td><strong>pname</strong></td>
<td>The system prompts for required parameters or parameter values in error.</td>
</tr>
<tr>
<td><strong>pname?</strong></td>
<td>The system provides any .HELP text about the procedure itself and then prompts for parameters.</td>
</tr>
<tr>
<td><strong>pname,?</strong></td>
<td>Same as pname?.</td>
</tr>
<tr>
<td><strong>pname,keywr?</strong></td>
<td>The system provides any .HELP text for the parameter associated with keywr and then prompts for parameters.</td>
</tr>
<tr>
<td><strong>pname,choice?</strong></td>
<td>Not applicable.</td>
</tr>
</tbody>
</table>
If your job is a batch job and you request a description of the procedure or its parameters, the system writes the description in the job dayfile. If any of the required parameter specifications are in error, error messages appear in the dayfile. In either case, the system does not execute the procedure.

The following example shows the interactive entry of parameters.

Example:

Procedure F5 resides on local file F5.

```
.PROC,F5*I,'INPUT'=(*F,*N=INPUT),
 'BINARIES'=(*F,*N=GO),
 'OUTPUT'=(*F,*N=OUTPUT),
FTN5,#I=#B,#L=#L0.
REVERT.
```

To elicit prompts for the parameters on the procedure, the user enters

```
f5,?
```

The following dialogue ensues:

```
PARAMETERS FOR F5 ARE I, B, L, L0
ENTER I INPUT? test
ENTER B BINARIES? bfile
ENTER L OUTPUT? listing
ENTER LO LIST OPTIONS? s
REVERT.
```

The following example is the same as the previous example, except that apostrophes replace the quotation marks in the procedure header:

```
.PROC,F5*I,'INPUT'=(*F,*N=INPUT),
 'BINARIES'=(*F,*N=GO),
 'OUTPUT'=(*F,*N=OUTPUT),
FTN5,#I=#B,#L=#L0.
REVERT.
```

To elicit prompts for the parameters on the procedure, the user enters

```
f5,?
```

The following dialogue ensues:

```
PARAMETERS FOR F5 ARE I, B, L, L0
INPUT? test
BINARIES? bfile
OUTPUT? listing
LIST OPTIONS? s
REVERT.
```
The following example shows help processing with a menu procedure:

```
NOTE

The .HELP text uses lowercase and uppercase characters.

/list,f=menu
.PROC,MENU=M"SAMPLE MENU",OPTION=
(1"OPTION 1",2"OPTION 2", 3"OPTION 3") .COMMENT.
.HELP
This procedure shows the structure of a menu procedure.
.HELP,1
This is HELP text for option 1.
.HELP,2
This is HELP text for option 2.
.HELP,3
This is HELP text for option 3.
.ENDHELP.
.IF,OPTION.EQ.1 .NOTE.+YOU CHOSE #OPTION 1 COMMENT.
.IF,OPTION.EQ.2 .NOTE.+YOU CHOSE #OPTION 2 COMMENT.
.IF,OPTION.EQ.3 .NOTE.+YOU CHOSE #OPTION 3 COMMENT.
.REVERT,NOLIST.

/menu?
This procedure shows the structure of a menu procedure.

SAMPLE MENU
  1. OPTION 1
  2. OPTION 2
  3. OPTION 3

SELECT BY NUMBER OR TYPE Q TO QUIT ? 1?
This is HELP text for option 1.

SAMPLE MENU
  1. OPTION 1
  2. OPTION 2
  3. OPTION 3

SELECT BY NUMBER OR TYPE Q TO QUIT ? 2?
This is HELP text for option 2.

SAMPLE MENU
  1. OPTION 1
  2. OPTION 2
  3. OPTION 3

SELECT BY NUMBER OR TYPE Q TO QUIT ? 3?
This is HELP text for option 3.
```
SAMPLE MENU
1. OPTION 1
2. OPTION 2
3. OPTION 3

SELECT BY NUMBER OR TYPE Q TO QUIT ? 1. finally
YOU CHOSE OPTION 1 FINALLY.
/menu,2
YOU CHOSE OPTION 2.

ENDING A PROCEDURE (REVERT COMMAND)

The REVERT command terminates procedure processing.

Format:

REVERT,option.command

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>option</td>
<td>Controls the revert options and whether the REVERT command appears at the terminal and in the job dayfile.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORT</td>
<td>Returns control to the next EXIT command in the command record unless a NOEXIT command has been processed. This parameter sets EF=CPE (CPU abort). It returns control to the command following the calling BEGIN command if a NOEXIT command has been processed. This parameter causes the REVERT command to appear at the terminal and in the job dayfile.</td>
</tr>
<tr>
<td>EX</td>
<td>Returns control to the command record of the calling procedure and executes the command parameter as if the command had actually appeared in the calling procedure. The EX parameter causes the REVERT command to appear in the job dayfile but not at the terminal.</td>
</tr>
<tr>
<td>NOLIST</td>
<td>Returns control to the command following the calling BEGIN command and suppresses the display of the REVERT command at the terminal and in the dayfile.</td>
</tr>
</tbody>
</table>

If you omit option, control returns to the command following the calling BEGIN command. The REVERT command appears in the job dayfile but not at a terminal unless you are under the batch subsystem and the REVERT is not within a nested procedure call.

| command | Specifies a comment when used with the EX option. Otherwise, it specifies a comment. |

The system always appends the following commands to a procedure record.

$REVERT.CCL
$EXIT.CCL
$REVERT,ABORT.CCL

These commands terminate procedure processing if no user-supplied REVERT commands are processed.

60459680 K
Example:

The following procedure (REVTST) is on a file called PROCFL. It reverts to the job calling it if the named file has no read permission and aborts (causing control to be transferred to the job EXIT command) if the named file has no read modify permission.

```
.PROC,REVTST*I,LFN1,LFN2.
.IF,FILE(LFN1,RD),LABEL1.
TDUMP,I=LFN1.
.ELSE,LABEL1.
REVERT.NO READ PERMISSION
.ENDIF,LABEL1.
.IF,FILE(LFN1,RM),LABEL2.
COPY,LFN2,LFN1.
.ELSE,LABEL2.
REVERT,ABORT.NO READ/MODIFY PERMISSION
.ENDIF,LABEL2.
```

The following two jobs (REVJOB1 and REVJOB2) call the REVTST procedure. REVJOB1 attaches an execute-only file; REVJOB2 attaches a read or execute file.

REVJOB1.
USER,USERNAM,PASSWRD,FAMNAME.
ATTACH,FILE1/UN=ALTUSER,PW=PW1,M=E.
BEGIN,REVTST,PROCFL,FILE1,XFIL.
COMMENT. RETURNS HERE
EXIT.
COMMENT. EXIT ON ERROR

REVJOB2.
USER,USERNAM,PASSWRD,FAMNAME.
ATTACH,FILE2/UN=ALTUSER,PW=PW2,M=R.
BEGIN,REVTST,PROCFL,FILE2,XFIL.
COMMENT. RETURNS HERE
EXIT.
COMMENT. EXIT ON ERROR

The following are the dayfile segments produced by REVJOB1 and REVJOB2. REVJOB1 processes the REVERT command and terminates normally. REVJOB2 processes the REVERT,ABORT command and terminates by error processing.

PARAMETER MATCHING MODES

When you call a procedure, the system must match each parameter on the BEGIN command with a parameter on the procedure header. The system uses two methods of parameter matching, order-dependent and order-independent.

ORDER-DEPENDENT MODE

In order-dependent mode, the system compares in order each parameter on the procedure call with the parameter in that position on the procedure header. If any parameter entries do not conform to the restrictions in the parameter checklist or required parameters are omitted on the procedure call, the system prompts you for them. After all required parameters are entered, the system substitutes the selected keywords into the procedure body according to the checklists in the .PROC directive.

Example:

Procedure ITEM is on a global library file:

.PROC, ITEM*I,F"LOCAL FILE NAME"=*N=LGO,*F,
L"NAME OF LIST OUTPUT FILE"=*N=OUTPUT,*F,
BL"EACH FILE START ON NEW PAGE? YES OR NO"=*N=YES,*BL*,NO=,*N=,
NR"REWIND BEFORE & AFTER? YES OR NO"=*N=YES,*NR*,NO=,*N=.
ITEMIZE,F,ML=BL_NR.
REVERT.

The procedure is called:

ITEM, LIST,, NO, NO.

The parameters are matched in order-dependent mode and the procedure body becomes:

ITEMIZE, LIST, L=OUTPUT, NR.
REVERT.

In order-dependent mode, the system treats excess parameters on the BEGIN command as a nonfatal error.

ORDER-INDEPENDENT MODE

For each BEGIN command, parameter matching always starts in order-dependent mode. The system switches to order-independent mode if, in the comparison of a BEGIN command parameter and a procedure header parameter, one of the following occurs.

- A parameter on the procedure call is in the format keyword=value.
- A reverse slant (\) precedes the parameter on the .PROC directive or the BEGIN command.
- A slant (/) precedes the parameter on the .PROC directive.
- A slant precedes the parameter on the procedure call and a slant separates any two parameters on the .PROC directive.
However, if a slant is specified on the procedure call and not on the .PROC directive, the slant is not treated as a separator, but as part of the parameter value.

Parameter matching mode cannot switch back from order-independent to order-dependent mode.

Once in order-independent mode, the system matches each successive keyword on the procedure call or interactive entry to the identical keyword in the procedure header directive, regardless of the order of the procedure header parameters or the order of specification on the procedure call.

To show order-independent parameter matching, the preceding example is slightly modified. An *K entry has been added to the BL parameter checklist to make BL a valid parameter entry. A reverse slant is used as a separator before the NR parameter to ensure order-independent mode.

```
.PROC,ITEM1*I,F"LOCAL FILE NAME"=(*N=LGO,*F),
L"NAME OF LIST OUTPUT FILE"=(*N=OUTPUT,*F),
\NR"REWIND BEFORE & AFTER? YES OR NO"=(YES=,NO=,$,NR$,*N=),
BL"EACH FILE START ON NEW PAGE? YES OR NO"=(YES=,$,BL$,NO=,*N=,*K=$,$BL).
ITEMIZE,F,#L=L_BL_NR.
REVERT.
```

The procedure call (ITEM1 is on a global library file):

```
ITEM1, LIST,, BL, NR=NO.
```

starts parameter matching in order-dependent mode. The reverse slant in the procedure header switches parameter matching to order-independent mode. BL and NR are matched in order-independent mode. In order-independent mode you must specify all parameters in the form keyword=value, unless there is an *K entry in the parameter checklist. Then you can specify just the keyword as the parameter entry. Since *K is specified in the BL parameter checklist, the system accepts BL as a parameter entry. The NR parameter must be specified as NR=value or omitted.

After the substitution, the procedure body becomes

```
ITEMIZE, LIST, L=OUTPUT, BL, NR.
REVERT.
```
Jobs entering the system consist of one or more logical records. The first logical record contains system directives (commands) which describe the processing that is to occur in the job file. In interactive jobs, you enter the commands directly at the terminal. This section describes command processing and how the commands affect other aspects of job processing.

The operating system recognizes four types of commands.

- **Local File Commands**
  These commands call programs or procedures on files that are assigned to the job. The name of the command is simply the name of the file. LGO is an example. It is the system default local file used for retaining object code generated by one of the language processors.

- **Global Library File Commands**
  These commands call programs or procedures on files that have been specified in a LIBRARY command.

- **System Commands**
  These commands are divided into 10 categories.
  - Flow control commands
  - Job control commands
  - Special commands for interactive jobs
  - File management commands
  - Permanent file commands
  - Load and dump central memory commands
  - Tape management commands
  - System utility commands
  - Library utility commands
  - Loader commands†

- **Product Set Commands**
  The product set commands call the various products available under NOS. Their formats are given in the applicable product reference manual and in the NOS 2 Applications Programmer's Instant.

Since your executing programs can access the command record of your job, it is possible that they might manipulate items like user names and passwords. Hence, your executing programs can affect system security.

†Refer to the CYBER Loader Reference Manual.
COMMAND FORMAT

All commands consist of from one to four fields. The first field is optional. It is a $ or / prefix character which precedes the program name. If a $ is present, it indicates that the specified program to be executed must be loaded from the system library. Therefore, even if a local file of the same name is present or a program or procedure of the same name resides on one of your global library files, the system program, not the local program or global library program, is executed. In all interactive subsystems except the batch subsystem, the system places a $ in the first field of all commands. Even in the batch subsystem, the system places a $ in front of the file editing commands ALTER, DELETE, DUP, LIST, MOVE, READ, WRITE, and WRITEN.

If you use a slant in the first field of local file or global library file commands, the system processes the parameters in operating system format. For global library file commands, the presence of an NPC= entry point in the specified library also forces the system to process the parameters in operating system format (refer to Volume 4, Program Interface). Otherwise, the system processes local file and global library file commands in product set format.

The slant option is ignored for command calls to programs residing on the system library. For those types of calls, parameters are processed in the operating system format unless the SC directive of SYSEDIT has been entered. Refer to the SYSEDIT command in the NOS 2 System Maintenance Reference Manual for a description of the SC directive.

Example:

If file EXTRACT is a local file and you enter

```
/EXTRACT,A,B,10.
```

the system treats the file as a local file command. The parameters are processed in operating system format because of the leading slant.

The second field contains the name of the program to be executed. The command name can be any valid file name.

The third field (optional) contains parameters which further define the operation to be performed. The parameter field is set off from the name field by a separator character. A valid terminator character must follow the third field (or the second field if no parameters are present). In interactive jobs, the terminator is optional.

The fourth field consists of a comments field. The comments field follows the terminator. In general, the system ignores this field. However, some commands (MODIFY, FSE, GTR, LIBEDIT, and the like) read this comments field for directives.

In general, commands may not be continued beyond a single line. Exceptions are the execution control commands (described in section 6) and tape management commands (described in section 12).

Global library file commands containing an ARG= entry point (ARG= is described in Volume 4, Program Interface) are not required to follow either the operating system or product set format. The only syntax requirements enforced by the system for these commands is that the command name must be a valid file name followed by a separator. The command itself may have additional syntax requirements.

The following is a comparison of the operating system and product set formats (refer to the NOS 2 Applications Programmer's Instant for commands using the product set format).
Operating System Format

1. Valid separators are
   \[ + \ - \ " \ / \ = \ , \ ( \] 
   and any other character with a display code value greater than 44g except *
   ) \$ . and blank.

2. Valid terminators are
   . )

3. Letters, numbers, and the * are the only characters allowed in the parameter field. The one exception to this rule is the use of literals (that is, character strings delimited by dollar signs). Characters other than letters, numbers, and the * can be included in literals. No characters within a literal have special meanings; the system merely checks the syntax of the literal. The called program must do its own processing of the literal.

4. All embedded blanks within a command except those appearing in literals are ignored.

5. Comments may appear on the command but they must follow the terminator. They may contain any character. Comments are not printed for some commands.

6. Parameters, separators, and terminators are stored in the job's field length beginning at RA+2. The characters , , and ) are stored as binary zero. For all parameters and all valid separators except the comma, their display code equivalent is stored. Refer to section 10 of Volume 4, Program Interface, for more information.

Product Set Format

1. Same as for the operating system format.

2. Same as for the operating system format.

3. Same as for the operating system format.

4. Same as for the operating system format.

5. Same as for the operating system format.

6. Parameters are stored in their display code equivalent beginning at RA+2. Separators and terminators are stored as follows:

<table>
<thead>
<tr>
<th>Character</th>
<th>Code (Octal)</th>
</tr>
</thead>
<tbody>
<tr>
<td>,</td>
<td>1</td>
</tr>
<tr>
<td>=</td>
<td>2</td>
</tr>
<tr>
<td>/</td>
<td>3</td>
</tr>
<tr>
<td>(</td>
<td>4</td>
</tr>
<tr>
<td>+</td>
<td>5</td>
</tr>
<tr>
<td>-</td>
<td>6</td>
</tr>
</tbody>
</table>
Operating System Format | Product Set Format
--- | ---
Character | Code (Octal)

<p>| | | | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>;</td>
<td>10</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>) or .</td>
<td>17</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Other valid separators</td>
<td>16</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Refer to section 10 of Volume 4, Program Interface, for more information.

7. File names are one to seven alphanumeric characters.

8. Not NOS/BE compatible.

In general, no parameter can contain more than seven characters. The exceptions include procedure calls, flow control commands, some tape management commands and system or global library file commands with an ARG= entry point.

Depending on the program, the parameters can appear in either order-dependent or order-independent format. Order-dependent parameters are required when the parameters must be passed in a specific order. An example of order-dependent parameters is:

```
RESEQ,MYFILE,B,,20.
```

In this example, the system expects the resequencing increment to be passed as the fourth parameter; therefore, a separator must be present for the parameter not specified.

Order-independent parameters may be passed in any order. This is made possible by the use of keywords. A keyword is an identifier which has meaning either by itself or when used in conjunction with an option. Usually, keywords are passed with an option and a separator. The separator must not be a comma. When the list of parameters is passed to the called program, all separators except commas are also passed.

Some programs require specific separators (usually =), and others merely require that a separator be present. Examples of keyword notation are:

1. COBOL5,I=SFILE,B=BFILE.
2. COBOL5,B=BFILE,I=SFILE.
3. COBOL5,L=0,E,EL.
4. JOBX,T10,CM45000.

In examples 1 and 2, both parameters and separators are passed to the COBOL 5 compiler. Since these parameters are order independent, both commands produce the same result.

In example 3, two keywords are passed with no separator character. In example 4, the keyword is the first character of the first parameter and the first two characters of the second parameter.
The parameters and an image of the command being processed are written in the job communication area (refer to section 10 of volume 4). The job communication area is the first 1000 words of your job's field length, from RA through RA+778. Section 1 and appendix B in Volume 4, Program Interface, describe this area.

The following commands produce the same image in the job communication area. Both commands are processed using operating system format.

```
PERMIT,FILEABC,USERAAA=R,USERBBB=W.
$PERMIT,FILEABC,USERAAA=R,USERBBB=W.
```

**COMMAND PROCESSING FLOW**

The system translates a command by the following steps (figure 5-1 shows the processing flow).

1. Reads the command from the job's command record or interactive terminal.
2. Verifies the format of the command as described in Command Format.
3. If the command is from an interactive terminal, the system compares the command with the list of special interactive command names. (See section 8 for a list of these commands.) If the command name is in this list, the command is processed by IAF.
4. Compares the specified command names with the list of command names. If the command name is CTIME, HTIME, RTIME, *, or STIME, the system processes the command.
5. Searches the job's file name table (FNT) for a file assigned to the job with a name identical to the name of the command. However, if a $ precedes the program name, this step is skipped. If an identical name is found, the program is loaded into memory. The arguments are extracted from the command and stored in RA+2 through RA+n+1 (n is the number of parameters) unless the command is a system or global library file command with an ARG= entry point. The CPU is requested to begin execution unless special loader commands follow.
6. Searches the global library directory for a program name that matches the command name. If a $ precedes the command name, this step is skipped. If the program is found, the system proceeds as in step 5; otherwise, the system searches further.
7. Searches the central library directory (CPU library) for a program name that matches the command name. If the name is found, the system proceeds as in step 4; otherwise, the system searches further.
8. If the command name is a three-character name with the first character alphabetic, and if there are no more than two parameters (each of which is an octal number), the system searches the peripheral processor library directory (PP library) for a program name that matches the command name. If found, the name is placed as a peripheral processor request.
9. If the system does not find the command name during any of the searches, it declares the command invalid and aborts the job.

**NOTE**

A command is normally echoed to the dayfile except for system commands or global library commands containing an SDM= entry point in the entry point list.
Figure 5-1. NOS Command Processing Flow
EXIT PROCESSING

When an error condition occurs during a job, the system searches the command record for an EXIT command. If the record does not contain an EXIT command, the system terminates the job if the job is not interactive or returns control to the terminal if the job is interactive. If the system finds an EXIT command, it clears the error condition and processes the commands that follow the EXIT command. If the error was a time limit error, the limit is reset to the time used plus eight seconds. This gives you time for post-error cleanup operations. If the error was an SRU limit error, the limit is reset to the SRUs used plus eight SRUs.

If a NOEXIT command has been processed, normal error processing is not performed. That is, if the no exit flag has been set by the NOEXIT command prior to the error, the error flag is cleared, no search is made for an EXIT command, and processing continues with the next command. An ONEXIT command can be used to return to error processing mode; it clears the no exit flag.

The following sequence of commands illustrates this exit processing.

```
JOBCCC.
USER,SMITH22,SMA1.
NOEXIT.
GET,A,B.
ONEXIT.
ATTACH,MASTER/M=W.
SKIPEI,MASTER.
COPYBF,A,MASTER.
COPYBF,B,MASTER.
PACK,MASTER.
COPYBSBF,MASTER.
EXIT.
ENQUIRE,F.
-EOR-  
-EOI-
```

This job attempts to make local copies of two indirect access permanent files and adds them to a direct access file. The NOEXIT command suspends error processing, and the job continues even if file A or B is not found. The ONEXIT command turns error processing back on. If any error occurs thereafter, processing skips to the EXIT command and continues with the ENQUIRE command. If no error occurs after the ONEXIT command, processing continues until reaching the EXIT command and then the job terminates (ENQUIRE command is not processed).

†After a security conflict, the system does not always allow EXIT processing. Refer to Security Features in section 3.
Flow control commands control the processing sequence of commands within the command record of a job. They can insert commands from a procedure file, conditionally or unconditionally skip commands, and control error processing. To determine the conditions for transfer of control, you can use error flags, file attributes, or other job attributes. The flow control commands and a brief description of each appear in the following list:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN</td>
<td>Initiates processing of a procedure.†</td>
</tr>
<tr>
<td>DISPLAY</td>
<td>Evaluates an expression and displays the result in the dayfile of the job.</td>
</tr>
<tr>
<td>ELSE</td>
<td>Terminates skipping initiated by a false expression within an IF command or initiates skipping to a matching ENDF command.</td>
</tr>
<tr>
<td>ENDF</td>
<td>Terminates skipping initiated by a matching IF, SKIP, or ELSE command.</td>
</tr>
<tr>
<td>ENDW</td>
<td>Establishes the end of the loop.</td>
</tr>
<tr>
<td>EXIT</td>
<td>Controls the command flow in the event of errors.</td>
</tr>
<tr>
<td>IF (or IFE)</td>
<td>Conditionally skips one or more commands.</td>
</tr>
<tr>
<td>MODE</td>
<td>Specifies the type of errors the system recognizes for EXIT processing.</td>
</tr>
<tr>
<td>NOEXIT</td>
<td>Disables EXIT error processing.</td>
</tr>
<tr>
<td>ONEXIT</td>
<td>Enables EXIT error processing.</td>
</tr>
<tr>
<td>REVERT</td>
<td>Returns processing from a procedure to the command record of procedure that called it.</td>
</tr>
<tr>
<td>SET</td>
<td>Assigns values to special symbolic names.</td>
</tr>
<tr>
<td>SKIP</td>
<td>Skips to the first matching ENDF command.</td>
</tr>
<tr>
<td>WHILE</td>
<td>Establishes the beginning of a loop. If the associated expression is true, the loop is processed; if it is false, the loop is not processed.</td>
</tr>
</tbody>
</table>

† Section 4 contains a detailed description of this command.
COMMAND SYNTAX

The syntax for these commands is similar to the syntax of all other commands as described in section 5. However, these are some significant differences.

- Functions, arithmetic expressions, relational expressions, and logical expressions can appear in parameters of certain commands.

- A right parenthesis ending an expression within a command cannot also serve as the command terminator. You must include an additional right parenthesis or period to terminate the command.

- Parentheses can nest expressions within expressions.

- A parameter can consist of more than seven characters.

- A command can be longer than 80 characters if its parameter specifications require such. It can extend over more than one line if each line to be continued contains no more than 80 characters and ends with a separator.

The following subsections describe the command syntax, including the operators, operands, and functions which make up valid expressions. Following that is a discussion of each command.

OPERATORS

Operators separate operands in an expression. There are four types of operators: arithmetic, relational, logical, and string. Operators are used in the expressions within the IF, WHILE, DISPLAY, and SET commands and the FILE, STR, STRB, and STRD functions.

ARITHMETIC OPERATORS

Integer arithmetic is used in each step of the evaluation of an expression. Division, multiplication, and exponentiation produce a zero result if the absolute value exceeds \(2^{16}-1\). The accuracy of computations depends on whether the operands are binary or decimal. Binary operands (specified using a postradix of B) are restricted to 9 digits not including the postradix; results involving binary operands are restricted to 16 digits. Decimal operands and displayed decimal results are restricted to 10 digits (the system interprets each digit as a 6-bit quantity). For both binary and decimal operands, overflow is ignored.†

†If an operand is one of the symbolic names R1, R2, R3, or R1G, there are further restrictions. Refer to the SET command in this section.
The following are the arithmetic operators.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Addition.</td>
</tr>
<tr>
<td>-</td>
<td>Subtraction.</td>
</tr>
<tr>
<td>*</td>
<td>Multiplication.</td>
</tr>
<tr>
<td>/</td>
<td>Division.</td>
</tr>
<tr>
<td>**</td>
<td>Exponentiation.</td>
</tr>
<tr>
<td>Leading -</td>
<td>Negation. This operator may be used to obtain a one's complement.</td>
</tr>
<tr>
<td>Leading +</td>
<td>Ignored.</td>
</tr>
</tbody>
</table>

**RELATIONAL OPERATORS**

A relational operator produces a value of 1 if the relationship is true, and 0 if it is false. The following are the relational operators (either form may be used).

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>.EQ. Equal to.</td>
</tr>
<tr>
<td>#</td>
<td>.NE. Not equal to.</td>
</tr>
<tr>
<td>&lt;</td>
<td>.LT. Less than.</td>
</tr>
<tr>
<td>&gt;</td>
<td>.GT. Greater than.</td>
</tr>
<tr>
<td>&lt;=</td>
<td>.LE. Less than or equal to.</td>
</tr>
<tr>
<td>&gt;=</td>
<td>.GE. Greater than or equal to.</td>
</tr>
</tbody>
</table>
LOGICAL OPERATORS

When an expression contains a logical operator, the system evaluates all bits of each operand. Each bit of the first operand is compared to the corresponding bit of the second operand. If the comparison is true, the corresponding bit in the result is set to 1. If the comparison is false, the corresponding bit in the result is set to 0. The operator .NOT. is a special case, operating on a single operand. If the operand is nonzero, the corresponding bit is set to 0. If the operand is 0, the corresponding bit is set to 1.

If neither of the operands in a logical operation is a string operand, the result of a logical operation is a 60-bit quantity. If one or both is a string operand, the result of the logical operation is a string whose length depends upon the result of the operation. The shorter of the two strings is logically extended with binary zero-fill to the length of the longer string for the logical operation, and trailing binary zero characters are truncated from the result string.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>.EQV.</td>
<td>Equivalence (complement of the logical sum).</td>
</tr>
<tr>
<td>.OR.</td>
<td>Inclusive OR (logical sum).</td>
</tr>
<tr>
<td>.AND.</td>
<td>AND (logical product).</td>
</tr>
<tr>
<td>.XOR.</td>
<td>Exclusive OR (logical difference).</td>
</tr>
<tr>
<td>.NOT.</td>
<td>NOT.</td>
</tr>
</tbody>
</table>

STRING OPERATORS

String operators operate on string operands. A string operand is the result of one of the functions STR, STRB, STRD, or of a logical operation involving one or more string operands.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>//</td>
<td>Concatenation of two strings into one string. (Either // or .CAT. may be used.)</td>
</tr>
</tbody>
</table>

Example:

```
.PROC,CATTER*I,P1=(A),P2=(S3/D).
.IF,STR(P1$,-1)/STRD(P2,-1),EQ.STR($GOOD1$),GO.
  NOTE,THE 1ST 4 CHAR OF P1 ARE GOOD AND P2 ENDS IN 1
  ELSE,GO.
  REVERT,EX.DISPLAY,STR($SORY, P1 IS NOT GOOD$).
.ENDIF,GO.
```

In this example, two substrings were concatenated to produce one string in the .IF expression. If GOODY and 101 were supplied as values for P1 and P2, the .IF statement would be true, and the NOTE command would be included and executed. If BADNEWS were substituted for P1, the .IF statement would be false, resulting in the execution of the REVERT command and then of the DISPLAY command.
ORDER OF EVALUATION

The order in which operators in an expression are evaluated is:

1. Exponentiation.
2. Multiplication, division.
3. Addition, subtraction, negation, concatenation.
4. Relations.
5. NOT.
6. AND.
7. Inclusive OR.
8. Exclusive OR, equivalence.

Operators of equal order are evaluated from left to right.

OPERANDS

One or more operands separated by operators make up an expression. Expressions are used within the IF, WHILE, DISPLAY, and SET commands. An expression within an expression must begin with a left parenthesis and end with a right parenthesis. There is no limit on the length of an expression, except that a period or a right parenthesis (not acting as a command terminator) must appear within the first 50 operands. Expressions can contain operands of one or more types. There are three types of operands: constants, symbolic names, and functions.

CONSTANTS

A constant is a string of 1 to 10 characters that the system processes as an integer. The constant can be a numeric string or a literal.

Numeric Strings

Each character in the string must be a digit (0 through 9), except the final character. The final character can be a postradix of D or B to indicate the number base of the constant. A postradix of B denotes an octal integer. D or an omitted postradix denotes a decimal integer.

Literals

A literal is a $-delimited string of characters or a string containing a $-delimited string. The literal can be a null string ($$$). The maximum length for a literal is 10 characters, unless it appears within the STR function, in which case it may be any length up to the maximum length of the line.
Special characters can appear in literals but they must appear in the $-delimited portion of the string. To represent a dollar sign within a literal, you must use double dollar signs.

<table>
<thead>
<tr>
<th>Valid Literal</th>
<th>Invalid Literals</th>
</tr>
</thead>
<tbody>
<tr>
<td>$LITERAL$</td>
<td>LITERAL1</td>
</tr>
<tr>
<td>$5LITERAL$</td>
<td>$LITERAL2</td>
</tr>
<tr>
<td>$*LITERAL$</td>
<td>LITERAL3$</td>
</tr>
<tr>
<td>$$SLITERAL$$</td>
<td>*SLITERAL$</td>
</tr>
<tr>
<td>$$$$</td>
<td>$$*LITERAL$$</td>
</tr>
<tr>
<td>$$LITERAL$$</td>
<td>$$$</td>
</tr>
</tbody>
</table>

When a literal appears as an operand in a command, a function, or an expression, the system processes it as an integer whose value is equal to the display code representation of the literal value rather than as a character string.

A non-numeric string that appears in an expression to be evaluated must be entered as a literal; otherwise, the system treats it as an erroneous symbolic name.

Example.

```
/IF,AF ILE.EQ.AF ILE,LAB EL.
CCL157- UNKNOWN NAME - AF ILE
```

The above command will execute successfully if the file names are entered as literals (that is, as integer values):

```
/IF,$AFILE$. EQ. $AFILE$, LABEL.
```

When you instruct the system to display or compare the value of a literal string, the system right-justifies the display code value of the string and treats it as a numeric value. If the string is the result of the STR, STRB, or STRD function, it is left-justified and treated as a character string. As a result of this different treatment, a literal string within the STR function does not compare equally with the same literal string outside the STR function. In other words, STR($ABC$) is not equal to $ABC$.

Example:

```
/display,$lit$
  49748  1411248
/display,$a$
  1  1B
/display,1
  1  1B
/display,$1$
  28  348
/display,$$$$
  43  538
/display,literal
CCL157- UNKNOWN NAME - LITERAL
/display,STR(STR(REALLY A STRING$)).
REALLY A STRING
```
As noted in the previous example (DISPLAY,LITERAL), nonnumeric strings that are not $-delimited cannot appear as operands. If they appear as such, the system treats them as erroneous symbolic names. You can, however, use such strings as parameter values for procedures.

**SYMBOLIC NAMES**

A symbolic name is a system-defined string of characters to which the system or you can assign a value. The symbolic names represent job or system attributes. You can ascertain and sometimes change these attributes by using these symbolic names (refer to the various commands and functions described later in this section).

Most symbolic names have an initial value of zero. The exceptions are shown in the following list:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>

</table>

- Symbolic names with fixed values that can be compared with the error flag value (EF or EFG) within an expression. These values correspond to error code values. In an expression, you can check the error flag (EF) for a nonzero value. A nonzero value indicates an error, and a zero value indicates no error. For detailed error examination, you can compare EF with a particular symbolic name or its error code value. You are encouraged to use the symbolic name, because the numeric values can change in future releases of NOS. The following list contains the errors that allow exit processing.

</tbody>
</table>

FUNCTIONS

Functions are used as expressions or operands within expressions in commands. Functions are not commands. The functions are FILE, DT, LEN, LVL, NUM, STR, STRB, and STRD.

FILE Function

The FILE function determines whether a local file has a specified attribute. The system returns a value of 1 (true) or 0 (false) depending upon whether the file has or does not have the specified attributes. Only the equipment number (EQ) and file size (FS) attributes can return values other than 1 or 0. The list of file attributes follows the description of the FILE function format.

The FILE function must be used as an expression or as a part of an expression in a command. A left parenthesis must appear before the file name, a comma must appear between the file name and the expression, and a right parenthesis must appear after the expression.
**Format:**

```
FILE(lfn,expression)
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Name of the local file for which attributes are being determined.</td>
</tr>
<tr>
<td>expression</td>
<td>Either a special FILE function attribute or an expression, consisting of logical operators and special FILE function attributes. The expression must be appropriate for the command in which the FILE function appears. If the FILE function is part of an IF command or .IF directive, the expression should be one that can be evaluated as true or false. If the FILE function is part of the DISPLAY command, the expression could have a numeric value other than a true or false value. The expression within a FILE function cannot include the NUM function, the symbolic name SS, or another FILE function. The DT function or the following symbolic names can be used within the expression.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP</td>
<td>File has append permission.</td>
</tr>
<tr>
<td>AS</td>
<td>File is assigned or attached to your job.</td>
</tr>
<tr>
<td>BOI</td>
<td>File is positioned at BOI. This is effective only for a file on mass storage.</td>
</tr>
<tr>
<td>EOF</td>
<td>Last operation was a forward operation, which encountered an EOF and is now positioned at that EOF. This is effective only for a file on mass storage.</td>
</tr>
<tr>
<td>EOI</td>
<td>Last operation was a forward operation, which encountered an EOI and is now positioned at that EOI. This is effective only for a file on mass storage.</td>
</tr>
<tr>
<td>EQ</td>
<td>EST ordinal of the equipment on which the file resides. If the file is not assigned to a device, it has an EST ordinal of zero.</td>
</tr>
<tr>
<td>EX</td>
<td>File has execute permission.</td>
</tr>
<tr>
<td>FS</td>
<td>File size in PRUs.</td>
</tr>
<tr>
<td>GL</td>
<td>File is a global library.</td>

<tr>
<td>IN</td>
<td>File type is input.</td>
</tr>
<tr>
<td>LB</td>
<td>File is on a labeled tape.</td>
</tr>
<tr>
<td>LI</td>
<td>File is a system library file.</td>
</tr>
</tbody>
</table>
**Parameter** | **Description**
--- | ---
LO | File type is local.
MD | File has modify permission.
MS | File is on mass storage.
OP | File is opened.
PM | File is an attached direct access permanent file.
PT | File type is primary.
QF | File type is queued.
RA | File has read append permission.
RD | File has read permission.
RM | File has read modify permission.
RU | File has read update permission.
TP | File is on magnetic tape.
TT | File is assigned to a terminal.
UP | File has update permission.
WR | File has write permission.
ZL | File has zero length.

Any other symbolic name within the expression is treated either as an implicit DT function (refer to DT Function, which follows) or as an unidentified variable.

**Example:**

The following job segment shows the FILE function being used inside an IF command. The FILE function determines if file ACCT is not at the beginning-of-information (BOI). If ACCT is not at BOI, the IF command is true and the system rewinds ACCT before copying it onto ITEM. If ACCT is at BOI, the IF command is false and the system skips to the ENDIF command and copies ACCT onto ITEM. In both cases, ACCT is copied to ITEM and is replaced.

```
IF, FILE (ACCT, .NOT.BOI), LABEL1.
REWIND, ACCT.
ENDIF, LABEL1.
COPY, ACCT, ITEM.
REPLACE, ITEM.
```

**DT Function**

The DT function determines the device type on which a file resides. DT can be used only within a FILE function. The value of the DT function is true if the two-character mnemonic included in the function is equal to the two-character device type. The operating system defines the mnemonics.

6-14 60459680 K
**Format:**

```plaintext
FILE(lfn,DT(dt))
```

<table>
<thead>
<tr>
<th>Parameter</th>

<tr>
<td>TT</td>
<td>Interactive terminal.</td>
</tr>
</tbody>
</table>
Example:

The following dayfile segment shows that TAXES is on a nine-track magnetic tape, so it is
 copied to output and then unloaded. If the DT function was false, TAXES would be unloaded
 without being copied.

14.00.45.IF,FILE(TAXES,DT(NT)),LABL1.
14.00.46.COPY,TAXES,OUTPUT.
14.00.46.EOI ENCOUNTERED.
14.00.46.ENDIF,LABL1.
14.00.46.UNLOAD,TAXES.

LEN Function

The LEN function returns the length of a specified string.

Format:

LEN(string)

Parameter Description
string A string of any length up to the maximum length of a line. If the
 string is a literal, the length returned is the length of the string
 after the removal of the surrounding dollar signs ($) and of any extra
 dollar signs within the string.

LVL Function

The LVL function returns the PSR level (or equivalent) for the NOS operating system or the
 CYBER Control Language.

Format:

LVL(name)

Parameter Description
name Specifies one of the following symbolic values:

<table>
<thead>
<tr>
<th>name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS</td>
<td>Network Operating System</td>
</tr>
<tr>
<td>NOS</td>
<td>Network Operating System</td>
</tr>
<tr>
<td>CCL</td>
<td>CYBER Control Language, the set of commands that determines the processing sequence within the command record</td>
</tr>
</tbody>
</table>

Default is SYS. Symbols for other operating systems that use the CYBER Control Language are recognized, but return a value of zero.
NUM Function

The NUM function determines whether a character string is numeric. It evaluates the character string as true (1) if it is numeric or false (0) if it is not. NUM must be used as an expression or as part of an expression.

Format:

\[ \text{NUM(string)} \]

Parameter Description
---
string A string of 1 to 40 characters. If the string contains one or more special characters, it must be delimited by dollar signs (for example, $***$). If delimited by dollar signs, the string is always evaluated as non-numeric.

Example:

The following procedure uses the NUM function to ensure that the passed parameter, NUMBER, is numeric. If a non-numeric value is passed, the procedure terminates with an appropriate message.

```plaintext
.PROC,PROC1*I,NUMBER.
.IF,NUM(NUMBER),QUIT.
.WHILE,R1.LE.NUMBER,LOOP.
.SET,R1=R1+1.
.WHILE,R1.LE.NUMBER,LOOP.
.ENDW,LOOP.
.REVERT. PROCESSING COMPLETED
.ENDIF,QUIT.
.REVERT,ABORT. NONNUMERIC PASSED
```

STR Function

The STR function produces a left-justified string of any length up to the maximum line length. The STR function makes it possible to manipulate character strings greater than 10 characters in length. An STR function result may be compared or combined with the results of STRB, STRD or other STR functions in a variety of ways.

Format:

\[ \text{STR(strexp,lc,rc)} \]

Parameter Description
---
strexp May be any legal expression, usually but not necessarily a literal. Literals are left-justified, and may be any length up to the maximum line length. Nonliteral values are treated normally during evaluation of the expression. However, a numeric result will be left-justified and treated as a string.

lc Must be an expression producing a numeric result, either positive or negative. lc indicates which character of strexp is to be the leftmost character of the string produced by STR, counting from the left if lc is positive or from the right if negative. A value of zero or a negative value which exceeds the length of strexp is treated as equivalent to 1. A positive value greater than the length of strexp produces a null string. lc may be omitted if it would reference the leftmost character of strexp and if rc is also omitted. (The preceding comma must also be omitted when lc is omitted.)
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rc</td>
<td>Must be an expression producing a numeric result, either positive or negative. rc indicates which character of strexp is to be the rightmost character of the string produced by STR, counting from the left if rc is positive or from the right if negative. A positive value greater than the length of strexp is considered equal to the length. A value of zero or a negative value which exceeds the length of strexp produces a null string. rc may be omitted if it would reference the rightmost character of strexp. (The preceding comma must also be omitted when rc is omitted.)</td>
</tr>
</tbody>
</table>

In summary, lc and rc both reference the string strexp in the same way: a positive value of n indicates the nth character of strexp counting from the leftmost character, 1 meaning the first character. A negative value of −n indicates the nth character of strexp counting from the rightmost character, −1 meaning the last character.

Example:
The following expressions all produce the same result, the string $ABET$.

```
STR($ALPHABETAGS,5,-3)
STR($ALPHABETAGS,-6,8)
STR($ALPHABETS,5)
```

**STRB Function**

The STRB function produces a left-justified string of 1 to 17 characters representing the octal value of a specified expression.

**Format:**

```
STRB(numexp,lc,rc)
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numexp</td>
<td>May be any legal expression, usually but not necessarily numeric. If numexp is or contains a literal, the literal is limited to no more than 10 characters and is right-justified and binary-zero filled for evaluation. The result produced by numexp is treated as a one-word signed value and is converted to a character string in octal. For example, the decimal value 25 for numexp would result in the string $31$.</td>
</tr>
<tr>
<td>lc</td>
<td>Specifies which character of numexp is to be the leftmost in the resulting string. For further explanation of this parameter, refer to the description of the STR function.</td>
</tr>
<tr>
<td>rc</td>
<td>Specifies which character of numexp is to be the rightmost in the resulting string. For further explanation of this parameter, refer to the description of the STR function.</td>
</tr>
</tbody>
</table>

Example:

Each of the following expressions produces the string $102$.

```
STRB($SABC','-5,-3)
STRB(102038,-5,-3)
```
STRD Function

The STRD function produces a left-justified string of 1 to 16 characters representing the decimal value of a specified expression.

Format:

```
STRD(numexp,lc,rc)
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| numexp    | May be any legal expression, usually but not necessarily numeric. If numexp is or contains a literal, the literal is limited to no more than 10 characters and is right-justified and binary-zero filled for evaluation. The result produced by numexp is treated as a one-word signed value, and is converted to a character string in decimal. For example, the decimal value 25 for numexp would result in the string $25$.
| lc        | Specifies which character of numexp is to be the leftmost in the resulting string. For further explanation of this parameter, refer to the description of the STR function. |
| rc        | Specifies which character of numexp is to be the rightmost in the resulting string. For further explanation of this parameter, refer to the description of the STR function. |

Example:

The following expression produces a string of $0012$.

```
STRD(10000+36/3,-4).
```

COMMAND DESCRIPTIONS

Individual descriptions of the commands follow in alphabetic order.

BEGIN COMMAND

Refer to Calling a Procedure in section 4.
DISPLAY COMMAND

The DISPLAY command evaluates an expression and sends the result to the job dayfile in both decimal and octal integer form or in character string form, depending on the expression. (If the expression is an STR, STRB, or STRD function or a concatenation thereof, the resulting string is displayed as a character string; otherwise, the decimal and octal integer format is used.) The largest decimal value which can be displayed is 10 digits. If the value is larger than 10 digits, GT followed by 9999999999 is displayed. If the value is negative and larger than 10 digits, LT followed by a minus and 9999999999 is displayed. In octal code, numbers as large as 16 digits can be displayed. For an expression larger than $2^{48}-1$, zeros are displayed.

Format:

```
DISPLAY,expression1,expression2,...,expressionn.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression1</td>
<td>Specifies any valid symbolic name or expression described earlier in this section.</td>
</tr>
</tbody>
</table>

Example:

The following sample dayfile shows several display operations.

```
12.53.18. DISPLAY,TIME.
12.53.18. 1253  2345B.
12.53.27. SET,R1,=99.
12.53.40. SET,R2,=901.
12.54.05. DISPLAY,R1.
12.54.05. 99  143B.
12.54.16. DISPLAY,R1+R2.
12.54.16. 1000  1750B.
12.55.09. DISPLAY,STR(SNOW IS THE TIMES).
12.55.09. NOW IS THE TIME.
12.56.10. DISPLAY,STRB(R1+R2).  
12.56.10. 1750B.
12.56.26. DISPLAY,STRD(R1+R2).  
12.56.26. 1000B.
12.58.26. DISPLAY,STRB(R1+R2)//STR($BB IS EQUAL TO $)/STRD(R1+R2).  
12.58.26. 1750B IS EQUAL TO 1000.
13.01.32. DISPLAY,STR(STRING,4,6)/STR($RINGER$,2,4).
13.01.32. STRING.
13.01.53. DISPLAY,3/2.
13.01.53. 1  1B
13.02.07. DISPLAY,2**47.
13.02.07. GT  9999999999999999B.
13.02.24. DISPLAY,-2**47.
13.02.24. LT  -9999999999999999B.
13.02.38. DISPLAY,2**48.
13.02.38. 0  0B.
13.03.28. DISPLAY,9999999999999999.
13.05.28. CCL156- STRING TOO LONG - 9999999999999999
```
The first DISPLAY command displays the value of the symbolic name TIME. The current time
given is in the form hhmm. The next six lines demonstrate the use of the R1 and R2 symbolic
names. The next 10 lines illustrate the use of the STR, STRB, and STRD functions for
generating display character strings. The other DISPLAY commands specify numeric
expressions. The integer constant in the final DISPLAY command has more than 10 digits,
resulting in an error message.

ELSE COMMAND

The ELSE command performs one of the following functions.

- It terminates skipping initiated by a false IF command whose label string matches
  that of the ELSE command. If the label string does not match, the ELSE command is
  skipped.

- It initiates skipping from the ELSE command to the ENDIF command whose label string
  matches that of the ELSE command. This happens for a true IF command.

Neither a SKIP nor an ELSE command terminates skipping initiated by another SKIP or ELSE
command.

Format:

ELSE,label.

Parameter Description
label Specifies a 0- to 10-character alphanumeric string. The string must
      begin with an alphabetic character.

Example:

The following commands use the FILE function to determine if a file named TEST1 is local to
the job. If the file is local, it is copied to the OUTPUT file. If it is not, it is
assumed to be an indirect access permanent file, and a local copy is obtained and copied to
OUTPUT.
If the file is local, each succeeding command, up to the ELSE command, is processed, and the ELSE command initiates a skip to the ENDIF command. If the file is not local, control skips to the ELSE command, and each command succeeding the ELSE command is processed.

```
IF,FILE(TEST1,L0),LABEL1.
COPYSBF,TEST1,OUTPUT.
ELSE,Label1.
GET,TEST1.
COPYSBF,TEST1,OUTPUT.
ENDIF,Label1.
```

The following dayfile segment results when the preceding commands are processed and TEST1 is not initially a local file.

```
11.33.00.IF,FILE(TEST1,L0),LABEL1.
11.33.00ELSE,Label1.
11.33.00.GET,TEST1.
11.33.00.COPYSBF,TEST1,OUTPUT.
11.33.01.END OF INFORMATION ENCOUNTERED.
11.33.01.ENDIF,Label1.
```

The following dayfile segment results when the preceding commands are processed and TEST1 is initially a local file.

```
15.40.19.IF,FILE(TEST1,L0),LABEL1.
15.40.19.GET,TEST1.
15.40.21.END OF INFORMATION ENCOUNTERED.
15.40.21.ENDIF,Label1.
```

**ENDIF COMMAND**

The ENDIF command terminates skipping initiated by a SKIP, IF, or ELSE command. In all cases, the label string on the ENDIF command must match the label string on the command that initiates the skipping. If the system encounters an ENDIF command with a nonmatching label string, it ignores that command.

**Format:**

```
ENDIF,label.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Specifies a 0- to 10-character alphanumeric string. The string must begin with an alphabetic character.</td>
</tr>
</tbody>
</table>
Example:

When the SKIP command in the following sequence of commands is processed, control skips to ENDIF, and none of the commands between SKIP and ENDIF are processed.

```
SKIP, LABEL1.
  
  commands
  
ENDIF, LABEL1.
```

ENDW COMMAND

The ENDW command identifies the end of the WHILE command loop. A command loop is a sequence of commands that may be repeatedly processed. The number of times the loop is processed depends on the evaluation of the expression specified in the WHILE command that begins the loop.

The ENDW command must have a label string that matches the label string specified in the WHILE command that begins the loop.

Format:

```
ENDW, label.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Specifies a 0- to 10-character alphanumeric string. The string must begin with an alphabetic character.</td>
</tr>
</tbody>
</table>

Refer to WHILE Command in this section for an example of ENDW command use.

EXIT COMMAND

The EXIT command indicates the position in the command record where processing will resume if an error is encountered prior to the EXIT command. If no error is encountered, the EXIT command indicates where to terminate normal command processing.

When used in procedures, we recommend that the EXIT command be preceded by a SKIP or REVERT command to prevent execution of the EXIT command in the case where no error occurs. An EXIT command executed in this way terminates the executing procedure as well as all calling procedures if nesting has occurred, but does not restore control registers to their previous values.

Format:

```
EXIT.
```

For additional information, refer to the description of the NOEXIT and ONEXIT commands later in this section and to the description of exit processing in section 5.
IF (OR IFE) COMMAND

The IF command conditionally skips one or more commands.

Formats:

IF,expression.command.
IF,expression,label.

Parameter   Description
expression   Specifies an expression that is either true or false. The separator following expression in the first format must be a terminator.
command     Specifies a valid command.
label       Specifies a 0- to 10-character alphanumeric string. The string must begin with an alphabetic character. An identical string must appear in a subsequent ELSE or ENDIF command.

The first format conditionally skips only the command specified within the IF command. If expression is true, the system executes the specified command. If expression is false, the system skips the command.

**NOTE**

When using the first format (IF,expression.command.), values for .command. that match a relational, logical, or string operator (such as .EQ. or .OR.) are interpreted as operators, causing the procedure to abort. To write a valid IF command when .command. matches an operator, terminate the expression or command with a right parenthesis instead of a period.

The second format conditionally skips all commands between the IF command and the first matching ELSE or ENDIF command (two commands match if their label parameters are identical). If expression is true, the system executes all commands between the IF and the matching ELSE or ENDIF. If expression is false, the system skips all intervening commands.

Example 1:

The following commands initiate the compilation and execution of a FORTRAN program and then test for any errors during execution. If an error was made, the error code is displayed.

```
FTN5,I=IFTTEST.
SET,EF=0. INITIALIZE ERROR FLAG
NOEXIT.
LGO.
ONEXIT.
IF,EF.NE.0.DISPLAY,EF.
```

If the job step executes without error, the error flag (EF) is 0. In this case, the DISPLAY command is not executed. If an error occurs, the error flag is not 0, expression is true, and control passes to the DISPLAY command. The system then displays the error code in the error flag register. (The NOEXIT and ONEXIT commands are described later in this section.)
In the following example, the FORTRAN program FTNPROG attempts to call a subroutine BETA which does not exist (outside the field length of the job). The commands that are used appear first and the dayfile segment follows.

```
FTN5,I=FTNPROG.
SET,EF=0. INITIALIZE ERROR FLAG
NOEXIT.
LGO.
ONEXIT.
IF,EF.NE.0.DISPLAY,EF.
```

```
12.57.02.FTN5,I=FTNPROG.
12.57.02. 61000 CM STORAGE USED.
12.57.02. 0.009 CP SECONDS COMPILATION TIME.
12.57.02.SET,EF=0. INITIALIZE ERROR FLAG
12.57.02.NOEXIT.
12.57.02.LGO.
12.57.03. NON-FATAL LOADER ERRORS -
12.57.03. UNSATISFIED EXTERNAL REF -- BETA
12.57.03. MODE ERROR.
12.57.03. JOB REPRIEVED.
12.57.03. UNSATISFIED EXT IN FLAG NEAR LINE 2
12.57.03. 7500 MAXIMUM EXECUTION FL.
12.57.03. 0.000 CP SECONDS EXECUTION TIME.
12.57.03. RPV - PREVIOUS ERROR CONDITIONS RESET.
12.57.03. CPU ERROR EXIT AT 400121.
12.57.03. CM OUT OF RANGE.
12.57.03.ONEXIT.
12.57.04.IF,EF.NE.0.DISPLAY,EF.
12.57.04.DISPLAY,EF.
```

Example 2:

The following procedure file is an indirect access file called COLORPR. It uses the IF command to determine if the color the BEGIN command substituted for COLOR is red or blue. Different processing is done for the colors red and blue. Any other color is ignored. The # character in the comment line inhibits substitution for the word (COLOR) it precedes (refer to Parameters and the Procedure Body in section 4).

```
.PROC,A*I,COLOR.
IF,SCOLORS.EQ.$RED$,L1.
COMMENT. PROCESSING DONE FOR #COLOR OF COLOR
REVERT.
ENDIF,L1.
IF,SCOLORS.EQ.$BLUE$,L2.
COMMENT. PROCESSING DONE FOR #COLOR OF COLOR
REVERT.
ENDIF,L2.
COMMENT. NO PROCESSING FOR #COLOR OF COLOR
```

60459680 F
The following commands call procedure A.

```
BEGIN,A,COLORPR,BLUE.
BEGIN,A,COLORPR,RED.
BEGIN,A,COLORPR,PINK.
```

The following dayfile segment results when the preceding commands are processed. It shows the effect of the # character.

```
08.34.30.BEGIN,A,COLORPR,BLUE.
08.34.32.IF,$BLUE$.EQ.$RED$,L1.
08.34.32.ENDIF,L1.
08.34.32.IF,$BLUE$.EQ.$BLUE$,L2.
08.34.32.COMMENT . PROCESSING DONE FOR COLOR OF BLUE
08.34.32.REVERT.
08.34.33.BEGIN,A,COLORPR,RED.
08.34.34.IF,$RED$.EQ.$RED$,L1.
08.34.34.COMMENT . PROCESSING DONE FOR COLOR OF RED
08.34.34.REVERT.
08.34.35.BEGIN,A,COLORPR,PINK.
08.34.35.IF,$PINK$.EQ.$RED$,L1.
08.34.35.IF,$PINK$.EQ.$BLUE$,L2.
08.34.35.ENDIF,L2.
08.34.36.COMMENT . NO PROCESSING FOR COLOR OF PINK
08.34.36.REVERT.CCL
```

MODE COMMAND

The MODE command defines the error conditions that cause the system to exit from normal processing. When the error that you specified occurs, the system sets the appropriate error flag and exits from normal processing to perform any error processing required. If an error occurs for which you did not select the exit mode processing, the system ignores the error and continues normal processing.

Format:

```
MODE,m,n.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>CPU program error exit mode (0 ≤ m ≤ 178). Modes 108 through 178 are only valid for model 176. Selects the error condition(s) for which normal error processing does and does not occur. If no mode is selected, the default is 7.</td>
</tr>
<tr>
<td>n</td>
<td>Included for compatibility with earlier versions of NOS. The system now ignores the value specified on the command.</td>
</tr>
</tbody>
</table>
The following values can be supplied for m.

<table>
<thead>
<tr>
<th>m</th>
<th>Normal Error Processing Occurs</th>
<th>Error Ignored and Job Continues</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>None.†</td>
<td>Address out of range, operand overflow, indefinite operand, or operand underflow.††</td>
</tr>
<tr>
<td>1</td>
<td>Address out of range.</td>
<td>Indefinite operand, operand overflow, or underflow.</td>
</tr>
<tr>
<td>2</td>
<td>Operand overflow.†</td>
<td>Address out of range, indefinite operand, or operand underflow.</td>
</tr>
<tr>
<td>3</td>
<td>Address out of range or operand overflow.</td>
<td>Indefinite operand or operand underflow.††</td>
</tr>
<tr>
<td>4</td>
<td>Indefinite operand.†</td>
<td>Address out of range or operand overflow or underflow.††</td>
</tr>
<tr>
<td>5</td>
<td>Address out of range or indefinite operand.</td>
<td>Operand overflow or underflow.††</td>
</tr>
<tr>
<td>6</td>
<td>Indefinite operand or operand overflow.</td>
<td>Address out of range or operand underflow.</td>
</tr>
<tr>
<td>7</td>
<td>Indefinite operand, address out of range, or operand overflow (default value).</td>
<td>Operand underflow.</td>
</tr>
<tr>
<td>10,11+++</td>
<td>Operand underflow or address out of range.</td>
<td>Operand overflow or indefinite operand.</td>
</tr>
<tr>
<td>12,13+++</td>
<td>Operand underflow, address out of range, or operand overflow.</td>
<td>Indefinite operand.</td>
</tr>
<tr>
<td>14,15</td>
<td>Operand underflow, address out of range, or indefinite operand.</td>
<td>Operand overflow.</td>
</tr>
<tr>
<td>16,17</td>
<td>Operand underflow, address out of range, operand overflow, or indefinite operand.</td>
<td>None.</td>
</tr>
</tbody>
</table>

†On the model 176, address out of range (m=1) is always selected.
††Operand underflow is applicable only to the model 176.
+++These modes are valid only on the model 176. Since address out of range (m=1) is always selected, the two modes are equivalent.
Descriptions of the error conditions are as follows:

<table>
<thead>
<tr>
<th>Error Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address out of range error.</td>
<td>An error caused by an attempt to reference central memory or extended memory outside of established limits.</td>
</tr>
<tr>
<td>Operand overflow error.</td>
<td>An error resulting when a floating-point arithmetic unit receives an operand with an exponent value of $+1777g$ (3777 or 4000 in packed form). This is the largest exponent value that can be represented in floating-point format.</td>
</tr>
<tr>
<td>Indefinite operand error.</td>
<td>An error resulting when a floating-point arithmetic unit encounters a calculation it cannot resolve. Examples of indefinite operand errors are an attempt to divide 0 by 0 and an attempt to multiply an overflow operand by an underflow operand.</td>
</tr>
<tr>
<td>Operand underflow error.</td>
<td>An error resulting when a floating-point arithmetic unit receives an operand with an exponent of $-1777g$ (0000 or 7777 in packed form). This is the smallest exponent value that can be represented in floating-point format.</td>
</tr>
</tbody>
</table>

For further information about the processing of error mode errors, refer to Error Control in section J. For further information on the error conditions described above, refer to the appropriate CYBER 180, CYBER 170, CYBER 70, or 6000 Computer System reference manual.

**NOEXIT COMMAND**

The NOEXIT command suppresses EXIT command processing. If an error occurs, control is not transferred to the command following the next EXIT command. Instead, processing continues with the next command (unless the error causes the job to unconditionally terminate). Refer to the description of exit processing in section 5 for more information.

Format:

```
NOEXIT.
```  

**ONEXIT COMMAND**

The ONEXIT command reverses the effect of a NOEXIT command. If an error occurs in processing the commands following ONEXIT, control transfers to the command following the next EXIT command. Refer to the description of exit processing in section 5 for further information.

Format:

```
ONEXIT.
```  

**REVERT COMMAND**

Refer to Ending a Procedure in section 4.
**SET COMMAND**

The SET command assigns a value to a control register, an error flag, or the flag that determines whether skipped commands are entered in the dayfile. Using the SS symbolic name, it also can change the current interactive subsystem.

**Format:**

```
SET,symbol1=expression1,symbol2=expression2,...,symboln=expressionn
```

*symbol1* One of the following symbolic names.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R1, R2, or R3</td>
<td>Local control registers. When a procedure is called, the current values of R1, R2, and R3 are passed to the procedure. The values of these registers may change within the procedure. However, when processing reverts, these registers are restored to the values they had when the procedure was called. The initial value for each is 0.</td>
</tr>
<tr>
<td>RIG</td>
<td>Global control register. When a procedure is called or reverts, RIG keeps its current value. The initial value for RIG is 0.</td>
</tr>
<tr>
<td>EF</td>
<td>Local error flag. When a procedure is called, the current value of the error flag is passed to the procedure. The value of the error flag may change within the procedure. However, when the procedure reverts, the error flag is restored to the value it had when the procedure was called. The initial value for EF is 0.</td>
</tr>
<tr>
<td>EFG</td>
<td>Global error flag. When a procedure is called or reverts, EFG keeps its current value if it is not zero. If EFG has a value of zero when the procedure reverts, the system sets EFG equal to EF. The initial value of EFG is 0.</td>
</tr>
<tr>
<td>DSC</td>
<td>Dayfile-skipped-command flag. Initially, it is set to 0, so that commands that are skipped (not processed) are not entered in the dayfile. If DSC is 1, the system enters skipped commands in the dayfile with two leading periods.</td>
</tr>
<tr>
<td>PL or PS</td>
<td>Page length (or page size). Default is 60 lines.</td>
</tr>
<tr>
<td>PW</td>
<td>Page width. Default is 136 characters.</td>
</tr>
<tr>
<td>PD</td>
<td>Page density. Default is six lines per inch.</td>
</tr>
<tr>
<td>SS</td>
<td>Interactive subsystem indicator. The default of SS is NULL.</td>
</tr>
</tbody>
</table>

*expression1* Any valid expression. The value derived through evaluation of the expression is assigned to the symbolic name. Acceptable values for each symbolic name follow.
<table>
<thead>
<tr>
<th>Symbol</th>
<th>Suggested Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>R1, R2, R3, or R1G</td>
<td>Any integer between -131071 and 131071. If the value is outside this range, it is truncated. The values in these registers are 18-bit quantities, 17 digits and a sign. When truncation occurs, the upper bits are truncated but the sign bit is always retained. The system does not issue a message as a result of the truncation.</td>
</tr>
<tr>
<td>EF or EFG</td>
<td>Any integer between 0 and 63. The values in these registers are 6-bit unsigned quantities. When truncation occurs, the upper bits are discarded. If the value is greater than 63, it is truncated. To assign the value defined by the system for an error condition, set the error flag to one of the error condition symbolic names (refer to Symbolic Names at the beginning of this section). The system sets the EF flag to the appropriate error code when an error occurs.</td>
</tr>
<tr>
<td>DSC</td>
<td>1 or 0. If the value of the expression is nonzero, DSC is set to 1. While DSC is 1, skipped commands are entered in the dayfile preceded by two periods. Some error processing routines set DSC to 1 so that skipped commands are written in the dayfile.</td>
</tr>
<tr>
<td>PL or PS</td>
<td>Any integer between 16 and 255.</td>
</tr>
<tr>
<td>PW</td>
<td>Any integer between 40 and 255.</td>
</tr>
<tr>
<td>PD</td>
<td>6 or 8. You can select a print density of either six or eight lines per inch.</td>
</tr>
<tr>
<td>SS</td>
<td>Any subsystem name (ACCESS, BASIC, BATCH, EXECUTE, FORTRAN, FTNTS, or NULL).</td>
</tr>
</tbody>
</table>
Examples:

The first three examples use procedures from the following procedure file. It is an indirect access permanent file with the name SETFILE.

```
.PROC,P1*X.
DISPLAY,R1.
DISPLAY,R1G.
SET,R1=9.
SET,R1G=888.
-EOR-
.PROC,P2*X.
GET,ABC.
DISPLAY,EF.
DISPLAY,EFG.
-EOR-
.PROC,P3*X.
GET,BASIC1.
BASIC.
DISPLAY,EF.
DISPLAY,EFG.
-EOR-
-EOF-
```

Example 1 - Control Register Use:

The following commands (below on the left side) set and display registers R1 and R1G. A procedure, P1, is called which displays these registers, resets them, and then reverts to the command record where they are again displayed.

On the right is the dayfile segment resulting from processing of the commands.

```
SET,R1=1.
SET,R1G=10.
DISPLAY,R1.
DISPLAY,R1G.
BEGIN,P1,SETFILE.
DISPLAY,R1.
DISPLAY,R1G.

16.34.42.SET,R1=1.
16.34.42.SET,R1G=10.
16.34.43.DISPLAY,R1.
16.34.43.11B
16.34.43.DISPLAY,R1G.
16.34.43.1012B
16.34.43.BEGIN,P1,SETFILE.
16.34.44.DISPLAY,R1.
16.34.44.11B
16.34.44.DISPLAY,R1G.
16.34.44.1012B
16.34.44.SET,R1=9.
16.34.44,R1G=888.
16.34.44.REVERT.CCL
16.34.44.DISPLAY,R1.
16.34.44.11B
16.34.45.DISPLAY,R1G.
16.34.45.1570B
```

The R1 and R1G registers retain their setting when the procedure is called. However, after new values are set in the procedure and control reverts to the command record, R1 returns to its previous value and R1G retains the value set in the procedure.
Example 2 - Error Flag Use (EFG Nonzero):

The following commands (below on left side) set values in the error flags EF and EFG and then call a procedure which attempts to access an indirect access permanent file. Control reverts to the command record where EF and EFG are displayed to see if any error code generated is returned via these flags. On the right side is the dayfile segment resulting from the processing of the commands.

```
NOEXIT.
SET,EF=10.
SET,EFG=20.
DISPLAY,EF.
DISPLAY,EFG.
BEGIN,P2,SETFILE.
DISPLAY,EF.
DISPLAY,EFG.
BEGI N,P2,SETFILE.
DISPLAY,EF.
DISPLAY,EFG.
GET,ABC.
ABC NOT FOUND.
DISPLAY,EF.
DISPLAY,EFG.
SREVERT.CCL
DISPLAY,EF.
DISPLAY,EFG.
```

The procedure attempts to get a permanent file which does not exist. This changes EF to error code 6. It does not affect EFG. Control reverts to the command record and displays EF and EFG. EF returns to its initial setting; EFG remains unchanged throughout.
Example 3 - Error Flag Use (EFG Zero):

To return the error code generated in a procedure to the command record, EFG must be 0
before there is an exit from the procedure. This is demonstrated by the following commands
(below left side).

The dayfile segment (on the right) resulting from processing of the commands shows how the
error code is returned.

```
NOEXIT.
SET,EF=10.
SET,EFG=0.
BEGIN,P3,SETFILE.
DISPLAY,EF.
DISPLAY,EFG.
```

```
09.42.52. NOEXIT.
09.42.52. SET,EF=10.
09.42.52. SET,EFG=0.
09.42.52. BEGIN,P3,SETFILE.
09.42.53. GET,BASIC1.
09.42.55. BASIC.
09.42.56. INPUT FILE EMPTY OR MISPOSITIONED
09.42.56. DISPLAY,EF.
09.42.56. 7 0B
09.42.57. DISPLAY,EFG.
09.42.57. 0 0B
09.42.57. $REVERT.CCL
09.42.58. DISPLAY,EF.
09.42.58. 10 12B
09.42.58. DISPLAY,EFG.
09.42.58. 7 0B
```

The procedure attempts to compile a BASIC program that is not an INPUT record. This
generates error code 7 in EF but does not affect EFG while control is still within the
procedure. When control reverts to the command record, EF returns to its original setting
and error code 7 is set in EFG.
Example 4 - DSC Flag Use:

The following commands (below on left side) demonstrate the effect of DSC=0 and DSC=1. On the right side is the dayfile segment resulting from processing of the preceding commands.

```
SET,DSC=0.
SKIP,LABL1.
COMMENT. SINCE THE DAYFILE SKIP
COMMENT. CONTROL IS SET TO ZERO.
COMMENT. THESE STATEMENTS WILL NOT
COMMENT. APPEAR IN THE DAYFILE.
ENDIF,LABL1.

SET,DSC=1.
SKIP,LABL2.
COMMENT. SINCE THE DAYFILE SKIP
COMMENT. CONTROL IS NOW SET TO ONE,
COMMENT. THESE STATEMENTS WILL
COMMENT. APPEAR IN THE DAYFILE AND
COMMENT. EACH WILL BE FLAGGED
COMMENT. WITH TWO INITIAL PERIODS.
ENDIF,LABL2.
```

16.49.36.SET,DSC=0.
16.49.36.SKIP,LABL1.
16.49.36.ENDIF,LABL1.
16.49.37.SET,DSC=1.
16.49.37.SKIP,LABL2.
16.49.37.ENDIF,LABL2.

SKIP COMMAND

The SKIP command initiates unconditional skipping of succeeding commands. Skipping is terminated by an ENDIF command that has a label string matching the label string specified on the SKIP command. Only an ENDIF command, and not an ELSE command, terminates skipping initiated by a SKIP command.

Format:

```
SKIP,label.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Specifies a 1- to 10-character alphanumeric string. The string must begin with an alphabetic character.</td>
</tr>
</tbody>
</table>

An example of the use of the SKIP command is given after the description of the ENDIF command.
WHILE COMMAND

The iterative commands WHILE and ENDW bracket a group of commands into a loop that can be repeatedly processed. The beginning of the loop is identified by a WHILE command and the end by an ENDW command. The ENDW command must have a label string that matches the label string specified on the WHILE command. The loop is repeated as long as the expression in the WHILE command is true. If the expression is initially false, control immediately skips to the ENDW command.

Label strings of all WHILE commands within the command record of a job should be unique. Duplication of a label string within a command record or within a procedure can produce unpredictable results. The same label string can be used in a called procedure and in the calling command record or procedure.

Format:

WHILE,expression,label.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Specifies any valid symbolic name or expression described earlier in this section. The separator following expression must be a comma.</td>
</tr>
<tr>
<td>label</td>
<td>Specifies a 0- to 10-character alphanumerical string. The string must begin with an alphabetic character.</td>
</tr>
</tbody>
</table>

Example:

The following commands initiate a loop which is repeated five times.

```
SET,R1=0.
SET,R2=5.
WHILE,R1.LT.R2,FINISH.
SET,R1=R1+1.
DISPLAY,R1.
```

You can vary the number of repetitions by setting different values in R2.
The job control commands alter information that controls jobs while in the system and retrieves information concerning the status of jobs. The commands included in this category are:

- BLOCK
- CFO
- CHARGE
- CHVAL
- CLASS
- COMMENT
- CTIME
- DAYFILE
- DROP
- ENQUIRE
- ENTER
- ERRMSG
- GO
- HTIME
- Job
- LDI
- LENGTH
- LIMITS
- LISTLID
- MACHINE
- MFL
- NERERUN
- NOTE
- OFFSW
- ONSW
- PASSWOR
- PAUSE
- PROTECT
- QGET
- QUEUE7
- REDO
- RERUN
- REDO
- RERUN
- RFL
- ROLLOUT
- RTIME
- SETASL
- SETCORE
- SETJAL
- SETJOB
- SETJSL
- SETPR
- SETTL
- SHELL
- STIME
- SWITCH
- UPROC
- USECPU
- USER

You must have specific authorization to use LDI, PASSWOR, PROTECT, or SUBMIT. You can use the remaining commands regardless of your authorization. A listing of validation information can be obtained using the LIMITS command. Although you are allowed to change several control values for your job (with the Job, RFL, SETPR, and SETTL commands), you can never specify more than that for which you are validated.

The system uses the USER command and CHARGE command for checking your authorization and system accounting information. The RESOURC command is used by the system to prevent deadlocks from occurring when several tapes or packs are used concurrently.
BLOCK COMMAND

The BLOCK command defines one or more lines of 10 by 10 (10 lines by 10 columns) block letters to be added to a file. The large, 10-line characters provide easier identification of output listings.

Format:

    BLOCK,ifn,rewind,cc./line1/line2/.../line_n

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifn</td>
<td>Specifies the name of the local file to receive the block character lines. Default is OUTPUT.</td>
</tr>
<tr>
<td>rewind</td>
<td>Specifies whether or not ifn is rewound before the block character lines are printed. Values that can be specified for rewind are R (rewind) and NR (no rewind). The default is NR.</td>
</tr>
<tr>
<td>cc</td>
<td>Specifies the carriage control character to be inserted before the first line of block characters. The default value is 1 (top of form). The carriage control characters are described in appendix H (a space, PM, and special characters are not accepted).</td>
</tr>
<tr>
<td>/</td>
<td>Specifies the delimiting character that separates the block character lines. The delimiter can be any character and must be the first character following the command terminator. Consecutive delimiters generate blank lines.</td>
</tr>
<tr>
<td>line_n</td>
<td>Specifies either a string of up to ten characters which constitute one line of block characters, or one of the following special values:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Special Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATE</td>
<td>Current date.</td>
</tr>
<tr>
<td>TIME</td>
<td>Current time.</td>
</tr>
<tr>
<td>USER</td>
<td>Current user name.</td>
</tr>
<tr>
<td>UJN</td>
<td>User job name.</td>
</tr>
<tr>
<td>JSN</td>
<td>Job sequence name.</td>
</tr>
</tbody>
</table>

**NOTE**

If file ifn contains data and you specify that ifn is to be rewound, the block characters written to the file will overwrite data at the beginning of the file.
Example:

Following is a BLOCK command and its resulting output:

```
/block,blockf.*myjob*date
BLOCK,BLOCKF .*MYJOB*DATE
/list,f=blockf
1
1
   MM   MM YY   YY   JJJJJJJJ   00000000   BBBBBBBB
   MMM  MMM YY   YY   JJJJJJJJ   0000000000   BBBBBBBB
   MM   MMM MM YY   YY   JJ   00   00   BB   BB
   MM   MM MM YYYY   JJ   00   00   BB   BB
   MM   MM MM YY   JJ   00   00   BBBBBBBB
   MM   MM YY   JJ   JJ   00   00   BB   BB
   MM   MM YY   JJJJJJ   0000000000   BBBBBBBB
   MM   MM YY   JJJJJJ   0000000000   BBBBBBBB
```

Column one of the listing contains printer carriage control characters 1 and 0. The 1 character produces a form feed. The 0 characters produce double spacing.

**CFO COMMAND**

The CFO (comment from operator) command sends data to one of your executing jobs. The command places data in locations RA + 70B through RA + 74B of the program's field length. The CPU program receiving the data must set the CFO flag (bit 14 of RA + 0) to indicate it will accept CFO data. The CFO command clears the CFO and the PAUSE flags in RA after it places data in the job's field length.

**Format:**

```
CFO,jsn.data
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jsn</td>
<td>The job sequence name (JSN) of the job to receive the data.</td>
</tr>
<tr>
<td>data</td>
<td>The data for the job. The data must be 36 characters or less.</td>
</tr>
</tbody>
</table>
CHARGE COMMAND

The CHARGE command causes the system to record on the account dayfile all information regarding resources used in the previous account block, and designates a new charge and project number for subsequent activity. Its purpose is to control the accounting activity of the system for a customer or the installation. An account block is that portion of a job from one CHARGE command to the end of the job or to another CHARGE command.

Format:

CHARGE,CN=chargenumber,PN=projectnumber.

or

CHARGE,chargenumber,projectnumber.

or

CHARGE,*.

or

CHARGE.

Parameter | Description
---|---
chargenumber | Specifies the charge number assigned to you by your site.
projectnumber | Specifies the project number assigned to you by your site.

The CHARGE command has four formats:

- If you use the first format, the parameters are order-independent.
- If you use the second format, the parameters are order-dependent.
- If you use the third format, the system uses your default charge and project numbers (refer to the LIMITS command in this section).
- If you use the fourth format, the system reads the charge number and the project number from a record of file INPUT. This record must be a single line with the following format:
  
  chargenumber,projectnumber

If your job is an interactive job, the system prompts you to enter your charge and project numbers.

The CHARGE command is used in the control of user accounting. The project master user can impose limits on the SRUs your jobs may accumulate under that project number, restrict your access to the system to a certain time of the day, and, in general, monitor your use of the system.

If the specified charge and project numbers have a project prologue associated with them, the project prologue is executed each time the charge number is entered on a CHARGE command. A CHARGE command entered as the first command in the job also causes the system and user prologues, if any, to be executed. The system prologue is executed first, followed by the project and user prologues. For a CHARGE command other than the first CHARGE command in the job, only the project prologue is executed.

If you use a second or subsequent CHARGE command in a job and if the current active charge and project numbers have a project epilogue associated with them, that project epilogue is executed, followed by the specified CHARGE command and then by the project prologue (if any) for the new charge and project numbers.
If your site requires that you use a CHARGE command, the system automatically uses your default charge and project numbers when necessary. For interactive jobs, the system uses your default charge and project numbers each time you log in. If your default charge and project numbers are not defined or are not valid, the system prompts you for valid charge and project numbers. For batch jobs, the system uses your default charge and project numbers if you do not include a CHARGE command immediately following the USER command. If you do include a CHARGE command following the USER command, the system uses the charge number you supply.

The CHARGE command sets the SRU limits for the account block and the job step to the user name validation limits or the account validation limits, whichever is smaller. Refer to the SETJSL and SETASL commands later in this section.

In addition to supplying charge and project numbers at job initiation, you may also be required to supply charge and project numbers under certain other conditions. Specifically, you may be required to enter additional charge and project numbers as a result of an SRU limits exceeded condition or as a result of a project prologue.

If you are assigned more than one charge or project number, you can include additional CHARGE commands in your job to record resources used under each charge number-project number combination. Whenever a new CHARGE command is issued, the SRU information for the previous charge number and project number is written to an account dayfile and then cleared. However, the other accumulators (central processor time, mass storage activity, and so on) are not cleared but continue to increment.

For a complete list of accounting messages issued to the job's dayfile, refer to Job Completion in section 3.

CHVAL COMMAND

The CHVAL command redefines your validation limits or privileges. Currently, you are only allowed to redefine your default service class assignments.

Format:

CHVAL, UC=otsc.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UC=otsc</td>
<td>Specifies the default service class assignment according to origin type. The value otsc is the desired service class mnemonic appended to the mnemonic for the origin type. Do not place a separator between the mnemonics. The value ot must be one of the following:</td>
</tr>
<tr>
<td>ot</td>
<td>Description</td>
</tr>
<tr>
<td>BC</td>
<td>Local batch</td>
</tr>
<tr>
<td>IA</td>
<td>Interactive origin</td>
</tr>
<tr>
<td>RB</td>
<td>Remote batch</td>
</tr>
<tr>
<td>sc</td>
<td>The value sc must be one of the following:</td>
</tr>
<tr>
<td>sc</td>
<td>Description</td>
</tr>
<tr>
<td>BC</td>
<td>Local batch</td>
</tr>
<tr>
<td>CT</td>
<td>Communication task</td>
</tr>
<tr>
<td>DI</td>
<td>Detached interactive</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>MA</td>
<td>Maintenance</td>
</tr>
<tr>
<td>NS</td>
<td>Network supervisor</td>
</tr>
<tr>
<td>RB</td>
<td>Remote batch</td>
</tr>
<tr>
<td>SY</td>
<td>System</td>
</tr>
<tr>
<td>TS</td>
<td>Interactive</td>
</tr>
<tr>
<td>In</td>
<td>Installation class n (0 ≤ n ≤ 3)</td>
</tr>
</tbody>
</table>

You must be authorized to use the service class you select. The LIMITS command shows the service classes you are allowed to use and your default service class assignments.

Example:

In the following example, the default service class assignment for interactive jobs is changed from interactive (TS) to detached interactive (DI).

```
/limits

THE FOLLOWING ARE ALLOWED SERVICE CLASSES -
BATCH (BC)
REMOTE BATCH (RB)
INTERACTIVE (TS)
DETACHED INTERACTIVE (DI)

THE USER DEFAULT SERVICE CLASS
FOR BATCH ORIGIN IS.........................BC
FOR REMOTE BATCH ORIGIN IS..................RB
FOR INTERACTIVE ORIGIN IS...................TS
INQUIRY COMPLETE.
/chval,uc=adi
UPDATE COMPLETE.
/limits

THE FOLLOWING ARE ALLOWED SERVICE CLASSES -
BATCH (BC)
REMOTE BATCH (RB)
INTERACTIVE (TS)
DETACHED INTERACTIVE (DI)

THE USER DEFAULT SERVICE CLASS
FOR BATCH ORIGIN IS.........................BC
FOR REMOTE BATCH ORIGIN IS..................RB
FOR INTERACTIVE ORIGIN IS...................DI
INQUIRY COMPLETE.
```
CLASS COMMAND

The CLASS command changes the service class of your current interactive job or of a batch job you have submitted for execution. For interactive jobs, the CLASS command can only change the service class of the interactive job from which it was entered; it cannot change an interactive job connected to another terminal. For batch jobs, you can change the service class of any executing job or any job in the input queue. This includes the job from which the CLASS command was entered.

The CLASS command also shows the relative priority of the available service classes for a specified origin type. Implicitly, the relative priority display also shows which service classes are allowed within the chosen origin type.

Format:

CLASS,SC=sc,OP=A.

or

CLASS,sc,,,A.

or

CLASS,OT=ot,L=lfn.

or

CLASS,,ot,lfn.

or

CLASS,SC=sc,JSN=jsn.

or

CLASS,sc,,,,jsn.

The parameters are order-independent if you specify them in the keyword=value form. Otherwise, they are order-dependent.

Parameter | Description
--- | ---
SC=sc | Specifies the desired service class for the job. The value sc must be one of the following:

<table>
<thead>
<tr>
<th>sc</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SY</td>
<td>System</td>
</tr>
<tr>
<td>BC</td>
<td>Local batch</td>
</tr>
<tr>
<td>RB</td>
<td>Remote batch</td>
</tr>
<tr>
<td>TS</td>
<td>Interactive</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sc</td>
<td>Detached interactive</td>
</tr>
<tr>
<td>DI</td>
<td>Network supervisor</td>
</tr>
<tr>
<td>NS</td>
<td>Maintenance</td>
</tr>
<tr>
<td>MA</td>
<td>Communication task</td>
</tr>
<tr>
<td>CT</td>
<td>Installation class n (0 ≤ n ≤ 3)</td>
</tr>
</tbody>
</table>

There is no default for this parameter. The service class you specify must be within your validation limits (refer to the LIMITS command).

- **OP=A**
  Selects the abort option. The command aborts if too many jobs in the system already have the service class you specified. Otherwise, if this situation occurs, the system rolls out your job and waits until it can make the desired assignment.

- **OT=ot**
  Specifies the origin type for which the system shows the relative priority of the available service classes. The value ot can be any of the following:

<table>
<thead>
<tr>
<th>ot</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SY</td>
<td>System origin</td>
</tr>
<tr>
<td>IA</td>
<td>Interactive origin</td>
</tr>
<tr>
<td>BC</td>
<td>Local batch origin</td>
</tr>
<tr>
<td>RB</td>
<td>Remote batch origin</td>
</tr>
</tbody>
</table>

  The default is the origin type of the current job. If you specify OT=ot along with SC=sc, OT=ot is ignored.

- **L=lfn**
  Specifies the file that receives the display generated by this command. OUTPUT is the default. If you specify L=lfn along with SC=sc, L=lfn is ignored.

- **JSN=jsn**
  Specifies the JSN of an executing job or a job in the input queue.

The first and second formats change the service class of your current job. If you use the first or second format and do not specify a valid service class (for instance, you omit that value), the system displays the relative priority of the service classes available for your job. Further, if your job is interactive, you receive a prompt for a service class.

The third and fourth formats generate a display of the relative priority of the available service classes for a designated origin type.

The fifth and sixth formats change the service class of an executing batch job or of a job in the input queue. They cannot be used to change the service class of an interactive job.
Example:

The following terminal session shows how you can ascertain the relative priority of the service classes for your current job.

/class

AVAILABLE SERVICE CLASSES

---RELATIVE PRIORITY---

CLASS INPUT FILES EXECUTING JOBS OUTPUT FILES
DI * ******* *******
IO * ******* *******
TS ******* ******* CURRENT

ENTER CLASS: di
CLASS COMPLETE.
/

COMMENT COMMAND

The COMMENT command allows you to place a comment in the system dayfile and the dayfile of any of your jobs.

Format:

COMMENT,jsn.comment

or

COMMENT.comment

or

*comment

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jsn</td>
<td>Specifies the job sequence name (JSN) of the job in whose dayfile you want the comment written. The default is the current job.</td>
</tr>
<tr>
<td>comment</td>
<td>Specifies the message you want written in the designated dayfiles.</td>
</tr>
</tbody>
</table>

If you use the third format of the command, the asterisk must be the first nonblank character of the command.
CTIME COMMAND

The CTIME command requests that the accumulated CPU time for the job be issued to the job's dayfile (in seconds).

Format:

CTIME.

DAYFILE COMMAND

The DAYFILE command causes the system to write the job's dayfile to the file specified.

For printed DAYFILE output, you can specify output page size and print density using the PL and PD parameters. The DAYFILE command also honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

DAYFILE,L=lnf,FR=string,OP=op,PD=pd,PL=pl,I=infile.

or

DAYFILE,lnf,string,op,pd,pl,infile.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>L=lnf</td>
<td>Specifies the file on which the dayfile is to be written. If L=lnf is omitted, OUTPUT is assumed. Pagination will occur if listing file name is OUTPUT or if the PD or PL parameters are specified.</td>
</tr>
<tr>
<td>FR=string</td>
<td>Specifies a character string for which a search is to be made in the dayfile. The op parameter specifies the field to be searched. The string specified must begin with the first character in the field to be searched. The time field begins with a blank. If the string contains characters other than letters and numbers (such as blanks), it must be enclosed by $ delimiters. A $ within the string must be entered twice ($$) so it is not interpreted as a delimiter. Interactive commands entered in the dayfile are preceded by a $ unless you were under the batch subsystem when you issued the command. To search for a interactive command, the $ preceding the command is replaced with two $'s, and the command is enclosed by $ delimiters (for example, $$OLD$). If the string is found, the portion of the dayfile following the last occurrence of the specified string is output. If the string is not found, an informative message and the entire dayfile is output for jobs where the output file is connected to a terminal; where the output file is not connected to the terminal, the job receives only the informative message.</td>
</tr>
</tbody>
</table>

Parameter | Description
--- | ---
OP=op | Selects search option (single character):

<table>
<thead>
<tr>
<th>op</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>Search time field for string specified by FR=string.</td>
</tr>
<tr>
<td>M</td>
<td>Search message field for string specified by FR=string.</td>
</tr>
<tr>
<td>I</td>
<td>Incremental dump (dayfile printed from point of last dayfile command).</td>
</tr>
<tr>
<td>F</td>
<td>Full dump.</td>
</tr>
</tbody>
</table>

If a literal string (string) is specified and op is omitted, OP=M is assumed. If both string and op are omitted, OP=F is assumed unless the output file is connected to a terminal. In this case, OP=I is assumed.

PD=pd | Specifies the print density; default is PD=6.

<table>
<thead>
<tr>
<th>pd</th>
<th>Print Density</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Double space; 6 lines per inch</td>
</tr>
<tr>
<td>4</td>
<td>Double space; 8 lines per inch</td>
</tr>
<tr>
<td>6</td>
<td>Single space; 6 lines per inch</td>
</tr>
<tr>
<td>8</td>
<td>Single space; 8 lines per inch</td>
</tr>
</tbody>
</table>

PL=pl | Specifies page size; if specified, the actual page size used is determined by page density (pd) and the value specified for pl, as follows:

<table>
<thead>
<tr>
<th>pd</th>
<th>Page Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>pl / 2</td>
</tr>
<tr>
<td>4</td>
<td>pl / 2</td>
</tr>
<tr>
<td>6</td>
<td>pl</td>
</tr>
<tr>
<td>8</td>
<td>pl</td>
</tr>
</tbody>
</table>

If this parameter is omitted, page size is determined from system page size and print density as follows:

<table>
<thead>
<tr>
<th>pd</th>
<th>Default Page Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>30 lines</td>
</tr>
<tr>
<td>4</td>
<td>30 lines</td>
</tr>
<tr>
<td>6</td>
<td>60 lines</td>
</tr>
<tr>
<td>8</td>
<td>60 lines</td>
</tr>
</tbody>
</table>

I=infile | Specifies a file which contains a dayfile to be used for input. If I=infile is omitted, the DAYFILE command uses the active dayfile for input.

NOTE

A paginated dayfile listing cannot be used as the input file (I= infile). Refer to L=lfn parameter.
Examples:

```
DAYFILE,,$ 11.21.,T.

The dayfile is dumped to OUTPUT starting at the last occurrence of 11.21. in the
time field.
```

```
DAYFILE,I=DAY,FR=$$GET,STATS.$

The dayfile is dumped to OUTPUT starting at the last occurrence of $$GET,STATS. in
the message field of the previously written dayfile named DAY.
```

The system may place diagnostic messages in the output produced by DAYFILE. They are not
part of the job's dayfile from which the DAYFILE output is produced. These messages begin
with NOTICE*** and are described in appendix B.
The DROP command drops executing jobs or queued files. You can drop only jobs or queued files belonging to you. You cannot drop the job from which you enter the DROP command.

A job or queued file belongs to you if it is your current job, was created by your current job, or was created by another job belonging to you. Thus, any job you submit from your current job belongs to you, even if the USER command in the submitted job has a user name different from the user name you specified when you logged in (or different from that of the first USER command if the current job is a batch job).

Format:

DROP,JSN=jsn,DC=q,UJN=ujn,OP=R.

or

DROP,jsn,q,ujn,R.

The parameters are order-independent if you specify the parameters in the keyword=value form. Otherwise, they are order-dependent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSN=jsn</td>
<td>Specifies the job sequence name (JSN) of the job to be dropped.</td>
</tr>
<tr>
<td>UJN=ujn</td>
<td>Specifies the user job name (UJN) of the job to be dropped. You can specify the JSN, the UJN, or both.</td>
</tr>
<tr>
<td>DC=q</td>
<td>Specifies the disposition of the job to be dropped. You must specify q if neither the JSN nor the UJN is specified. In this case, the system drops all of your jobs with the specified disposition. If JSN or UJN is specified, the default for q is ALL.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<tr>
<td>ALL</td>
<td>All jobs belonging to you.</td>
</tr>
</tbody>
</table>

| OP=R    | Directs the system to drop the specified executing jobs without EXIT processing but with single-reprieve processing for jobs containing such. |

Examples:

DROP,ABDA.                          Drops executing job ABDA.
DROP,,PR.                            Drops all of your jobs queued for printing.
DROP.                                Incorrect. You must specify a JSN, UJN, or the DC=q parameter.
DROP,JSN=ABFF,OP=R.                  Drops executing job ABFF with a single reprieve and without EXIT processing.
ENQUIRE COMMAND

The ENQUIRE command gives you information about your jobs in the system. For output listing files not connected to your terminal, the ENQUIRE command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

ENQUIRE,OP=p1p2...pn,FN=lfn1,O=1fn2.

or

ENQUIRE,p1p2...pn.

or

ENQUIRE,JSN=jsn,O=1fn2.

or

ENQUIRE,UJN=ujn,O=1fn2.

or

ENQUIRE.

Parameter Description

OP=p1p2...p7 Any combination of the following options. You can request a maximum of seven options on a command (for example, ENQUIRE,OP=BDFJLRS.).

P1 Description

A Gives listings of the B, D, R, U, J, L, and F options. If you specify no parameters or only the O=1fn2 parameter in a batch job, the OP=p1p2...pn parameter defaults to OP=A.

B Returns identification and priority information. On a secured system, the system also lists the current job access level, the upper limit for the job access level, the lower limit for the job access level, and the security access categories you can assign to permanent files.
Parameter Description

Example:

/enquire,b

SYSTEM ACTIVITY.

<td>INACCESS*</td>
<td>NAD</td>
<td></td>
</tr>
</tbody>
</table>

**TOTAL = 8**

An asterisk (*) after the file type indicates that the file is locked. (You cannot write on a locked file.) Refer to the FILE function in section 6 for the meaning of the file type mnemonics. For magnetic tape files (TYPE=TP), the current position block number is displayed in the LENGTH/PRUS column instead of the file length. The Status column indicates the current position of the file (I/C indicates mid-record) and whether the last operation performed was a write. The entry *INACCESS* indicates that the file is inaccessible; it resides on a mass storage device that is currently off or down. The FS column indicates whether a file has the no-auto-drop status (refer to the SETFS command). The LEVEL column gives the security access level of the file.

On an unsecured system, the security access level is listed only if it is not null.
<table>
<thead>

</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>Returns your accumulated SRUs. The SRU represents your total usage of the system. This unit is derived from central processor time, I/O activity, adder activity, and memory usage.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>SRU ACCUMULATOR.</td>
</tr>
<tr>
<td></td>
<td>SRU 3.162 UNTS.</td>
</tr>
<tr>
<td>T</td>
<td>Returns accumulated CPU time.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>CPU ACCUMULATOR.</td>
</tr>
<tr>
<td></td>
<td>CPU TIME 0.111 SECS.</td>
</tr>
<tr>
<td>U</td>
<td>Returns the initial amount of resources available to you in seconds, job step SRU, account block SRU, and the remaining resources available for dayfile messages, commands, and mass storage. These values apply to the current job and were set at the beginning of the job by default or by the SETJSL, SETASL, or SETTL commands. As the job progresses, the system increments the appropriate resource counters. Secondary USER commands do not affect these values. Entering a different CHARGE command affects your account block and job step SRU limits (refer to the CHARGE command).</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>RESOURCE USAGE ALLOWED.</td>
</tr>
<tr>
<td></td>
<td>SECONDS 64</td>
</tr>
<tr>

<td>MASS STORAGE 59008</td>
</tr>
</tbody>
</table>
**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UJN=ujn</td>
<td>Returns a one-line report of each of your jobs with the specified user job name (UJN). The report for each job has the following fields:</td>
</tr>
</tbody>
</table>

```
jsn  sc  cs  ds  lid  ujn  status  executing message
```

The fields have the following descriptions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jsn</td>
<td>The job sequence name (JSN). It is a four-character, system-defined name.</td>
</tr>
<tr>
<td>sc</td>
<td>The service class of the job. One of the following mnemonics appears in this field:</td>
</tr>
<tr>
<td></td>
<td>Service Class</td>
</tr>
<tr>
<td>S</td>
<td>System</td>
</tr>
<tr>
<td>B</td>
<td>Batch</td>
</tr>
<tr>
<td>R</td>
<td>Remote batch</td>
</tr>
<tr>
<td>T</td>
<td>Interactive</td>
</tr>
<tr>
<td>D</td>
<td>Detached interactive</td>
</tr>
<tr>
<td>N</td>
<td>Network supervisor</td>
</tr>
<tr>
<td>C</td>
<td>Communication task</td>
</tr>
<tr>
<td>M</td>
<td>Maintenance</td>
</tr>
<tr>
<td>0</td>
<td>Installation class 0</td>
</tr>
<tr>
<td>1</td>
<td>Installation class 1</td>
</tr>
<tr>
<td>2</td>
<td>Installation class 2</td>
</tr>
<tr>
<td>3</td>
<td>Installation class 3</td>
</tr>
<tr>
<td>cs</td>
<td>The connection status (CS) of your job; that is, whether your job is online and interactive, detached and interactive, not interactive or queued. The following values can appear:</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td>ON</td>
<td>Online and interactive</td>
</tr>
<tr>
<td>DT</td>
<td>Detached and interactive</td>
</tr>
<tr>
<td>NI</td>
<td>Not interactive</td>
</tr>
<tr>
<td>blank</td>
<td>Queued</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ds</td>
<td>The default destination of batch output. It indicates whether batch output will be routed to the central site (BC) or to a remote batch terminal (RB).</td>
</tr>
<tr>
<td>lid</td>
<td>The logical identifier (LID) of the mainframe that is to process the job. This is a three-character, site-defined mnemonic.</td>
</tr>
<tr>
<td>ujn</td>
<td>The user job name (UJN) of the job. It is either the name you assigned the job or it is your user index hash if you did not assign the job a name.</td>
</tr>
<tr>
<td>status</td>
<td>The overall job status. It indicates whether the job is executing, whether it has been rolled out, or the queue in which it now resides.</td>
</tr>
<tr>
<td>executing</td>
<td>The command that the system is now executing.</td>
</tr>
<tr>
<td>message</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```
/enquire,ujn=ldijob
```

<table>
<thead>
<tr>
<th>JSN</th>
<th>SC</th>
<th>CS</th>
<th>DS</th>
<th>LID</th>
<th>UJN</th>
<th>STATUS</th>
<th>EXECUTING</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABCF.B.</td>
<td>.BC.</td>
<td>.LDIJOB</td>
<td>WAIT</td>
<td>QUEUE</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If you specify only the keyword UJN, the system returns a one-line report for each job associated with your user name.

Example:

```
/enquire,ujn
```

<table>
<thead>
<tr>
<th>JSN</th>
<th>SC</th>
<th>CS</th>
<th>DS</th>
<th>LID</th>
<th>UJN</th>
<th>STATUS</th>
<th>EXECUTING</th>
<th>MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABCB.T.ON.BC.</td>
<td>.AJLA</td>
<td>EXECUTING</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ABCB.B.</td>
<td>.BC.M42.LDIJOB</td>
<td>PRINT</td>
<td>QUEUE</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>ABCF.B.</td>
<td>.BC.</td>
<td>.LDIJOB</td>
<td>WAIT</td>
<td>QUEUE</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Do not specify the UJN=ujn parameter with any parameter other than O=lfn2.

```
JSN=jsn
```

Returns a detailed report of the job with the specified job sequence name (JSN). The format of the report varies with the status of the job. If the job is executing, the report includes the JSN, the job's service class, its connection status, the default destination of its batch output, the current status of the job, the user job name (UJN), the job access level (on a secured system only), job resource information, the executing command, a dayfile extract (maximum of 10 messages), and a list of the next commands to be executed (maximum of 10 commands).
### Parameter Description

Example:

/\enquire,jsn=abcb

ABCB.T.ON.BC. .EXECUTING UJN=AJLA LEVEL=LVLO
SRUS= 2.573. SRT LIMIT=NO LIMIT. CM FL= 5000. ECS FL= 0.

DAYFILE=

17.26.55. SUBMIT COMPLETE. JSN IS ABCE.
17.27.07. GET, OPL.JOB.
17.27.21. REPLACE, CATEGOR.
17.27.32. SUBMIT, OPL.JOB, TO.
17.27.32. SUBMIT COMPLETE. JSN IS ABCF.
17.28.04. ROUTE, CATEGOR, DC=IN.
17.28.04. ROUTE COMPLETE. JSN IS ABCH.
17.28.13. ENQUIRE, UJN.
17.28.26. ENQUIRE, JSN.
17.29.04. ENQUIRE, JSN=ABCB.

If the job is a queued file, the report includes the job’s JSN, its service class, the default destination of its batch output, the logical identifier (LID) of the mainframe that is to process the job, its queue residence, its UJN, length in PRUs, and output specifications.

Example:

/\enquire,jsn=abcf

ABCF.B. .BC. .WAIT QUEUE UJN=LDIJOB LEVEL=LVLO
PRU LENGTH= 32. DC=TT. FC= . ID= 0. EC= .

If you specify the keyword JSN, the system returns a one-line report on each job associated with your user name. The fields in the display are identical to those you get when you specify only the keyword UJN, except that the UJN field and the EXECUTING MESSAGE fields are omitted.

Example:

/\enquire,jsn

JSN SC CS DS LID STATUS
ABCH.B. .BC.M42.INPUT QUEUE ABCB.T.ON.BC. .EXECUTING
ABCI.B. .BC.M42.PRINT QUEUE ABCF.B. .BC. .WAIT QUEUE

Do not specify the JSN=jsn parameter with any parameter other than O=lfn2.

PN=lfn1

Returns the status of local file lfn1 (refer to the OP=F parameter).

0=lfn2

Writes the output on file lfn2. The default is OUTPUT. If you specify only the 0=lfn2 parameter in a batch job, the OP=p1p2...Pn parameter defaults to OP=A.
If you enter the ENQUIRE command with no parameters from an interactive job, the system gives a two-line report of the current job.

Example:

```
enquire

JSN: AAFA  SYSTEM: BATCH  SRU: 2.055  FILE NAME: SAMPOUT
STATUS: IDLE
```

It always returns the status IDLE. To get a report on the current job while the system is executing another command, enter the ctE or ctS command (refer to Interactive Status Commands in section 8).

If you enter the ENQUIRE command with no parameters in a batch job, the command defaults to ENQUIRE, OP=A.

**ENTER COMMAND**

The ENTER command enters a series of commands on one line. This is especially useful for interactive users operating in the batch subsystem.

Format:

```
ENTER./command1/command2/.../commandn
```

- **/** Delimiting character used to separate the individual commands on one line. It can be any character not used within the commands and must immediately follow a period or right parenthesis.
- **commandi** Any NOS command you are authorized to use. Interactive commands for which there are no batch counterparts are not acceptable.

The system supplies a terminator (period or right parenthesis) if it is missing from any command.

Example:

From a terminal, you enter the batch subsystem and type in an ENTER command on one line as follows:

```
bash
batch
RFL,0.
/enter.#get,fprog#ftn5,i=fprog#map,part#1go#exit#dmp#rewind,zzzdump#copy,zzzdump
```

This is the sequence of commands used in section 14 to illustrate the reading of CM dumps. Assuming that a FORTRAN 5 program is on the indirect access file FPROG, output like that shown in the figures in section 14 is produced when this command is processed.
ERRMSG COMMAND

The ERRMSG command controls the display of error messages generated by commands executed within a NOS procedure. An ERRMSG,OFF command inhibits the display of error messages at the terminal, although all messages are still listed in the dayfile. This command has no effect when issued from a batch job.

The ERRMSG command must be executed from within a procedure. The error message off status remains in effect until an ERRMSG,ON command is issued, or until your job returns to interactive command status. The error message off status is not affected by the entry of subsequent BEGIN or REVERT commands (that is, nested procedures).

Format:

```
ERRMSG,status
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Specifies whether error messages generated by commands within a procedure are displayed at the terminal. Values that can be specified for status are OFF (messages are not displayed) and ON (messages are displayed). The default value is ON.</td>
</tr>
</tbody>
</table>

GO COMMAND

The GO command clears the pause bit of one of your executing jobs. The system may have set the pause bit because of an error or a request for user input. You can set the pause bit with one of your programs or with the PAUSE command.

Format:

```
GO,jsn.
```

| jsn | Specifies the job sequence name (JSN) of the job whose pause bit you want to clear. |

You must check the status of the pause bit to effectively use this command. The program does not pause just because the pause bit is set. Similarly, the program does not proceed just because the pause bit has been cleared. You can write a program that checks the status of the pause bit and waits for that bit to be cleared (refer to the RECALL macro in Volume 4, Program Interface).

If you want to determine whether a PAUSE or GO command has been entered, write a program to set bit 13 of word RA and then status it. The system unconditionally clears bit 13 of word RA whenever the PAUSE/GO command sets/clears the pause flag (bit 12 of word RA). Hence, when the system clears it, you can check the pause flag. CPU programs that check the pause flag on NOS 1 continue to work properly on NOS 2, but these programs cannot determine when a PAUSE or GO command has been entered.
HTIME COMMAND

The HTIME command issues a dayfile message giving the model 176 accumulated clock cycle count for the job. A clock cycle on the model 176 is 27.5 nanoseconds. COMPASS instructions require a certain number of clock cycles to execute as described in the COMPASS Reference Manual. This command can be used for performance comparisons.

Format:

HTIME.

The resulting dayfile message has the following format. The cycle count is in kilocycle units.

HTIME nnnnnnnnnnn.nnn KCYCLES.

An HTIME command processed on a machine other than the model 176 produces the following dayfile message.

HTIME NOT AVAILABLE.
JOB COMMAND

The Job command, also known as the job card, specifies the user job name (UJN) and may specify job processing parameters. Refer to Job Names in section 3 for the significance of the user job name. The first command of a batch job must be a Job command.

Format:

```
ujn,P=priority,T=timelimit,CM=memory,EC=xmemory,ST=lid,AL=level.punchmode
or
ujn,Ppriority,Ttimelimit,CMmemory,ECxmemory,STlid,ALlevel.punchmode
or
ujn,SC=class,T=timelimit,CM=memory,EC=xmemory,ST=lid,AL=level.punchmode
or
ujn,SCclass,T=timelimit,CM=memory,EC=xmemory,ST=lid,AL=level.punchmode
or
ujn,priority,TTimelimit,memorY,xmemory,lid,level.punchmode
or
ujn,class,Timelimit,memorY,xmemory,lid,level.punchmode
```

All parameters except the parameter ujn are optional. If you include keywords when you specify optional parameters, they are order-independent. Otherwise, they are order-dependent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ujn</td>
<td>Alphanumeric user job name (UJN) of one to seven characters. This name identifies the individual jobs being run under the same user name.</td>
</tr>
<tr>
<td>P=priority</td>
<td>Specifies the priority level at which the job enters the system. Using this priority level, the system assigns the job a service class according to a site-defined algorithm. The value you specify must be an integer in the range of 0 through 7. The default for P=priority depends on your default service class assignments and your site-defined algorithm for mapping priority levels and service classes (refer to Job Service Classes in section 3). To assign a service class to your job directly, use the SC=class parameter.</td>
</tr>
<tr>
<td>SC=class</td>
<td>Specifies the service class to be assigned to the job. The value class must be one of the following values:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SY</td>
<td>System</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>class</td>
<td>Description</td>
</tr>
<tr>
<td>BC</td>
<td>Local batch</td>
</tr>
<tr>
<td>RB</td>
<td>Remote batch</td>
</tr>
<tr>
<td>TS</td>
<td>Interactive</td>
</tr>
<tr>
<td>DI</td>
<td>Detached interactive</td>
</tr>
<tr>
<td>NS</td>
<td>Network supervisor</td>

<tr>
<td>SS</td>
<td>Subsystem</td>
</tr>
<tr>
<td>MA</td>
<td>Maintenance</td>
</tr>
<tr>
<td>CT</td>
<td>Communication task</td>
</tr>
<tr>
<td>In</td>
<td>Installation-defined class n (0 ≤ n ≤ 3)</td>
</tr>
</tbody>
</table>

The default for SC=class depends on your default service class assignments (refer to Job Service Classes in section 3).

**AL=level**

Specifies the maximum security access level your job can attain. Unless changed by your site, the value level can be any one of the following names:

LVLO, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7

You may not be authorized to use all of these access levels (refer to the LIMITS command). The default is the lowest access level you are authorized to use. On an unsecured system, this parameter has no effect, but the system does ensure that you specify a valid level name.

**T=timelimit**

Specifies the central processor job step time limit in seconds. Values can range from 1 to 99999. Decimal is the default base. Octal values from 1 to 777777 (1 to 32767) can be entered if followed by a B suffix. The default limit is 64 (100B).† Decimal values from 32767 to 99999, or values that are greater than your validated time limit, set the time limit at its maximum. The time limit set by this parameter must be sufficient for completion of each of the steps in the job (refer to Time Limit Control in section 3).

**CM=memory**

Specifies the maximum octal field length for the job (refer to Field Length Control in section 3). The system rounds the value to the next highest multiple of 100B. The default value is the maximum field length for which you are authorized (refer to the LIMITS command) or the maximum field length available for user jobs (dependent on machine size), whichever is smaller. The field length cannot exceed 376500B. This is the absolute upper limit; however, your site may choose a lower limit.

†Your site can change this default.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC=xmemory</td>
<td>Specifies the maximum octal number of (1000_8), (2000_8), or (4000_8) word extended memory blocks required by the job. The extended memory block size is site dependent; the default block size is (1000_8) words. This extended memory field length cannot exceed the amount of user extended memory allowed by the installation (refer to the LIMITS command). Your job must request the extended memory (refer to the RFL command in section 7) before it can be used. A value containing an 8 or 9 or the suffix D is interpreted as decimal.</td>
</tr>
<tr>
<td>ST=lid</td>
<td>Specifies the logical identifier (LID) of the host to which you are routing the specified job. The LID must be a three-character alphanumeric string defined by site personnel. The local host is the default. You must have special authorization to use this parameter (refer to the LIMITS command).</td>
</tr>
<tr>
<td>punchmode</td>
<td>Specifies the conversion mode for card decks. This parameter must be entered in columns 79 and 80. A 26 indicates that coded cards are to be converted in 026 mode; 29 indicates cards are converted in 029 mode. This initial keypunch mode can be changed within the job by a conversion change card (refer to Coded Cards in appendix F) when reading cards or a ROUTE command when punching cards. If this parameter is omitted, the installation default keypunch mode is used. This conversion mode indicator is ineffective for remote batch jobs entered with mode 4 card readers; it is effective for remote batch jobs entered with HASP, 2780, and 3780 card readers.</td>
</tr>
</tbody>
</table>

The system issues error messages when parameter specifications exceed validation limits. It also issues an error message if an extended memory field length is specified when your central memory validation limit is less than \(10000_8\) words. Consult installation personnel for further installation restrictions based on the machine configuration and subsystems used.

Example:

```
JOBAAA,,1,50000,20.
```

has the same effect as:

```
JOBAAA,CM=50000,EC=20,T=1.
```

†Refer to the UEBS parameter in common deck PPCOM under Installation Parameters in the NOS 2 Installation Handbook.
**LDI COMMAND**

The LDI routine queues one or more jobs for input and optionally enters the job sequence name (JSN) of each job in the dayfile of the job that entered the LDI command. LDI initiates a new job each time it encounters an EOF. LDI starts processing at the current position of the file and continues until an EOI, double EOF, or EOF followed by an empty record is encountered. The jobs submitted are batch origin type jobs. LDI does no reformatting of the job file. Therefore, SUBMIT directives (/JOB,/USER,/NOSEQ, and so forth) are not allowed.

Format:

```
LDI,FN=fn, ID=id, OP=op, DC=dc, UN=un, FM=fm.
```

or

```
LDI, fn, id, OP, dc, un, fm.
```

The parameters in the first format are order-independent. Those in the second format are order-dependent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FN=fn</td>
<td>Specifies the name of the file containing the job(s) to be submitted. LOAD is the default.</td>
</tr>
<tr>
<td>ID=id</td>
<td>Specifies the identifier of the local device which will receive job output. The identifier id must be octal and in the range 0 through 67B. If you omit this parameter or specify only the keyword ID, implicit central site routing occurs (refer to Implicit Routing under the description of the ROUTE command, section 9). You may not specify ID=id parameter if you specify the UN=un or FM=fm parameter.</td>
</tr>
<tr>
<td>OP=op</td>
<td>Directs the system to enter the job sequence name (JSN) of each job in the dayfile of the job that issued the LDI command.</td>
</tr>
<tr>
<td>DC=dc</td>
<td>Specifies the disposition of output for each job that is queued for input.</td>
</tr>
<tr>
<td>UN=un</td>
<td>Specifies the user name of the remote batch user to whom the system routes each job's output. If you omit this parameter or specify only the keyword UN, implicit remote routing occurs (refer to Implicit Routing under the description of the ROUTE command, section 9). You may not specify this parameter if you specify the ID=id parameter.</td>
</tr>
</tbody>
</table>

**dc**

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN</td>
</tr>
<tr>
<td>NO</td>
</tr>
<tr>
<td>TO</td>
</tr>
</tbody>
</table>
Parameter | Description
---|---
FM=fm | Specifies the family name of the remote batch user to whom the system routes each job's output. You must have special authorization to specify an alternate family name (refer to the LIMITS command). If you omit this parameter or specify only the keyword FM, implicit remote routing occurs (refer to Implicit Routing under the description of the ROUTE command, section 9).

You may not specify this parameter if you specify the ID=id parameter.

The number of executing jobs and output files you have within the system cannot exceed your deferred batch job validation limit (refer to the LIMITS command in this section). If this limit is reached, no further jobs can be loaded until an existing job completes.

If any of the submitted jobs contain an invalid USER command, the job entering the LDI command is aborted with no exit processing. If you entered the command interactively, you are immediately logged off with no dayfile message. The security count for the user name that entered the LDI command is decremented accordingly.

**LENGTH COMMAND**

The LENGTH command gives you the current status of one of your local files.

Format:

```
LENGTH, lfn.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Name of a file assigned to the job.</td>
</tr>
</tbody>
</table>

The information given for the local file includes its length in PRUs, type, and current status. The same information can be obtained with the ENQUIRE command.
LIMITS COMMAND

The LIMITS command directs the system to list your validation limits. The LIMITS command always lists the validation limits associated with the job's current user name. However, if a job contains more than one USER command, the actual limits associated with the job are a combination of the limits of the first user name and those of the current user name. You can use the ENQUIRE(OP=U) command to determine what your actual limits would be in such a case.

Format:

LIMITS,L=ln.

Parameter Description
L=ln

Specifies the file which receives the validation information. The default is OUTPUT.

The validation limits show the extent to which you can use various system resources. The LIMITS output falls into the following categories:

- Resource Limits.
- Other Characteristics.
- User Permissions.
- Network Applications.
- Privileged Network Applications.
- Local Applications.
- Shell Permissions.
- Security Permissions.
- Security Access Categories.
- Security Access Levels.
- Service Classes.
- Default Service Classes.

If there are no entries for a category, the system suppresses the header for that category.
RESOURCE LIMITS

The system indicates the maximum number of specific system resources you can use. The following list shows the resources that appear in this category:

- Magnetic tape units that may be assigned.
- Removable auxiliary devices that may be assigned.
- CPU seconds allowed for each job step.
- Central memory words allowed.
- Extended memory words allowed.
- Jobs that can be detached.
- Deferred batch files allowed.
- Permanent files allowed in your catalog.†
- PRUs available for any one indirect file.
- PRUs available for any one direct file.
- PRUs available for all indirect files.
- PRUs available per job.
- Messages that may be issued to the dayfiles.
- Batch commands that may be processed.
- Cards that may be punched per file.
- Lines that may be plotted per file.
- Lines that may be printed per file.
- SRUs allowed per job.

The maximum number of deferred batch jobs does not apply to you if you have system privileges and debug mode is set on the system display console or if your jobs are of the system origin type.

†The value SYSTEM denotes that you do not have a static limit for the number of permanent files allowed in your catalog. Whenever you initiate a permanent file operation, the system assigns a limit, which can vary with the service class of your job.
OTHER CHARACTERISTICS

This category lists some general characteristics associated with your user name and your jobs. The list may include any of the following:

- User index.
- Default charge number.
- Default project number.
- User prologue.
- System prologue.
- Default subsystem for interactive jobs.
- Default character set mode for interactive jobs.
- Expiration dates for your user passwords.
USER PERMISSIONS

In addition to specifying resource limits for certain resources, the system lists special privileges that you possess. The following is a list of these special privileges:

- Change your passwords.
- Use privileged interactive commands.
- Create direct access files.
- Create indirect access files.
- Have system origin privileges.
- Access/create library files.
- Assign magnetic tapes.
- Access system without supplying charge/project number.
- Access or create files on auxiliary devices.
- Access transaction functions for library updates.
- Have unlimited terminal connect time without timeout.
- Use system control point facility.
- Have special accounting privileges.
- Have the BIO subsystem privilege to use the V carriage control character in a user-specified PFC array in a file.
- Use the PROTECT command.
- Transfer permanent files between hosts.
- Transfer queued files between hosts.
- Access the NVE subsystem.
- Specify charge numbers other than the default charge number.
- Define a password without random characters.
- Have remote maintenance privileges.
- Control network processing units (NPUs).
- Specify an alternate family during a job.
- Specify mainframe logical identifiers (LIDs) on the Job and ROUTE commands.
- Specify permanent file residence as Locked to Disk (PR=L).
- Access the system without specifying a personal identifier.
- Use more than one interactive terminal at the same time.
- Perform privileged analyst operations if PRIVILEGED ANALYST MODE is enabled.
NETWORK APPLICATIONS

The following are network applications you may be authorized to use:

- Interactive Facility (IAF).
- Interactive Transfer Facility (ITF).
- Message Control System (MCS).
- Network Operator Utility (NETOU).
- Network Job Entry Facility (NJF).
- PLATO - NAM Interface (PLATO).
- Printer Support Utility (PSU).
- Remote Batch Facility (RBF).
- Terminal Verification Facility (TVF).
- Tieline Facility (TLF).
- Transaction Facility (TAF).
- NOS/VE Interactive Facility (VEIAF).

LOCAL APPLICATIONS

The system lists local applications you are authorized to use. If there are no such applications, this category does not appear in the output.

PRIVILEGED NETWORK APPLICATIONS

The system lists the privileged network applications you are authorized to use. The Communications Supervisor (CS) is one such application.

SHELL PERMISSIONS

The system lists controls applicable to a shell program you write to monitor commands entered under your user name. The list includes the following:

- Clear controls upon loading errors with shell program.
- Clear shell processing if screening program aborts.
- Local file load of shell program.
- Global file load of shell program.
- System library load of shell program.
- Monitor commands from terminal.
- Monitor commands outside of procedures.
- Monitor commands inside of procedures.
SECURITY PERMISSIONS

There are special security-related permissions you may possess. The list may include any of the following permissions:

- Write unlabeled magnetic tapes.
- Write to or extend a file with an access level lower than your job access level.
- Lower file access levels.
- Lower your job access level.
- Assign an expiration date for a file password or file permission.
- Assign an expiration date for your user password.
- Execute on-line diagnostics.
- Perform security administrator duties.

SECURITY ACCESS CATEGORIES

The system lists the access categories you can associate with your permanent files. When you create a permanent file, the system associates all categories for which you are authorized with this file. You can change this association with the SETPFAC command.

SECURITY ACCESS LEVELS

The system lists a set of access levels that determine the access levels at which your jobs may run and the access levels at which you may create or access files.

SERVICE CLASSES

The system lists all of the service classes you can assign to a job. Your site can further restrict the use of a service class to jobs of certain origin types. You can determine these restrictions with the CLASS command.

DEFAULT SERVICE CLASSES

The system lists the service class it initially assigns to your job if you do not specify a service class on the Job command or ROUTE command. This default assignment can vary with the origin type of your job. Unlike most other validation limits and privileges, you can change this default assignment with the CHVAL command.
The following is an example of a user's validation limits:

/limits
LIMITS FOR STARSKY FM/NOSCLSH 83/08/09. 17/11/13/

MAXIMUM NUMBER OF -
MAGNETIC TAPE UNITS THAT MAY BE ASSIGNED.............. 3
REMOVABLE AUXILIARY DEVICES THAT MAY BE ASSIGNED...... 2
CPU SECONDS ALLOWED FOR EACH JOB STEP.................... UNLIMITED

FOR BATCH ORIGIN IS.......................... BC
FOR REMOTE BATCH ORIGIN IS.................. RB
FOR INTERACTIVE ORIGIN IS.................... TS
INQUIRY COMPLETE.
LISTLID COMMAND

The LISTLID command lists information on the configuration of your network and on the availability of hosts in the network. Information available through LISTLID includes:

- Logical identifiers (LIDs) and physical identifiers (PIDs) for hosts in the network. LIDs are used in certain NOS commands (for example, Job, ROUTE, MFLINK, and MFQUEUE) to specify the destination host for a job or file routing operation.
- The subsystem(s) available to provide network communications. This could be any or all of the following: Remote Host Facility (RHF), Network Access Method (NAM), and SCOPE 2 Station Facility (SSF).
- Host characteristics such as local host or linked status, store and forward capabilities, and host availability.

Note that the site administration has the option of choosing whether information for any given LID or PID can be listed using the LISTLID command.

Format:

\[
\text{LISTLID, LID}=\text{lid}, \text{PID}=\text{pid}, \text{L}=\text{lfn} \\
\text{or} \\
\text{LISTLID, ST}=\text{lid}, \text{PID}=\text{pid}, \text{L}=\text{lfn}
\]

Parameter | Description
---|---
LID=lid or ST=lid | Specifies the LID for which information is to be displayed. If LID=lid or ST=lid is specified, information is listed for the specified LID. (The LID and ST keywords are interchangeable; either may be used, but not both.) If this parameter is omitted and the PID parameter is also omitted, information is listed for all LIDs in the network.
PID=pid | Specifies that output is to be listed only for LIDs associated with this PID. If the LID=lid parameter is also specified, information is listed only for that LID. If no LID=lid parameter is specified, information is listed for all LIDs associated with this PID. If only the keyword PID is specified, information is listed on all LIDs, grouped according to their associated PIDs.
L=lfn | Specifies that LISTLID output is to be written to file lfn. If this parameter is omitted, output is written to file OUTPUT.

Examples:

\[
\text{LISTLID.} \\
\text{LISTLID, LID}=\text{lid}, \text{PID}=\text{pid}, \text{L}=\text{lfn}
\]

This command lists information on all LIDs in the network for which the site allows information to be listed. The information is listed in output format l.

\[
\text{LISTLID, LID}=\text{lid}, \text{L}=\text{lfn}
\]

This command lists information on all LIDs in the network with the name lid except those that the site does not allow to be listed. The information is listed in output format l on file lfn.

†Hosts connected through an X.25 network are always considered available as long as the network processing unit (NPU) connecting your host to the X.25 network is available.
LISTLID,LID=lid,PID=pid.

This command provides information on the named LID associated with the specified PID. If the site does not allow listing of the named LID, or of both the named LID and PID, the system returns a dayfile message indicating that the specified LID was not found. If the site allows the LID to be listed but not the PID, LISTLID outputs information using format 2; however, the system will not display the PID name or the names of available subsystems. Instead, the system replaces those names with the characters ---.

LISTLID,LID=lid,PID.

This command lists all LIDs with the name lid except those that the site does not allow to be listed. The specified LIDs are listed under their associated PIDs using output format 2.

LISTLID,PID.

This command uses output format 2 to list all LIDs, grouped according to their associated PIDs. Any LIDs that the site does not allow to be listed are omitted from the output. Any PIDs that cannot be listed are replaced by the characters ---.

LISTLID,PID=pid.

This command uses output format 2 to list all LIDs associated with the specified PID. Any LIDs that the site does not allow to be listed are omitted from the output. If the PID cannot be listed, pid is replaced with the characters ---.

LISTLID uses two output formats. Output format 1 is used when the LISTLID command does not contain a PID parameter.

- Example of output format 1:

<table>
<thead>
<tr>
<th>LID</th>
<th>MAINFRAME</th>
<th>ATTRIBUTE</th>
<th>NETWORK</th>
</tr>
</thead>
<tbody>
<tr>
<td>M64</td>
<td>NOS 964</td>
<td>LOOPBACK</td>
<td>RHF,SSF</td>
</tr>
<tr>
<td>M42</td>
<td>NOS 420</td>
<td>LINKED</td>
<td>NONE AVAILABLE</td>
</tr>
<tr>
<td>B2C</td>
<td>VSOS</td>
<td>LINKED</td>
<td>RHF</td>
</tr>
<tr>
<td>MFZ</td>
<td>SCOPE2</td>
<td>LINKED</td>
<td>SSF</td>
</tr>
<tr>
<td>MS1</td>
<td>NOS MS1</td>
<td>LINKED</td>
<td>NAM</td>
</tr>
</tbody>
</table>

In output format 2, the attributes listed for each PID are also applicable for each LID listed under that PID. In the above example, therefore, LID M64 has the attributes H and V, while LID LBK has the attributes H, V, and B.
Attributes listed in the ATTRIBUTE column can be listed by name or by mnemonic.

<table>
<thead>
<tr>
<th>Attribute Name</th>
<th>Mnemonic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOST</td>
<td>H</td>
<td>Indicates that this is the local host (that is, the host you are logged into).</td>
</tr>
<tr>
<td>LINKED</td>
<td>L</td>
<td>Indicates that this host is linked to your local host.</td>
</tr>
<tr>
<td>STORE FORWARD</td>
<td>S</td>
<td>Indicates that you can transfer queued files to this host through an intermediate linked host.</td>
</tr>
<tr>
<td>VALIDATION</td>
<td>V</td>
<td>Indicates that user validation is performed by the local host as well as by the destination host. If this attribute is not listed for your local host, user validation is performed only by the destination host.</td>
</tr>
<tr>
<td>LOOPBACK</td>
<td>B</td>
<td>Indicates that the LID is a loopback LID (used for test purposes).</td>
</tr>
</tbody>
</table>

Entries that can be listed in the RHF, NAM, and SSF columns are as follows:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN</td>
<td>Indicates that the link to the PID is in service. Note that for RHF networks and NAM X.25 public data networks, an in service (IN) status is returned whenever the network is in service, without regard to whether the remote host itself is available. To determine if the remote host is available, you can attempt a file transfer to that host.</td>
</tr>
<tr>
<td>NA</td>
<td>Indicates that the subsystem is not available or that no link exists to this PID through this subsystem.</td>
</tr>
<tr>
<td>OUT</td>
<td>Indicates that the link to the PID is out of service due to a network fault condition.</td>
</tr>
<tr>
<td>DISABLED</td>
<td>Indicates that the link to the PID has been disabled by the console operator.</td>
</tr>
</tbody>
</table>
**MACHINE COMMAND**

Some programs that ran on mainframes other than models 815, 825, 835, 845, and 855 will not run on the models 815, 825, 835, 845, and 855 until changes are made in your job. Programs most likely to run incorrectly on models 815, 825, 835, 845, and 855 are COMPASS programs with tight instruction-modification loops. The MACHINE command enables some of these programs to run correctly on these models.

Format:

```
MACHINE, EP=state.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EP=state</td>
<td>Specifies whether extended stack purging is selected. EP=ON selects it and EP=OFF disables it.</td>
</tr>
</tbody>
</table>

Instruction stack purging is extended by specifying ON and is made normal by specifying OFF and remains in effect until a subsequent MACHINE command or MODE macro alters it. The initial status of stack purging is site-selectable. For more information on stack purging, refer to the MODE macro in Volume 4, Program Interface.

To determine if a program will run correctly on models 815, 825, 835, 845, and 855, run the job with extended stack purging disabled (EP=OFF). If unexpected results occur, do another run with stack purging extended (EP=ON). When stack purging is extended, the execution time of the program may be increased. If unexpected results still occur, recode COMPASS programs or recompile high-level language programs on models 815, 825, 835, 845, and 855.

**MFL COMMAND**

The MFL command resets the maximum field length for each subsequent job step.

Format:

```
MFL, CM=nnnnnn, EC=mmmm.
```

or

```
MFL, nnnnnn, mmmm.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CM=nnnnnn</td>
<td>Specifies the maximum central memory field length (octal is assumed unless decimal is specified by a D suffix or use of the digits 8 or 9).</td>
</tr>
<tr>
<td>EC=mmmm</td>
<td>Specifies the maximum extended memory field length. The value of mmmm is the actual extended core field length divided by 10008.</td>
</tr>
</tbody>
</table>

The first format is the order-independent form and the second format is the order-dependent form.
The parameter nnnnnn sets an upper boundary for the field length of subsequent job steps. The value cannot exceed the maximum field length for the job nor can it be less than 1500, the field length required for the utility (CONTROL) that processes MFL. If extended memory is assigned for the job, the CM field length cannot be less than 10000. Likewise, the parameter mmmm sets an upper boundary for the extended memory field length of subsequent job steps and cannot exceed the maximum field length for the job. If the value 0 (zero) is entered for CM or extended memory field length, the MFL is set to either the maximum field length for which you are authorized or the field length specified on the Job command, whichever is smaller.

The MFL command clears any initial running field length previously established with the RFL command or the SETRFL macro and allows the system to determine the field length for each succeeding job step. The system continues to determine field lengths until another RFL command or SETRFL macro is encountered.

**NORERUN COMMAND**

The NORERUN command clears the job rerun status.

Format:

```
NORERUN.
```

If the NORERUN command has been issued, the job may not be rerun. This may be desirable to prevent updating of a data base when the job would otherwise be rerun at deadstart or by the operator.

This command is ignored from an interactive origin job.

**NOTE COMMAND**

The NOTE command creates a file containing lines of data entered as a character string on the same line as the command.

Format:

```
NOTE,lfn,NR./line1/line2/.../line_n
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file which contains the specified lines. Default is OUTPUT.</td>
</tr>
<tr>
<td>NR</td>
<td>Inhibits rewind of lfn. Default is to rewind the file at the beginning and end of NOTE command execution.</td>
</tr>
<tr>
<td>/</td>
<td>Specifies the delimiting character used to separate the individual entries that become lines in the file. It can be any character. It must immediately follow a period or right parenthesis. Multiple delimiters generate blank lines.</td>
</tr>
<tr>
<td>line_n</td>
<td>Specifies the character string which constitutes one line of data in lfn.</td>
</tr>
</tbody>
</table>

If a file contains more lines than can be entered with a single NOTE command, a series of NOTE commands, each with an NR, can be used. This series should be followed with a PACK command since each NOTE command writes an EOR.
Example:

The following sequence of commands creates a procedure file (PFILE) that can insert an input record after any record in an existing master file (LISTFIL).

```plaintext
NOTE,PFILE,NR.+PROC,INSERT*I,N.+GET,LISTFIL.+COPYBR,LISTFIL,NEWLIST,N.  
NOTE,PFILE,NR.+COPYBR,INPUT,NEWLIST.+COPYEI,LISTFIL,NEWLIST.  
NOTE,PFILE,NR.+REPLACE,NEWLIST=LISTFIL.  
PACK,PFILE.  
SAVE,PFILE.  
```

To insert an input record after the second record in LISTFIL, the user includes the following command in the job that contains the new input record.

```
BEGIN,INSERT,PFILE,2.  
```

**OFFSW COMMAND**

The OFFSW command clears the sense switches for reference by one of your jobs.

**Format:**

```
OFFSW,switch1,switch2,...,switchn,jsn.  
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switch1</code></td>
<td>Specifies the switches to be cleared. You must denote each <code>switch1</code> by an integer in the range of 1 through 6. If you specify 0 for this parameter, the system clears all sense switches.</td>
</tr>
<tr>
<td><code>jsn</code></td>
<td>Specifies the job sequence name (JSN) of the job whose sense switches will be changed. <code>jsn</code> is an optional parameter; its default is the JSN of the current job. The system recognizes the <code>jsn</code> parameter by its alphabetic characters; therefore, <code>jsn</code> can appear anywhere in the parameter list and can be omitted without leaving a blank parameter field.</td>
</tr>
</tbody>
</table>

Refer to the description of the ONSW command for further information on sense switch settings.
**ONSW COMMAND**

The ONSW command sets the sense switches for reference by one of your jobs. The system stores the sense switch settings in your control point area and copies them to RA at the beginning of each job step for use by the central program. The sense switch field in the control point area and the one in RA are updated separately.

Format:

```
ONSW,switch1,switch2,...,switchn,jsn.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>switchi</td>
<td>Specifies the switches to be set. You must denote each switchi by an integer in the range of 1 through 6. If you specify 0 for this parameter, the system sets all sense switches.</td>
</tr>
<tr>
<td>jsn</td>
<td>Specifies the job sequence name (JSN) of the job whose sense switches will be changed. jsn is an optional parameter, its default is the JSN of the current job. The system recognizes the jsn parameter by its alphabetic characters; therefore, jsn can appear anywhere in the parameter list and can be omitted without leaving a blank parameter field.</td>
</tr>
</tbody>
</table>

You can also use the SWITCH command to set the sense switches.

**PASSWOR COMMAND**

The PASSWOR command changes the passwords associated with your user name. To use PASSWOR, you must be authorized to change your password. (Refer to the LIMITS command to determine if you are authorized to change your password.) Your user name has two passwords:

- The interactive password, which must be entered when logging in.
- The batch password, which must be included in batch and remote batch jobs.

You may specify the password you want the system to change. If you omit this parameter selection, the system changes the password that matches the origin type of your job. That is, a PASSWOR command in an interactive job changes your interactive password; a PASSWOR command in a batch or remote batch job changes your batch password.

If your site uses the password randomization feature, you can enter the PASSWOR command only from an interactive job. When you select a new password, the system appends a site-determined number (from two to five) of randomly generated characters to it.

Format:

```
PASSWOR,oldpassword,newpassword,XD=expiredate,PT=passwordtype.
```

or

```
PASSWOR,oldpassword,newpassword,XT=expireterm,PT=passwordtype.
```

or

```
PASSWOR.
```

7-42
**Parameter** | **Description**
---|---
oldpassword | Specifies the old password. This is a required parameter if password randomization is used.
newpassword | Specifies the new password. The new password must not be more than seven characters long. Your site determines the minimum length of passwords (4 is the default). This is a required parameter if password randomization is used.
XD=expirdate | Specifies the expiration date for the password. The value expirdate must be a six-digit string of the form yymmdd, where yy, mm, dd are two-digit year, month, and day designators, respectively. The latest date you can specify and the default expiration date are site-determined.
XT=expireterm | Specifies the life of the password in days. If you specify 0, the password expires immediately. If you specify 4095 or *, the password does not expire. The default expiration term and the maximum expiration term are site-determined (no site can choose a value greater than 4095).
PT=passwordtype | Specifies the type of password to be changed.

<table>
<thead>
<tr>
<th>passwordtype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Batch.</td>
</tr>
<tr>
<td>I</td>
<td>Interactive.</td>
</tr>
</tbody>
</table>

If you omit the PT parameter, the password that matches the origin type of your job is changed.

You cannot specify a new expiration date (using either XD or XT) without also specifying the oldpassword and newpassword parameters. Also, if you omit both the XD and XT parameters when you enter the PASSWOR command, the default expiration date is the current date plus the site-determined expiration term.

The first and second formats of the PASSWOR command can be entered either from batch or interactive jobs. These formats cannot be used if the password randomization feature is used.

The use of the third format of the PASSWOR command is dependent on whether or not your site uses the password randomization feature.

For sites that do not use password randomization, the third format of the PASSWOR command can be used for added security and can be entered from either an interactive or batch job. When entered from an interactive job, the system prompts you to enter the password type, the old password, and the new password. If you are authorized to set an expiration date, the system also prompts you for an expiration date or term. When entered from a batch job, the third format of the PASSWOR command can be used only to change the batch password. The system reads the parameters from a record in file INPUT. This record must be a single line of the format:
oldpassword, newpassword
or
oldpassword, newpassword, expiratedate
or
oldpassword, newpassword, expireterm

For sites using password randomization, the third format is the only valid format, and it must be entered from an interactive job.

**PAUSE COMMAND**

The PAUSE command sets the pause bit of one of your executing jobs.

**Format:**

```
PAUSE, jsn.
```

**Parameter** | **Description**
---|---
jsn | Specifies the job sequence name (JSN) of the job whose pause bit you want to set.

You must check the status of the pause bit to effectively use this command. The program does not pause just because the pause bit is set. Similarly, the program does not proceed just because the pause bit has been cleared. You can write a program that checks the status of the pause bit and waits for that bit to be cleared (refer to the RECALL macro in Volume 4, Program Interface).

If you want to determine whether a PAUSE or GO command has been entered, write a program to set bit 13 of word RA and then status it. The system unconditionally clears bit 13 of word RA whenever the PAUSE/GO command sets/clears the pause flag (bit 12 of word RA). Hence, when the system clears it, you can check the pause flag. CPU programs that check the pause flag on NOS 1 continue to work properly on NOS 2, but these programs cannot determine when a PAUSE or GO command has been entered.

**PROTECT COMMAND**

The PROTECT command is used to activate or deactivate preservation of the extended memory assigned to your job field between job steps. Ordinarily, the extended memory assigned to your job is zeroed at the completion of a job step. With EC=ON, it is preserved between job steps.

You must be authorized to use the PROTECT command (refer to the LIMITS command in this section).

**NOTE**

The PROTECT command inhibits the release of extended memory by the system between job steps. However, if the LOADER is called to load an absolute program or program overlay, PRESET must be defined as NONE with an LDSET command to the LOADER or with the LOADER build directive PRESET=NONE at the time that the system is built. If PRESET=NONE is not defined, then extended memory is not preserved across job steps regardless of the status of the PROTECT command.
Format:

`PROTECT,EC=state.`

or

`PROTECT,state.`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC=state</td>
<td>Activates or deactivates extended memory preservation. You can specify two values for state:</td>
</tr>
<tr>
<td>state</td>
<td>Description</td>
</tr>
<tr>
<td>ON</td>
<td>Activates the preservation of memory.</td>
</tr>
<tr>
<td>OFF</td>
<td>Deactivates the preservation of memory. OFF is the default.</td>
</tr>
</tbody>
</table>

**QGET COMMAND**

The QGET command assigns a queued file to your job. You must specify the job sequence name (JSN) or the user job name (UJN) associated with the queued file. Unless explicitly routed elsewhere, the file remains with your current job. If a local file already exists with the same name as the queued file, the QGET operation is aborted.

Format:

`QGET,JSN=jsn,DC=q,UJN=ujn,FN=lfn.`

or

`QGET,jsn,q,ujn,lfn.`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSN=jsn</td>
<td>Specifies the four-character, system-generated JSN associated with the queued file.</td>
</tr>
<tr>
<td>DC=q</td>
<td>Specifies the disposition of the queued file. WT is the default.</td>
</tr>
<tr>
<td>q</td>
<td>Description</td>
</tr>
<tr>
<td>PR</td>
<td>Print</td>
</tr>
<tr>
<td>PU</td>
<td>Punch</td>
</tr>
<tr>
<td>PL</td>
<td>Plot</td>
</tr>
<tr>
<td>WT</td>
<td>Wait</td>
</tr>
<tr>
<td>IN</td>
<td>Input</td>
</tr>
<tr>
<td>UJN=ujn</td>
<td>Specifies the UJN associated with the queued file.</td>
</tr>
<tr>
<td>FN=lfn</td>
<td>Specifies the local file name for the queued file. If specified, the JSN is the default local file name. Otherwise, the default is the UJN.</td>
</tr>
</tbody>
</table>

If you specify neither a JSN nor a UJN or specify a UJN associated with two queued files with the same disposition, a fatal system error occurs.
The QUEUE7 command allows you to examine the system batch queues in linked SCOPE 2 systems.

The QUEUE7 command has two formats:

```
QUEUE7,ID=pid,L=1fn,p1,p2,p3,p4.
```

or

```
QUEUE7,help.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID=pid</td>
<td>Specifies the physical identifier (PID) of the SCOPE 2 mainframe to be searched. If no PID is specified, all mainframes are searched. This parameter may be specified with the parameter name (ID) and equal sign omitted.</td>
</tr>
<tr>
<td>L=1fn</td>
<td>Specifies the name of the file to receive the QUEUE7 output. The default is OUTPUT.</td>
</tr>
<tr>
<td>P1</td>
<td>Specifies the SCOPE 2 queues (input, output, execute, or punch) to be displayed. Valid options for P1 are listed below. From one to four options can be specified. The default is E.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>P1</th>

QUEUE7 COMPLETE

Figure 7-1. QUEUE7 Execute Queue Sample Listing

Column headers for the QUEUE7 execute queue listing have the following meanings:

Header | Description
---|---
ORD | The job ordinal.
ACTION ID | The station/terminal identifier of the terminal from which the job expects a response; present only when the job requires a response.
JOBNAME | Job name of the executing job.
PRTY | Priority of the job; must be in the range of 0 to 7777.
JOB ORIGIN | Station/terminal identifier of the terminal from which the job was submitted.
TIME USED | CPU seconds used by the job.
TIME LEFT | CPU seconds remaining for execution.
LCM IN USE | Number of LCM buffers in use by the job.
JOB STAT | Current processing state of the job.
BG | Indicates that the job will be scheduled as a background priority job.
FIRST ACTION MESSAGE/
LAST DAYFILE MESSAGE

If there are action messages for the job, the message is the first action message; otherwise, the message is the last dayfile message.

**ACTION** Indicates that the above message requests an operator action such as a tape mount.

**CFO RESP** Indicates that the above message requests the operator to respond with a CFO type entry.

**RESPONSE** Indicates that the above message requests the operator to respond with a command such as GO or DROP.

```

Figure 7-2. QUEUE7 Input Queue Sample Listing
Column headers for the QUEUE7 input queue listing have the following meanings:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORD</td>
<td>Input queue suffixed with the last letter of the SCOPE 2 physical identifier.</td>
</tr>
<tr>
<td>FILENAME</td>
<td>File name of the input job as specified on the job card.</td>
</tr>
<tr>
<td>FILE ORIGIN</td>
<td>Identifier of the station/terminal from which the job was submitted.</td>
</tr>
<tr>
<td>PRTY</td>
<td>File priority; must be in the range from 0 to 7777.</td>
</tr>
<tr>
<td>DEVICE-REQUIREMENTS</td>
<td>The number of magnetic tape or disk devices assigned to the job.</td>
</tr>
<tr>
<td>TIME LIMIT</td>
<td>Job time limit as specified on the job card.</td>
</tr>
<tr>
<td>DEPEND</td>
<td>A two-character dependency identifier as specified on the job card.</td>
</tr>
<tr>
<td>BG</td>
<td>Indicates that the job will be scheduled as a background priority job.</td>
</tr>
</tbody>
</table>

Figure 7-3. QUEUE7 Output Queue Sample Listing
Column headers for the QUEUE7 output queue listing have the following meanings:

**ORD**  Output queue ordinal suffixed with the last letter of the SCOPE 2 physical identifier.

**FILENAME**  File name of the output file as specified on the job card.

**FILE DESTIN**  Station/terminal identifier of the terminal to which the output file is to be routed.

**PRTY**  File priority. Must be in the range from 0 to 7777.

**DISP CODE**  File disposition code.

**FORM CODE**  Forms code of the file.

**FILE SIZE**  File length in PRUs.

**FILE IN TRANSFER**  Indicates whether or not the file is currently being transferred to a station. Possible values are Y for yes, and N for no.

**REDO COMMAND**

The REDO command allows you to modify and reenter a previously entered command without retyping the entire command.

**Format:**

```
REDO,string/GO.
```

or

```
R,string/GO.
```

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>Specifies the initial characters of the command to be modified and reentered. string can be up to 10 characters long. If string is specified, the system searches for the most recently entered command beginning with that string. If string contains one or more leading blanks or asterisks, the command to be located may have leading blanks. If string is omitted, the system reenters the command immediately preceding the REDO command.</td>
</tr>
<tr>
<td>GO</td>
<td>Reenters the specified command without modification. Display of the OLD:, MOD:, and NEW: prompts is suppressed.</td>
</tr>
</tbody>
</table>

**NOTE**

The GO option is forced on noninteractive jobs.

When you enter the REDO command, the system prints the characters OLD:, followed by the command to be modified, with leading blanks removed. On the next line, the system prints the characters MOD: as a prompt for you to enter modifications to the line. You enter modifications using the modification symbols described below. When you finish your modifications and enter a carriage return, the system removes leading blanks from the modified line, prints the characters NEW:, followed by the modified line, then executes the command. Following is an example of a CATLIST command that is altered to specify a different file name:

```
/REDO
OLD:  CATLIST,LO=F,FN=BTK
MOD:   fac
NEW:  CATLIST,LO=F,FN=FAC
```
In this example, the user spaced over to the last three characters in the line and typed in a new file name.

The REDO command modification symbols are as follows:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>space</td>
<td>Leaves the character unchanged.</td>
</tr>
<tr>
<td>#</td>
<td>Deletes the character and shifts the remainder of the line one character to the left.</td>
</tr>
<tr>
<td>&amp;</td>
<td>Replaces the character with a space.</td>
</tr>
<tr>
<td>^</td>
<td>Inserts a character string before the character marked by the ^. The inserted string is terminated by a # or a carriage return. If a ^ is followed immediately by a # or a carriage return, the line is redisplayed as modified up to that point, and further modifications are allowed.</td>
</tr>
<tr>
<td>!</td>
<td>Deletes the remainder of the line.</td>
</tr>
<tr>
<td>other</td>
<td>Any other character entered replaces the original character.</td>
</tr>
</tbody>
</table>

Example:

```
/REDO
OLD: RECLAIM/DUMP,TN=MYVSN,PF=/ALPHA,GAMMA=BETA
MOD: ^,Z,# DF FIL\DT=MS,
NEW: RECLAIM,Z./DUMP,DF=MYFIL,DT=MS,PF=/ALPHA,GAMMA=BETA
```

**RERUN COMMAND**

The RERUN command sets job rerun status.

**Format:**

```
RERUN.
```

If the RERUN command has been issued, the operator can rerun the job if necessary. This command is ignored from an interactive origin job.

**RESOURC COMMAND**

The RESOURC command is required in any job that uses more than one tape or removable auxiliary pack concurrently. It prevents deadlocks with other jobs that may need the same resources. You do not need to use a RESOURC command if you have only one multivolume tape file or multipack disk file because the system treats each as only one resource unit. Nonremovable auxiliary packs should not be specified on the RESOURC command. (Nonremovable packs are always available to all users.)

**NOTE**

The RESOURC command should precede the first tape or pack request in a job.
Format:

RESOURC,rt<sub>1</sub>=u<sub>1</sub>/level<sub>1</sub>,rt<sub>2</sub>=u<sub>2</sub>/level<sub>2</sub>,...,rt<sub>n</sub>=u<sub>n</sub>/level<sub>n</sub>.

<tr>
<td>DW</td>
<td>819 Disk Storage Subsystem (double-density)</td>
</tr>
</tbody>
</table>

The value m denotes the number of units (spindles) required for a particular auxiliary disk file that you access in your job. In this case, the rt<sub>i</sub> value must correspond to the R=r specification on the permanent file command that references the disk pack (refer to section 10).

Maximum number of units of resource type rt<sub>i</sub> this job will use concurrently; any rt<sub>i</sub>=u<sub>i</sub> entry can be changed on subsequent RESOURC commands. (Refer to Altering Resource Requirements.) An rt=0 entry can be entered to clear a resource type that is no longer required.

Specifies the security access level at which you want to access magnetic tape units. The parameter is ignored for auxiliary disk packs. Unless changed by your site, level can be one of the following names:

LVLO, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7

The default is the current job access level.

On a secured system, the access level you specify must be valid for the job (ENQUIRE,B returns this information) and for the device to which you are assigning the file.

On an unsecured system, the parameter has no effect. The system does, however, check for valid parameter specifications.

†Retained for compatibility with NOS 1.2. Refer to restrictions described under Tape Units in this section.
DEADLOCK PREVENTION

The system manages the use of tape units and disk packs so as to prevent deadlocks from occurring. A deadlock means that the system, by assigning a tape unit or pack to one job, prevents another job with currently assigned resources from completing. For example, an installation with two tape units is processing jobs A and B. Each job needs both units during some phase of processing. Job A is assigned unit 1. If job B were assigned unit 2, neither A nor B could complete until the other job relinquishes its assigned unit.

To prevent deadlocks from occurring, the system requires that a RESOURC command be included in any job that uses more than one tape or disk pack concurrently. Thus, in the previous example, a RESOURC command is required in both jobs. The information supplied by the commands enables the system to anticipate the deadlock situation and roll out job B until job A no longer needs both units. When the RESOURC command is executed, the system first checks if the specified number of units exceeds the number of units you are authorized to use or the number of units available at the installation. If either of these situations occurs, the system issues an error message to your dayfile and aborts the job. (Refer to figure 7-4.)

†For jobs that use only one tape or pack at a time and do not contain a RESOURC command, the system checks validation limits when the request is made.
The commands are described in sections 10 and 12.
††Refer to Resource Overcommitment later in this section.

Figure 7-4. Resource Commitment Processing (Simplified)

When the job requests a tape or pack,† the system compares the number of units that jobs being processed have scheduled via RESOURC commands with the number of units actually assigned. If it determines that the assignment would cause a deadlock (refer to Resource Overcommitment), it rolls out the job until a deadlock would not occur. If the assignment would not cause a deadlock, the system searches for the requested tape or pack. If found, it is assigned to the requesting job. If the pack is not found and the NA keyword was included in the request or if the tape is not found, the requesting job is rolled out until the operator makes the pack or tape available.

††Refer to Permanent File Commands in section 9 for a description of disk pack requests and to Tape Management Commands in section 12 for a description of tape requests.
NOTE

If a job already has a tape or pack assigned when the RESOURC command is issued and the system determines that the assignment would cause a deadlock, the job aborts and the system issues a RESOURCE DEMAND ERROR message.

SINGLE RESOURCE USE

A job that uses only one tape or disk pack concurrently does not need to specify resource demand with a RESOURC command. However, before assigning the same or a different type of resource, the current single resource (tape or disk pack) must be returned with either the RETURN or UNLOAD command. To allow more flexible resource handling, both the RETURN and UNLOAD functions decrement the default resource demand count from one to zero for jobs requiring only one tape or disk pack concurrently. For those jobs requiring more than one tape or disk pack concurrently (as specified by the RESOURC command), UNLOAD does not decrement the resource demand count; RETURN decrements the resource demand count only when all concurrent resource demands have been satisfied.

TAPE UNITS

The system supports nine-track magnetic tapes in three different densities. In system commands, you use a 2-character density resource identifier to specify the correct density. The identifiers are as follows:

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Density</th>
</tr>
</thead>
<tbody>
<tr>
<td>HD</td>
<td>800 cpi</td>
</tr>
<tr>
<td>PE</td>
<td>1600 cpi</td>
</tr>
<tr>
<td>GE</td>
<td>6250 cpi</td>
</tr>
</tbody>
</table>

The 679-2/3/4 tape units are capable of processing both 800-cpi and 1600-cpi nine-track tapes; the 679-5/6/7 tape units handle both 1600-cpi and 6250-cpi nine-track tapes. An 800-cpi nine-track tape cannot be processed on a 1600/6250-cpi unit, and 6250-cpi nine-track tape cannot be processed on an 800/1600-cpi unit. The NT resource identifier, retained for compatibility, can be used only to allocate 800/1600-cpi nine-track units and cannot be specified concurrently in the same job with HD, PE, and GE resource demands. Default nine-track resource allocation is by density.

Examples:

Assume that an installation has the following tape drive resources:

- Two 679-4 nine-track tape drives (800/1600-cpi densities).
- Two 679-7 nine-track tape drives (1600/6250-cpi densities).

1. If a job makes a tape unit resource request with RESOURC, NT=3,

   the job is aborted with the message

   INSUFFICIENT RESOURCES ON SYSTEM.

   because only two units (the 679-4s) meet the NT specification.
2. If a job makes a tape unit resource request with

```
RESOURC,NT=1,PE=1.
```

the job is aborted with the message

```
CONFLICTING RESOURCE TYPES.
```

because the NT specification cannot be used with a density specification (HD/PE/GE).

3. If a job contains the following commands

```
LABEL,T APE,NT,D=PE,VSN=T APE1.
RESOURC,NT=2.
```

the job is aborted with the message

```
CONFLICTING RESOURCE TYPES.
```

because the LABEL command requested a tape unit by density (the default); therefore, later commands cannot schedule tape units using the NT specification.

Density identifiers are provided for seven-track tape units even though these units do not have alternate densities. This is done for consistency of format. The LO, HI, HY, and MT resource identifiers are all equivalent, and the last specification of any one of these is the seven-track tape unit demand for the job. For example, the resource request

```
RESOURC(HI=1,HY=2)
```

results in two seven-track tape resources being allocated for the job.

**RESOURCE OVERCOMMITMENT**

Under certain conditions, the system overcommits resources, provided all jobs with currently assigned resources can complete. For example, an installation with three tape units is processing jobs A and B. Included in each job is a RESOURC command scheduling two units. Job A requests its first tape. It is assigned the tape (unit 1) because there are enough units available for job A to complete. Job B requests its first tape. It is assigned the tape (unit 2) because either A or B can complete if assigned the last unit, and when the job that is assigned the last unit completes, the other can then use that unit and also complete. Job B then requests and is assigned its second tape (unit 3). It completes its operations (that is, terminates or returns the files on the tape) and makes the unit available for job A to complete.

**NOTE**

In a multimainframe environment, only the configuration of the machine on which the job is processed is considered in the overcommitment algorithm.
ALTERING RESOURCE REQUIREMENTS

The system manages its resources by keeping totals of the number of units of each device type scheduled and assigned to jobs. The number of units scheduled and the number of units assigned to a job can vary during job processing.

To change the number of units of a device type scheduled for this job, you can issue another RESOURC command. When decreasing the number of units scheduled for the job via a RESOURC command, the total resulting scheduled units must not be less than the number of units currently assigned to the job. If the resulting total would be less than the number currently assigned, the system aborts the job with an error message.

If the job has tape and/or removable pack units assigned to it when it attempts to increase its resource demands, the system determines if the request would cause a deadlock. If it would, it aborts the job with an error message.

NOTE

Always return all units assigned to your job before issuing another RESOURC command to increase resource demands. This action prevents a possible job abort caused by a potential deadlock condition.

The scheduled units can also be decreased by a RETURN command if the job, at the time of the return, is using its maximum scheduled units (refer to the description of the RETURN command in section 9).

Example:

The first RESOURC command schedules two 1600-cpi, nine-track tape units. The two LABEL commands assign the tape units to the job. Because the maximum scheduled units were used concurrently, the RETURN command decreases the scheduled tape units to zero. The second RESOURC command schedules two 844-21 disk units and one 1600-cpi, nine-track tape unit.

LABEL,Y,D=PE,VSN=TAPE2.
RETURN,X,Y.
RESOURC,D1=2,PE=1.

EOI
UNIT ASSIGNMENT

The method of assigning units depends on the resource type. For example, all tapes and all private disk packs not accessible by alternate users can only be assigned to one job at a time. All public packs and those private packs accessible by alternate users are shareable, and therefore, can be assigned to several jobs at the same time.

On indirect access file requests, the pack is charged to the job in fulfilling its resource demand only if the request causes the pack to be mounted. For direct access file requests, the pack is charged to the job when the first ATTACH of a direct access file is made.

A unit is assigned to a job until the job terminates or all direct access files residing on the unit that are assigned to the job are returned. At this point, a tape or a nonshareable pack can be dismounted. A shareable pack, however, can be dismounted only when there are no files residing on the unit that are assigned to any of the jobs sharing the pack.

**NOTE**

In GET requests for indirect access files, a pack is assigned to a job only as long as the pack is actually being used (that is, until the system retrieves the local copy of the file). Therefore, during a series of GET requests, the operator may determine that the pack is not being used and dismount it. If you have a direct access file on the pack, you can avoid this situation by attaching the direct access file before issuing the GET requests.

A single job cannot have more than 36 removable pack devices attached to the job concurrently.

RFL COMMAND

The RFL command sets the initial running field length for each subsequent job step when neither the routine for processing that step nor a loader table specifies a field length (refer to Field Length Control in section 3).

Format:

```
RFL, CM=n00000, EC=m0000.
```

or

```
RFL, m00000, m0000.
```

**Parameter** | **Description**
--- | ---
CM=n00000 | Specifies the central memory field length (octal is assumed unless decimal is specified by a D suffix or use of the digits 8 or 9). The value is rounded up to the nearest multiple of 1000g.

Specifying n00000 as 0 removes the effect of the previous RFL command and returns the setting of the field length to system control.

EC=m0000 | Specifies the extended memory field length in octal. The value of m0000 is the actual extended memory divided by 1000g.

60459680 D
The parameters may be specified positionally, by keyword, or intermixed positionally and by keyword. If intermixed, the positional parameters are evaluated according to their position among all the parameters.

The values of nnnnnn or mmmm cannot exceed the values specified on the last MFL command or the maximum allowed for the job.

Prior to the appearance of the RFL command (or SETRFL macro), the system determines the field length for each job step, provided no field length is specified by a system routine or loader table (refer to Field Length Control in section 3).

**ROLLOUT COMMAND**

The ROLLOUT command suspends job execution and places the job in the rollout state. This releases the control point, central memory, and extended memory assigned to the job. You can specify a time period that must elapse before the job is returned. Otherwise, the job scheduler usually returns the job to execution when its priority is the highest of the jobs rolled out (refer to Rollout Control in section 3).

Format:

```
ROLLOUT,t.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>Optional time delay measured in job scheduler delay intervals. Values for t range from 0 to 262080 (777700g) intervals. Although the default base is decimal, octal values can be specified by a B suffix.</td>
</tr>
</tbody>
</table>

Typically, a job scheduler delay interval is one second but can be site-determined.

**RTIME COMMAND**

The RTIME command requests that the time be read from the real-time clock and issued to the dayfile (in seconds). This is the accumulated time since the last system deadstart.

Format:

```
RTIME.
```

The dayfile message format is:

```
RTIME nnnnnn.nnn SECS.
```
SETASL COMMAND

The SETASL command sets the system resource unit (SRU) limit for an account block. An account block is the job step sequence whose execution is charged to an account (refer to SRU Limit Control in section 3). The account is specified by the charge and project numbers on a CHARGE command, or if no CHARGE command is required, by the user name on the USER command. Each user name and each account has an SRU validation limit (refer to the LIMITS and ENQUIRE commands). Except for interactive jobs, the default account block SRU limit (set during CHARGE or USER command processing) is the smaller of the user name and the account validation limits. For interactive jobs, the default limit is 64 SRUs.

Format:

```
SETASL,s.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>s</strong></td>
<td>Maximum number of SRUs allowed for account block execution. Although the default base is decimal, octal values can be specified by a B suffix on the value.</td>
</tr>
</tbody>
</table>

If **s** is an asterisk (*), or has a value of 262136 (777770B) or greater, or has a value greater than your validation limit, the account block SRU limit is then set to your validation limit. Also, if **s** is less than your current job step SRU limit (refer to the SETJSL command in this section for a description of the job step SRU limit), both the account block and job step SRU limits are set to **s**.

A dayfile message is then issued indicating what the new values are for the account block. SRU limit (ASL) and job step SRU limit (JSL).

If the account block SRU limit is reached during account block execution, the system issues an error message and terminates the job (refer to Exit Processing in section 5).
SETCORE COMMAND

The SETCORE command presets each word within the field length except for RA+2.

Format:

SETCORE,p.

or

SETCORE,-p.

Parameter Description

p Any of the following: (If a minus sign precedes the parameter p, the complement of p is set in core.)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>ZERO Zeros (0)</td>
</tr>
<tr>
<td></td>
<td>INDEF Indefinite (1777 0000 0000 0000 0000)</td>
</tr>
<tr>
<td></td>
<td>INF Infinite (3777 0000 0000 0000 0000)</td>
</tr>
</tbody>
</table>

Each word within the field length (except for RA+2) is set to p. If p is omitted, the system assumes p=0.

Calling the CYBER loader destroys the effect of a SETCORE command since the loader uses memory as a work area.

To preset memory within a load sequence, use a LDSET,PRESET command as described in the CYBER Loader Reference Manual.
SETJAL COMMAND

The SETJAL command changes the security access level of the current job. Initially, your job has the lowest possible access level that is valid for your job (ENQUIRE,B returns this information). Refer to Security Features in Section 3 for a detailed discussion of access levels.

Format:

SETJAL,AL=level.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AL=level</td>
<td>Specifies the security access level you want assigned to the job. Unless changed by your site, level can be one of the following names:</td>
</tr>
</tbody>
</table>

LVL0, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7

On a secured system, the access level you specify must be valid for the job. In addition, to lower the access level of your job, you must be authorized to do so (refer to the LIMITS command).

On an unsecured system, the command has no effect. The system does, however, check for valid parameter specifications.
SETJOB COMMAND

The SETJOB command changes some of the current job's attributes. You can change the user job name (UJN), can redirect the disposition of output if the job is not interactive or becomes a detached interactive job, and can change the job processing option for job termination or job suspension.

The SETJOB command does not take effect until the job terminates or is suspended. If you specify more than one SETJOB command, the last one takes precedence.

Format:

SETJOB,UJN=ujn,DC=dc,OP=op.

or

SETJOB,ujn,dc,op.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UJN=ujn</td>
<td>Changes the job's default UJN to ujn. A UJN must be seven or less alphanumeric characters. For interactive jobs, the default is the user index hash (refer to the ENQUIRE command). Otherwise, the default is the UJN specified on the Job command.</td>
</tr>
<tr>
<td>DC=dc</td>
<td>Specifies the disposition for output upon job termination. The default for all jobs is DF. You cannot change the output disposition for an interactive job unless the job terminates as a detached interactive job.</td>
</tr>
</tbody>
</table>

- **TO** Queues output with a wait disposition.
- **NO** Discards output.
- **DF** Specifies default output processing. The output disposition depends on the job's origin type (refer to File Types in section 2). No output is queued for interactive jobs.

| OP=op | Specifies the job processing option the system exercises upon detached interactive job when it is no longer executing. Not applicable to noninteractive jobs. The default is SU. |

- **SU** The job remains in a suspended state until recovered or timed out (refer to the RECOVER command).
- **TJ** The system terminates the job.

Job attributes associated with omitted parameters remain unchanged.
SETJSL COMMAND

The SETJSL command sets the system resource unit (SRU) limit for each subsequent job step (refer to SRU Limit Control in section 3). Except for interactive jobs, the default job step SRU limit (set during CHARGE or USER command processing) is the smaller of the user name and the account validation limits (refer to the LIMITS and ENQUIRE commands). For interactive jobs, the default job step limit is 64 SRUs. From an interactive job, you can increment your job step SRU limit to complete job step execution as described in the following paragraphs.

Format:

```
SETJSL, s.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| s         | Maximum number of SRUs allowed for job step execution. Although the default base is decimal, octal values can be specified by a B suffix on the value. The value s must be greater than 0. The asterisk (*), values greater than 262136 (777770B), and values greater than your validated limit set the job step SRU limit at the validation limit. If s is greater than your current account block SRU limit (refer to the SETASL command in this section for a description of the account block SRU limit), both the job step and account block SRU are set to s. Also, if s is greater than your validation limit, both SRU limits are set to the validation limit. A dayfile message is then issued indicating what the new values are for the job step SRU limit (JSL) and the account block SRU limit (ASL).

The system issues an error message when the job step SRU limit is reached. A job step within a batch job is then terminated (refer to Exit Processing in section 5). In interactive jobs, you can increment the SRU limit after receiving the SRU limit message or terminate the job. If the job is suspended because a job step or the job itself exceeded its SRU limit, the message

```
*SRU LIMIT*
ENTER S TO CONTINUE OR STOP TO END JOB STEP.
TYPED AHEAD INPUT MUST BE REENTERED.
```

is issued. You can enter one of the following:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>Increases the SRU limit by 64 units. Job execution continues. The 64-unit increment can be changed by your site.</td>
</tr>
<tr>
<td>S,nnnnn</td>
<td>Increases the SRU limit by nnnnn decimal units. Job execution continues. You can enter octal units by specifying a B after the octal number.</td>
</tr>
<tr>
<td>S,*</td>
<td>Increases the SRU limit to your maximum. Job execution continues.</td>
</tr>
<tr>
<td>STOP</td>
<td>Terminates the job step. Subsequent commands, if any, are not processed.</td>
</tr>
</tbody>
</table>

Any increase to the SRU limit through either S or S,nnnn is in effect only for the current job step. When the job step terminates, the account block SRU limit and job step SRU limit revert to their original values, set by default or by the SETASL and SETJSL commands, respectively. Entering S,* in response to an SRU LIMIT message could cause the interactive session in progress to exceed the account block SRU limit set by the SETASL command or by default. The system then issues an SRU LIMIT message after a job step has begun. To remedy this situation, use the SETASL command to raise the account block SRU limit above the current number of accumulated SRUs for the interactive session.
When a limit occurs, any typed ahead input will be discarded since it would be processed as a response to the limit message.

**SETPR COMMAND**

The SETPR command decreases the CPU priority of a job. A user job cannot increase its priority.

SETPR,p.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Specifies the priority, $1 \leq p \leq 70$.</td>
</tr>
</tbody>
</table>

Upon job initiation, a job is assigned the maximum priority allowed for its service class. (The installation defines these priority values.) If a job's CPU priority is lower than that of other jobs, the job is assigned control of the CPU only when jobs of a higher priority do not need it.

**SETL COMMAND**

The SETTL command sets the CPU time limit for each subsequent job step. Each user name is validated for a maximum job step time limit (refer to the LIMITS and ENQUIRE commands). When you do not specify a time limit, the system sets the limit at 64 CPU seconds. Interactive jobs can increment their job step time limit to complete job step execution (refer to section 8).

Format:

SETL,t.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t</td>
<td>Maximum number of CPU seconds allowed for job step execution. Although the default base is decimal, octal values can be specified by a B suffix on the value.</td>
</tr>
</tbody>
</table>

$t$ must be greater than 0. The asterisk (*), values greater than 32760 (77770B), and values greater than your validated time limit set the job step time limit at your validated time limit.

A dayfile message is then issued indicating what the new value is for the time limit.

To set a time limit for job step execution on one CPU of a dual-processor machine, you must include a USECPU command in the job. Otherwise, the time limit is set for the cumulative job step execution time on both CPUs.

The system issues an error message when the job step time limit is reached. A job step within a batch job is then terminated (refer to Exit Processing in section 5). In interactive jobs, you can increment the time limit after receiving the time limit message or terminate job.

† Your site can change this default.
If the job is suspended because a job step exceeded its time limit, the message:

*TIME LIMIT*
ENTER T TO CONTINUE OR STOP TO END JOB STEP.
TYPED AHEAD INPUT MUST BE REENTERED.

is issued and you can enter one of the following:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>T</td>
<td>Increases the central processor time limit by 64 CPU seconds. Job execution continues. The 64 CPU second increment can be changed by your site.</td>
</tr>
<tr>
<td>T,nnnn</td>
<td>Increases the central processor time limit by nnnn decimal seconds. Job execution continues. You can enter octal seconds by specifying a B after the number.</td>
</tr>
<tr>
<td>T,*</td>
<td>Increases the central processor time limit to your maximum. Job execution continues. Causes the job to go through normal abort procedures (for example, EXIT processing which can be useful when using procedure files).</td>
</tr>
<tr>
<td>STOP</td>
<td>Terminates the job step. Subsequent commands, if any, are not processed.</td>
</tr>
</tbody>
</table>

Any increase to the central processor time limit through either T or T,nnnn is in effect only for the current job step. When the job step terminates, the central processor time limit reverts to its original value, previously set by default or by the SETTL command.

When a limit occurs, any typed ahead input will be discarded since it would be processed as a response to the limit message.

In the following example, a program exceeds its allocated time limit. The user enters T to increase the time limit and the program then runs to completion.

```
list
00100 PROGRAM T
00110 DO 6 I=1,2500
00120 DO 6 J=1,4000
00130 A=1
00140 6 CONTINUE
00150 END

READY.
settl,10

READY.
run

*TIME LIMIT*
ENTER T TO CONTINUE OR STOP TO END JOB STEP.
TYPED AHEAD INPUT MUST BE REENTERED.

t

SRU 66.835 UNITS.

RUN COMPLETE.
```
SHELL COMMAND

The SHELL command enables or disables shell program processing of system commands.

A shell program is a user-written program (usually in COMPASS) which redefines the set of commands that can be entered by a user. A shell program can:

- Limit a user to a subset of NOS commands; the shell program can define which NOS commands the user can or cannot enter.

- Redefine the effects of a NOS command. A shell program redefines a particular command by defining an alternate command or series of commands to be executed whenever the user enters the original command. For example, you could redefine a user's ATTACH command to execute both an ATTACH and a LIBRARY command for the specified file, thus making the file a global library.

- Define user-written commands that are not a part of the standard NOS command set.

In effect, a shell program creates a user-defined subsystem that can be imposed on application users by user name. To enable a shell program for a user name, you can place the SHELL command in the user's prologue. You can also associate a shell program with a user name using the MODVAL utility. (MODVAL is described in the NOS2 Administration Handbook.)

For more information on how to write a shell program, refer to the NOS Reference Set, Volume 4, Program Interface.

Format:

SHELL.

or

SHELL, spn.

or

SHELL, spn, P1,..., P7.

Parameter | Description
---|---
spn | Specifies the shell program name to be executed.
P1 | Specifies parameters to control the loading and execution of the shell program.

| P1 | Description |
---|---|
E | Clears controls if there are errors during the loading of the shell program. If you do not specify E and such errors occur, your job is aborted with no EXIT processing. |
A | Clears controls if the shell program aborts. |
L | Allows local file loading of the shell program. When loading the program from a local file, the program must be stored in ABS-type records. (Refer to section 15 for a description of record types.) |
G  Allows global library load of the shell program.

S  Allows system library load of the shell program.

T  Specifies that the system monitor commands directly from the terminal.

B  Specifies that the system monitor commands outside procedures.

C  Specifies that the system monitor commands inside procedures.

The first format disables shell control.

The second format, specifying only the shell program name, sets the default for p1 as A, S, and B.

The last format specifies the extent of shell program control. To get your shell program loaded, you must specify at least one of the parameters L, G, or S. To enable any type of command monitoring, you must specify at least one of the parameters T, B, or C.

Example:

```
/shell, rmshell
SHELL, RMSHELL.
/rewind,*
  9 FILES PROCESSED.
/ascii
  UNAUTHORIZED COMMAND.
```

In this example, RMSHELL is a shell program that allows execution of REWIND but not ASCII. The SHELL command causes the system to perform a system library load of RMSHELL, to enable shell control, to clear controls if the shell program aborts, and to monitor commands outside procedures.

The system passes REWIND,* to RMSHELL for examination. Since it is part of the subset of allowed system commands, RMSHELL passes control to the system to process that command exactly as it is. However, when the system passes the ASCII command to RMSHELL, an UNAUTHORIZED COMMAND message is issued, and the command is not passed back to the system.

**STIME COMMAND**

The STIME command requests that the accumulated SRU value for the job be issued to the job’s dayfile.

Format:

```
STIME.
```

Dayfile message format:

```
STIME nnnnnn.nnn UNTS.
```
SUBMIT COMMAND

The SUBMIT command places a user-supplied job file into the input queue as a separate job. SUBMIT can reformat the file according to directives within the file. Refer to Job Names in section 3 for a description of the names associated with the submitted job.

Format:

SUBMIT, lfn, q, NR.c

Parameter | Description
--- | ---
lfn | Specifies the name of the file to be submitted to the system for processing as a batch job. The first record of the file must be in 6-bit display code. The default is the job's primary file.
q | Specifies disposition of job output (OUTPUT, PUNCH, PUNCHB, and P8) as follows:
   - BC or B: Use the default processing for local batch jobs to dispose of job output at the central site.
   - NO or N: Discard job output at job termination unless the files have been explicitly routed (default value for interactive origin jobs). The dayfile is not written to file OUTPUT.
   - RB=un or E=un: Route job output to the remote batch or interactive user specified by the user name un. The default for un is the user name associated with the submitting job.
   - TO: Job output (including the dayfile) is queued with a wait disposition.
NR | No rewind option; the submit file and the file specified on a cREAD reformatting directive are not rewound before or after processing. If NR is omitted, the files are rewound before, but not after processing.
c | Prefix character used to identify reformatting directives in the file to be submitted (lfn). If omitted, the system assumes c is /.

The number of deferred batch (LDI, SUBMIT, and ROUTE) jobs that you can have in the system concurrently depends on your validation (refer to the LIMITS command in this section). If this limit is exceeded, an error message is issued to the dayfile, and the SUBMIT command is not processed.

For SUBMIT to process reformatting directives, the first line of the submit file must be a cJOB directive. Each line preceded by a prefix character is recognized as a reformatting directive. The prefix character is specified on the SUBMIT command (/ by default). Throughout this description, the letter c, preceding a directive, denotes the prefix character. Reformatting directives may be interspersed throughout the submit file as long as transparent submit mode is not in effect. Transparent submit mode is selected by the cTRANS directive and requires you to observe special rules when inserting subsequent directives into the file (refer to description of TRANS and NOTRANS directives).
The system does not process reformatting directives unless the first line of the submit file contains the cJOB directive. Other directives can follow the cJOB directive (that is, they can precede the job and/or USER commands), but the first two commands following the cJOB directive must be a Job command and a USER command, respectively. The USER command can be inserted in the form of a cUSER directive. For example, the following sequences of lines are both valid:

```
ln1    cJOB
ln2    ujn,parameters.
ln3    USER,username,password. (or cUSER)
```

or

```
ln1    cJOB
ln2    cNOSEQ
ln3    ujn,parameters.
ln4    USER,username,password. (or cUSER)
```

ln1, ln2, ln3, and ln4 are optional line numbers.

You can include line numbers on the submit file and specify which line numbers are to be removed during reformatting with the cSEQ and cNOSEQ directives. This is especially useful if the submit file contains a BASIC program where line numbers are a requirement of the language. If line numbers are included in a submit file, the file must begin with a cJOB directive.

The reformatting directives available are described as follows:

<table>
<thead>
<tr>
<th>Directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cJOB</td>
<td>Indicates that the submit file is to be reformatted and selects the following default reformatting directives. The default directives remain in effect until specified otherwise.</td>
</tr>
<tr>
<td>cNOTRANS</td>
<td>(disabled by cTRANS)</td>
</tr>
<tr>
<td>cSEQ</td>
<td>(disabled by cNOSEQ)</td>
</tr>
<tr>
<td>cPACK</td>
<td>(disabled by cNOPACK)</td>
</tr>
</tbody>
</table>

The cJOB directive must be the first line of the submit file. If omitted, the file is not reformatted. If line numbers are included in a submit file, the file must begin with a cJOB directive.

<table>
<thead>
<tr>
<th>Directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cUSER</td>
<td>Inserts a USER command specifying the user name and family of the submitting job. If you specify this directive when you are routing a job to a remote mainframe (ST=1id parameter on the Job command), the destination mainframe must be a NOS mainframe, the same user name and family must be valid on the destination mainframe, and your batch passwords must be identical on both mainframes. You can use this directive only to create the first USER command in a job.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cCHARGE</td>
<td>Inserts a CHARGE command that is identical to the CHARGE command currently in effect for the submitting job. If no CHARGE command is in effect for the submitting job, this directive has no effect on the SUBMIT file.</td>
</tr>
</tbody>
</table>

60459680 K
<table>
<thead>
<tr>
<th>Directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cEOR</td>
<td>Indicates that an end-of-record mark is to be placed at this point in the submit file during reformatting.</td>
</tr>
<tr>
<td>cEOF</td>
<td>Indicates that an end-of-file mark is to be placed at this point in the submit file during reformatting.</td>
</tr>
<tr>
<td>cSEQ</td>
<td>Indicates that the following lines may be preceded by line numbers and requests that they be removed (default value).</td>
</tr>
<tr>
<td>cNOSEQ</td>
<td>Reverses the effect of the cSEQ directive. No attempt is made to remove leading line numbers from subsequent lines. This is especially useful when line numbers are required (such as in a BASIC program).</td>
</tr>
<tr>
<td>cPACK</td>
<td>Requests that all succeeding end-of-record and end-of-file marks be removed (default value). This directive applies only to internal EOR and EOF marks that currently exist. The cEOR and cEOF reformatting directives are not affected.</td>
</tr>
<tr>
<td>cNOPACK</td>
<td>Reverses the effect of the cPACK directive. Requests that the system not discard (currently existing) succeeding internal end-of-record and end-of-file marks.</td>
</tr>
<tr>
<td>cTRANS</td>
<td>Requests transparent submit mode. In transparent submit mode, SUBMIT ignores reformatting directives until an EOR or EOF mark is encountered. The EOR or EOF mark cannot be a mark to be created by a cEOR or cEOF directive. SUBMIT performs the following procedure for transparent submit mode processing.</td>
</tr>
</tbody>
</table>

1. Read cTRANS directive.
2. Check if the next line is a reformatting directive. If it is not, skip steps 3 and 4.
3. Process reformatting directive. If it is a cNOTRANS directive, end transparent submit mode processing.
4. Return to step 2.
5. Select transparent submit mode and read lines until an internal EOR or EOF mark is encountered.
6. If the cPACK directive is in effect, remove the EOR or EOF mark.
7. Return to step 2.
<table>
<thead>
<tr>
<th>Directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cTRANS</td>
<td>The cTRANS directive is typically used in conjunction with the cREAD directive. The cREAD directive copies the contents of an existing file into the submit file at the location of the cREAD directive. Because the file is read in transparent submit mode, no check for reformattting directives is attempted until an internal EOR or EOF is encountered. The cREAD directive must follow the cTRANS directive and must be located before the first succeeding line that is not a reformattting directive. If not, transparent submit mode is selected before the cREAD directive is encountered and the cREAD is ignored.</td>
</tr>
<tr>
<td>cNOSEQ</td>
<td>Reverses the effect of the cTRANS directive and informs the system that the submit file is to be examined on a line-by-line basis. All directives encountered in the submit file while the cNOSEQ directive is in effect are processed. This directive is initially selected by default and remains in effect until a cTRANS directive is encountered in the submit file. Be careful in placing this directive in the submit file. If transparent submit mode is selected, this directive can possibly be ignored unless it immediately follows either a cREAD directive or an internal EOR or EOF mark.</td>
</tr>
<tr>
<td>cREAD, lfn</td>
<td>Requests that the system read the contents of the specified file, lfn, and insert that file in place of the cREAD directive in the submit file, during reformattting. Reading terminates when an EOF or EOI is encountered on lfn. If the file to be read is not currently local to the job, the system automatically attempts a GET and then an ATTACH on the file. If lfn is not specified in the directive, TAPE1 is assumed. If the file specified cannot be found or the read file is busy (direct access files only), the job is terminated. The file specified by lfn in the cREAD directive is automatically rewound before the read operation unless the NR parameter is specified on the SUBMIT command. In this case, the rewind directive must precede the cREAD directive in the submit file if it is desired to rewind file lfn before the read operation begins. The system returns all files specified in cREAD directives before completion of the job. If the cPACK directive is in effect when the file lfn is read, all internal EOR marks are removed. If the cNOPACK directive is in effect, all internal EOR marks are read into the submit file in the proper position during reformattting.</td>
</tr>
</tbody>
</table>
Each line of that file is also checked for a reformatting directive, unless transparent submit mode is in effect when file lfn is read. Any directives contained in the file, except another cREAD, are processed. The cREAD directive cannot be nested. In addition, any directives in effect before the cREAD directive is processed remain in effect for the file being read, unless transparent submit mode is selected. Then, only the cPACK or cNOPACK directive remains in effect for the file being read. Moreover, only those directives that immediately follow an internal EOR in the file being read are processed.

If the file to be read is a binary file, it is recommended that the cTRANS directive be used to ensure that binary data is not mistaken for a reformatting directive. The cTRANS directive should immediately precede the cREAD directive in the submit file, if used.

cREWIND,lfn
Requests that the system rewind file lfn to the beginning-of-information (BOI). If lfn is not supplied, TAPE1 is assumed. This directive is required only if the NR parameter is included in the SUBMIT command. Otherwise, file lfn is automatically rewound.

This directive is used in conjunction with the cREAD directive. Thus, if it is desired to rewind a file before the read operation begins, this directive must precede the cREAD directive in the submit file.

c1EC=c2
Indicates that the prefix character is to be changed from c1 (current prefix character) to c2 (new prefix character). The new prefix character code is used to recognize all subsequent reformatting directives until further changed.

Input lines must not exceed 320 6-bit characters. If a line exceeds 320 characters, the results are unpredictable.

If the submitted job contains an invalid USER command, the job entering the SUBMIT command is aborted. This constitutes a security conflict (refer to the USER command later in this section). The security count for the user name that entered the SUBMIT command is decremented. If this results in a security count of zero, the job is immediately terminated with no EXIT processing (you are logged out if the job is interactive). For further information concerning use of the SUBMIT command from an interactive terminal, refer to Volume 2, Guide to System Usage.

Consult your job's dayfile to determine the cause of any errors that occurred during job processing. The dayfile for the submitted job is disposed according to the disposition parameter on the SUBMIT command.

When you submit a batch job from an interactive job, all output is dropped (unless requested otherwise by the disposition parameter). This includes the dayfile output. Therefore, make provisions within your job to save the contents of the dayfile if a processing error occurs. You can do this by including the following commands at the end of the command record.

EXIT.
DAYFILE,lfn.
REPLACE,lfn.
SWITCH COMMAND

The SWITCH command sets the sense switches for reference by one of your programs.

Format:

\[
\text{SWITCH,switch}_1,\text{switch}_2,\ldots,\text{switch}_n,\text{jsn.}
\]

Parameter | Description
--- | ---
switch\_i | Specifies the switches to be set. You must denote each switch\_i by an integer in the range of 1 through 6. If you specify 0 for this parameter, the system sets all sense switches.

jsn | Specifies the job sequence name (JSN) of the job whose sense switches will be changed. jsn is an optional parameter, its default is the current job. The system recognizes the jsn parameter by its alphabetic characters; therefore, jsn can appear anywhere in the parameter list and can be omitted without leaving a blank parameter field.

UPROC COMMAND

The UPROC command specifies a user prologue, a program the system executes each time you start a job.

Format:

\[
\text{UPROC,FN=pfile.}
\]

or

\[
\text{UPROC,pfile.}
\]

Parameter | Description
--- | ---
pfile | One of your permanent files that contains the desired prologue. If pfile contains more than one procedure, the system executes only the first one. If you omit the FN=pfile parameter or give pfile the value of zero, the system will no longer execute a user prologue.

The system executes your user prologue only after it processes your user validation and charge information but before it initiates job recovery processing. Depending on the length and nature of your user prologue, you may want to initiate recovery processing before your user prologue ends. For example, if your user prologue aborts, the system does not initiate recovery processing. To do this, place the RECOVER command within your user prologue (refer to section 8 for the RECOVER command and section 4 for writing procedures).
USECPU COMMAND

The USECPU command specifies which central processor is to be used when more than one is available for processing.

Format:

USECPU,n.

Parameter Description
n Specifies which central processor to use.

 n Description
 0 Use either central processor.
 1 Use CPU 0.
 2 Use CPU 1.

The USECPU command may be used only when the system is running on a model 72-2x, 73-2x, 74-2x, 720-2, 730-2, 6500, 6700, 830-2, 865-2, or 875-2. On a model 74-2x or 6700, CPU 0 is the parallel processor, and CPU 1 is the serial processor. On the other systems, both CPUs are serial processors. This command is ignored on single CPU machines.

USER COMMAND

The system uses the parameters on the USER command to determine if you are an authorized user, which resources you are validated to use, and the extent (limits) to which you may use those resources.

No commands are allowed between the Job and USER commands in noninteractive jobs. If this is attempted, the first command is interpreted as an invalid USER command, and the submitting job is aborted with appropriate messages to the dayfile. The submitted job is dropped.

Format:

USER,UN=username,PW=password,FM=familyname.

or

USER,username,password,familyname.

Parameter Description
username Specifies a one- to seven-character alphanumeric user name.
password Specifies an alphanumeric password. Its maximum length is seven characters; its minimum length is defined by the installation.
familyname Specifies an optional parameter identifying the family of permanent file devices on which your permanent files reside. Specify a family name when the system can access more than one permanent file device family.

If this is not the first USER command of the job or it is the first USER command from a job submitted from another job, you must not specify a family name different from the current one unless you are so authorized (refer to the LIMITS command).

†Refer to section 2 for a description of permanent file device families.
This command also defines controls and validation limits for the job and defines your permanent file base. An installation may operate with secondary USER commands either enabled or disabled. If the system is a secured system, secondary user commands cannot be enabled. Only if secondary USER commands are enabled, may you specify a different permanent file catalog or family during job processing by issuing another USER command. The system only associates permanent file validation limits with this new user name. The remaining validation limits still reflect those of the user name specified at job initiation (refer to the LIMITS command earlier in this section).

On a secured system or on an unsecured system with secondary USER commands enabled, an invalid USER command is processed as a security conflict. Your job aborts and your security count is decremented. If this results in your security count being set to zero, batch jobs will terminate without EXIT processing. At a terminal, you will be immediately logged out with no dayfile messages issued to the terminal. If the security count is not zero, the job step is aborted with appropriate messages to the terminal and the dayfile and with EXIT processing enabled (unless explicitly disabled).

On an unsecured system with secondary USER commands disabled, any secondary USER command will be invalid and aborts the job. This is not a security conflict and the security count is not decremented.

The password is deleted from the USER command before this command is issued to the dayfile.

Normally, the familyname parameter need not be included on the USER command. However, if you make a practice of specifying your family name each time you submit a job, you can be sure that your job will be processed even if your normal system is not available and your permanent file family is moved to a backup system. If, after the first USER command, you do not specify a familyname on the USER command, your permanent file family remains the same. If you specify the 0 (zero) familyname, your permanent file family becomes the system default family.

Example:

An installation has two systems, A and B. System B provides backup service for system A. The system default family name for system A is AFAM, and the system default family name for system B is BFAM.

During normal operations, system A user CWJONES with password JPWD could enter either of the following USER commands.

```
USER,CWJONES,JPWD.
USER,CWJONES,JPWD,AFAM.
```

System B user JDSMITH with password SPWD could enter either of the following commands.

```
USER,JDSMITH,SPWD.
USER,JDSMITH,SPWD,BFAM.
```

If system A failed, user CWJONES would be required to enter

```
USER,CWJONES,JPWD,AFAM.
```

to identify his family of permanent file devices. User JDSMITH could enter either of the USER commands as before because the default family name would still be valid.
Normally, the familyname parameter need not be included on the USER command. However, if you make a practice of specifying your family name each time you submit a job, you can be sure that your job will be processed even if your normal system is not available and your permanent file family is moved to a backup system. If, after the first USER command, you do not specify a familyname on the USER command, your permanent file family remains the same. If you specify the 0 (zero) familyname, your permanent file family becomes the system default family.

Example:

An installation has two systems, A and B. System B provides backup service for system A. The system default family name for system A is AFAM, and the system default family name for system B is BFAM.

During normal operations, system A user CWJONES with password JPWD could enter either of the following USER commands.

```
USER,CWJONES,JPWD.
USER,CWJONES,JPWD,AFAM.
```

System B user JDSMITH with password SPWD could enter either of the following commands.

```
USER,JDSMITH,SPWD.
USER,JDSMITH,SPWD,BFAM.
```

If system A failed, user CWJONES would be required to enter

```
USER,CWJONES,JPWD,AFAM.
```

to identify his family of permanent file devices. User JDSMITH could enter either of the USER commands as before because the default family name would still be valid.
There are many system commands that you can use only in interactive jobs or that were
designed primarily for interactive use. Unless specified otherwise, these commands cannot
be used in procedures. This section describes these commands under the following headings:

- Terminal Control Commands
  
  ASCII | LINE
  AUTO  | NORMAL
  BRIEF | SCREEN
  CSET  | TDU
  EFFECT | TIMEOUT
  KEY | TRMDEF

- Subsystem Selection Commands
  
  ACCESS | FORTRAN
  BASIC | FTNTS
  BATCH | NULL
  EXECUTE

- Interactive Status Commands
  
  ctD
  ctE
  ctS

- Job Processing Commands
  
  APPSW | LOGIN
  BYE | LOGOUT
  DIAL | NOSORT
  EXPLAIN | RECOVER
  GOODBYE | RUN
  HELLO | Secure Login
  HELLO7 | SHOW
  HELP | TEXT
  HELPME | WHATJSN
  LIB | X
  LIST | XMODEM

- Primary File Editing Commands
  
  ALTER
  DELETE
  DUP
  LIST
  MOVE
  READ
  RESEQ
  WRITE
  WRITEN
TERMINAL CONTROL COMMANDS

The terminal control commands change the characteristics of the terminal and vary the source and format of information given to and received from the system. You can enter these commands at any time after you successfully log in.

ASCII COMMAND

If you are at an ASCII terminal, this command allows you to use the ASCII 128-character set and to place the terminal in ASCII mode. On non-ASCII terminals, this command allows the use of up to 128 of the characters defined for the terminal. The ASCII command allows you to enter lowercase letters that are interpreted by the system rather than translated to uppercase as is done in normal mode.

Format:

ASCII

In ASCII mode, characters entered from the terminal are translated into 6/12-bit display code. On an ASCII terminal, 6/12-bit display code consists of 95 graphic characters and 33 control characters (the 128-character set). The standard ASCII graphic 64-character set contains only the first 64 (or 63 depending on an installation option) of these 95 characters. In normal mode, you are restricted to these 64 (or 63) characters. Characters of the ASCII graphic 64-character set are processed internally as 6-bit display code characters. The additional characters that make up the ASCII 128-character set are processed internally as 12-bit display code characters. Refer to appendix A for further information on display codes and character sets.

The system normally receives all ASCII characters except line feed, carriage return, NUL, EOT, DEL, and the logical backspace character. Control characters (line feed, cancel line, and backspace) are not received unless in full-ASCII or special editing mode. Commands can be entered in either uppercase or lowercase regardless of ASCII mode.

NOTE

If a correspondence code terminal is being used, you must be in ASCII mode in order to use the full correspondence code set.

You can include this command in a procedure.
AUTO COMMAND

The AUTO command automatically generates five-digit line numbers.

Format:

AUTO,nnnnn,iiii

Parameter Description
nnnn Specifies the beginning line number; default value is 00100.
iiii Specifies the increment value added for each succeeding line number; default value is 10.

To exit from auto mode, you press the cancel line character followed by @, thus deleting the current line. You can also exit from auto mode by entering the termination sequence. You can then enter a new command on the next line.

You can alter the line numbering sequence by deleting the line with the cancel line character and then entering a new beginning line number. You should exercise caution when doing this since the AUTO command is still in effect and continues generating line numbers using the original increment value. Thus, if a line number is generated that already exists in the file, the original contents of that line are lost and must be reentered. The increment value cannot be altered unless a new AUTO command is entered.

In the following example of the AUTO command, the user deletes a line number to change the numbering sequence and then deletes another line number in order to place a character in column 6.

```
READY,
auto
00100 program header
00110 write 1000
00120
*DEL*
00230 1000 format(15x,'headings')
00240 write 2000
00250 2000 format(15x,'author',9x,'title',15x,
00260
*DEL*
00260+ 'publisher',6x,'cost')
00270 stop
00280 end
00290
*DEL*
list

00100 PROGRAM HEADER
00110 WRITE 1000
00230 1000 FORMAT(15X,'HEADINGS')
00240 WRITE 2000
00250 2000 FORMAT(15X,'AUTHOR',9X,'TITLE',15X,
00260+ 'PUBLISHER',6X,'COST')
00270 STOP
00280 END

READY.
```
**BRIEF COMMAND**

The BRIEF command suppresses all full and partial headers produced by certain commands (for example, LIBEDIT). It also prevents the system from echoing editing changes you make to the primary file when using the primary file editing commands described later in this section.

Format:

    BRIEF

To clear the effect of the BRIEF command, use the NORMAL command.

**CSET COMMAND**

The CSET command sets the character set mode of the terminal.

Format:

    CSET, mode

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>Specifies terminal character set mode.</td>
</tr>
<tr>
<td></td>
<td>ASCII Selects ASCII mode (ASCII 128-character set).</td>
</tr>
<tr>
<td></td>
<td>NORMAL Selects normal mode (ASCII graphic 63/64-character set).</td>
</tr>
</tbody>
</table>

The CSET command may also appear in a procedure file.

**NOTE**

The CSET command sets only the terminal character set. If you specify the NORMAL parameter, you do not affect auto or brief mode.

**EFFECT COMMAND**

The EFFECT command enables or disables the output format effectors supplied by IAF. With the IAF effectors disabled, you control terminal output by supplying an appropriate effector as the first character of each output line; the system interprets the first character of each line as an effector and inhibits printing of the character.

Format effectors control carriage positioning on output operations. The effectors for specific terminal classes are described in the Network Access Method Version 1/Communications Control Program Version 3 Terminal Interfaces Reference Manual. This command is valid for all terminals connected through NAM.
Control bytes 0001, 0002, 0003, 0005, 0010, 0013, 0014, 0015, and 0016 should not be used with IAF effectors disabled.

The ? prompt, normally supplied by the system, to request input is not displayed when format effectors are user-supplied.

Format:

EFFECT,mode.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>Specifies whether or not IAF automatically supplies format effectors. Values that can be entered for mode are as follows:</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>Format effectors are supplied by IAF. This is the default value.</td>
</tr>
<tr>
<td>USER</td>
<td>Format effectors are user-supplied as the first character of each output line. When format effectors are user-supplied (i.e., EFFECT,USER is specified), all format effectors are supported except those that specify carriage positioning after output. Specifically, the slant (/) and period (.) effectors are not supported.</td>
</tr>
</tbody>
</table>

You can include this command in a procedure.

KEY COMMAND

The KEY command maintains key definition files which define the function keys for a CDC 721 terminal. KEY is used to create, edit, display, or load a definition file.

The KEY command is valid only for a CDC 721 terminal operating in screen mode. To use this command, select the appropriate option from those listed below and enter the command with that option. The KEY command provides you with interactive help to assist you in creating, editing, or loading the definition file.

Format:

KEY,option,filenamex.

KEY?
### Parameter | Description
--- | ---
**option** | Any of the following options.

| Option | Description |
--- | ---
**HELP** | Gives a brief description of each option available. The filename parameter is ignored. |
**CHECK** | Checks to see if function key definitions are already loaded into the terminal. If not, the definitions in file filename are loaded. |
**DEFAULT** | Sets key definitions to the NOS system default keys. The filename parameter is ignored. The default keys are:
- HELP key = HELP
- EDIT key = FSE
- STOP key = CTRL-T followed by carriage return |
**DISPLAY** | Displays the key labels for function keys Fl through Fl6. |
**EDIT** | Initiates creation or editing of a key definition file. KEY first searches for a local file by the specified name, then for an indirect access permanent file. If filename does not exist, it is created. The edited file is saved or replaced at completion of editing. |
**LOAD** | Loads key definitions into the terminal from the specified file. |
**PRINT** | Creates a local file called KEYPRNT on which the key definitions are listed from the specified filename. |
**filename** | The name of the key definition file. Default is KEYDEFS. |
**?** | Lists the options and prompts you for an option and filename. |

The KEY command may appear in a procedure file.
LINE COMMAND

The LINE command specifies that your terminal is to be operated in line (or scrolling) mode, as opposed to screen mode. Commands and features affected by the LINE command include CATLIST, FSE, screen formatting, and the display of NOS procedure parameters.

The LINE command also identifies the terminal model to the system and initiates a search for the terminal definition file for that model (unless the CDC 721 terminal was specified; characteristics of this terminal are preloaded into the system so that no definition file is required). The system uses the following search order in attempting to find the definition file:

- A local file called TERMLIB (created using the TDU utility).
- An indirect access permanent file called TERMLIB under your user name.
- An indirect access permanent file called TERMLIB under user name LIBRARY (UN=LIBRARY). Your site may maintain a system file containing common terminal definitions.

If TERMLIB is found under your user name or under user name LIBRARY, the system copies the terminal definition to a local file called ZZZZTRM for later use by NOS full screen display features. The terminal files listed below for the TM parameter are released with the system and are always available once you have identified your terminal in a LINE or SCREEN command.

Format:

LINE,TM=model.

or

LINE,model.
**Parameter**  
TM=model  

**Description**  
Specifies the terminal model. The value specified for model is the terminal mnemonic defined in the terminal definition file or the terminal mnemonic for one of the following preloaded terminal definitions:

<table>
<thead>
<tr>
<th>model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>721</td>
<td>CDC 721 terminal.</td>
</tr>
<tr>
<td>721V3</td>
<td>CDC 721 terminal version 3.</td>
</tr>
<tr>
<td>722</td>
<td>CDC 722 terminal.</td>
</tr>
<tr>
<td>72230</td>
<td>CDC 722-30 terminal.</td>
</tr>
<tr>
<td>VT100</td>
<td>DEC VT100 terminal.</td>
</tr>
<tr>
<td>Z19</td>
<td>Zenith Z19 or Z29 terminal or Heathkit H19 terminal.††</td>
</tr>
<tr>
<td>ADM3A</td>
<td>Lear Siegler ADM3A terminal.†††</td>
</tr>
<tr>
<td>ADM5</td>
<td>Lear Siegler ADM5 terminal.†††</td>
</tr>
<tr>
<td>TV924</td>
<td>TeleVideo 924 terminal.</td>
</tr>
<tr>
<td>TV950</td>
<td>TeleVideo 950 terminal.</td>
</tr>
<tr>
<td>TV955</td>
<td>TeleVideo 955 terminal.</td>
</tr>
<tr>
<td>T4115</td>
<td>Tektronix 4115 terminal.</td>
</tr>
<tr>
<td>3270</td>
<td>IBM 3270 terminal.††††</td>
</tr>
<tr>
<td>PCONxx</td>
<td>IBM PC using CDC CONNECT. xx is the current level of CONNECT.</td>
</tr>
</tbody>
</table>

If you want your terminal to have the type-ahead capability, append T to the model name you are using in the LINE command. Type-ahead allows you to press a function key two or more times in quick succession, rather than pressing it once and waiting for the system to execute it before pressing it a second time.

If this parameter is omitted, the terminal model is left unchanged.

You can include this command in a procedure.

†††††IBM 3270 is a product of the IBM Corporation.
††††††TeleVideo 924, 950, and 955 are products of TeleVideo Systems, Inc.
NORMAL COMMAND

The NORMAL command reverses the effect of the ASCII; AUTO; BRIEF; CSET,ASCII; and NOSORT commands on both input and output. The system initially assumes that this command has been entered. Normal mode uses the ASCII graphic 63/64-character set. All lowercase letters are converted to uppercase (refer to ASCII command) and all command headers are printed (refer to BRIEF command).

Format:

NORMAL

SCREEN COMMAND

The SCREEN command specifies that your terminal is to be operated in screen mode, as opposed to line (or scrolling) mode. Commands and features affected by the SCREEN command include CATLIST, FSE, screen formatting, and the display of NOS procedure parameters. The SCREEN command also identifies the terminal model to the system and initiates a search for the terminal definition file for that model (unless the CDC 721 terminal was specified; characteristics of this terminal are preloaded into the system so that no definition file is required). The system uses the following search order in attempting to find the definition file:

- A local file called TERMLIB (created using the TDU utility).
- An indirect access permanent file called TERMLIB under your user name.
- An indirect access permanent file called TERMLIB under user name LIBRARY (UN=LIBRARY). Your site may maintain a system file containing common terminal definitions.

If TERMLIB is found under your user name or under user name LIBRARY, the system copies the terminal definition to a local file called ZZZZTRM for later use by NOS full screen display features. The terminal files are always available once you have identified your terminal in a SCREEN or LINE command.

Format:

SCREEN,TM=model.

or

SCREEN,model.
The value specified for model is the terminal mnemonic defined in the terminal definition file or the terminal mnemonic for one of the following preloaded terminal definitions:

<table>
<thead>
<tr>
<th>Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>721</td>
<td>CDC 721 terminal.</td>
</tr>
<tr>
<td>721V3</td>
<td>CDC 721 terminal version 3.</td>
</tr>
<tr>
<td>722</td>
<td>CDC 722 terminal.</td>
</tr>
<tr>
<td>72230</td>
<td>CDC 722-30 terminal.</td>
</tr>
<tr>
<td>VT100</td>
<td>DEC VT100 terminal.</td>
</tr>
<tr>
<td>Z19</td>
<td>Zenith Z19 or Z29 terminal or Heathkit H19 terminal.††</td>
</tr>
<tr>
<td>ADM3A</td>
<td>Lear Siegler ADM3A terminal.†††</td>
</tr>
<tr>
<td>ADM5</td>
<td>Lear Siegler ADM5 terminal.†††</td>
</tr>
<tr>
<td>T4115</td>
<td>Tektronix 4115 terminal.††††</td>
</tr>
<tr>
<td>3270</td>
<td>IBM 3270 terminal.††††</td>
</tr>
<tr>
<td>PCONxx</td>
<td>IBM PC using CDC CONNECT. xx is the current level of CONNECT.</td>
</tr>
</tbody>
</table>

If you want your terminal to have the type-ahead capability, append T to the model name you are using in the SCREEN command. Type-ahead allows you to press a function key two or more times in quick succession, rather than pressing it once and waiting for the system to execute it before pressing it a second time.

If this parameter is omitted, the terminal model is left unchanged.

You can include this command in a procedure.

†DEC is a registered trademark of the Digital Equipment Corporation.
††Zenith Z19 and Z29 are products of the Zenith Corporation. Heathkit H19 is a product of the Heath Corporation.
†††Lear Siegler ADM3A and ADM5 are products of the Lear Siegler Corporation.
††††Tektronix 4115 is a product of the Tektronix Corporation.
†††††IBM 3270 is a product of the IBM Corporation.
TDU COMMAND

The TDU command calls an interactive procedure to compile a terminal definition file and store the compiled definition (in load capsule form) in a user library. The user library can later be accessed by a SCREEN or LINE command to define terminal characteristics to the system.

The user library to receive the load capsule must be a local file. If the library file you specify does not exist as a local file, TDU creates it. If you do not specify a library file, TDU uses a local file with the name TERMLIB. If no file TERMLIB exists, TDU creates it.

Format:

TDU,I=definition,L=listing,LIB=library,REC=recname,RW=option

Parameter Description

I=definition Specifies the terminal definition file. The file must be in 6/12-bit display code. For information on how to create a terminal definition file, refer to the NOS Version 2 Screen Formatting Reference manual.

L=listing Specifies the listing file. The listing file contains the list of error messages, if any. The default name is OUTPUT.

LIB=library Specifies the library file to receive the load capsule. The default name is TERMLIB. To be used by the SCREEN and LINE commands, the library file must be a local file or an indirect access file called TERMLIB.

REC=recname Specifies the name of the terminal definition record to be selected for processing from the terminal definition file. If an asterisk (*) is entered, all records are processed. If REC is omitted, the current record is processed with no regard to the record name.

RW=option Specifies if the terminal definition file and listing file are to be rewound before and after processing.

<table>
<thead>
<tr>
<th>option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO or N</td>
<td>Files are rewound.</td>
</tr>
<tr>
<td>YES or Y</td>
<td>Files are rewound.</td>
</tr>
</tbody>
</table>

If RW is omitted, the files are rewound.

The TDU command may appear in a procedure file.
TIMEOUT COMMAND

The TIMEOUT command can change your status from the no-timeout status to the standard timeout status. In standard timeout status, you are automatically logged out after 10 minutes of inactivity. If you have a no-timeout status (refer to the LIMITS command), the terminal remains connected until you log out. The TIMEOUT command changes your status for the session in progress.

Format:

TIMEOUT

TRMDEF COMMAND

The TRMDEF command changes one or more of the characteristics of your terminal (for example, the page length or the page-wait attribute). You can also use terminal definition commands (also called network commands) for this purpose. Typically, you would use TRMDEF in a prologue to set your terminal attributes for each login—especially if you tend to log in at the same type of terminal each time. You would use network commands to make on-the-fly changes during a given terminal session.

The network commands for a NAM/CCP network are in appendix J. The CDCNET Terminal Interface Usage manual describes network commands for a NAM/CDCNET network.

Format:

TRMDEF,L=lnf,tci=vi,...,tcn=vn

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>L=lnf</td>
<td>Specifies an optional file on which the terminal redefinition information is written. If lnf is omitted, file OUTPUT is assumed. If another file is specified, the changes are implemented when the file is listed or copied to the terminal.</td>
</tr>
<tr>
<td>tci=vi</td>
<td>Specifies the terminal characteristic to be changed. tci is specified by a two-character mnemonic listed in table J-1 in appendix J. The NUL and DEL characters can be specified on the TRMDEF command although they cannot be used with the terminal definition commands (refer to table J-1). You may not use the mnemonics AR, CH, HN, HS, MS, and TM for tci. The new option, vi, is any value in the range given for that terminal characteristic in table J-1. It can be a decimal value, a coded value with a special meaning (such as PR for printer), or a single character. You can specify multiple values for DL, EB, EL, and XL if you separate the values with slants (/), but only as specified in appendix J. If the new option is a single character, it can be given in any of the following formats.</td>
</tr>
</tbody>
</table>

For example:

vi

v  Any alphanumerical character (a character with a display code in the range from 0 through 44g).
Parameter | Description
---|---
**v** | Any character, including special characters, delimited by dollar signs (for example, $*$$). If the character is a dollar sign ($), it must be specified using two dollar signs (for example, $$$$).

**vvB** | Octal value of the 8-bit ASCII code for a character (for example, 52B, which would be equivalent to an entry of $*$).

**vvD** | Decimal value of the 8-bit ASCII code for a character (for example, 42D, which would be equivalent to an entry of $*$).

**Xvv** | Hexadecimal value of the 8-bit ASCII code for a character (for example, X2A, which would be equivalent to an entry of $*$).

**NOTE**
If a numeric value for a single ASCII character is specified without a pre- or post-radix, the value is assumed to be octal unless it contains an 8 or 9. In this case, it is translated as decimal.

Using TRMDEF with NAM/CDCNET

The CDCNET network defines a larger set of terminal attributes than does the CCP network. This gives you a greater degree of control of your terminal and its connections. For example, associated with the page wait attribute under CCP are two attributes under CDCNET: H0LD_PAGE (HP) and H0LD_PAGE_0VER (HPO). To avail yourself of this added control, you must use the CDCNET mnemonics for the attributes when using TRMDEF. The CDCNET Access Guide describes the CDCNET mnemonics along with any restrictions for parameter specifications with TRMDEF.

If you do choose to use the CCP mnemonics for terminal attributes even though you are using a CDCNET network, the system maps the CCP attributes into the corresponding CDCNET attributes. But again, it will not be a one-to-one mapping. The CDCNET Access Guide shows how the two sets of attributes interrelate.
Examples

TRMDEF,IN=PT  This command changes the input device to a paper tape reader, thus allowing you to read data and commands from a tape. It has the same effect as the corresponding terminal definition command (that is, entry of the control character followed by IN=PT).

TRMDEF,DL=C20/X03/TO  This command defines three different transparent input delimiters.

- the transmission of 20 characters
- the entry of an ETX character code
- a timeout

The first delimiter encountered terminates transparent input mode.

The operating system and the network check the validity of the parameter values you enter. The operating system does the preliminary check (syntax and general range checking) and the network does the specialized parameter checking. If you specify an invalid parameter value, the system informs you and the terminal characteristics in effect before you entered the command remain in effect. In general, the system informs you immediately of the error. The only case where you do not receive immediate notification of the error is where you have specified the L=lfn parameter and the system does not detect the error in its preliminary check. However, the network notifies you of the error as soon as you try to actualize the changes (copy file lfn to the terminal). Also, in this case, the system does not report to EXIT processing if you entered the command from a procedure.

SUBSYSTEM SELECTION COMMANDS

A subsystem creates an environment that facilitates the execution of certain classes of jobs. For instance, the FORTRAN subsystem provides a framework in which you can conveniently enter, compile, and execute FORTRAN 5 programs.

The access, execute, BASIC, FORTRAN, FTNTS, and null subsystems greatly restrict your job capabilities. Under them, you cannot enter many of the commands described in this manual unless you use the X,ccc command format (described later in this section). To have the largest set of system commands at your disposal, use the batch subsystem. If you want to use the RUN command, however, you must select either the BASIC, execute, FORTRAN, or FTNTS subsystem.

The following commands select a specific subsystem. You should always be aware of the subsystem that is currently active. For example, attempting to execute a FORTRAN program while operating under the BASIC subsystem causes meaningless diagnostic messages to be issued. To determine which subsystem is currently active, enter the ENQUIRE command.

NOTE

The subsystem may be automatically selected by the system at login if this has been set in the validation file (refer to the LIMITS command). You can also set the subsystem in your prologue with the SET command.
A specific subsystem can be associated with an indirect access file so that whenever you specify that file as the primary file, the associated subsystem is selected automatically. A subsystem flag can be set when you save the file. If you include the SS=subsystem parameter on the SAVE command, you can specify any of the valid subsystems. If you enter SAVE without SS=subsystem and the file is the primary file, the subsystem flag for the current subsystem with the file is set. To save the primary file with no subsystem association, you can either enter the null subsystem before saving the file, or enter the command:

SAVE,lfn/SS=NULL

Automatic subsystem association is made only when the primary file is saved. To associate a subsystem with a temporary file other than the primary file, it must be saved with the SS=subsystem parameter specified.

ACCESS COMMAND

The ACCESS command selects the access subsystem. You cannot enter a RUN command under the access subsystem. While in the access subsystem, you can communicate with another interactive terminal using the DIAL and WHATJSN commands. You must be authorized to use the access subsystem (refer to LIMITS command).

Format:

ACCESS

The DIAL and WHATJSN commands can be entered only when the access subsystem is active.

BASIC COMMAND

The BASIC command selects the BASIC subsystem. A RUN command under the BASIC subsystem uses the BASIC compiler.

Format:

BASIC,ccc

Parameter Description
ccc Specifies a command to be executed after the system executes the BASIC command. Any valid command is permitted, as well as all valid parameters for that command.

The following example illustrates the use of the ccc parameter.

BASIC, OLD, PRIME

In this example, the user selects the BASIC subsystem and makes a copy of permanent file PRIME the primary file. The file name (PRIME) is a valid parameter with the OLD command.
BATCH COMMAND

The BATCH command selects the batch subsystem. You cannot use the RUN command under the batch subsystem.

Format:

```
BATCH,fl
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fl</td>
<td>Specifies the initial running field length for subsequent job steps. Entering this value is equivalent to entering the RFL,fl command (refer to section 7). If fl is omitted, 0 is assumed. If you implicitly selected the batch subsystem by retrieving an indirect access permanent file with the OLD command, the field length is either 0 or that entered with the last RFL command.</td>
</tr>
</tbody>
</table>

Unless you have a reason to do otherwise, choose the batch subsystem for normal job processing. The batch subsystem allows you to enter essentially all commands allowed in batch jobs. Some file management commands and nearly all execution control processing commands are available in the other subsystems only through the X,ccc command.

Although you can enter any system command from an interactive job, the output produced by several of these commands is formatted for transmission to a line printer (137 characters per line). Through use of the L072 command, you can format the output for transmission to a terminal (72 to 160 characters per line) but some data may be lost. Refer to the description of the L072 command in section 9.

EXECUTE COMMAND

The EXECUTE command selects the execute subsystem. A RUN command under this subsystem executes a previously compiled (object code) program. The RUN command must be entered to initiate execution.

Format:

```
EXECUTE,ccc
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccc</td>
<td>Specifies one command to be executed after the system executes the EXECUTE command. Any valid command is permitted, as well as all valid parameters for that command.</td>
</tr>
</tbody>
</table>

In the following example, you select the execute subsystem and make a copy of permanent file OBJFILE the primary file. The file name (OBJFILE) is a valid parameter with the OLD command.

```
EXECUTE,OLD,OBJFILE
```

**NOTE**

Source language programs cannot be executed under the execute subsystem.
Use the execute subsystem whenever possible to conserve system resources. Efficiency can be achieved when certain programs are used frequently. For example, a source code program created under the FORTRAN subsystem must first be compiled before it can be executed (this process is automatic; you need only enter the RUN command). The program automatically goes through a compilation phase, which produces an executable object code program, and the object code program is then executed. Thus, greater efficiency can be achieved by retaining the object code program in the permanent file system for later execution under the execute subsystem. This can be accomplished by using the following commands (under the FORTRAN subsystem):

```
RUN,B=lfn
```

Causes the object code program to be placed on temporary file lfn.

```
SAVE,lfn/SS=EXECUTE
```

Retains file lfn as a permanent file and sets the execute subsystem flag.

If this is done, subsequent requests for the file using the OLD command causes the execute subsystem to be selected. Entering the RUN command initiates execution of the object code program.

**FORTRAN COMMAND**

The FORTRAN command selects the FORTRAN subsystem. A RUN command under this subsystem uses the FORTRAN Version 5 compiler.

Format:

```
FORTRAN,ccc
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccc</td>
<td>Specifies a command in addition to the FORTRAN command. Any valid command is permitted, as well as all valid parameters for that command.</td>
</tr>
</tbody>
</table>

The following example illustrates the use of the ccc parameter.

```
FORTRAN,OLD,TAX
```

In this example, the user selects the FORTRAN subsystem and makes a copy of permanent file TAX the primary file. The file name (TAX) is a valid parameter with the OLD command.
**FTNTS COMMAND**

- The FTNTS command selects the FTNTS subsystem. A RUN command under this subsystem uses the FORTRAN Extended Version 4 compiler.

**Format:**

```
FTNTS,ccc
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccc</td>
<td>Specifies a command in addition to the FTNTS command. Any valid command is permitted, as well as all valid parameters for that command.</td>
</tr>
</tbody>
</table>

The following example illustrates the use of the ccc parameter.

```
FTNTS,OLD,DATA GEN
```

In this example, the user selects the FTNTS subsystem and makes a copy of permanent file DATA GEN the primary file. The file name (DATA GEN) is a valid parameter with the OLD command.

**NULL COMMAND**

- The NULL command selects the null subsystem. You cannot use the RUN command under this subsystem.

**Format:**

```
NULL
```

This command is entered before saving the primary file if you do not want a specific subsystem flag to be associated with the file. Normally, when you save the primary file, an internal indicator called the subsystem flag is set to indicate the subsystem currently in use. That subsystem is automatically selected in each succeeding request for the file using the OLD command. An alternative way of saving the primary file with no subsystem association is to specify the SS=NULL parameter on the SAVE command. No automatic subsystem association occurs when saving temporary files other than the primary file.

If you do not specify a subsystem at login time, the system sets the subsystem specified in the validation file during login (refer to the LIMITS Command in section 7). Null is the default.
INTERACTIVE STATUS COMMANDS

The system executes interactive status commands immediately. You may enter them while the system is executing another command. The system queues other commands that are typed prior to prompts (refer to section 17).

Format:

ct x

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>ct is the network control character defined for the terminal (refer to the CT command in appendix J). Do not include a space between ct and x. We show one here only for clarity.</td>
</tr>
<tr>
<td>x</td>
<td>x can be the letter D, E, or S.</td>
</tr>
</tbody>
</table>

With the exception of the Detach command (ctD), the system generates only a line feed if you enter an interactive status command during one of the following states:

- Text mode
- Auto mode
- Input mode (a program is waiting for input)
- During login
- During the processing of the interruption or termination sequence

DETACH COMMAND (ctD)

The Detach command detaches a terminal job from the terminal. You can detach a job at any time during a terminal session. To detach the job during output, first enter the interruption sequence and then enter the Detach command. Otherwise, ctD alone is sufficient.

When you detach a job, the following message appears at the terminal:

JOB DETACHED, JSN=jsn

All files assigned to the detached job remain assigned to it. Any commands typed ahead, before the detachment, are discarded.

Subsequent to the detachment, the system creates a new terminal session with a new job sequence name (JSN). Any commands you enter after the detachment become part of the new terminal job. However, if your job is executing a procedure when you detach it, the procedure remains a part of the detached job. The system initiates the new job with recovery dialogue processing (refer to the RECOVER command in this section).

The detached job executes until one of the following occurs:

- No more commands remain. Detaching a job while it is in the IDLE status causes the system to reach the end of the command record.
- A fatal error aborts the job.
The job requests input from the terminal or queues output to the terminal.

The job exceeds its time limit or SRU limit.

Certain system requests are encountered.

At this point, the system suspends the detached job unless you specified the OP=TJ parameter (terminate job option) on the most recent SETJOB command. The job remains suspended until you recover it or until it exceeds its timeout period. You can recover an executing or suspended job with the RECOVER command, which is described later in this section.

You may route terminal output from a detached job to the wait queue. To do this you must enter a SETJOB command and an ASSIGN command before detaching the job. The SETJOB command should specify DC=TO. The ASSIGN command should be as follows:

ASSIGN,MS,OUTPUT

The system limits the number of jobs you can detach (refer to the LIMITS command in section 7).

IMMEDIATE JOB STATUS COMMAND (ctE)

This command requests detailed job status response. You can enter this command while another command is active, and the system processes it immediately. The following output is an example of the system's response to a ctE command:

JSN: AADF SYSTEM: BATCH SRU: 2.095 FILE NAME: SAMPLE2
STATUS: IDLE

ABBREVIATED JOB STATUS COMMAND (ctS)

This command causes the system to give an abbreviated job status response. The system issues one of the following responses.

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTE</td>
<td>System is currently processing your command.</td>
</tr>
<tr>
<td>IDLE</td>
<td>System is waiting for you to enter a command.</td>
</tr>
<tr>
<td>WAIT</td>
<td>System is waiting for system resources to become available.</td>
</tr>
</tbody>
</table>
JOB PROCESSING COMMANDS

The job processing commands allow you to perform a variety of job processing or job-related operations. These commands can be entered at any time after login is complete.

APPSW COMMAND

The APPSW command allows you to temporarily switch to a secondary (alternate) NAM application program. The NAM application you originally logged into is called the primary application. The secondary application that you specify on the APPSW command must be one that is supported by your site and one that you are validated to use. When you log out of the secondary application, your terminal reverts to the primary application. While in the secondary application, your current session is suspended. Upon exiting the secondary application, your session resumes processing at the point where the APPSW command was encountered.

The job issuing the APPSW command must be an interactive terminal job and must be a NAM terminal connection. The APPSW command is invalid for RDF terminals or any origin type other than interactive.

Format:

APPSW,AP=appl,Z.data

or

APPSW,appl,Z.data

Parameter Description
appl Specifies one of the following NAM applications:
appl Description
ITF Interactive Transfer Facility
MCS Message Control System
NETOU Network Operator Utility
NJF Network Job Entry Facility
PLATO PLATO-NAM Interface
PSU Printer Support Utility
RBF Remote Batch Facility
TVF Terminal Verification Facility
TLF Tieline Facility
TAF Transaction Facility
VEI AF NOS/VE Interactive Facility
Z Specifies that any characters following the command terminator are to be forwarded to the secondary application as data.
data Data to be forwarded to the secondary application. data can be up to 50 characters long. Any additional characters are truncated.
BYE COMMAND

The BYE command ends your session with IAF and either logs you out of your host and disconnects the terminal or places you under the control of another NAM application.

If you are connected to IAF as your secondary application (refer to the APPSW command description for more information on secondary applications), entering the BYE command with a null application parameter returns your terminal connection to the primary application.

Format:

BYE, appl

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>appl</td>
<td>If IAF is your primary application, appl specifies an application to which you wish to be connected. The following are some supported applications:</td>
</tr>
<tr>
<td></td>
<td>appl</td>
</tr>
<tr>
<td>ITF</td>
<td>Interactive Transfer Facility.</td>
</tr>
<tr>
<td>MCS</td>
<td>Message Control System.</td>
</tr>
<tr>
<td>PLATO</td>
<td>PLATO-NAM Interface.</td>
</tr>
<tr>
<td>RBF</td>
<td>Remote Batch Facility.</td>
</tr>
<tr>
<td>TAF</td>
<td>Transaction Facility.</td>
</tr>
<tr>
<td>TVF</td>
<td>Terminal Verification Facility.</td>
</tr>
<tr>
<td>VEIAF</td>
<td>NOS/VE Interactive Facility.</td>
</tr>
</tbody>
</table>

If IAF is your secondary application, you have the following options for the appl parameter:

<table>
<thead>
<tr>
<th>appl</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>omitted</td>
<td>If you omit the appl parameter, your terminal is logged out of IAF and is returned to the control of the primary application.</td>
</tr>
<tr>
<td>ABORT</td>
<td>If you specify ABORT for appl, an abort status message is returned to the primary application, and your terminal is disconnected from both the primary and secondary applications.</td>
</tr>
</tbody>
</table>

Any other application name will be ignored, and you will be returned to your primary application.
If IAF is your primary application and if you select an application that is available and that you are validated to use, you are automatically released from IAF control and placed under the control of the named application. If you do not select another application, you are logged out of the host and the terminal is disconnected. In this case, IAF responds by printing:

```
UN=username
JSN=jsn
Characters=xxxxx
LOGGED OUT.
```

The following describes the variable items in the logout information:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>User name.</td>
</tr>
<tr>
<td>hh.mm.ss.</td>
<td>Time of day this command was entered.</td>
</tr>
<tr>
<td>jsn</td>
<td>Job sequence name.</td>
</tr>
<tr>
<td>s.sss</td>
<td>Measure of system resources used during IAF connection. The SRU is a unit of measurement which includes all CPU time, memory usage, and I/O activity since login to IAF.</td>
</tr>
<tr>
<td>xxxxxxxxx</td>
<td>A count of the total number of input and output characters read from, or written to, your terminal.</td>
</tr>
</tbody>
</table>

If you switch applications without disconnecting from the network, your terminal's characteristics do not change.

**NOTE**

Ensure that all temporary files to be retained are made permanent before issuing this command. All files which have not been saved are released when the BYE command is processed.

This command can appear in a procedure or in a batch job. If used in this manner, it terminates the job.
DIAL COMMAND

The DIAL command sends a one-line message to another terminal user.

Format:

DIAL,jsn,sss

Parameter                  Description
jsn                        Specifies the job sequence name (JSN) of the terminal to receive the message.
sss                        Specifies the one-line message.

The receiving terminal displays the message in the format:

FROM sjsn:sss

where sjsn is the JSN of the sending job and sss is the message.

The DIAL command can be entered only if the access subsystem is active. The terminal to receive the message can have any subsystem active; it need not be under the access subsystem or have access validation.

You can determine the appropriate jsn by using the WHAT.JSN command. If the terminal specified is currently receiving output or has an input request outstanding, the message is lost. No further attempt to transmit the message is made.

EXPLAIN COMMAND

The EXPLAIN command retrieves an online version of a CDC manual.

Format:

EXPLAIN,M=manual

or

EXPLAIN,manual

Parameter                  Description
M=manual                   Specifies the manual you want to retrieve. Your site determines what manuals are available to you. If you omit the parameter M=manual, the system generates a menu of the EXPLAIN features.
GOODBYE COMMAND

Same as BYE command.

Format:

GOODBYE, application

This command can appear in a procedure or a batch job. If it does, it terminates the job.

HELLO COMMAND

The HELLO command logs you out of IAF and switches you to another application or reinitiates the login sequence. Your terminal's characteristics do not change.

Format:

HELLO, application

If application is specified or if you are logged into IAF as a secondary application (in which case, the application parameter is ignored), this command is the same as the BYE, application command.

If application is not specified, this command logs you out of IAF, as in the BYE command, but reinitiates the login sequence. Any temporary files that are to be retained must be made permanent before the HELLO command is entered. This form of the command allows a new user to log in without first having to establish communications with the network by dialing the terminal telephone number.

This command can appear in a procedure or a batch job. If it does, it terminates the job.
HELLO7 COMMAND

The HELLO7 command allows you to submit a job that requires terminal input or output to a linked SCOPE 2 system and to communicate interactively with an executing SCOPE 2 job. If your SCOPE 2 job does not require interactive participation, you can route it to SCOPE 2 with the ROUTE command.

A job you submit through HELLO7 (or the ROUTE command) must be a standard SCOPE 2 job using SCOPE 2 control statements. The job initiates terminal input or output operations by specifying CNF=YES on a FILE control statement or macro or by issuing a CONNECT macro for a file.

There are two modes of operation under HELLO7: control mode and run mode. In control mode, the initial mode on entering HELLO7, you are communicating with the HELLO7 utility. In control mode you can submit a job to SCOPE 2, drop a job, or obtain status information on a job. Once you submit a job to SCOPE 2 (by entering a SUBMIT directive), you enter run mode, in which you interact directly with your job as it executes on the SCOPE 2 system. You remain in run mode until you enter a termination directive.

The following command calls HELLO7 and places the terminal in control mode.

Format:

HELLO7.

If your NOS system is attached to a single SCOPE 2 mainframe, HELLO7 normally responds with a control mode prompt indicating that it is ready to accept a directive. The control mode prompt consists of two asterisks (**). The run mode prompt, two dollar signs ($$), is discussed under the PROMPT directive below. Both the control mode and run mode prompts are followed by a ? prompt. The ? prompt appears at the beginning of the input line.

In a multimainframe environment, the following prompt may appear after you enter the HELLO7 command.

MAINTFRAME=

You respond by entering the logical identifier (LID) of the SCOPE 2 system you want to access. If the mainframe you request is not available, the following message appears at the terminal.

MAINFRAME ID NOT IN ID TABLE

In response to this message you may enter an alternate LID, or you may terminate HELLO7 processing by typing END.

HELLO7 Directives

Once you have received the control mode prompt (**), you can submit a job, drop a job, obtain status information, or temporarily exit from HELLO7 using the following HELLO7 directives. The termination directive, *EOF directive, *EOP directive, and *EOS directive can be entered only in run mode. All other directives can be entered only in control mode.
Directive | Function
--- | ---
ub2 (termination directive) | Suspends terminal communications with the SCOPE 2 job. The terminal returns to control mode while the job continues to run. You can re-establish communications with the job (reenter run mode) later using the RESUME directive.

ub2 represents the user break 2 termination sequence recognized by your terminal. The actual termination sequence varies with the terminal class; most terminal classes use ) or CTRL/T in the termination sequence. Refer to Terminating Job Step in Section 16 and to the B2 terminal definition command in Appendix J for more information on the termination sequence.

DROP, J or DR | Drops a SCOPE 2 job prior to normal termination. You can then enter a status request to determine when drop completion has occurred.

END or E | Disconnects the terminal from HELLO7 and drops any SCOPE 2 job active at the time the END directive is issued.

*E0F | Inserts an end-of-information designator into terminal input data.

*EOP | Inserts an end-of-partition designator into terminal input data.

*EOS | Inserts an end-of-section designator into terminal input data.

EXIT | Disconnects the terminal from HELLO7 but does not drop an active job you have submitted to SCOPE 2. This allows you to leave HELLO7, execute other commands, eventually return to HELLO7, and resume monitoring the executing job.

PROMPT,status | Activates or deactivates the automatic run mode prompt which appears at the terminal whenever the SCOPE 2 job requests input from the terminal. The run mode prompt consists of two dollar signs ($$). When the automatic prompt is off, terminal prompts must be supplied by the executing SCOPE 2 job. Valid entries for status are as follows.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>The automatic prompt is activated (default).</td>
</tr>
<tr>
<td>OFF</td>
<td>The automatic prompt is deactivated.</td>
</tr>
</tbody>
</table>

RESUME or R | Reestablishes terminal communications with an executing SCOPE 2 job. This directive allows you to reenter run mode after having issued a termination directive. On reentering run mode, the following message appears at your terminal.

RESUMING 7000 MODE..

**NOTE**

If you have no SCOPE 2 job active when the RESUME directive is issued, the above message will be preceded by the warning message, NO 7000 JOB ACTIVE. The terminal will then wait in run mode indefinitely for connected file input/output with a SCOPE 2 job output.
Directive

STATUS or S

Retrieves status information on the SCOPE 2 job submitted (using the SUBMIT directive). The response is of the following form.

JOBNAME=jobname USERID=id STATUS=status

where:

- **jobname**: Name of last job submitted to SCOPE 2.
- **id**: Your user ID.
- **status**: Indicates the status of the job identified by jobname. The following values can be returned for status.

<table>
<thead>
<tr>
<th>status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INPUT</td>
<td>Indicates job waiting for terminal input.</td>
</tr>
<tr>
<td>OUTPUT</td>
<td>Indicates job ready for terminal output.</td>
</tr>
<tr>
<td>RUN</td>
<td>Indicates job is currently executing.</td>
</tr>
<tr>
<td>STOP</td>
<td>Indicates job has aborted.</td>
</tr>
</tbody>
</table>

SUBMIT,lfn

Submits a local file lfn to the SCOPE 2 system for execution and places the terminal in run mode. The SUBMIT directive must be entered with no terminator. HELLO7 responds to the directive with this message.

FORWARDING JOB TO MONITOR

The above message indicates that the job is being validated for account codes. When validation is completed, the following message appears.

ENTERING 7000 MODE .. WAIT

This message indicates that the logical file name has been routed to SCOPE 2 for execution. At this point, you have entered run mode and are waiting for the job to be scheduled. When the job is ready for input, the run mode prompt ($$) will appear, unless you have disabled the automatic prompt using the PROMPT,OFF directive.

If the connection to the SCOPE 2 system is inoperative, the following message is returned in response to the SUBMIT directive.

7000 INTERACTIVE NOT ENABLED
Example:

The sample job below reads interactive input from a terminal and writes the input information to the output file. The sample job is contained in a local file called TESTJOB. Following the sample job is an example of an interactive session in which the sample job is submitted to SCOPE 2 through HELLO7.

Sample Job

H7JOB,STMFZ,jobcard parameters.
ACCOUNT,account card parameters.
FILE (INPUT,CNF=YES)
FILE (OUTPUT,CNF=YES)
WHILE,EF=0,TAG.
COPYR.
ENDW,TAG.

HELP COMMAND

The HELP command generates a menu of the online help features and prompts you to make a selection.

Format:

HELP

There are four online help features:

- A list of all NOS commands, except for compiler calls.
- Help in entering a command (the HELPME feature). HELPME gives a description of the command and its parameters, prompts you for the parameters, and then executes the command.
- Access to an online version of selected CDC manuals (the EXPLAIN feature).
- A list of the NAM/CCP network commands.

HELPME COMMAND

The HELPME command gives a brief description of a command and its parameters, prompts you for parameter values, and then executes the command.

Format:

HELPME,command

Parameter Description

command Specifies a command. You can get a list of commands by using the HELP command or by requesting help after entering HELPME.

The HELPME command is an interactive procedure. You can get help at any time during your dialog with HELPME by entering a question mark (or pressing the HELP function key if your terminal is in screen mode). For more information about help on procedure calls, refer to Requesting Help on Procedure Calls in section 4.

LIB COMMAND

The LIB command retrieves a copy of an indirect access permanent file from the catalog of special user name LIBRARY and makes it the primary file.

Format:

LIB,lfn=pfn/PW=password,PN=packname,R=r,NA,ND,WB

Parameter Description

lfn=pfn Specifies the local file name lfn given the retrieved copy of permanent file pfn. If lfn= is omitted, the local copy is called pfn.

PW=password Specifies the password needed to retrieve file pfn if one exists.
Parameter | Description
--- | ---
PN=packname | Specifies the auxiliary device on which pfn resides if pfn resides on one.
R=r | Specifies the device type of the auxiliary device on which pfn resides, only if different from the installation-defined default.
NA | Specifies the no-abort option. LIB processing errors do not terminate the job. The job waits for the mounting of disk packs.
ND | Specifies the no-drop option. Local files are not released.
WB | Specifies the wait-if-busy option. The job waits for the mounting of disk packs.

Section 10 contains a detailed description of parameters used on permanent file management commands.

Direct access files can also reside in the catalog of LIBRARY although another command method must be used to access these files (described in the following paragraphs). The file category is private, semiprivate, or public. The permission mode is that which has been granted for private files or specified in the catalog for semiprivate and public files.

When you enter the LIB command, the system retrieves a copy of the specified indirect access permanent file and makes it become the new primary file. For example:

```
LIB,ABC75/PW=13479,ND
```

Unless you enter the ND parameter, the system releases all files that do not have the no-auto-drop status. Certain system scratch files (ZZZZZC0, ZZZZZC1, ZZZZZC2, and ZZZZZLD, for example) have this status. You can give a local file this status with the SETFS command.

In this example, you retrieve a copy of permanent file ABC75 and it becomes the new primary file; all local files remain associated with the job. The previous primary file becomes a nonprimary temporary file. The LIB command accesses only indirect access permanent files.

You can enter the following commands to access permanent files in the catalog of LIBRARY (differences in command function are described).

```
ATTACH, lfn=pfn/UN=LIBRARY,PW=password,M=m
```

This command must be entered to use any direct access permanent files in the catalog of LIBRARY. The system does not create a temporary file since all input and output operations directly involve the permanent file itself. However, if you wish to reference the file by a name other than its permanent file name, you can assign a local file name (lfn) in the command. The primary file name remains unchanged.

```
GET,lfn=pfn/UN=LIBRARY,PW=password
```

This command retrieves a copy of the specified indirect access permanent file (from the catalog of LIBRARY) for use as a temporary file. The primary file remains unchanged unless lfn specifies the name of the current primary file.

```
OLD,lfn=pfn/UN=LIBRARY,PW=password
```

The function of this command is identical in all respects to that of the LIB command.
You can access from the catalog of LIBRARY only those files that allow alternate user access. The system considers all users, except user name LIBRARY, alternate users. A summary of the rules for alternate user access follows:

- Only those users with permission can access private files.
- All users can access semiprivate and public files providing they know the file name, password (if one exists for the file), type of access (direct or indirect), and user name (LIBRARY).

The following forms of CATLIST generate the list of accessible files in the catalog of LIBRARY.

- CATLIST,LO=F,UN=LIBRARY (full listing)
- CATLIST,UN=LIBRARY (file names only)

LIST COMMAND

The LIST command lists the contents of a local file. If you want to selectively list lines of the primary file, use the alternate form of the command described later in this section under Primary File Editing Commands.

Format:

\texttt{LIST,F=lfn}  \hfill Parameter Description
  \texttt{F=lfn} \quad \text{Specifies the local file to be listed. The default is the primary file.}

LOGIN COMMAND

Same as HELLO command.

Format:

\texttt{LOGIN, application}

This command can appear in a procedure or in a batch job. If used in this manner, the command terminates the job.
LOGOUT COMMAND

Same as BYE command.

Format:

LOGOUT, application

This command can appear in a procedure or in a batch job. If used in this manner, the command terminates the job.

NOSORT COMMAND

The NOSORT command prevents the system from automatically sorting the primary file by clearing an internal indicator called the sort flag. Normally, the system sorts the primary file, if needed, whenever the current command causes it to read the file.

Format:

NOSORT

This command can be used when making additions or other modifications to the primary file. When followed by the NOSORT command, the modifications create a new logical record in the primary file. The NOSORT command remains in effect only until the next numbered line of source code is entered. This causes the sort flag to be turned on again.
RECOVER COMMAND

The RECOVER command recovers detached jobs or interrupted terminal sessions. The RECOVER command can also appear in a procedure.

Format:

RECOVER,JSN=jsn,OP=T

or

RECOVER,jsn,T

or

RECOVER

The parameters are order-independent if you specify the parameters in the keyword=value form. Otherwise, the parameters are order-dependent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSN=jsn</td>
<td>Specifies the job sequence name (JSN) of the detached job.</td>
</tr>
<tr>
<td>OP=T</td>
<td>Directs the system to abort recovery processing if you have no recoverable jobs. Otherwise, the system engages you in a recovery dialog.</td>
</tr>
</tbody>
</table>

If you specify no parameters and have recoverable jobs, the system displays those jobs and their status and prompts you for further recovery directives.

During job processing, recovery may be necessary in the following cases:

• Your terminal is disconnected from the system without being logged out.

• A system malfunction occurs which requires a restart.

• You want to continue a job you detached.

The length of time before the system times out the job depends on your validation limits (refer to the LIMITS command) and the site-determined default time-out period.

If you have recoverable jobs in the system, the system automatically displays them after login. The system lists four attributes of each recoverable job: its job sequence name (JSN), user job name (UJN), current job status, and the time remaining before the system forces termination of the job.
Example:

WELCOME TO THE NOS SOFTWARE SYSTEM.
COPYRIGHT CONTROL DATA 1978, 198X.

yy/mm/dd. hh:mm:ss. LEOT1
CDC NETWORK OPERATING SYSTEM.............NOS 2
FAMILY: ,username,password,iaf
JSN: ABNA, NAMIAF

RECOVERABLE JOB(S)

<table>
<thead>
<tr>
<th>JSN</th>
<th>UJN</th>
<th>STATUS</th>
<th>TIMEOUT</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABMK</td>
<td>AJLA</td>
<td>SCH ROLLED</td>
<td></td>
</tr>
<tr>
<td>ABMQ</td>
<td>AJLA</td>
<td>SUSPENDED 14 MIN.</td>
<td></td>
</tr>
</tbody>
</table>

ENTER GO TO CONTINUE CURRENT JOB,
RELIST TO LIST RECOVERABLE JOBS,
OR DESIRED JSN: go

READY.

There are eight status messages that can appear in the STATUS column:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTING</td>
<td>The job is executing.</td>
</tr>
<tr>
<td>IDLE</td>
<td>The system has reached the end of the job's command record.</td>
</tr>
<tr>
<td>INITIAL</td>
<td>The job awaits its initial rollin.</td>
</tr>
<tr>
<td>I/O ROLLED</td>
<td>The system is processing interactive input or output from the job.</td>
</tr>
<tr>
<td>SCP ROLLIN</td>
<td>The job awaits a rollin for an SCP (system control point) request.</td>
</tr>
<tr>
<td>SUSPENDED</td>
<td>The job is no longer executing.</td>
</tr>
<tr>
<td>T/E ROLLED</td>
<td>The rolled out job awaits a time or an event.</td>
</tr>
<tr>
<td>SCH ROLLED</td>
<td>The scheduler has rolled out the job.</td>
</tr>
</tbody>
</table>

If you choose the GO option, the system ends the recovery dialogue. If you choose the RELIST option, the system relists the recoverable jobs. If you specify one of the JSNs, you get the following display:

JSN: jsn SYSTEM:subsystem SRU: nnnnnn.nnn FILE NAME: primaryfile
STATUS: message
CHARACTER SET: charset MODES: modes
instruction

The following describes the variable items (in lowercase) in the display:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jsn</td>
<td>Job sequence name.</td>
</tr>
<tr>
<td>subsystem</td>
<td>Interactive subsystem.</td>
</tr>
</tbody>
</table>
The SRUs used by the job.

The job's primary file. The system suppresses this field if there is no primary file.

Message from executing job, if present. Otherwise, the field is blank.

The interactive character set mode (ASCII or NORMAL) of the job.

The prompting mode (BRIEF or PROMPT ON).

The system's instruction on job continuation. There are five possibilities:

- TEXT MODE.
- OUTPUT AVAILABLE.
- INPUT REQUESTED.
- IDLE.
- JOB IN SYSTEM.

If the job has output available, the job is started and output continues at the terminal. A job waiting for input will not start until you enter the input.

In general, recovery is designed to provide minimum inconvenience to you with maximum security. Certain programs (like the FSE editor) recreate the environment that existed at the time of job disruption. However, under certain circumstances, recovery of your information cannot be perfect. Here are three examples of such circumstances:

- In some cases, a few lines of output may be lost when a phone line is disconnected because data queued in the network cannot be recaptured by IAF.

- If a phone line is disconnected when you are entering lines, you can normally expect to lose the last few lines you entered.

- When you are reconnected, terminal characteristics for that terminal session are set to the initial values. If a system prologue or user prologue sets terminal characteristics, these characteristics are restored during job recovery. If the recovered job had altered any of the terminal characteristics, they will not be restored automatically. For example, you set the page width to 90 before being disconnected. Upon recovery, the page width is set to the initial value for the terminal class, not to 90.
The following is another example of job recovery.

```
00100 LET A=1
00110 INPUT B
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT I," FACTORIAL IS ";A
00150 NEXT I
00160 END
```

The user is disconnected before entering data and logs in again.

WELCOME TO THE NOS SOFTWARE SYSTEM.

```

READY.
Text on this page is deleted.
RUN COMMAND

The RUN command compiles and/or initiates execution of a local file. The compiler used (if any) depends on the current subsystem. This command is valid only in the BASIC, FORTRAN, FTNIS, and execute subsystems.

Formats:

RUN

RUN,I=lfni

RUN,B=lfn2

RUN,I=lfni,B=lfn2

RUN,T,q1,q2,...,qn

Parameter Description

lfni Specifies the local file that contains the source program to be compiled and executed.

lfn2 Specifies the compiler or assembler output file. File lfn2 can be later executed in the execute subsystem by entering just RUN.

q1 Specifies local files to replace files specified on the PROGRAM statement in a FORTRAN 5 program.

The first format of the command compiles and initiates execution of the primary file.

The second format of the command compiles and initiates execution of the local file lfn1 if the subsystem and the source program are compatible.

The third format of the command compiles the primary file and generates a binary file, lfn2, containing the resulting object code. The object code is not executed. File lfn2 can later be executed under the execute subsystem by entering the RUN command. The B and C parameter names are interchangeable.

The fourth format compiles local file lfn1 and generates a binary file, lfn2, containing the resulting object code. The object code is not executed. File lfn2 can later be executed under the execute subsystem by entering the RUN command. The B and C parameter names are interchangeable.

The fifth format of the command applies only when running a previously compiled (object code) FORTRAN program in the execute subsystem. It allows you to rename local files specified in the PROGRAM statement without recompiling the program. Parameters q1 through qn specify new local file names to be used in place of those that currently exist in the PROGRAM statement (the parameters are order-dependent and must correspond to those they replace).

The following example illustrates the use of the RUN,T command. Assume a FORTRAN program contains the following PROGRAM command.

```fortran
PROGRAM TEST (INPUT,OUTPUT,AAA,BBB,TAPE1=AAA,TAPE2=BBB)
```

Normally, to execute a program containing this command, you must define local file AAA. Local file BBB results from the execution of the program. However, you could change the names of local files AAA and BBB without recompiling the program (if the object program exists) by using the RUN,T command under the execute subsystem. For example:

```fortran
RUN,T,INPUT,OUTPUT,CCC,DDD
```
**SECURE LOGIN COMMAND**

The secure login command ensures that your login information goes to the correct host software. You can enter this command at any time you are connected to the network. If you are already connected to a host when you enter this command, you will be unconditionally disconnected and reconnected so that you can proceed with a secure login. This command does not disconnect you from the network.

The secure login command includes a security character that is chosen by your site. The procedure you use to enter this security character depends on your terminal type:

<table>
<thead>
<tr>
<th>Terminal Type</th>
<th>Secure Login Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asynchronous (except 2741s)</td>
<td>Press the BREAK key (or ATTN) and type the security character.</td>
</tr>
<tr>
<td>X.25 PSN terminal</td>
<td>Press the BREAK key (or ATTN), type the security character, and enter the message transmission signal.</td>
</tr>
<tr>
<td>Mode 4</td>
<td>Clear the screen, enter a carriage return, and clear the screen again. Type the security character and press the end-of-block key.</td>
</tr>
<tr>
<td>HASP</td>
<td>Type the security character and press the end-of-line key.</td>
</tr>
<tr>
<td>2780 or 3780</td>
<td>Enter /* and the security character from the console or a card reader.</td>
</tr>
<tr>
<td>2741</td>
<td>Press the NL key twice and the ATTN key once. Type the security character and press the NL key again.</td>
</tr>
<tr>
<td>3270</td>
<td>Clear the screen and enter the program attention 1 key once. Type the security character and press the ENTER key.</td>
</tr>
</tbody>
</table>

**SHOW COMMAND**

The SHOW command calls an interactive procedure to display a screen formatting panel. SHOW is used for testing purposes. It allows you to display a panel without having to write a program that calls the panel.

Format:

SHOW,1=panelname

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>panelname</td>
<td>Specifies the name of a compiled panel in user library PANELIB or in a global library set.</td>
</tr>
</tbody>
</table>

Since the SHOW command is an interactive procedure, you can get help information for the procedure by entering:

SHOW?

†If your terminal is connected to a CDCNET network, refer to the CDCNET Terminal Interface Usage Manual.
TEXT COMMAND

The TEXT command selects text mode. Text mode allows direct entry of information (program commands, data, or text) into the primary file without specifying line numbers. The system interprets commands entered in text mode as text and does not process them directly.

Format:

TEXT

Unless changed during installation, the input line can consist of a maximum of 160 characters. The system appends data to the end of the file.

To terminate text mode, you should terminate the current input line with a carriage return, then enter the interruption sequence or the termination sequence defined for the terminal in use or the ETX character followed by a carriage return. ( Interruption and termination in sequences are discussed in section 16.)

The system automatically packs the text file to ensure that the data is in one logical record.

NOTE

Do not enter a user break to terminate text mode until you have received the ENTER TEXT MODE message at your terminal. If entered before this message, your user break clears any unprocessed input, and no data goes into the primary file.

WHATJSN COMMAND

The WHATJSN command returns the job sequence name (JSN) of the terminal you specify by a user name. When several terminals are logged in under the specified user name, a list of JSNs is returned. The WHATJSN command can be entered only from the access subsystem. It is used in conjunction with the DIAL command to send a message to a user at an interactive terminal.

Format:

WHATJSN,username

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Specifies the user name of user whose JSN you seek.</td>
</tr>
</tbody>
</table>
X COMMAND

The X command forces the system to interpret a command as a batch command. The X command does not explicitly change the current subsystem for your job, however.

Format:

X,ccc

Parameter             Description
ccc                    Any valid batch command.

This command cannot exceed 80 characters. You must type the entire command but can omit the terminator. However, you must enter a terminator after a command if you want to append a comment to the command.

This command is used to enter a batch command that either is invalid in your current subsystem or has a different function in that subsystem.

For example, the command

X,BASIC

calls the BASIC compiler instead of changing your subsystem to BASIC.

XMODEM COMMAND

The XMODEM command initiates the transfer of files between NOS and a microcomputer using the Christensen protocol.

Format:

XMODEM,fn,td,ft,lf,sp,ec,fm,cf.

XMODEM,FN=fn,TD=td,FT=ft,LF=lf,SP=sp,EC=ec,FM=fm,CF=cf.

Refer to appendix P for more information on the XMODEM command.
PRIMARY FILE EDITING COMMANDS

To allow ease of editing primary files, the system provides a line editing capability that can be used under any subsystem. The line editing capability allows you to:

- List lines
- Correct lines
- Delete lines
- Insert lines
- Copy lines

The following commands perform the previously indicated editing operations upon the primary file:

<table>
<thead>
<tr>
<th>Command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER</td>
<td>Changes character strings within lines of the primary file.</td>
</tr>
<tr>
<td>DELETE</td>
<td>Deletes lines from the primary file.</td>
</tr>
<tr>
<td>DUP</td>
<td>Duplicates lines and moves the duplicates to a specific location in the primary file.</td>
</tr>
<tr>
<td>LIST</td>
<td>Selectively lists lines of the primary file.</td>
</tr>
<tr>
<td>MOVE</td>
<td>Moves lines from one location to another in the primary file.</td>
</tr>
<tr>
<td>READ</td>
<td>Inserts another file at a specified location in the primary file.</td>
</tr>
<tr>
<td>RESEQ</td>
<td>Resequences or adds line numbers to the primary file.</td>
</tr>
<tr>
<td>WRITE</td>
<td>Copies lines from the primary file to a specified sequenced file.</td>
</tr>
<tr>
<td>WRITEN</td>
<td>Copies lines from the primary file to an unsequenced file.</td>
</tr>
</tbody>
</table>

For other methods of file editing, refer to the EDIT, FSE, and XEDIT commands.
### PARAMETER FORMAT

The following subsections describe the specific format of each command. Each command uses one or more of the following parameters:

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Format</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Line number</td>
<td>n</td>
<td>Specifies primary file line number.</td>
</tr>
<tr>
<td>Line range</td>
<td>q..r</td>
<td>Specifies a set of sequential lines in the primary file. q is the beginning line number of the range. r may be specified by an asterisk to signify that the line range ends at the beginning of information (BOI).</td>
</tr>
<tr>
<td>Lines</td>
<td>c₁,c₂,…,cₙ</td>
<td>Specifies a nonsequential set of lines and line ranges separated by commas. cᵢ represents a line or line range. For example,</td>
</tr>
<tr>
<td>Line number increment</td>
<td>z</td>
<td>Generates sequential line numbers when inserting text into the file or when resequencing is required due to overlapping line numbers (refer to Line Number Overlap section). z must be in the range of one to 4095 and, when omitted, assumes a value of one.</td>
</tr>
<tr>
<td>String</td>
<td>/string/</td>
<td>Specifies a sequence of characters, including spaces, delimited by a string delimiter. The string delimiter may not consist of the following:</td>
</tr>
</tbody>
</table>

- digit
- * : letter
- $)
- @ space

The delimiter chosen may not appear in the string. In this subsection, a slant (/) is used as the string delimiter.
### Parameter Name

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>String pair</td>
<td>/string1/string2/</td>
<td>Specifies two different character sequences separated by a string delimiter. String1 represents a string as it appears in the file. String2 represents how string1 will appear after command processing. String1 and string2 may be null strings. A null string contains no characters. For example, if string1 were null, the string pair would appear as //string2/. Refer to the string parameter description for invalid string delimiters.</td>
</tr>
<tr>
<td>File name</td>
<td>filename</td>
<td>A file name consisting of 1 to 7 characters where each character is a letter or digit.</td>
</tr>
</tbody>
</table>

### SUPPRESSING EDITING RESPONSES

When changing lines within a file, the changed lines are displayed immediately after the edit command has been processed. If you do not want the changed lines listed, enter:

**BRIEF**

This command will prevent the listing of changed lines. To resume listing changed lines, enter:

**NORMAL**

The BRIEF and NORMAL commands are described earlier in this section.

### LINE NUMBER OVERLAP

Some editing commands require the system to resequence lines of your file. New line numbers may overlap existing line numbers. If this occurs, you are asked if the command should be executed:

**INSERTED LINES OVERLAP EXISTING LINES, AT 130.**
**ENTER Y TO CONTINUE OR N TO STOP**

If your response is **YES**, the lines will be inserted and all lines that are overlapped will have new line numbers generated in increments of the specified line number increment. If no increment is specified, new line numbers are generated in increments of one from the last inserted line. If your response is **NO**, the command is not executed.

If your primary file is a BASIC or FORTRAN program, select the corresponding subsystem before editing. If you are not under the correct subsystem, the system may not make the necessary changes when resequencing lines. Refer to the RESEQ command in section 9 for more information on how the system resequences FORTRAN and BASIC programs.
INSERTING LINES

You can add a line to the primary file by prefacing it with a unique line number.

The following example demonstrates how to insert a single line into a sequenced file.

Example:

```
list
00100 LET A=1
00110 LET B=10
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00200 END
```

File is listed.

```
READY.
00115 LET C=30
```

Line is entered inserting line 115 between 110 and 120

```
list
00100 LET A=1
00110 LET B=10
00115 LET C=30
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00200 END
```

File is listed to show corrected version.

ALTER COMMAND

The ALTER command enables you to change character strings within specified lines in the primary file.

Format:

```
ALTER,c1,c2,...,cn,string1/string2/
```

where the lines parameter is optional. If the lines parameter is omitted, the changes specified by string1 and string2 apply to the entire file.

When you enter the lines and string pair, only the occurrences of string1 appearing in the lines specified by the lines parameter are changed to string2.

When you enter the lines parameter, string1, and a null string2 (/string1//), all occurrences of string1 appearing in the lines specified in the lines parameter are deleted.

When you enter the lines parameter, a null string1, and string2 (//string2/), string2 is appended to the lines specified in the lines parameter.
To correct a single line in error, you can simply respecify the line number and enter the line correctly.

The following example demonstrates how to change a line by entering the corrected version of the line:

Example:

```
 00100 LET A=1
 00110 LET B=10
 00120 FOR I=1 TO B
 00130 A=A*I
 00140 PRINT "FACTORIAL ";I," IS ";A
 00150 NEXT I
 00200 END
 00110 LET B=20
```

Line is entered changing B's value from 10 to 20. READY message is not given after entry of line.

File is listed to show corrected version.

When you enter the lines parameter, and string1 and string2 are null (///), the lines specified in the lines parameter are listed.

Example:

```
 00110 LET C=20
 00120 FOR I=1 TO C
```

ALTER command is entered, changing B to C in lines 100 through 130. Changed lines are displayed automatically.

File is listed to show corrected version.
DELETE COMMAND

You can delete specified lines from the primary file using the DELETE command.

Format:

`DELETE,c1,c2,...,cn,/string/`

where either the lines parameter or string parameter must be specified.

When you enter the lines parameter and do not enter the string parameter, all lines specified by the lines parameter are deleted.

When you enter the string parameter and do not enter the lines parameter, all lines in the file containing the specified string are deleted.

When you enter both the lines parameter and the string parameter, only those lines specified by the lines parameter containing the string specified in the string parameter are deleted.

Example:

```
list
00100 LET A=1
00105 LET B=10
00110 LET C=20
00120 FOR I=1 TO C
00130 A=A*I
00140 PRINT "FACTORIAL I; I, " IS " ; A
00150 NEXT I
00200 END

READY.
delete,100..130,/B=10/
00105 LET B=10

READY.
list
00100 LET A=1
00110 LET C=20
00120 FOR I=1 TO C
00130 A=A*I
00140 PRINT "FACTORIAL I; I, " IS " ; A
00150 NEXT I
00200 END

File is listed.
```

DELETE command is entered, deleting all lines from 100 through 130 which contain the string B=10. The deleted line is automatically listed.

File is listed to show corrected version.
You can also delete a line by specifying its line number and entering an empty line for it.

The following example demonstrates how to delete a single line from a sequenced file by entering the number of the line to be deleted.

Example:

```
list
00100 LET A=1
00105 LET B=10
00110 LET C=20
00120 FOR I=1 to C
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00200 END
```

File is listed.

```
00105
```

File is listed to show corrected version.

```
list
00100 LET A=1
00110 LET C=20
00120 FOR I=1 TO C
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00200 END
```

DUP COMMAND

You can duplicate lines and insert them in a specified location in the primary file using the DUP command.

Format:

```
DUP,q..r,n,z
```

where q..r is a line range and may be specified as a single line number.

n specifies the line number after which the duplicated lines are to be inserted. If n is not specified, the duplicated lines are inserted at the end of the file. If n is less than the first line number in the file, the duplicated lines are inserted at the beginning of the file. If n is between two existing line numbers, the duplicated lines are inserted between the adjacent lines and incremented by z. If the new line numbers overlap existing edit file line numbers, line resequencing occurs as described under Line Number Overlap.
When BASIC statements containing line numbers and their referenced lines are duplicated, the lines and their duplicates are kept separate. The duplicate statements containing line references reference duplicate lines. Duplicate statements do not reference original statements.

Example:

```
list
00100 LET A=1
00110 LET B=10
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00200 END
```

File is listed.

```
DUP command is entered, duplicating lines 130 through 150, and inserting the duplicates after line 150, incrementing subsequent lines by 10. Affected lines are automatically listed.
```

```
dup,130..150,150,10
00160 A=A*I
00170 PRINT "FACTORIAL ";I,"IS ";A
00180 NEXT I
```

READY.

```
list
00100 LET A=1
00110 LET B=10
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00160 A=A*I
00170 PRINT "FACTORIAL ";I,"IS ";A
00180 NEXT I
0200 END
```

File is listed to show corrected version.

LIST COMMAND

You can selectively list the lines of the primary file using the LIST command.

Format:

```
LIST,c1,c2,...,cn/string/
```

If you specify no parameters, the system lists all lines in the file. To list all of the lines in a local file other than the primary file, you can use the alternate format of the LIST command, described earlier in this section under Job Processing Commands.
The following example illustrates how to use the command.

Example:

```
00100 LET A=1
00105 LET B=10
00110 LET C=20
00120 FOR I=1 TO C
00130 A=A+1
00140 PRINT "FACTORIAL ";I, "IS ";A
00150 NEXT I
00200 END
```

- `list`: List the entire file.
- `list,100..130`: List a range of lines.
- `list,120,100,140..200`: List a nonsequential set of lines.
- `list,130..200,/a/`: List all lines that contain the character A.
- `list,130..200,/a/`: List only those lines in a specified range that contain the character A.
MOVE COMMAND

You may also manipulate lines of the primary file with the use of the MOVE command. The MOVE command moves lines from one location in the primary file to another location.

Format:

MOVE,q..r,n,z

where q..r is the line range parameter and may be specified by a single line number. The line number (n) and line number increment (z) parameters are optional.

The line range parameter specifies the lines to be moved.

If the n parameter is omitted, the lines are moved to the end of the file and successive line numbers are generated in increments of z, if specified, from the last line of the primary file.

If the new line numbers overlap existing line numbers in the primary file, line resequencing occurs as described in the Line Number Overlap subsection.

Example:

```
list
00100 LET A=1
00110 LET B=10
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT "FACTORIAL ";I," IS ";A
00150 NEXT I
00160 END

READY.
```

```
move,100,110,10
INSERT LINES OVERLAP EXISTING LINES, AT 120.
ENTER Y TO CONTINUE OR N TO STOP
? y
00120 LET A=1
00130 FOR I=1 TO B
00140 A=A*I
00150 PRINT "FACTORIAL ";I," IS ";A
00160 NEXT I

READY.
```

```
list
00110 LET B=10
00120 LET A=1
00130 FOR I=1 TO B
00140 A=A*I
00150 PRINT "FACTORIAL ";I," IS ";A
00160 NEXT I
00200 END

File is listed.
```

MOVE command is entered, moving line 100 and inserting it immediately following line 110, incrementing subsequent lines by 10. Affected lines are automatically listed.

```
list
00110 LET B=10
00120 LET A=1
00130 FOR I=1 TO B
00140 A=A*I
00150 PRINT "FACTORIAL ";I," IS ";A
00160 NEXT I
00200 END

File is listed to show corrected version.
```
**READ COMMAND**

The READ command inserts the lines of a file (read file) at a specific location in the primary file.

**Format:**

```
READ, filename, n, z
```

where the line number \( n \) and line number increment \( z \) parameters are optional. The parameter filename is the name of the file to be inserted.

When the line number parameter is entered, the contents of the file to be inserted are inserted immediately following line \( n \). If the parameter \( n \) is a line number that is not in the primary file, the read file is inserted after the largest line number that is less than \( n \). The line numbers of read files are incremented by 1, unless an increment is specified by the \( z \) parameter.

If the line number parameter is not entered, the contents of the read file are added to the end of the primary file and incremented by \( z \) from the last line number of the primary file. For sequenced read files, line numbers are added in increments of one, unless otherwise specified by the \( z \) parameter. A sequenced read file will be resequenced in increments of \( z \) from the last line number in the primary file.

Unsequenced read files will have a five-digit line number added and followed by a blank (in the FORTRAN and FTNTS subsystems, the line number is added but not the blank). If a line consists of only a line number or a line number followed by zero or one blank, the line will not be inserted into the primary file.

If the new line numbers overlap existing lines in the primary file, line resequencing occurs as described in the Line Number Overlap subsection.
In the BASIC subsystem, when inserting a sequenced read file where no overlapping of line numbers occurs, the system handles line references within the read file in the following manner. The system automatically updates line references within statements if the referenced lines are within the read file. It does not alter line references within statements if the lines referenced lie outside of the read file.

Example:

```
list
00100 LET A=1
00110 LET B=10
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00200 END

READY.
get,skid

READY.
read,skid,150,10
INSERT LINES OVERLAP EXISTING LINES, AT 200.
ENTER Y TO CONTINUE OR N TO STOP
? y
00160 LET A=1
00170 LET B=50
00180 FOR I=1 TO B
00190 A=A*I
00200 PRINT "FACTORIAL";I,A
00210 NEXT I
00220 END

READY.
list
00100 LET A=1
00110 LET B=10
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00160 LET A=1
00170 LET B=50
00180 FOR I=1 TO B
00190 A=A*I
00200 PRINT "FACTORIAL";I,A
00210 NEXT I
00220 END
```

Primary file is listed.

Read file is made local.

READ command is entered. With line increments of 10, the read file is inserted after line 150.

Y is entered to continue command processing.

Inserted lines are automatically listed.

Primary file is listed to show corrected version.
RESEQ COMMAND

Refer to the RESEQ command in section 9.

WRITE COMMAND

You can also append lines and line numbers of the primary file to another specified file (destination file) by using the WRITE command.

Format:

WRITE, filename, c1, c2, ..., cn, /string/

where the required parameter filename is the name of a local file. The lines and string parameters are optional.

If the lines parameter is entered and the string parameter is omitted, all lines specified by the lines parameter are copied to the destination file. If both the lines parameter and string parameter are entered, the lines specified by the lines parameter which contain the string specified by the string parameter are copied to the destination file.

If the string parameter is entered and the lines parameter is omitted, all lines in the primary file containing the specified string are copied to the destination file. If both the lines and string parameters are omitted, all lines of the primary file are copied to the destination file.

Example:

```
list
00100 LET A=1
00110 LET B=10
00115 LET C=20
00120 FOR I=1 TO B
00130 A=A*I
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00200 END

READY.
write, file2, 100..110, 120..*

READY.
list, f=file2

00100 LET A=1
00110 LET B=10
00120 FOR I=1 TO B
00130 A=A*I
00140 PRINT "FACTORIAL ";I,"IS ";A
00150 NEXT I
00200 END

Primary file is listed.

WRITE command is entered, writing lines 100 through 110 and lines 120 through 200 to destination file FILE2.

FILE2 is listed.

60459680 D
WRITEN COMMAND

To copy lines from a sequenced primary file to an unsequenced destination file, enter the WRITEN command. The WRITEN command copies specified lines of the primary file to the destination file while removing the line numbers; resulting in an unsequenced destination file.

Format:

WRITEN,filename,c1,c2,...,cn,/string/

Example:

```
list
00100 LET A=1
00110 LET B=10
00115 LET C=20
00120 FOR I=1 TO B
00125 A=A*I
00130 PRINT "FACTORIAL ";I," IS ";A
00135 NEXT I
00140 END

READY .
```

```
WRITEN, file3,100..110,120..*

READY .
list , f = file3

LET A=1
LET B=10
FOR I=1 TO B
A=A*I
PRINT "FACTORIAL ";I," IS ";A
NEXT I
END

READY .
```

Parameter combinations and functions are the same for the WRITEN and WRITE commands.
The file management commands manipulate files assigned to your job. The commands included in this category are:

- ASSIGN
- EVICT
- RENAME
- SKIPF
- BKSP
- FCOPY
- REQUEST
- SKIPFB
- CLEAR
- LIST80
- RESEQ
- SKIPR
- COPY
- LOCK
- RETURN
- SORT
- COPYBF
- LO72
- REWIND
- TCOPY
- COPYBR
- MFQUEUE
- ROUTE
- TDUMP
- COPYCF
- NEW
- SCOPY
- UNLOAD
- COPYCR
- OUT
- SECHDR
- UNLOCK
- COPYEI
- OVIWRITE
- SETFAL
- VERIFY
- COPYSBF
- PACK
- SETFS
- WRI TEMF
- COPYX
- PRIMARY
- SKIPEI
- W RITEF
- DOCUMENT

The commands in this section position files, copy data from one file to another, specify the method and format of input or output, sort files, and add corrections. You can assign your files to a specific device type; change the file type, identification code, and write interlock status; and release them from your job. You can also receive information about records in a file or documentation in a file.

If you use these commands on files structured by CYBER Record Manager (CRM), the output may not reflect the CRM logical file structure. The only commands recommended for copying CRM files are COPY and COPYEI.

If a file is not specifically assigned through the use of an ASSIGN, LABEL, or REQUEST command, the system assigns the file to available mass storage.
ASSIGN COMMAND

The ASSIGN command directs the system to assign a file to the specified device or device type. The following descriptions refer to devices other than magnetic tape. For use of the ASSIGN command with magnetic tape, refer to section 12.

Format:

ASSIGN,nn,lfn,checkpoint,AL=level.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nn</td>
<td>Specifies the device or device type to which the specified file is to be assigned; nn may be either the EST ordinal of a peripheral device or the device type as defined as follows:</td>
</tr>
</tbody>
</table>

<table>

†This device type applies only to interactive origin jobs.
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to be assigned to the specified equipment.</td>
</tr>
<tr>
<td>checkpoint</td>
<td>Specifies that lfn is to be used as a checkpoint file (refer to section 13).</td>
</tr>
<tr>
<td>AL=level</td>
<td>Specifies the security access level to assign to the file. Unless changed by your site, level can be one of the following names: LVLO, LVLI, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7. The default is the current access level of the job.</td>
</tr>
</tbody>
</table>

#### Meaning

- **CB**: Each dump is written at the BOI of lfn.
- **CK**: Each dump is written at the previous EOI of lfn.

#### Example 1:

**ASSIGN,MS,OUTPUT.**

This command assigns file OUTPUT to mass storage. With this assignment in an interactive job, you can cause output normally printed at your terminal to be written on a mass storage file instead. Here, output means information generated by a program during execution. Dayfile messages are still printed at the terminal. Once this assignment is made, output is written on the mass storage file OUTPUT until the file is returned or reassigned.

#### Example 2:

**ASSIGN,TT,XYZ.**

This command assigns file XYZ to your interactive terminal. The assignment means that input that the system would have read from file XYZ is instead solicited by a prompt at the terminal and that output that the system would have written on file XYZ is instead displayed at the terminal.

If you have multiple input or output files assigned to your terminal, you may get some unpredictable results.
Example 3:

\texttt{ASSIGN,DI,ABC.}

This command assigns file ABC to an 844-21 disk drive, if one is available.

The \texttt{ASSIGN} command can also be used to create or access existing seven- or nine-track unlabeled tapes. For a description of the command as it applies to magnetic tape assignment, refer to section 12, Tape Management.

\textbf{BKSP COMMAND}

The \texttt{BKSP} command directs the system to bypass a specified number of logical records in the reverse direction.

\textbf{Format:}

\texttt{BKSP,lfn,n,m.}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to be backspaced.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number of logical records (decimal) to backspace; if this parameter is omitted, the system assumes n=1. The maximum for n is 262143.</td>
</tr>
<tr>
<td>m</td>
<td>Specifies the file mode: C for coded, B for binary. If m is omitted, the system assumes the file is in binary mode.</td>
</tr>
</tbody>
</table>

The \texttt{BKSP} request can be issued at any point in a logical record. If, for example, \texttt{FILE1} were positioned within the third record, a

\texttt{BKSP,FILE1.}

request would reposition \texttt{FILE1} to the beginning of the third record. The system does not backspace past the beginning-of-information (BOI). However, EOF indicators are considered separate records and are included in the record count.

The \texttt{BKSP} command has no effect on a primary file since that file is rewound before every operation.
CLEAR COMMAND

The CLEAR command releases all files currently assigned to the job. You can also specify files that are not to be released.

Format:

CLEAR.

or

CLEAR,*,lfn1,lfn2,...,lfnn.

The first format releases all files. The second format releases all files except those named. If no files are named, all files assigned to the job are released.

There are several exceptions. The CLEAR command does not release any files that have checkpoint or no-auto-drop status. Certain system scratch files (for example, ZZZZZC0, ZZZZZC1, ZZZZZC2, and ZZZZZLD) have no-auto-drop status. You can give any local file this status by using the SETFS command.

Refer to RETURN command in this section for the operations performed on each file type.

COPY COMMAND

The COPY command copies data from one file to another if the files are within the range of permissible formats listed in table 9-1.

NOTE

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.
Table 9-1. Range of Permissible Formats for the COPY Command

<table>
<thead>
<tr>
<th>Input (I=ifn₁)</th>
<th>Mass Storage or Terminal</th>
<th>Tape Formats</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>I</td>
<td>SI</td>
</tr>
<tr>
<td>Mass Storage or Terminal</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Tape Formats</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>SI</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>S</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>L</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>F</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Order-dependent format:

COPY,lfn1,lfn2,x,c,tc,copycnt,bsize,charcnt,erlimit,p1p2...pn,lfn3,ns

Order-independent format:

COPY,I=lfn1,O=lfn2,V=x,M=c,TC=tc,N=copycnt,BS=bsize,CC=charcnt,EL=erlimit,
P0=p1p2...pn,L=lfn3,NS=ns.

The parameters can appear in order-dependent format, order-independent format, or a combination of both. If order-dependent and order-independent parameters are mixed in one COPY command, the order-dependent parameters must appear in their proper position. All parameters are optional. However, the specification of certain parameters precludes the application of others. A nonapplicable parameter may be ignored or it may be invalid. This is stated in the individual descriptions of the parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>I=lfn1</td>
<td>Specifies the name of the file to be copied.</td>
<td>INPUT</td>
</tr>
<tr>
<td>O=lfn2</td>
<td>Specifies the name of the file receiving the copy.</td>
<td>OUTPUT</td>
</tr>
<tr>
<td>V=x</td>
<td>If the x parameter (1 to 7 alphanumeric characters) is present, both files are rewound, copied, rewound, verified, and rewound. The x parameter must not be zero.</td>
<td>No verify</td>
</tr>
<tr>
<td>M=c</td>
<td>Specifies whether the input and output files are coded files.</td>
<td></td>
</tr>
</tbody>
</table>

- c Description
  - C1 Coded mode is set on input only. Binary
  - C2 Coded mode is set on output only.
  - x Coded mode is set on both input and output. The value x is any alphanumeric, 1- to 7-character string.

This parameter applies only to S and L format tapes. If coded mode is set on an SI tape, the system aborts the job. For other formats, the system ignores the mode setting.

<table>
<thead>
<tr>
<th>TC=tc</th>
<th>Specifies the termination condition for copying used in conjunction with N=copycnt. The termination condition can be specified as follows:</th>
</tr>
</thead>
</table>

- tc Description
  - F or EOF The N keyword specifies the number of files to copy.
  - I or EOI Copy to the end of information. The N keyword is ignored.

Copy to double EOF (TC=D or TC=EOD)
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>N=copycnt</td>
<td>Specifies the copy count used with the copy termination condition specified by the parameter TC=tc.</td>
<td>1</td>
</tr>
<tr>
<td>BS=bsize</td>
<td>Specifies the maximum block size (in central memory words) which specifies S or L tape PRU size. This applies only when copying to or from S and L tapes. It cannot be specified with the CC=charcnt parameter.</td>
<td>If CC=charcnt is not specified, 1000g for S tape copy and 2000g for L tape copy.</td>
</tr>
<tr>
<td>CC=charcnt</td>
<td>Specifies the maximum number of characters in an S or L tape block. This parameter can be specified only when copying to or from S and L tapes. The PRU size and unused bit count are calculated from the character count. However, the unused bit count is used only when writing a full block to an S or L output tape during a copy from mass storage, I, or SI format tape. The charcnt value should be a multiple of 10. If it is not, the characters that exceed the charcnt value in the last word of the record are discarded when writing an S or L format tape. This parameter cannot be specified with the BS=bsize parameter.</td>
<td>Not used (the PRU size is specified by the BS=bsize parameter)</td>
</tr>
<tr>
<td>EL=erlimit</td>
<td>Specifies the number of nonfatal errors allowed before abort. This includes both parity errors and block-too large errors which are returned by the tape subsystem after completing recovery procedures. If EL=U is specified, unlimited error processing is allowed. Error recovery is supported on mass storage and on all tape formats but is not supported on a terminal or on unit record equipment. In the latter cases, any error aborts the job.</td>
<td>0 (zero)</td>
</tr>
</tbody>
</table>

D or EOD: The N keyword is the number of double EOFs to copy to. If N > 1 is specified together with this TC value, and verify is also selected, the files are verified only to the first empty file (COPY calls VERIFY with N=0 parameter).
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>( P_0 = p_1 p_2 \ldots p_n )</td>
<td>One or more of the following processing options:</td>
<td></td>
</tr>
<tr>
<td>E</td>
<td>Input blocks with parity errors or block-too-large errors are processed (copied).</td>
<td>Error blocks are skipped.</td>
</tr>
<tr>
<td>D</td>
<td>Any noise blocks generated by a copy from mass storage, I format tape, or SI format tape to an S or L format tape are deleted. This parameter cannot be specified on any other type of copy.</td>
<td>For S or L binary tapes, noise blocks are padded to noise size with binary zeros; for coded mode, they are padded with blanks.</td>
</tr>
<tr>
<td>R</td>
<td>Allows record splitting during a copy from mass storage, I format, or SI format to S or L format tape. This parameter cannot be specified on any other type of copy.</td>
<td>Record splitting is not allowed.</td>
</tr>
<tr>
<td>M</td>
<td>Copy files according to the copy termination condition specified by the keyword TC, eliminating each EOF on output. This option is primarily for use with labeled S and L output tapes since it eliminates the conflict of the double meaning of a tape mark on these formats (the tape mark on these formats serves as both an EOF and label group delimiter).</td>
<td>Copy files according to specification of the copy termination (TC), writing an EOF after each file on output.</td>
</tr>
<tr>
<td>L=lfn3</td>
<td>Specifies the name of an alternate file to receive parity error messages when extended error processing is in effect (nonzero EL specified), in which case, file name lfn3 must not be the same as lfn1 or lfn2.</td>
<td>OUTPUT</td>
</tr>
<tr>
<td>NS=ns</td>
<td>Noise size. Any input block containing fewer than ns characters is considered to be noise and is discarded. This parameter is valid for input tapes in S, L, or F format. The maximum value that can be specified for ns is 41. If NS=0 is specified, the default value of 18 is used.</td>
<td></td>
</tr>
</tbody>
</table>

Example:

The following COPY command combines order-dependent and order-independent parameters.

```
COPY, FILE1, FILE2, VERIFY, CODED, EOF, 6, L=MYOUT, PO=E, EL=10.
```

FILE1 is the input file, and FILE2 the output file. Six coded files are copied and verified. Up to 10 nonfatal errors are allowed, and the bad data is copied with informative error messages written to the file MYOUT.
The COPY command begins a copying operation at the current position of both files unless the verify option is specified. If verification is specified, both files are rewound before the copying begins and rewound, verified, and rewound again after the copying is completed. This verification may not be meaningful if the logical structure of the two files is incompatible.

COPY TERMINATION

Copying continues until the termination condition for copying is met or EOI is encountered. The termination condition can be a file count, a double EOF count, or EOI. If the copying is terminated by a double EOF (for TC=EOD), the second EOF is detected on lfn1, but is not transferred to lfn2. If lfn1=lfn2 the named file is read until the termination condition is satisfied or EOI is encountered.

If the copying command specifies a file count, TC=EOF, and EOI is encountered on the input file before the file count is satisfied, an additional EOF is written on the output file only if data or records have been transferred since the previous EOF was written (or since the beginning of the copying if no EOFs have been encountered).

BLOCK SIZES

Both L and F tapes may require additional field length to accommodate their maximum block size. The maximum block size for an L tape copy is specified either by the BS=bsize parameter (or its default), or it is calculated from the CC=charcnt. The maximum block size for an F tape is determined by the maximum frame or character count specified when the file was assigned. The more accurate the selection of these values which determine block size, the less are the requirements for field length, CPU time, and I/O time.

PROCESSING OPTIONS

The PO=D option specifies noise block processing, and the PO=R option specifies record splitting for copies from mass storage, i format, or SI format to S or L format tapes. Due to the incompatibilities between the logical structure of the input and output files, records may be encountered on the input file that are too small or too large to be copied directly to the S or L output tape. If the output file block size is less than noise block size, it is deleted if PO=D is specified. If PO=D is not specified, the block size is rounded to the word multiple of noise size with binary zero fill for a binary S or L tape or with blank fill for a coded S or L tape. Empty records on the input file are skipped since they cannot exist on an S or L tape. If PO=R is specified and an input file record length exceeds the S or L tape maximum block size (the PRU size as specified by BS=bsize or its default, or by CC=charcnt), it is split into multiple blocks.

The PO=M option makes it possible to copy a multifile file to a labeled S or L format tape without writing the EOF tape marks. This avoids the conflict of a tape mark serving the double purpose of defining an EOF and delimiting a label group on S and L format tapes. This is in keeping with the tendency in the computer industry to define a tape mark only as a label delimiter.

The EL=erlimit and PO=E parameters provide extended error processing.
COPYBF COMMAND

The COPYBF command copies a specified number of files from one multifile file to another.

NOTE

The COPYBF command is not recommended for use with S, L, or F format tapes because it does not have the data specification parameters needed to accommodate the variety of data formats possible with those tape formats. For S, L, or F format tape copying operations, issue a COPY command with the appropriate parameter specifications.

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.

Format:

COPYBF,lfn1,lfn2,n,c.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of the file to copy. If this parameter is omitted, file INPUT is assumed.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Specifies the name of the file to receive the copy. If this parameter is omitted, file OUTPUT is assumed.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies number of files (decimal) on lfn1 to copy. If this parameter is omitted, 1 is assumed.</td>
</tr>
<tr>
<td>c</td>
<td>Indicates that the copying to or from an S or L format tape should be performed in coded rather than binary mode. C is a one- to seven-character string. If coded mode is set on an SI tape, the system aborts the job. The system ignores this parameter for mass storage files and I and F format tape files.</td>
</tr>
</tbody>
</table>

The copying begins at the current position of lfn1. If lfn1=lfn2, the file is read until the file count is satisfied or EOI is encountered.

If EOI is encountered on lfn1 before the file count is satisfied, an additional EOF is generated on lfn2 only if data or records have been transferred since the previous EOF was written (or since the beginning of copy if no EOFs have been encountered).
COPYBR COMMAND

The COPYBR command copies a specified number of records from one file to another.

NOTE

The COPYBR command is not recommended for use with S, L, or F format tapes because it does not have the data specification parameters needed to accommodate the variety of data formats possible with those tape formats. For an S, L, or F format tape copying operation, issue a COPY command with the appropriate parameter specifications.

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.

Format:

COPYBR,lfni,lfn2,n,c.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of the file to copy. If this parameter is omitted, file INPUT is assumed.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Specifies the name of the file to receive the copy. If this parameter is omitted, file OUTPUT is assumed.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number of records (decimal) to copy; if this parameter is omitted, 1 is assumed.</td>
</tr>
<tr>
<td>c</td>
<td>Indicates that the copying to or from an S or L format tape should be performed in coded rather than binary mode. The value C is an alphanumeric one- to seven-character string. If coded mode is set on an SI tape, the system aborts the job. The system ignores the mode setting for other formats.</td>
</tr>
</tbody>
</table>

The copying begins at the current position of lfn1. EOF indicators are considered separate records and are included in the record count. If lfn1=lfn2, the file is read until the record count is satisfied or EOI is encountered.

If EOI is encountered on lfn1 before the record count is satisfied, an additional EOR is written on lfn2 only if data has been transferred since the previous EOR or EOF was written (or since the beginning of the copy if no EORs or EOFs have been encountered).
COPYCF COMMAND

The COPYCF command copies a specified number of coded files from one file to another. A coded file is defined as a file containing lines of 500 characters or less, each terminated by a zero byte (12 zero bits in the lowest byte of a word).

NOTE

The COPYCF command is not recommended for use with S, L, or F format tapes because it does not have the data specification parameters needed to accommodate the variety of data formats possible with those tape formats. For an S, L, or F format tape copying operation, issue a COPY command with the appropriate parameter specifications.

The COPYCF command cannot copy SI format tapes. If coded mode is set for an SI tape, the system terminates the job. The TCOPY command converts SI coded tape files.

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.

Format:

COPYCF, lfn1, lfn2, n, fchar, lchar, na.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of the file to copy. If this parameter is omitted, file INPUT is assumed.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Specifies the name of the file to receive the copy. If this parameter is omitted, file OUTPUT is assumed.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number of files (decimal) to copy. If this parameter is omitted, 1 is assumed.</td>
</tr>
<tr>
<td>fchar†</td>
<td>Specifies the first character position of each line to copy for 6-bit characters. If this parameter is omitted, the copying begins at character position 1.</td>
</tr>
<tr>
<td>lchar†</td>
<td>Specifies the last character position of each line to copy for 6-bit characters. lchar must be greater than or equal to fchar. If this parameter is omitted, the copying ends at character position 136.</td>
</tr>
<tr>
<td>na</td>
<td>Specifies that the job step should not abort when a line terminator does not appear before an EOR. na can be any alphanumeric, one- to seven-character string.</td>
</tr>
</tbody>
</table>

†Since many characters in 6/12-bit display code require 12 bits rather than 6, this parameter may produce unforeseen results when copying a file containing 6/12-bit display code data. Refer to appendix A for a description of character set codes.
The copying begins at the current position of lfn1. If lfn1=lf2, the file is read until the file count is satisfied or EOI is encountered. If EOI is encountered before the file count is satisfied, an EOF is written on lfn2, and the operation terminates. If a line is encountered that has more than lchar characters, the excess characters are truncated.

The COPYCF command writes lines with an even number of characters. If an input line has an odd character count and the last character is a blank not immediately preceded by a colon, the last character is removed. If an input line has an odd character count and the last character is not a blank or is a blank immediately preceded by a colon, an additional trailing blank is appended.

If the COPYCF command attempts to copy a line longer than 500 6-bit characters, the line is truncated, and an informative message is issued to the dayfile after the copying completes.

If the last line of a record does not have an end-of-line terminator, the system issues a dayfile message. If the na parameter is not specified, the job step then aborts.
COPYCR COMMAND

The COPYCR command copies a specified number of coded records from one file to another. A coded record contains lines of 500 characters or less, each terminated by a zero byte (12 zero bits in the lowest byte of a word).

**NOTE**

The COPYCR command is not recommended for use with S, L, or F format tapes because it does not have the data specification parameters needed to accommodate the variety of data formats possible with those tape formats. For an S, L, or F format tape copying operation, issue a COPY command with the appropriate parameter specifications.

The COPYCR command cannot copy SI format tapes. If coded mode is set for an SI tape, the system terminates the job. The TCOPY command converts SI coded tape files.

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.

Format:

```
COPYCR,lfn1,lfn2,n,fchar,lchar,na.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of the file to copy. If this parameter is omitted, file INPUT is assumed.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Specifies the name of the file to receive the copy. If this parameter is omitted, file OUTPUT is assumed.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number of records (decimal) to copy. If this parameter is omitted, 1 is assumed.</td>
</tr>
<tr>
<td>fchar†</td>
<td>Specifies the first character position of each line to copy for 6-bit characters. If this parameter is omitted, the copying begins at character position 1.</td>
</tr>
<tr>
<td>lchar†</td>
<td>Last character position of each line to copy for 6-bit characters. lchar must be greater than or equal to fchar. If this parameter is omitted, the copying ends at character position 136.</td>
</tr>
<tr>
<td>na</td>
<td>Specifies that the job step should not abort if a line terminator does not appear before an EOR. The parameter na can be any alphanumeric, one- to seven-character string.</td>
</tr>
</tbody>
</table>

†Since many characters in the 6/12-bit display code require 12 bits rather than 6, this parameter may produce unforeseen results when copying a file containing 6/12-bit display code data. Refer to appendix A for a description of character set codes.
The copying begins at the current position of lfn1. If lfn1=lfn2, the file is read until the record count is satisfied or EOI is encountered. EOR indicators are considered separate records and are included in the record count. If the EOI is encountered before the record count is satisfied, an EOR is written on lfn2, and the operation terminates. The COPYCR command is processed in exactly the same manner as the COPYCF command except that n specifies the number of records rather than the number of files.

If the COPYCR command attempts to copy a line longer than 500 6-bit characters, the line is truncated, and an informative message is issued to the dayfile after the copying completes.

If the last line of a record does not have an end-of-line terminator, the system issues a dayfile message. If the na parameter is not specified, the job step then aborts.

COPYEI COMMAND

The COPYEI command copies one file to another. The copying begins at the current position of the file and continues until the EOI is encountered. The EOI is not defined for certain tape formats (refer to table 2-1).

NOTE

The COPYEI command is not recommended for use with S, L, or F format tapes because it does not have the data specification parameters needed to accommodate the variety of data formats possible with those tape formats. For an S, L, or F format tape copying operation, issue a COPY command with the appropriate parameter specifications.

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.

Format:

COPYEI, lfn1, lfn2, x, c.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of the file to copy. If this parameter is omitted, file INPUT is assumed.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Specifies the name of the file to receive the copy. If this parameter is omitted, file OUTPUT is assumed.</td>
</tr>
<tr>
<td>x</td>
<td>Specifies that both files are rewound before the copying, and rewound, verified, and rewound again after the copying is complete. x can be any alphanumeric, one- to seven-character string.</td>
</tr>
<tr>
<td>c</td>
<td>Indicates that the copying to or from an S or L format tape should be performed in coded rather than binary mode. If coded mode is set on an SI tape, the system aborts the job. For other formats, the system ignores the mode setting. c can be any alphanumeric, one- to seven-character string.</td>
</tr>
</tbody>
</table>

If lfn1=lfn2, the file is read until EOI is encountered.
COPYSBF COMMAND

The COPYSBF command copies a file and inserts a space before the first character of each line of the file. For a file without printer control characters, insert spaces in the file with this command before routing the file to a printer. The system assumes that a file routed to a printer has a printer control character as the first character of each line. You might get undesirable results if you do not ensure that a printer control character appears first. Refer to appendix H for more information on printer control characters.

NOTE

The COPYSBF command is not recommended for use with S, L, or F format tapes because it does not have the data specification parameters needed to accommodate the variety of data formats possible with those tape formats. For an S, L, or F format tape copying operation, issue a COPY command with the appropriate parameter specifications.

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.

Format:

COPYSBF,lfn1,lfn2,n,na.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of the file to copy. If this parameter is omitted, file INPUT is assumed.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Specifies the name of the file to receive the copy. If this parameter is omitted, file OUTPUT is assumed.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number of files (decimal) to copy. If this parameter is omitted, 1 is assumed.</td>
</tr>
<tr>
<td>na</td>
<td>Specifies that the job step should not abort if a line terminator does not appear before an EOR. na can be any alphanumeric, one- to seven-character string.</td>
</tr>
</tbody>
</table>
The COPYSBF command copies n files beginning at the current position of lfn1 to file lfn2, shifting each line image one character to the right and adding a leading space. Each line image may contain up to 500 (6-bit) characters. Any characters beyond 500 are lost. A page eject character is inserted at the beginning of each logical record (refer to appendix I for a list of carriage control characters). If lfn1=lfn2, n files are skipped but no data transfer occurs. If the EOI is encountered before the file count is satisfied, an EOF is written to lfn2, and the operation terminates.

If the COPYSBF command attempts to copy a line longer than 500 6-bit characters, the line is truncated, and an informative message is issued to the dayfile after the copying completes.

If the last line of a record does not have an end-of-line terminator, the system issues a dayfile message. If the na parameter is not specified, the job step then aborts.

COPYX COMMAND

The COPYX command copies logical records of a file until a user-specified condition is met.

NOTE

The COPYX command is not recommended for use with S, L, or F format tapes because it does not have the data specification parameters needed to accommodate the variety of data formats possible with those tape formats. For an S, L, or F format tape copying operation, issue a COPY command with the appropriate parameter specifications.

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.

Format:

COPYX, lfn1, lfn2, x, b, c.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of the file to copy. If this parameter is omitted, file INPUT is assumed.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Specifies the name of the file to receive the copy. If this parameter is omitted, file OUTPUT is assumed.</td>
</tr>
</tbody>
</table>
Parameter | Description
---|---
x | Provides additional copy specifications. If omitted, one record is copied. The value for x may be one of the following:

<table>
<thead>
<tr>
<th>x</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Copy n records, when n is a decimal number.</td>
</tr>
<tr>
<td>00</td>
<td>Copy all records up to and including first zero-length record.</td>
</tr>
<tr>
<td>name</td>
<td>Copy all records up to and including record of specified name (record name is first seven characters of record or the name in the prefix table, if present).</td>
</tr>
<tr>
<td>type/name</td>
<td>Copy all records up to and including record of specified type and name (refer to Library Record Types in section 15 for list of valid record types).</td>
</tr>
</tbody>
</table>

b | Specifies the backspace control. If omitted, 0 is assumed.

<table>
<thead>
<tr>
<th>b</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Do not backspace.</td>
</tr>
<tr>
<td>1</td>
<td>Backspace file lfn1 one record after copying completes.</td>
</tr>
<tr>
<td>2</td>
<td>Backspace file lfn2 one record after copying completes.</td>
</tr>
<tr>
<td>3</td>
<td>Backspace files lfn1 and lfn2 one record after copying completes.</td>
</tr>
</tbody>
</table>

c | Indicates that the copying to or from an S or L format tape should be performed in coded rather than binary mode. If coded mode is set on an SI tape, the system aborts the job. For mass storage files and I and F format tape files, the mode setting is ignored. c can be any alphanumeric, 1- to 7-character string.

The COPYX command copies logical records from lfn1 to file lfn2 at the current position of lfn1 until the condition specified by x is met. It then backspaces the files according to the value specified by the b parameter. If an EOF or EOI is encountered on lfn1 before the condition specified by x is met, the operation terminates and the backspace parameter b is ignored. If lfn1=lfn2, the file is read until the termination condition is satisfied or an EOF or EOI is encountered.

If EOI is encountered on lfn1 before the termination condition is satisfied, an additional EOR is written on lfn2 only if data has been transferred since the previous EOR was written (or since the beginning of the copying if no EORs have been encountered).
DOCMEN T COMMAND

The DOCMEN T command extracts either the external or internal documentation from an appropriately documented COMPASS or FORTRAN program. For output listing files not connected to your terminal, the DOCMEN T command honors the page size and print density set for your job using the SET command and the PS and PD symbolic names.

Format:

DOCMEN T, P1, P2, ..., Pn.

The parameters Pi can be in any order, but must be in one of the following forms.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Omitted</td>
<td>The first default value is assumed.</td>
</tr>
<tr>
<td>a</td>
<td>The alternate default value is assumed.</td>
</tr>
<tr>
<td>a=x</td>
<td>x is substituted for the assumed value.</td>
</tr>
</tbody>
</table>

Any numeric parameter can be specified with a postradix character of either B or D. The parameter Pi can assume the following values (the default values are presented in a table after the descriptions):

<table>
<thead>
<tr>
<th>Pi</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I=ln1</td>
<td>Specifies the name of the file that contains the page footing information; this must be a single statement in the following format.</td>
</tr>
<tr>
<td></td>
<td>Column(s)</td>
</tr>
<tr>
<td></td>
<td>Contents</td>
</tr>
<tr>
<td>1</td>
<td>Blank</td>
</tr>
<tr>
<td>2-45</td>
<td>Document title</td>
</tr>
<tr>
<td>46-55</td>
<td>Publication number</td>
</tr>
<tr>
<td>56-60</td>
<td>Revision level</td>
</tr>
<tr>
<td>61-70</td>
<td>Revision date</td>
</tr>
<tr>
<td>S=ln2</td>
<td>Specifies the name of the file containing the source statement images from which to extract the documentation. This file is rewound by default unless the NR parameter is specified.</td>
</tr>
<tr>
<td>L=ln3</td>
<td>Specifies the name of the file on which the output is to be written.</td>
</tr>
<tr>
<td>N=nn</td>
<td>Specifies the number of copies to be produced.</td>
</tr>
<tr>
<td>T=type</td>
<td>Specifies the documentation type:</td>
</tr>
<tr>
<td></td>
<td>INT Internal documentation (detailed description of the internal features of the software).</td>
</tr>
<tr>
<td></td>
<td>EXT External documentation (detailed description of the external features of the software).</td>
</tr>
<tr>
<td>C=cc</td>
<td>Specifies the octal display code of the key character for documentation.</td>
</tr>
</tbody>
</table>
Pi

P=pp  Specifies the number of print lines per page.
NR  Disables rewind on the S (source) file.
NT  Negates table generator.
TC  Lists table of contents.

The following are the default values for the parameters described.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>First Default</th>
<th>Alternate Default</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>0</td>
<td>INPUT</td>
<td>Page footing information. If I is 0, no footing information is printed.</td>
</tr>
<tr>
<td>S</td>
<td>COMPILe</td>
<td>SOURCE</td>
<td>Source statement images.</td>
</tr>
<tr>
<td>L</td>
<td>OUTPUT</td>
<td>OUTPUT</td>
<td>List file.</td>
</tr>
<tr>
<td>N</td>
<td>1</td>
<td>1</td>
<td>Number of copies (decimal).</td>
</tr>
<tr>
<td>T</td>
<td>EXT</td>
<td>INT</td>
<td>Documentation type.</td>
</tr>
<tr>
<td>C</td>
<td>47(*)</td>
<td>03(C)</td>

</tr>
<tr>
<td>P</td>
<td>60</td>
<td>80</td>
<td>Number of print lines per page. This is either the system default or the user-set value of the PS symbolic name (refer to the SET command in section 6).</td>
</tr>
<tr>
<td>NR</td>
<td>REWIND</td>
<td>NO REWIND</td>
<td>Source file rewind status.</td>
</tr>
<tr>
<td>NT</td>
<td>ON</td>
<td>OFF</td>
<td>Table generator status.</td>
</tr>
<tr>
<td>TC</td>
<td>OFF</td>
<td>ON</td>
<td>Table of contents status.</td>
</tr>
</tbody>
</table>

Refer to Volume 4, Program Interface, for a detailed explanation of the documentation standards followed. Volume 4 also contains an example of external and internal documentation for a sample program.
**EVICT COMMAND**

The EVICT command releases file space for the specified files but does not release file assignment to the job unless you have the file assigned to a magnetic tape or cannot write on it. In this case, the system releases the file assignment to the job.

**Format:**

`EVICT, lfn1, lfn2, ..., lfn_n`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn_i</td>
<td>Names of the files to be evicted.</td>
</tr>
</tbody>
</table>

The operation that EVICT performs depends on the file characteristics.

<table>
<thead>
<tr>
<th>File</th>
<th>EVICT Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permanent and primary files with write permission</td>
<td>Releases all file space except the first track and writes an EOI on the first sector of the first track, but keeps file assigned to the job.</td>
</tr>
<tr>
<td>Deferred routed file†</td>
<td>Releases all file space and clears all file routing information.</td>
</tr>
<tr>
<td>Read-only file</td>
<td>Unloads file.</td>
</tr>
<tr>
<td>Tape files</td>
<td>Releases tape from the job.</td>
</tr>
<tr>
<td>All other files</td>
<td>Releases file space, but keeps file assigned to job.</td>
</tr>
</tbody>
</table>

Evicting a tape file performs the same function as an UNLOAD command and so cannot be used to decrease the number of resource units scheduled via the RESOURC command.

†Refer to the ROUTE command in this section.
FCOPY COMMAND

The FCOPY command converts a file from one character code set to another.

Format:

FCOPY, P=lfn1, N=lfn2, PC=cs1, NC=cs2, PL=lt1, NL=lt2, FL=fl, LB=lb, R, A.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P=lfn1</td>
<td>Specifies the file to be converted (default is OLD). Assign lfn1 to the job before performing the FCOPY operation.</td>
</tr>
<tr>
<td>N=lfn2</td>
<td>Specifies the file on which the converted data from lfn1 is written (default is NEW). If lfn2 is not assigned to the job, FCOPY creates it.</td>
</tr>
<tr>
<td>PC=cs1</td>
<td>Specifies the code set of lfn1. The default value for cs1 is ASCII.</td>
</tr>
</tbody>
</table>

When copying from lfn1, the system normally reads lfn1 to EOI, preserving all EOR and EOF marks unless lfn1 or lfn2 is an S- or L-format tape. If an S- or L-format tape is specified for lfn1, the system reads lfn1 only to the first tape mark. If an S- or L-format tape is specified for lfn2, the system reads lfn1 only to the first EOR, EOF, or EOI encountered. If you want to copy an entire file to an S- or L-format tape, you can do so by first removing all EORs and EOFs using the PACK command.

<table>
<thead>
<tr>
<th>cs1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII</td>
<td>Specifies the 6/12-bit display code that supports the ASCII graphic 63- or 64-character set present on the current system.</td>
</tr>
<tr>
<td>ASCII8</td>
<td>Specifies the 7-bit ASCII code, right-justified in 12-bit bytes.</td>
</tr>
<tr>
<td>ASCII88</td>
<td>Specifies the 8-bit ASCII code, right-justified in 8-bit bytes.</td>
</tr>
<tr>
<td>ASCII63</td>
<td>Specifies the 6/12-bit display code that supports the ASCII graphic 63-character set.</td>
</tr>
<tr>
<td>ASCII64</td>
<td>Specifies the 6/12-bit display code that supports the ASCII graphic 64-character set.</td>
</tr>
<tr>
<td>ASCFL</td>
<td>Specifies the 8-bit ASCII code on S- and L-format tapes (with fixed line length and no line terminators).</td>
</tr>
<tr>
<td>DIS</td>
<td>Specifies the 6-bit display code that supports the CDC graphic 63- or 64-character set present on the current system.</td>
</tr>
<tr>
<td>DIS63</td>
<td>Specifies the 6-bit display code that supports the CDC graphic 63-character set.</td>
</tr>
<tr>
<td>DIS64</td>
<td>Specifies the 6-bit display code that supports the CDC graphic 64-character set.</td>
</tr>
<tr>
<td>EBCFL</td>
<td>Specifies the 8-bit EBCDIC code set on S- and L-format tapes (with fixed line length and no line terminators).</td>
</tr>
</tbody>
</table>
Parameter | Description
--- | ---
**NC=cs2** | Specifies the code set of lfn2. The default value for cs2 is ASCII8. The possible values for cs2 are the same as for cs1.
**PL=lt1** | Specifies the line terminator used for file lfn1. Table 9-2 shows valid line terminators for each code set. Values that can be specified for lt1 are as follows:

<table>
<thead>
<tr>
<th>Value</th>
<th>Line Terminator</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR</td>
<td>Carriage return.</td>
</tr>
<tr>
<td>CRLF</td>
<td>Carriage return and line feed.</td>
</tr>
<tr>
<td>FF</td>
<td>Form feed.</td>
</tr>
<tr>
<td>LF</td>
<td>Line feed.</td>
</tr>
<tr>
<td>LFCSR</td>
<td>Line feed and carriage return.</td>
</tr>
<tr>
<td>RS</td>
<td>Record separator.</td>
</tr>
<tr>
<td>US</td>
<td>Unit separator.</td>
</tr>
<tr>
<td>ZB</td>
<td>Zero byte.</td>
</tr>
<tr>
<td>n</td>
<td>Specified octal character value (See table 9-2).</td>
</tr>
</tbody>
</table>

The default value for lt1 for most code sets is ZB. For ASCII88, the default is US. ASCFL and EBCFL do not use line terminators.

**NL=lt2** | Specifies the line terminator to be used in file lfn2. Table 9-2 shows valid line terminators for each code set. Values that can be specified for lt2 are the same as for the PL=lt1 parameter. The default value for lt2 for most code sets is ZB. For ASCII88, the default is US. ASCFL and EBCFL do not use line terminators.

**FL=fl** | Specifies the length of fixed length lines for S- and L-format tapes. The default value is 80 characters. This parameter is valid only if ASCFL or EBCFL was specified for cs1 or cs2.
Parameter Description

LB=lb Specifies the number of lines per block for S- and L-format tapes. The default value is 3840 divided by the fixed line length (FL). (For example, if FL=80, the default for LB is 3840/80 or 48 lines per block.) For S-format tapes, the maximum value of FL*LB is 3840. This parameter is valid only if ASCFL or EBCFL was specified for cs1 or cs2.

R Rewinds lfn1 and lfn2 before and after the conversion. The default is no rewinding.

A Aborts the FCOPY command if errors occur during the conversion. The default is not to abort when errors occur.

FCOPY reads lfn1 to its EOI, preserving its EOR and EOF marks on the converted file unless lfn1 or lfn2 is an S- or L-format tape. If lfn1 is an S- or L-format tape, FCOPY reads it only to the first tape mark. If lfn2 is an S- or L-format tape, FCOPY reads lfn1 only to the first EOR, EOF, or EOI encountered. The maximum line length that can be processed is 160 12-bit codes or 320 6-bit codes. Lines that exceed the maximum length are truncated.

Files converted to 7-bit ASCII code can be listed on a local batch printer (refer to the ROUTE command) but cannot be listed at an interactive or remote batch terminal.

Example:

If you are at an interactive terminal and want to print a file (FILE1) created in ASCII mode, enter a COPYSBF command to prefix the file lines with appropriate carriage control characters. Then enter an FCOPY command to convert the file containing 6/12-bit display code (FILE2) to a file containing 7-bit ASCII code (FILE3). Finally, route the converted file (FILE3) to a line printer that prints the ASCII graphic 95-character set.

```
/ascii
/copy,FILE1.
AaBbCcDdEeFfGg
HhIiJjKkLmMnN
EOI ENCOUNTERED.
/rewind,FILE1.
REWIND,FILE1.
/copysbf,FILE1,FILE2.
END OF INFORMATION ENCOUNTERED.
/rewind,FILE2.
REWIND,FILE2.
/copy,FILE2.
1AaBbCcDdEeFfGg
HhIiJjKkLmMnN
EOI ENCOUNTERED.
/FCOPY,p=FILE2,n=FILE3,r.
COPY COMPLETE.
/route,FILE3,dc=lp,ec=a9.
ROUTE COMPLETE.
```

The following is the local batch output from the ROUTE command.

```
AaBbCcDdEeFfGg
HhIiJjKkLmMnN
```

60459680 L
LIST80 COMMAND

The LIST80 routine reads a file containing list output produced by the COMPASS assembler and compresses it to 80 columns, which fits on 8-1/2-inch by 11-inch printer paper. For output listing files not connected to your terminal, the LIST80 command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

LIST80,lfn1,lfn2,NR.

Parameter   Description
lfn1         Specifies the file from which to copy; if this parameter is omitted, file LIST is assumed.
lfn2         Specifies the file to which to copy; if this parameter is omitted, file OUTPUT is assumed.
NR           Indicates that lfn1 should not be rewound.

The output listing omits the following information that appears on the COMPASS assembler output listing.

- COMPASS version number on the page heading.
- COMPASS assembler binary values.
- INVENTED SYMBOLS comment.
- Symbolic Reference Table block column that contains either the system text file name, the overlay name, or the name of the block containing the symbol.

Comments are truncated to column 65.

LOCK COMMAND

The LOCK command prevents writing on a file.

Format:

LOCK,lfn1,lfn2,...,lfnn.

Parameter   Description
lfn1         Logical file name of a local file.

With the LOCK command, you can set the write interlock for a local file. Subsequently, the system allows only read operations on the file.
L072 COMMAND

The L072 command reformats files.

Format:

L072, P1, P2, ..., Pn.

Enter any of the following parameters in any order:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I=lfn1</td>
<td>Specifies that the reformat parameters are on file INPUT.</td>
</tr>
<tr>
<td>I=0</td>
<td>Reformat parameters are on file lfn1.</td>
</tr>
<tr>
<td></td>
<td>There is no input file of reformat parameters.</td>
</tr>
<tr>
<td></td>
<td>If the I parameter is omitted, I=0 is assumed.</td>
</tr>
<tr>
<td>S=lfn2</td>
<td>Specifies that the data to be reformatted is on file SCR.</td>
</tr>
<tr>
<td></td>
<td>Specifies that the data to be reformatted is on file lfn2.</td>
</tr>
<tr>
<td></td>
<td>If the S parameter is omitted, SCR is assumed.</td>
</tr>
<tr>
<td>L=lfn3</td>
<td>Specifies that the reformatted data is listed on file OUTPUT.</td>
</tr>
<tr>
<td></td>
<td>Specifies that the reformatted data is listed on file lfn3.</td>
</tr>

<td>Other source data.</td>
</tr>
</tbody>
</table>

If the T parameter is omitted, B is assumed.

H=xxx

Specifies that the number of characters per output line is 72.

Specifies that the number of characters per output line is xxx (maximum allowed is 150 characters). xxx must be greater than or equal to the number of characters being moved (Nx) plus the starting column number of the destination field (Ox).

If the H parameter is omitted, 72 is assumed.

LP

Specifies that the output is formatted for the line printer.

NR

Specifies that the output file is not rewound.
P4

Nx=y

Description

Specifies the number of characters to be moved (up to six fields).

x (l to 6) Number of field being moved.

y Number of characters being moved.

NOTE

The following restrictions apply to the H, N, I, and O parameters.

(Nx+Ix).GT.150 Yields an error (1≤x≤6).
(Nx+Ox).GT.H Yields an error (1≤x≤6).
H.GT.150 Yields an error.

Ix=y

Specifies the field from which the data originates.

x (l to 6) Number of field being moved.

y Starting column of originating field.

Ox=y

Specifies the destination field to which the data is going.

x (l to 6) Number of the field to receive data.

y Starting column of destination field.

IT

Suppresses query to terminal asking if you want to change any of the input parameters before processing begins. If omitted, query is issued. This parameter is effective only from interactive origin jobs.

The following shows the default values assumed for the N, O, and I parameters for the various source types.

<table>
<thead>
<tr>
<th>Type</th>
<th>N1</th>
<th>I1</th>
<th>O1</th>
<th>N2</th>
<th>I2</th>
<th>O2</th>
<th>N3</th>
<th>I3</th>

<td>48</td>
<td>10</td>
<td>3</td>
<td>22</td>
<td>82</td>
<td>51</td>
</tr>
</tbody>
</table>

The remaining parameters of these types are defaulted to 0.

L072 reformat files (output files in general). You can rearrange each line (all lines must be formatted the same) in the format you choose. All default values compress output to 72 columns, which is appropriate for terminal output or 8-1/2-inch by 11-inch printer paper. If a 1 is encountered in column 1 (the page eject printer control character), the next two lines of source data are processed as a two-line header. This header is compressed to 72 columns for all source types. If no page eject control characters are encountered, no headers are processed.
The following values apply to the first line of header and cannot be changed.

N1=42, I1=8, O1=0 (if LP not specified; otherwise, O1=1).
N2=20, I2=90, O2=42.
N3=5, I3=115, O3=62.
N4=5, I4=121, O4=67.

The subheader lines for COMPASS and Modify listings are processed uniquely.

For B listings, the following values apply to the reformatting.

N1=43, I1=8, O1=0 (if LP not specified; otherwise, O1=1).
N2=29, I2=70, O2=43.

All parameters are passed to L072 by the command. If an input file is specified, L072 reads it for additional input parameters. If the job originates from an interactive terminal, and the IT parameter is not specified, you are asked if you wish to change any of the input parameters. If you enter YES, the system prints the current parameter values and allows you to change them individually. Pressing the carriage return key for any parameter leaves the parameter at its former value. In the following examples, the same input parameters are entered in three possible ways.
Examples:

Noninteractive entry of parameters from a terminal:

```
/lo72,i=0,s=source,t=b,l=out,n4=1,i4=2,o4=75,h=90
```

Interactive entry of parameters:

```
/lo72
DO YOU WANT TO CHANGE ANY CONTROL ARGUMENT VALUES- ENTER: YES OR NO

LO72 COMPLETE.
```

Batch job entry:

```
LO72,I.
```

where the input file has the following form:

```
S=SOURCE,L=OUT,T=B.
N4=1,I4=2,O4=75.
H=90.
-EOR-
```

Each line in the input file must end with a terminator.
MFQUEUE COMMAND

The MFQUEUE command sends a local file from your host to the input or output queue of a remote host. The MFQUEUE command functions much like the ROUTE command. For most file transfers between mainframes, ROUTE is the preferred command. Unlike the ROUTE command, MFQUEUE provides the capability of sending a separate routing directive with the file or of indicating that the file has a nonstandard data format. The remote host processes the file according to the routing directive. Only when you need special routing specifications not provided by the ROUTE command do you need to use the MFQUEUE command. You must be authorized to use the MFQUEUE command (refer to the LIMITS command).

Format:

MFQUEUE, lfn, ST=stid, DD=dd, I=dirfile, PC=p, DC=dc.

PARAMETER DESCRIPTIONS

Parameters lfn and ST=stid are required and lfn must be the first parameter; the other parameters are optional and order-independent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the local file to be routed to the remote host. The file name must be one to seven alphanumeric characters.</td>
</tr>
<tr>
<td>ST=stid</td>
<td>Specifies the logical identifier (LID) of the remote host to which the file is to be routed. The LID specification must be three alphanumeric characters. ST=stid may not specify the local host.</td>
</tr>
<tr>
<td>DD=dd</td>
<td>Specifies the data format of the file to be transferred. The DD=dd parameter both describes the character set of lfn on the host where it currently resides and also specifies the character set lfn is to have after the transfer. For file transfers between NOS mainframes and between NOS/BE and NOS mainframes this parameter is effectively ignored. The file will have the same format on both mainframes. The interpretation of the DD=dd parameter depends on the operating system(s) involved in the file transfer. The following paragraphs describe how NOS interprets the DD=dd parameter. For its interpretation by other operating systems, refer to the Remote Host Facility Usage manual.</td>
</tr>
</tbody>
</table>
Parameter Description

On NOS, you can specify the following values for dd:

<table>
<thead>
<tr>
<th>dd</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C6</td>
<td>The file contains character data in a 64-character (or less) subset of the ASCII 128-character set. The character code of lfn is 6-bit display code and its lines are zero-byte terminated (Z-type records).</td>
</tr>
<tr>
<td>C8</td>
<td>The file contains character data in a larger than 64-character subset of the ASCII 128-character set. The character code of lfn is the 7-bit ASCII code (right-justified in 12-bit fields) and its lines are zero-byte terminated (Z-type records).</td>
</tr>
<tr>
<td>US</td>
<td>Specifies that the file contains binary data in structured format with EORs and EOFs. The file is transmitted as a continuous string of binary data, broken only by EORs and EOFs as appropriate.</td>
</tr>
<tr>
<td>UU</td>
<td>Specifies that the file contains binary data without EORs and EOFs. NOS treats UU as US.</td>
</tr>
</tbody>
</table>

If the file is character data, you do not need to specify a DD=dd parameter. The remote host determines the format in which to write the file. If NOS is the remote host and the DD=dd parameter has not been specified, NOS assumes character data and reads/writes the file in C6 format.

I=dirfile

Specifies the local file which contains the routing directive that the system sends to the remote host. The file name must be one to seven alphanumeric characters. If you specify only the keyword I, file INPUT becomes the directive file. If you omit the I=dirfile parameter, the system reads directives from the lines immediately following the MFQUEUE command. The lines must begin with the prefix character defined by the PC=c parameter. The system reads the lines until it comes to a line without the prefix character. It then strips off the prefix character from each line and concatenates the lines into one single directive to send to the remote host. This directive must not exceed the 256-character limit.

PC=c

Specifies the prefix character for the lines of the routing directive. The default is an asterisk (*). The prefix character can be any 6-bit display code character, except a closing parenthesis, a dollar sign, a period, or a colon. To avoid ambiguity between commands and routing directives, use alphabetic values for c cautiously.
Parameter Description

DC=dc Specifies the disposition codes for the file to be transferred. You can specify one of the following codes for dc:

dc Description
CP Punch the file in coded format.
IN Queue the file for input.
IX Queue the file for input but do not return the output unless explicitly directed to do so.
LP Print the file.
PB Punch the file in system binary format.
PH Same as CP.
PR Same as LP.
PU Same as CP.
P8 Punch in 80-column binary format.
SB Same as PB.
SP Plot in binary format.

Example:

To route a 7-bit ASCII file (MYFILE) to a remote mainframe (with REM as its LID) for execution, enter this command:

MFQUEUE,MYFILE,ST=REM,DC=IN,DD=C8.

THE ROUTING DIRECTIVE

The routing directive provides additional routing specifications for the queued file. The I=dirfile parameter determines the residence of this directive. The host strips the prefix characters from the lines of this directive and forwards the directive unaltered (except for prefix characters) to the remote host for processing. Hence, the directive must be a command recognized by the remote host.

This section documents only the routing directive recognized by a NOS 2 remote host. For information on routing directives for other remote hosts, refer to the Remote Host Facility Usage manual.

The routing directive accepted by a NOS 2 remote host closely resembles its ROUTE command.

Format:

ROUTE,lfn,p1,p2,...,pn.*

The parameter descriptions for this directive are the same as those for the ROUTE command with the following exceptions:

- The lfn parameter is not required on the ROUTE directive and can be omitted.
Parameters $p_i$ can be any of the following as described for the ROUTE command:

- **DC**=$d_c$
- **DO**=$l_d$
- **EC**=$e_c$
- **FC**=$f_c$
- **FID**=$f_id$
- **FM**=$f_m$
- **ID**=$i_d$
- **PI**=$p_i$
- **REP**=$r_e_p$
- **SC**=$s_c$
- **SCL**=$s_cl$
- **TID**=$t_i_d$
- **UJN**=$u_j_n$
- **UN**=$u_n$

**EXAMPLE:**

Assume you are at mainframe MFA. To route local file RBPRINT from mainframe MFA to a remote batch printer logged in with user name ABC on NOS mainframe MFB, enter a command similar to the following:

```
MFQUEUE,RBPRINT,ST=MFB.
*ROUTE,DC=PR,UN=ABC.
```

You can accomplish the same task with the following ROUTE command:

```
ROUTE,RBPRINT,DC=PR,UN=ABC,ST=MFB.
```

**NEW COMMAND**

The **NEW** command creates a primary file.

**Format:**

```
NEW,lfn/ND.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to be made the primary file.</td>
</tr>
<tr>
<td>ND</td>
<td>Specifies that no files currently assigned to the job are released.</td>
</tr>
</tbody>
</table>

The **NEW** command creates an empty file and makes it your new primary file. If you do not specify the ND parameter, the system releases all files assigned to the job, except those with checkpoint or no-auto-drop status. Certain system files (for example, ZZZZZC0, ZZZZZC1, ZZZZZC2, and ZZZZZLD) always have no-auto-drop status. You can give any local file this status by using the SETFS command. When the ND parameter is specified, any currently existing primary file becomes a nonprimary local file.

The automatic rewinding of primary files is incompatible with some file manipulation commands. Refer to the note in PRIMARY command later in this section.
OUT COMMAND

The OUT command queues files that you or the system has given a deferred routing (refer to the ROUTE command, which is described later in this section). The command initiates the queueing that the system automatically does at job termination.

Format:

OUT.

or

OUT,*,$fn_1,$fn_2,...,$fn_n.

The first format queues all eligible files. The second format queues all eligible files except those named ($fn_1$). If no files are named, all eligible files are queued.

Any file given a deferred routing can be processed by the OUT command. Eligible files also include local mass storage files named OUTPUT, PUNCH, PUNCHB, and P8. If selected, OUTPUT is queued for printing and files PUNCH, PUNCHB, and P8 are queued for punching.

File PUNCH is punched as a coded deck in either 026 or 029 mode, depending on the origin of the job. If the job is a local batch job, PUNCH is punched in the initial keypunch mode of the job's command record. For all other job origin types, PUNCH is punched in the system default keypunch mode.

File PUNCHB is punched as a binary deck in system binary format. File P8 is punched as a binary deck in 80-column binary format.

OVWRITE COMMAND

The OVWRITE command destroys the contents of files by overwriting them. This command does not apply to tape files or to files on which you cannot write (for example, direct access files attached in a mode besides WRITE or files that have been locked). The command overwrites the entire file.

Formats:

OVWRITE,$fn_1,$fn_2,...,$fn_n/OP=p_1p_2.

or

OVWRITE,*,$fn_1,$fn_2,...,$fn_n/OP=p_1p_2.

Parameter Description

$fn_1$ Specifies a file assigned to your job. This file cannot be a tape file.

OP=p_1p_2 Specifies how the files are to be overwritten and whether the files are to be released from the job after the overwriting. The value $p_i$ can be any of the following:
The first format shown overwrites files $lfn_1$. The second format overwrites all files assigned to the job except files $lfn_1$.

**PACK COMMAND**

The PACK command removes all EOR and EOF marks from a specified file and copies it as one record to another file.

**Format:**

`PACK, lfn1, lfn2, x.`

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$lfn_1$</td>
<td>Specifies the name of file to be packed. From batch origin, $lfn_1$ must be specified; from interactive origin, the primary file is used if $lfn_1$ is omitted. The file must not be assigned to an interactive terminal (file type TT).</td>
</tr>
<tr>
<td>$lfn_2$</td>
<td>Specifies the name of file to receive packed data. If $lfn_2$ is omitted, the packed file is written on $lfn_1$.</td>
</tr>
<tr>
<td>$x$</td>
<td>Indicates that $lfn_1$ should not be rewound before the pack occurs. $x$ can be any alphanumeric, one- to seven-character string.</td>
</tr>
</tbody>
</table>

The input file, $lfn_1$, may consist of any number of records or files. If no third parameter is supplied, $lfn_1$ is read from the BOI to the EOI, and all EOR and EOF marks are removed. It is written to file $lfn_2$ at the current position as one record. File $lfn_2$ is rewound after the pack; $lfn_1$ is not.

**NOTE**

Do not use the PACK command with S, L, or F format tapes.
PRIMARY COMMAND

The PRIMARY command makes a local file the primary file, or it creates an empty primary file.

Format:

\texttt{PRIMARY, lfn.}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of local file.</td>
</tr>
</tbody>
</table>

If lfn already exists, it must be a local mass storage file in order to be made the primary file. If lfn does not exist, the PRIMARY command creates it on mass storage. Any currently existing primary file (other than the lfn specified) becomes a nonprimary local file. If the specified file is already primary, the operation is ignored.

\textbf{NOTE}

The primary file is rewound before every command is processed. Therefore, the file manipulation commands cannot be used to position within the file. An attempt to add to the file using one of the copying commands may result in writing over existing data at the BOI.

RENAME COMMAND

The RENAME command changes the name of a local file.

Format:

\texttt{RENAME, nfn_1=ofn_1, nfn_2=ofn_2, ..., nfn_n=ofn_n.}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nfn_1</td>
<td>Specifies the new name of the local file.</td>
</tr>
<tr>
<td>ofn_1</td>
<td>Specifies the existing name of the local file.</td>
</tr>
</tbody>
</table>

The RENAME command changes the name of the local file ofn_1 to nfn_1. This does not change the names of files in the permanent file catalog. The renaming is done in the following manner:

- If local file nfn_1 did not previously exist, file ofn_1 is simply renamed.
- If a local file nfn_1 already exists and is not the primary file, the system discards nfn_1 and gives ofn_1 the name nfn_1.
- If nfn_1 is the primary file, then the system discards nfn_1, gives ofn_1 the name nfn_1, and makes it the primary file. In this case, ofn_1 must have a local file type.
For example, you have only two files assigned to the job. File A is a local mass storage file and file B has a queued file type. If you issue the following request

```
RENAME,X=A.
```
ile A is renamed file X, and its file type (local) is not changed. If you issue the request

```
RENAME,B=A.
```

file B no longer exists; file A is renamed file B and retains its local file type.

**REQUEST COMMAND**

The REQUEST command assigns a file to receive checkpoint dumps or sends a message to the system operator requesting that the named file be assigned to the device described in the comment field.

**Format:**

```
REQUEST,lfn,checkpoint,AL=level,.comment
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to be assigned to a specified device or to be used as a checkpoint file.</td>
</tr>
<tr>
<td>checkpoint</td>
<td>Specifies that lfn is to be used as a checkpoint file.</td>
</tr>
</tbody>
</table>
| AL=level       | Specifies the security access level to assign to the file. Unless changed by your site, level can be one of the following names:
|                | LVLO, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7                          |
| comment        | Specifies the comment that is displayed at the system console. In the comment field, you direct the operator to make the requested device assignment. |

The default is the current access level of the job.

On a secured system, the access level you specify must be valid for the job (ENQUIRE,B returns this information) and for the device to which you are assigning the file.

On an unsecured system, the parameter has no effect. The system does, however, check for valid parameter specifications.

When using this command to assign a file for checkpoint dumps on a secured system, use the AL=level parameter to assign the file at the highest access level valid for the job (ENQUIRE,B returns this information). The CKP command aborts the job if the checkpoint file is not at this access level.
If the REQUEST command is used to request assignment of file lfn to the equipment specified in the comment field, lfn must not be a local file.

If the REQUEST command is used to assign lfn for checkpoint dumps, lfn must be a local file and either the CK or CB keyword is specified. These keywords are used in conjunction with the CKP and RESTART commands; they do the following:

- Save all checkpoint dumps by appending each dump to checkpoint file lfn:
  
  REQUEST, lfn, CK.

- Save only the last checkpoint dump by writing each dump at the beginning of checkpoint file lfn:
  
  REQUEST, lfn, CB.

- Save two consecutive checkpoint dumps by alternately writing on two checkpoint files:
  
  REQUEST, lfn1, CB.
  REQUEST, lfn2, CB.

If the CK keyword is specified for different files or if more than two checkpoint files are specified, the job aborts. The CK and CB keywords specify a checkpoint file that is local to the job. You can make the checkpoint file permanent by placing a DEFINE command before the REQUEST command.

  DEFINE, lfn.

  REQUEST, lfn, CK.

  CKP.

You are not required to supply a REQUEST command to define a checkpoint file. You can use an ASSIGN or LABEL command or you can use default values.

If no REQUEST command specifying a checkpoint file has been detected when the first CKP command is encountered, the system requests a device, specifies a file name of CCCCCCCCC, and selects the CK option. For a subsequent restart job, however, the system assumes you have made the checkpoint file available.

If lfn is a local file when you enter the REQUEST command, no new assignment is made and job processing continues with the next command. However, you can reassign lfn by issuing a RETURN command on the file before entering the REQUEST command.

You can use the REQUEST command to assign a file to a mass storage device. However, you must be authorized to assign a file to a magnetic tape or auxiliary device. If you do not have this authorization and attempt to request a tape unit or auxiliary device, the system aborts the job.

The REQUEST command can also be used to create or access existing seven- or nine-track unlabeled tapes. If a magnetic tape assignment is needed to satisfy a REQUEST command, the MT or NT parameter should be specified. For a description of magnetic tape assignment with the REQUEST command, refer to section 12, Tape Management.

†Any mass storage file used as a checkpoint file must have write permission. Refer to LIMITS Command in section 7.
RESEQ COMMAND

The RESEQ command resequences source files which have leading sequence numbers or adds sequence numbers to an unsequenced file. The RESEQ command for interactive jobs acts only upon the primary file and has a different parameter order.

Format for noninteractive jobs:

RESEQ,lfn,type,start,step.

Format for interactive jobs:

RESEQ,start,step,type.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the sorted file to be resequenced. The system does not sort lfn (refer to the SORT command).</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of file:</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>B</td>
</tr>
<tr>
<td></td>
<td>T</td>
</tr>
<tr>
<td></td>
<td>F</td>
</tr>
<tr>
<td></td>
<td>other or omitted</td>
</tr>
<tr>
<td>start</td>
<td>Specifies the new line number of the first line. The default is 100.</td>
</tr>
<tr>
<td>step</td>
<td>Specifies the line number increment. The default is 10.</td>
</tr>
</tbody>
</table>

Files that have leading sequence numbers include FORTRAN and BASIC source files formatted for interactive processing. If the file has no leading sequence numbers, five-digit numbers are inserted at the beginning of each line. No line number can exceed 99999. When the system encounters line numbers longer than five digits, it uses only the first five digits to resequence the file.
When resequencing a BASIC source program, you must specify B for the file type parameter or enter the command under the BASIC subsystem so that the system changes the line number references within the source statements. The system supplies 5-digit line numbers and line number references; excess surrounding blanks are used in the expansion of line number references.

In order to resequence a BASIC program written in 6/12-bit display code, you must call RESEQ from an interactive job which is in ASCII mode.

Example:

File X contains the following BASIC source statements.

```
95 ON SGN(A)+2 GOTO 100,110,120 'COMMENT
100 PRINT "A IS NEGATIVE"
105 GOTO 130 'COMMENT
110 PRINT "A IS ZERO"
115 GOTO 130 'COMMENT
120 PRINT "A IS POSITIVE"
130 LET B=A+130
135 END
```

The following command changes the contents of file X.

```
RESEQ,X,B,90,10.
```

File X now has the following contents:

```
00090 ON SGN(A)+2 GOTO 00100,00120,00140 'COMMENT
00100 PRINT "A IS NEGATIVE"
00110 GOTO 00150 'COMMENT
00120 PRINT "A IS ZERO"
00130 GOTO 00150 'COMMENT
00140 PRINT "A IS POSITIVE"
00150 LET B=A+130
00160 END
```

The RESEQ command changes the line numbers and the line number references. Line numbers now begin at 90 and increment by 10. The comment on the first line is moved to the right to allow for the expanded line number references.

The RESEQ command retains at most one trailing space on a blank line. During a sort, the system deletes lines with only one or no trailing spaces. Hence, a RESEQ command followed by a sort causes all blank lines to be deleted from the file.
RETURN COMMAND

The RETURN command releases files assigned to a job and may release file space depending on the file type.

Format:

RETURN, lfn1, lfn2,..., lfnn.*

or

RETURN,*, lfn1, lfn2,..., lfnn.*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of a file assigned to your job.</td>
</tr>
</tbody>
</table>

The first format returns the named files (lfn1, lfn2,..., lfnn). The second format returns all files assigned to the job except the named files. If no files are named on the second format, the asterisk returns all files assigned to the job.

There are several exceptions. The RETURN command does not release any files that have checkpoint or no-auto-drop status. Certain system scratch files (for example, ZZZZZC0, ZZZZZC1, ZZZZZC2, and ZZZZZLD) have no-auto-drop status. You can give any local file this status by using the SETFS command.

RETURN performs the following operations according to the file type.

<table>
<thead>
<tr>
<th>Type</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>File name is changed to INPUT*. File space is not released (refer to Input File Control in section 3 for further information).</td>
</tr>
<tr>
<td>Queued</td>
<td>File space is released, and the file is no longer assigned to the job. The file also loses its queued status.</td>
</tr>
<tr>
<td>Local</td>
<td>File space is released, and the file is no longer assigned to the job.</td>
</tr>
<tr>
<td>Primary</td>
<td>Same as Local.</td>
</tr>
<tr>
<td>Library</td>
<td>File space remains, but the file is no longer assigned to the job.</td>
</tr>
<tr>
<td>Direct access</td>
<td>File space remains, but the file is no longer attached to the job.</td>
</tr>
<tr>
<td>Tape</td>
<td>Tape is no longer assigned to the job. Refer to the REWIND or UNLOAD command for a description of the processing that occurs if the previous operation was a write.</td>
</tr>
</tbody>
</table>

In addition, the return of a magnetic tape file or the return of your last direct access file on an auxiliary removable disk pack decrements the resource demand count as scheduled by the RESOURC command if, and only if, the total concurrent resource demand (tapes and removable packs) is presently assigned.

To release a file without decrementing the resource demand count, you can issue an UNLOAD command. To release file space without releasing the file from the job, you can issue an EVICT command.
If the file is a magnetic tape file and if the previous operation was a write, the following operations are performed:

- If the tape is ANSI labeled, the system writes a tape mark, an EOFl label, and three tape marks and then returns the tape.
- If the tape is unlabeled and the data format specified on the ASSIGN, LABEL, or REQUEST command is S, L, or F, the system writes four tape marks and then returns the tape.
- If the tape is unlabeled and the data format is I or SI, the system writes a tape mark, an EOFl label, and three tape marks and then returns the tape.

Refer to Magnetic Tape Files in section 2 and Tape Management command in section 12 for further information about tape files, and to appendix G for a description of an EOFl label.

**REWIND COMMAND**

The REWIND command rewinds files. A mass storage file is positioned at its BOI. A tape file is positioned at BOI (refer to appendix G). If the labeled tape file begins on a previous volume, the system notifies the operator to mount that volume.

Format:

```
REWIND, lfn1, lfn2, ..., lfn_n.
```

or

```
REWIND, *, lfn1, lfn2, ..., lfn_n.
```

**Parameter** | **Description**
--- | ---
`lfn_i` | Specifies the name of a file assigned to your job.

The first format rewinds the named files (`lfn1, lfn2, ..., lfn_n`). The second format rewinds all files assigned to the job except the named files. If no files are named on the second format, the asterisk specification rewinds all files assigned to the job.

If the previous operation on the magnetic tape file was a write, a REWIND command causes the following operations to be performed:

- If the tape is ANSI labeled, the system writes a tape mark, an EOFl label, and three tape marks and then rewinds the tape.
- If the tape is unlabeled and the data format specified on the ASSIGN, LABEL, or REQUEST command is S, L, or F, the system writes four tape marks and then rewinds the tape.
- If the tape is unlabeled and the data format is I or SI, the system writes a tape mark, an EOFl label, and three tape marks and then rewinds the tape.

Refer to Magnetic Tape Files in section 2 and to section 12, Tape Management, for further information about tape files, and to appendix G for a description of EOFl labels.
ROUTE COMMAND

The ROUTE command queues a file for disposal. The file routing may take effect when the command is processed, or it may be deferred. If deferred, the routing characteristics specified define the handling of the file in later job steps or at job termination. This command can also rescind a prior deferred ROUTE command.

With the proper validation, you can use the ROUTE command to queue files on other mainframes. Enter the LIMITS command to display the limits and user permissions for your user name. The MFQUEUE command also queues files on other mainframes, but use the ROUTE command for this purpose unless you need special routing specifications not provided by ROUTE.

PARAMETER DESCRIPTIONS

Format:

ROUTE, lfn, p1, p2, ..., pn.

Parameter Description

lfn

Specifies the file to route. File lfn must have a queued file type or a local file type; it cannot be a primary or direct access file. The lfn parameter is required on all ROUTE commands.

The remaining parameters are order-independent.

Parameter Description

p1

DC=dc

Specifies the disposition of the queued file.

dc

Meaning

IN  Queue the file with an input disposition. Normal job input file format is required and the first record of the file must be in 6-bit display code. If the Job command within the file is in error, the file is not queued and remains a local file.

LP  Queue the file for printing on any printer.

LR  Queue the file for printing on 580-12 printer.

LS  Queue the file for printing on 580-16 printer.

LT  Queue the file for printing on 580-20 printer.

LX  Queue the file for printing on 5870 Non-Impact Printer.

NO  Queue the file with an input disposition. Output not explicitly routed by the job is discarded at job completion. The dayfile is not written to file OUTPUT. Normal job input file format is required and the first record of the file must be in 6-bit display code. If the Job command within the file is in error, the file is not queued and remains a local file.
<table>

<tr>
<td>WT</td>
<td>Queue the file with a wait disposition.</td>
<td>Queue the file with a wait disposition.</td>
</tr>
</tbody>
</table>

If the DC=dc parameter is omitted and lfn has been previously given a deferred routing, the file is queued with the disposition code previously specified. If the DC=dc parameter is omitted and lfn is not a deferred routed file, the file name may determine the default.

If DC is omitted and lfn is:  

<table>
<thead>
<tr>
<th>OUTPUT</th>
<th>DC=LP</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUNCH</td>
<td>DC=PU</td>
</tr>
<tr>
<td>PUNCHB</td>
<td>DC=SB</td>
</tr>
<tr>
<td>P8</td>
<td>DC=P8</td>
</tr>
</tbody>
</table>

If a ROUTE command specifies an input disposition for the file (DC=IN, DC=NO, or DC=TO) and the file has an invalid USER command, the job containing the ROUTE command aborts with no exit processing. The security count for the user name that did the ROUTE is decremented accordingly. If you specify a remote host (ST=lid2) that does not perform USER command validation, the local host does not check your queued file for a USER command.

If a ROUTE command sends a file to a remote host with an input disposition not supported on that host (for example, DC=TO or DC=NO to a non-NOS 2 host), the remote host accepts the input file but treats it as though it were routed with DC=IN. Hence, job output from a job routed to a non-NOS 2 host with DC=NO or DC=TO returns and prints locally.
On a dual-state system, if DC=NO is specified when routing a NOS/VE batch job from NOS, the job output is discarded at termination of the NOS/VE job. If DC=TO is specified, job output is queued with a wait disposition.

**DEF**
Indicates that queueing of the file is deferred to a later job step (OUT command or ROUTE command with the SC parameter specified) or end of job. If this parameter is specified, the file is created if it does not exist. DEF is not allowed if DC=IN, DC=NO, or DC=TO.

**DO=**
Specifies the logical identifier (LID) of the mainframe to receive the output generated by the routed file. The LID can be any three-character, alphanumeric string defined by your site or you can specify an asterisk. By default, output returns to the originating mainframe, including cases where your routed file submits jobs to still other mainframes. For example, you are at mainframe MAA and you route job X to mainframe MBB. Job X routes job Y to mainframe MCC. Then the output from both jobs X and Y return to mainframe MAA by default.

**DO=** returns the output to the mainframe that processed the ROUTE command on which **DO=** appears. For example, you are at mainframe MAA and you route job A to mainframe MBB. Job A routes job B to mainframe MCC with **DO=** specified. Then output from job A returns to MAA but output from job B returns to MBB.

In both preceding examples, all the mainframes must be directly connected; that is, no two mainframes have to rely on a third for file transfers.

You must have special authorization to use this parameter (refer to the LIMITS command).

**EC=**
Defines external characteristics for files queued for printing or punching.

For files queued for printing, ec can be the following. (For more information on print trains associated with various EC codes, refer to Jobs Using Line Printers in appendix A.)

<table>
<thead>
<tr>
<th>ec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>A4</td>
<td>Provided for NOS/BE compatibility. If you specify A4, the system uses the appropriate EC default (refer to following note).</td>
</tr>
<tr>
<td>A6</td>
<td>ASCII graphic 63/64-character set.</td>
</tr>
<tr>
<td>A9</td>
<td>ASCII graphic 95-character set (except for CYBER model 810 systems using a PSU printer; to route files to a PSU printer, use the FC parameter). File lfn must be a 7-bit ASCII file. Refer to the FCOPY command earlier in this section for information on how to convert a file to 7-bit ASCII.</td>
</tr>
</tbody>
</table>
**Description**

<table>
<thead>
<tr>
<th>ec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>B4</td>
<td>Provided for NOS/BE compatibility. If you specify B4, the system uses the appropriate EC default (refer to following note).</td>
</tr>
<tr>
<td>B6</td>
<td>CDC graphic 63/64-character set.</td>
</tr>
</tbody>
</table>

For files queued for punching, `ec` can be the following:

<table>
<thead>
<tr>
<th>ec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII</td>
<td>Punch ASCII.</td>
</tr>
<tr>
<td>026 or 026</td>
<td>Punch 026 mode.</td>
</tr>
<tr>
<td>029 or 029</td>
<td>Punch 029 mode.</td>
</tr>
<tr>
<td>SB</td>
<td>Punch system binary.</td>
</tr>
<tr>
<td>80COL</td>
<td>Punch 80-column binary.</td>
</tr>
</tbody>
</table>

For files queued for plotting, `ec` can have the following values:

<table>
<thead>
<tr>
<th>ec</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>T6</td>
<td>Specifies 6-bit, transparent plot data.</td>
</tr>
<tr>
<td>T8</td>
<td>Specifies 8-bit, transparent plot data.</td>
</tr>
</tbody>
</table>

**NOTE**

If an invalid external characteristic is specified, the queued file processor cannot output the file. You must not specify a printing characteristic for a queued punching file or a punching file characteristic for a print file queued for printing. You also must not specify an external characteristic not available at the site. If EC is not specified, an appropriate EC default is set on the basis of the DC parameter setting and installation options.

**FC=value**

This parameter has two possible uses depending on your site or host configuration:

For routing of output requiring special forms, specify `FC=fc`, where `fc` is a 2-character code assigned by the system operator to an output device. This prevents output of a file before its special forms are placed in the output device. In this case, omission of the parameter results in a null value.
Pi

For sites supporting two 533/536 or 585 printers, an ASCII graphic 64-character printer and an ASCII graphic 95-character printer, you can use the FC parameter to select either printer. Specify FC=AS to select the 95-character printer. In this case, omission of the parameter results in routing to the 64-character printer.

FID=ujn

FID is a NOS/BE parameter included for compatibility. Under NOS, this parameter performs the same function as the UJN parameter.

FM=fm

Indicates routing to a remote batch or interactive terminal logged in with the family name specified. You must have special authorization to specify an alternate family name (refer to the LIMITS command). The one- to seven-character family name must be alphanumeric. If you specify only the keyword FM, implicit remote routing results (refer to Implicit Routing following the last parameter description).

IC=ic

Specifies internal characteristics of the file; the value ic is one of the following:

<table>
<thead>
<tr>
<th>ic</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIS</td>
<td>6-bit display code.</td>
</tr>
<tr>
<td>ASCII</td>
<td>7-bit ASCII code.</td>
</tr>
<tr>
<td>BIN</td>
<td>Binary.</td>
</tr>
</tbody>
</table>

This parameter is normally not specified since its default is automatically established through the disposition code (DC=dc) and the external characteristic (EC=ec) parameters. The following lists show the default for ic for the various ec values.

<table>
<thead>
<tr>
<th>ec for printing</th>
<th>Default ic</th>
</tr>
</thead>
<tbody>
<tr>
<td>A4</td>
<td>ASCII</td>
</tr>
<tr>
<td>B4</td>
<td>DISPLAY</td>
</tr>
<tr>
<td>B6</td>
<td>DISPLAY</td>
</tr>
<tr>
<td>A6</td>
<td>DISPLAY</td>
</tr>
<tr>
<td>A9</td>
<td>ASCII</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ec for punching</th>
<th>Default ic</th>
</tr>
</thead>
<tbody>
<tr>
<td>SB</td>
<td>BINARY</td>
</tr>
<tr>
<td>80COL</td>
<td>BINARY</td>
</tr>
<tr>
<td>026</td>
<td>DISPLAY</td>
</tr>
<tr>
<td>029</td>
<td>DISPLAY</td>
</tr>
<tr>
<td>ASCII</td>
<td>ASCII</td>
</tr>
</tbody>
</table>
Selects the device locally associated with identifier id. Identifier id can be 0 to 67B (octal default). If you specify only the keyword ID, implicit remote routing results (refer to Implicit Routing following the last parameter description).

Selects a print train image denoted either by a digit from 1 to 7 or by a one- to seven-character symbolic name assigned by your site.

File priority. This is a NOS/BE parameter included for compatibility. It produces an informative message under NOS.

Specifies the number of additional file copies to be routed to a destination. The range for rep is from 0 to 63; therefore, the number of copies that can be sent ranges from 1 to 64. Values for rep beyond its range are set to zero, an informative message is sent to the dayfile, and one copy is routed to the destination. The default value is zero; only one copy is routed.

Specifies a programmable format control (PFC) array for the 580 PFC printer, or a vertical format definition for a 533/536, 537, or 585 printer. The system is released with two PFC arrays, a default (SC=0), and an alternate (SC=1). If your site has 533/536, 537, or 585 printers, the system contains six vertical format definitions for these printers with a default of SC=3. For more information on PFC arrays and vertical format definitions, refer to appendix H and the NOS Version 2 Analysis Handbook.

For 533/536, 537, and 585 printers, you may choose one of the following sc values:

<table>
<thead>
<tr>
<th>sc</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>12-inch forms at 6 lines/inch.</td>
</tr>
<tr>
<td>2</td>
<td>12-inch forms at 8 lines/inch.</td>
</tr>
<tr>
<td>3</td>
<td>11-inch forms at 6 lines/inch.</td>
</tr>
<tr>
<td>4</td>
<td>11-inch forms at 8 lines/inch.</td>
</tr>
<tr>
<td>5</td>
<td>8.5-inch forms at 6 lines/inch.</td>
</tr>
<tr>
<td>6</td>
<td>8.5-inch forms at 8 lines/inch.</td>
</tr>
</tbody>
</table>

If no sc value is specified, the system default (SC=3) is used. Refer to NOS Version 2 Analysis Handbook for more information on 533/536, 537, and 585 printers.
### SCL=SCL

Specifies the service class to be assigned to this routed file. The value SCL must be one of the following:

<table>
<thead>
<tr>
<th>SCL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BC</td>
<td>Local batch.</td>
</tr>
<tr>
<td>CT</td>
<td>Communication task.</td>
</tr>
<tr>
<td>DF</td>
<td>The default service class according to the origin type of the routed file. The LIMITS command shows your default service class assignments.</td>
</tr>
<tr>
<td>DI</td>
<td>Detached interactive.</td>
</tr>
<tr>
<td>In</td>
<td>Installation class n (0 ≤ n ≤ 3).</td>
</tr>
<tr>
<td>MA</td>
<td>Maintenance.</td>
</tr>
<tr>
<td>NS</td>
<td>Network supervisor.</td>
</tr>
<tr>
<td>RB</td>
<td>Remote batch.</td>
</tr>
<tr>
<td>SY</td>
<td>System.</td>
</tr>
<tr>
<td>TS</td>
<td>Interactive.</td>
</tr>
</tbody>
</table>

When using the ROUTE command to queue a file to a remote host, the service class for your job must be valid on the remote host and all mainframes in the link to the remote host.

For a file queued for output, you can only specify a service class valid for your current job. The default service class for such a file is the service class of the current job.

For a file queued for input (DC=IN, DC=NO, and DC=TO), you can only specify a service class valid for local batch jobs. The default service class in this case is the service class the system assigns by default to any of your local batch jobs. If you specify a service class with this parameter for a file queued for input and the file's Job command also has a service class specification, the service class specified on the ROUTE command takes precedence. Refer to Job Service Classes in section 3 for more information on service classes.

### ST=LID

Specifies the logical identifier (LID) of the mainframe to which you are routing the specified file. The LID can be any three-character alphanumeric string defined by your site or you can specify an asterisk.

By default, the mainframe processing the ROUTE command also processes the routed file if it is queued for input. This mainframe also processes the routed file if it is queued for output unless the job containing this ROUTE command emanated from another job that is diverting the output elsewhere.

ST= ensures that the mainframe processing the ROUTE command always processes the routed file.
In a dual-state environment, you can route an input file to NOS/VE by specifying the NOS/VE LID on this parameter. The file must be in ASCII (6/12-bit display code) format.

The ST=lid2 on the ROUTE command overrides the ST=lid parameter on the Job command of the routed file.

You must have special authorization to use this parameter (refer to the LIMITS command).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TID=tid</td>
<td>The TID=tid form of this parameter functions the same as the UN=un parameter and is included for compatibility with NOS/BE. The TID=C form of the parameter specifies routing to the central site. If you specify only the keyword TID, implicit remote routing is selected (refer to Implicit Routing below).</td>
</tr>
<tr>
<td>UJN=ujn</td>
<td>Specifies a user job name (UJN) for the file to be routed. Except for input dispositions, the default is the UJN of the job from which you enter the command. In the case where you specify an input disposition (DC=IN, DC=NO, or DC=TO), the Job command of the queued file determines the default UJN.</td>
</tr>
<tr>
<td>UN=un</td>
<td>Specifies the user name of the remote batch or interactive user to whom the system routes the file. If you specify only the keyword UN, implicit remote routing occurs (refer to Implicit Routing following the last parameter description).</td>
</tr>
</tbody>
</table>

**IMPLICIT ROUTING**

For remote batch origin jobs, the following action is taken.

- Specifying an ID, ID=id, or TID=C parameter causes routing to the central site.
- Specifying an FM=fm or UN=un parameter with valid arguments causes routing to the specified remote batch or interactive terminal.
- In all other cases, the system routes the file to the originating remote batch terminal.

For jobs of any origin other than remote batch, the following action is taken.

- Specifying an ID, ID=id, or TID=C parameter causes routing to the central site.
- Specifying UN, TID, or FM causes routing to the terminal specified by the job's family name and user name at the time of the processing of the ROUTE command.
- Specifying UN=un or FM=fm with valid arguments causes routing to the specified remote batch or interactive terminal.

You can use the ENQUIRE command to determine whether your routed file is destined for the central site or a remote batch terminal. If you specify the JSN=jsn or UJN=ujn parameter, ENQUIRE returns either RB (remote batch routing) or BC (routing to the batch devices at the central site) in the DS field of the display.
SCOPY COMMAND

The SCOPY command copies a specified number of coded files from one file to another and, unless explicitly prohibited, indicates the structure of the file being copied by displaying the EORs and EOFs in the receiving file. A coded file is defined as a file containing lines of 500 characters or less, each terminated by a zero byte (12 zero bits in the lowest byte of a word).

**NOTE**

The SCOPY command is not recommended for use with S, L, or F format tapes because it does not have the data specification parameters needed to accommodate the variety of data formats possible with those tape formats. For an S, L, or F format tape copying operation, issue a COPY command with the appropriate parameter specifications.

The SCOPY command cannot copy SI format tapes. If coded mode is set for an SI tape, the system terminates the job. The TCOPY utility converts SI coded tape files.

When you copy a file with no EOR or EOF file marks, the resulting file may have a different logical file structure. In particular, when copying such a file to tape, the system adds an EOR mark to the end of the file. Such changes do not affect file content but may cause verification errors.

Format:

```plaintext
SCOPY,lfn1,lfn2,n,fchar,lchar,na,R,fcs,fline,lline,ns.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies the name of the file to be copied. You must specify this parameter.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Specifies the name of the file onto which lfn1 is copied; if this parameter is omitted, file OUTPUT is assumed.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number of files (decimal) to copy; if this parameter is omitted, the file is copied to EOI.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>fchar</td>
<td>Specifies the first character position (1 to 500 for 6-bit characters) of each line to copy; if this parameter is omitted, the copy begins at character position 1.†</td>
</tr>
<tr>
<td>lchar</td>
<td>Specifies the last character position (1 to 500 for 6-bit characters) of each line to copy; lchar must be greater than or equal to fchar. If this parameter is omitted, the copy ends at character position 500.†</td>
</tr>
<tr>
<td>na</td>
<td>Specifies that the job step should not abort when a line terminator does not appear before an EOR. na can be any string of one to seven alphanumeric characters.</td>
</tr>
<tr>
<td>R</td>
<td>Specifies that both lfn1 and lfn2 be rewound before copying.</td>
</tr>
<tr>
<td>fcs</td>
<td>Specifies the character set code of lfn1. The value 0 indicates display code or 6/12-bit display code. 0 is also the default. No other values are allowed.</td>
</tr>
<tr>
<td>fline</td>
<td>Specifies the line number of the first line you want to copy from lfn1 if lfn1 is a sequenced file. If you do not specify this parameter or if lfn1 is not a sequenced file (no line numbers), the copying begins with the first line of lfn1.</td>
</tr>
<tr>
<td>lline</td>
<td>Specifies the line number of the last line you want to copy from lfn1 if lfn1 is a sequenced file. If you do not specify this parameter or if lfn1 is not a sequenced file (no line numbers), the copying is controlled by parameter n.</td>
</tr>
<tr>
<td>ns</td>
<td>Specifies no structure reporting. If you specify a nonnull value, the system does not display the EORs and EOFs in lfn2.</td>
</tr>
</tbody>
</table>

If EOI is encountered before the file count is satisfied, an EOF is written on lfn2, and the operation terminates. If a line is encountered that has more than lchar characters, the excess characters are truncated.

†Since many characters in 6/12-bit display code require 12 bits rather than 6, this parameter may produce unforeseen results when copying a file containing 6/12-bit display code data. Refer to Appendix A for a description of character set codes.
SCOPY writes lines with an even number of characters. If an input line has an odd character count and the last character is a blank not immediately preceded by a colon, the last character is removed. If an input line has an odd character count and the last character is not a blank or is a blank immediately preceded by a colon, an additional trailing blank is appended.

If SCOPY attempts to copy a line longer than 500, 6-bit characters, the line is truncated, and an informative message is issued to the dayfile after the copy completes.

If the last line of a record does not have an end-of-line terminator, SCOPY issues a dayfile message. If the na parameter is not specified, the job step then aborts.

Example:

```
old, filea
  READY.
list

RECORD 1
  AAA
  BBB
  CCC
RECORD 2
  DDD
  EEE
  FFF
RECORD 3
  GGG
  HHH
  III

  READY.
  scopy, filea

RECORD 1
  AAA
  BBB
  CCC
  -EOR-
RECORD 2
  DDD
  EEE
  FFF
  -EOR-
RECORD 3
  GGG
  HHH
  III
  -EOR-
  -EOF-

  READY.
```
SECHDR COMMAND

The SECHDR command adds security-related information to a file. You can choose to have this information placed on banner pages throughout the file, placed at the top and bottom of each page, or both.

Format:

SECHDR, lfn, FF, OP= p1p2p3p4.

The parameter lfn is required and must be the first parameter. The other parameters are optional and order-independent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies a file assigned to your job.</td>
</tr>
<tr>
<td>FF</td>
<td>Specifies that the file has already been formatted for printing; that is, carriage control characters (such as those controlling page ejects and page density) have already been inserted.</td>
</tr>
<tr>
<td>OP= p1p2p3p4</td>
<td>Specifies where the security information will be inserted in the file. OP=B is the default. You have the following choices:</td>
</tr>
<tr>
<td>P1</td>
<td>Description</td>
</tr>
<tr>
<td>B</td>
<td>Print the security information on two banner pages, one at the beginning of the file and one at the end of the file.</td>
</tr>
<tr>
<td>F</td>
<td>Print the security information on a banner page at the beginning and the end of every logical file within file lfn.</td>
</tr>
<tr>
<td>R</td>
<td>Print the security information on a banner page at the beginning and the end of every logical record within file lfn.</td>
</tr>
<tr>
<td>P</td>
<td>Print the access level of the file at the top and bottom of every page of output.</td>
</tr>
</tbody>
</table>

You can specify any combination of these options.
The banner pages have the following header lines:

FILE NAME = file name

DATE PRINTED = yy/mm/dd

USER NAME = user name

where the lowercase characters represent job-specific information. Following those header 
lines, the system prints the security access level of the file in large block characters.

Example:

The following command specifies that security information is to be placed both in a header 
and a footer on each page of the file and also on banner pages that are to be printed at the 
beginning and ending of each logical file within FILE213:

SECHDR,FILE213,OP=PP.

SETFAL COMMAND

The SETFAL command changes the security access level of a local file. In most cases, a 
local file receives the access level of the job that creates it. Refer to Security Features 
in section 3 for a detailed discussion of file access levels.

Format:

SETFAL,Ifn,AL=level.

The two parameters are required and are order-dependent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ifn</td>
<td>Specifies a local file. The file cannot be a direct access permanent file or a magnetic tape file.</td>
</tr>
<tr>
<td>AL=level</td>
<td>Specifies the security access level you want assigned to the file. Unless changed by your site, level can be one of the following names: LVLO, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7</td>
</tr>
</tbody>
</table>

On a secured system, the access level you specify must be valid for the job (ENQUIRE,B returns this information). In addition, to lower the access level of a file, you must be 
authorized to do so (refer to the LIMITS command).

On an unsecured system, the system does not use this access level assignment in monitoring access to the file. It does, however, become an attribute of the file.
**SETFS COMMAND**

The SETFS command sets the auto-drop or no-auto-drop status on files assigned to your job. If given the no-auto-drop status, a file is not released from your job by commands like NEW, OLD, CLEAR, RETURN(*), and UNLOAD(*).

Format:

\[
\text{SETFS}, lfn_1, lfn_2, \ldots, lfn_n/FS=fs. \\
\text{or} \\
\text{SETFS}, *, lfn_1, lfn_2, \ldots, lfn_n/FS=fs. \\
\]

Parameter Description
---
\(lfn_1\) Specifies the local file to be affected.
\(FS=fs\) Specifies either the auto-drop (FS=AD) or no-auto-drop (FS=NAD) status. The default status for user-created files is auto-drop. Certain system files (for example, ZZZZZC0, ZZZZZC1, ZZZZZC2, and ZZZZZLD) always have the no-auto-drop status.

The first format of the command gives the specified status to the files \(lfn_1\). The second format gives the specified status to all files assigned to the job, except files \(lfn_1\).

The CLEAR command never releases a file that has a no-auto-drop status, the RETURN and UNLOAD commands release such a file only if you specify it, and the NEW or OLD command releases such a file only if it has the same name as the new primary file.

**SKIPEI COMMAND**

The SKIPEI command directs the system to position the specified file at the EOI.

Format:

\[
\text{SKIPEI}, lfn. \\
\]

Parameter Description
---
\(lfn\) Specifies the name of the file to be positioned.

On magnetic tapes where no EOI is defined, the operation stops at an EOF.

The SKIPEI command has no effect on a primary file since the file is rewound before every operation.
SKIPF COMMAND

The SKIPF command directs the system to bypass, in a forward direction, the specified number of files from the current position of the named file.

Format:

SKIPF,lfn,n,m.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to be positioned.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number (decimal) of files to be skipped; if the parameter is omitted, the system assumes 1. The maximum for n is 262143.</td>
</tr>
<tr>
<td>m</td>
<td>Specifies the file mode: C for coded, B for binary. If m is omitted, the system assumes the file is in binary mode. If coded mode is set on an SI tape, the system aborts the job.</td>
</tr>
</tbody>
</table>

If an EOI is encountered before n files are bypassed, file lfn remains positioned at the EOI.

The SKIPF command has no effect on a primary file since the file is rewound before every operation.

SKIPFB COMMAND

The SKIPFB command directs the system to bypass, in the reverse direction, the specified number of files from the current position of the named file.

Format:

SKIPFB,lfn,n,m.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to be positioned.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number (decimal) of files to be skipped; if the parameter is omitted, the system assumes 1. The maximum for n is 262143.</td>
</tr>
<tr>
<td>m</td>
<td>Specifies the file mode: C for coded, B for binary. If m is omitted, the system assumes the file is in binary mode. If coded mode is set on an SI tape, the system aborts the job.</td>
</tr>
</tbody>
</table>

If the system encounters BOI (or the load point of the current volume of a multivolume tape file), SKIPF command processing ends.

The SKIPFB command has no effect on a primary file since the file is rewound before every operation.
**SKIPR COMMAND**

The SKIPR command directs the system to bypass, in a forward direction, the specified number of logical record or file marks from the current position of the named file.

Format:

```
SKIPR, lfn, n, level, m.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to be positioned.</td>
</tr>
<tr>
<td>n</td>
<td>Specifies the number (decimal) of record and file marks to be skipped; if this parameter is omitted, the system assumes 1. The maximum for n is 262143.</td>
</tr>
<tr>
<td>level</td>
<td>Specifies the level number; 0 &lt; level &lt; 17. If 0 &lt; level &lt; 16, both EOR and EOF marks are counted. If level is 17, only EOF marks are counted. The default is 0.</td>
</tr>
<tr>
<td>m</td>
<td>Specifies the file mode: C for coded, B for binary. If m is omitted, the system assumes the file is in binary mode. If coded mode is set on an SI tape, the system aborts the job.</td>
</tr>
</tbody>
</table>

Consecutive EOR or EOF marks are counted separately. If the EOI is encountered before n EOR and EOF marks are bypassed, file lfn remains positioned at the EOI.

The SKIPR command has no effect on a primary file since the file is rewound before every operation.

**SORT COMMAND**

The SORT command sorts a file of lines in numerical order based on leading line numbers consisting of a specified number of digits.

Format:

```
SORT, lfn, NC=n.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the file to be sorted. lfn may be a local file or a direct access permanent file assigned to your job.</td>
</tr>
<tr>
<td>NC=n</td>
<td>Specifies the number of leading line number digits to use in sorting the file. n ≤ 10. The default is 5.</td>
</tr>
</tbody>
</table>

In the case of duplicate line numbers, all lines other than the first are considered correction lines. All lines with the same number are deleted from the file except the last line encountered.

For input from an interactive terminal, SORT deletes a line if a line number is followed by an empty line or a line number is followed only by a blank. However, the system retains a line with more than one blank after the line number.

For input from cards, SORT deletes a line if a card containing only the line number is submitted.
If a line number contains more than n digits, you can delete the line either by entering the first n digits of the line number and pressing the carriage return (terminal input) or by submitting a card containing only the first n digits of the line number (batch input).

After the sort, lfn is packed and set at EOI.

**TCOPY COMMAND**

The TCOPY command copies X (external) format binary tapes or E (line image), B (blocked), or SI (system internal) format coded tapes to mass storage, to an I format tape, or to an SI binary format tape. It also writes E or B format tapes converted from files on mass storage, I format tape, or SI format binary tape. The X binary and E, B, and SI coded tape formats were supported under earlier versions of NOS. Refer to appendix I for the tape formats of B, E, and X format coded tapes. Now, to access data or write data in one of these formats, the tape must be assigned as an S (stranger) format tape (refer to the tape assignment commands in section 12) and the file copied using the TCOPY command.

**Order-dependent format:**

TCOPY, lfn1, lfn2, format, tc, copycnt, charcnt, erlimit, pip2, lfn3, ns.

**Order-independent format:**

TCOPY, I=lfn1, O=lfn2, F=format, TC=tc, N=copycnt, CC=charcnt, EL=erlimit, PO=pip2, L=lfn3, NS=ns.

The parameters on the TCOPY command can appear in order-dependent format, order-independent format, or a combination of both.

If order-dependent and order-independent parameters are mixed in one TCOPY command, the order-dependent parameters must appear in their proper position. All parameters are optional. However, the specification of certain parameters precludes the application of others. A nonapplicable parameter may be ignored or may generate an error. This is stated in the individual descriptions of the parameters.

The parameters are defined as follows:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>I=lfn1</td>
<td>Specifies the file to copy.</td>
<td>INPUT</td>
</tr>
<tr>
<td>O=lfn2</td>
<td>Specifies the file to receive the copy.</td>
<td>OUTPUT</td>
</tr>
<tr>
<td>F=format</td>
<td>Data format that specifies the type of conversion for the copying operation. This can be any one of the following.</td>
<td>X</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>format</th>
<th>Conversion</th>
</tr>
</thead>
<tbody>
<tr>
<td>E</td>
<td>Copy an E format tape to mass storage, an I, or an SI binary tape file, or generate a new E format tape from mass storage, an I, or an SI binary tape file. The E tape must be unlabeled and assigned as S format.</td>
</tr>
</tbody>
</table>
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>format</strong></td>
<td><strong>Conversion</strong></td>
<td></td>
</tr>
<tr>
<td>B</td>
<td>Copy a B format tape to mass storage, an I, or an SI binary tape file, or generate a new B tape from mass storage, an I, or an SI binary tape file. The B tape must be unlabeled and assigned as S format.</td>
<td></td>
</tr>
<tr>
<td>X</td>
<td>Copy an X format tape to mass storage, an I, or an SI binary tape file. The unlabeled input tape must be assigned an S format, with noise size of eight frames for seven-track tape or six frames for nine-track tape (refer to NS parameter on tape assignment command).</td>
<td></td>
</tr>
<tr>
<td>SI</td>
<td>Copy an SI coded format tape to mass storage, an I, or an SI binary tape file. The labeled or unlabeled input tape must be assigned as S format, with noise size of eight frames for seven-track tape or six frames for nine-track tape (refer to NS parameter on tape assignment command). If the SI coded input tape is completed before EOI is encountered; the position of the input tape after the copying is indeterminate. This is because control words are used on the SI coded tape read via S format (EOF on an SI coded tape is a level 17g block terminator, whereas EOF on an S tape is a tape mark).</td>
<td></td>
</tr>
<tr>
<td>TC=tc</td>
<td>Specifies the termination condition for copying used in conjunction with N=copycnt. The termination condition can be specified as follows:</td>
<td>Copy to double EOF (TC=Dor TC=EOD)</td>
</tr>
<tr>
<td></td>
<td>F or EOF</td>
<td>When this TC=tc value is set, the N keyword specifies the number of files to copy.</td>
</tr>
<tr>
<td></td>
<td>I or EOI</td>
<td>This specifies copying to the end of information. The N keyword is ignored.</td>
</tr>
<tr>
<td></td>
<td>D or EOD</td>
<td>When this TC=tc value is set, the N keyword is the number of double EOFs to which to copy.</td>
</tr>
<tr>
<td>N=copycnt</td>
<td>Specifies the copy count used by the termination condition parameter TC=tc.</td>
<td>1</td>
</tr>
</tbody>
</table>
### Parameter Description Default

**CC=charcnt**
Specifies the character count which determines maximum block size (line length) in characters for an E or B format tape. This parameter can only be specified for copying an E or B format tape.

136 characters for E format; 150 characters for B format.

**EL=erlimit**
Specifies the error limit, which sets the number of nonfatal errors allowed before abort. An EL=U specification allows an unlimited number of errors before an abort. This includes parity errors and block-too-large errors which are returned by the tape subsystem after completing recovery procedures. It also includes invalid block format errors (invalid byte-count coded format and/or unused bitcount) for X format and SI coded format tapes. Error limit is ignored when generating an E or B format tape from mass storage, an I format, and an SI binary format file since control word read is not used. Error limit is likewise ignored if the input file device does not support control word read (terminals). In that case, any error aborts the job.

Zero

**PO=p1p2**
Specifies one or both of the following processing options (not separated by commas).

- **E** Input blocks with parity errors or block-too-large errors are processed (copied).
- **T** When generating a B or E format tape, blocks exceeding the maximum block size (refer to the CC=charcnt parameter) are truncated. PO=T is not allowed for other file conversions.

Error blocks are skipped.

Lines exceeding the maximum line size are split into multiple blocks.

**L=lfn3**
Specifies the name of an alternate output file to receive parity error messages when extended error processing is in effect (nonzero EL specified), in which case, the file name lfn3 must not be the same as lfn2.

OUTPUT

**NS=ns**
Noise size. Any input block containing fewer than ns characters is considered to be noise and is discarded. This parameter is valid only for E format to B format conversions. The maximum value that can be specified for ns is 41. If NS=0 is specified, the default value of 18 is used.

Example:
The following TCOPY command combines order-dependent and order-independent parameters:

`TCOPY,TAPE1,FILE2,E,CC=200,EL=12.`
The input file TAPE1 is an E-format tape (assigned as an S-format tape). It has a maximum of 200 characters per line. The copying terminates when a double EOF is encountered (default). The output file FILE2 can be a mass storage file or an I or SI binary format tape. The error limit allows up to 12 nonfatal errors (parity/block-too-large), and the bad data is skipped (default) with informative error messages written to the file OUTPUT (default).

The TCOPY command begins a copying operation at the current position of both files and continues until the copy termination condition for copying is met or EOI is encountered. This termination condition can be a file count, double EOF count, or EOI. If the copying is terminated by a double EOF (for TC=EOD parameter), the second EOF is detected on lfn1 but is not transferred to lfn2. If lfn1=lfn2, the named file is read until the termination condition is satisfied or EOI is encountered. An SI coded tape can be positioned correctly only to EOI (refer to the F=SI parameter description).

If you specify a file count TC=EOF, and EOI is encountered on the input file before the file count is satisfied, an additional EOF is written on the output file only if data or records have been transferred since the previous EOF was written (or since the beginning of the copying, if no EOFs have been encountered).

The EL=erlimit or P0=E parameters provide extended error processing. This allows the processing or skipping of blocks with parity errors or block-too-large errors. The block count for the first block to be copied is initially set to zero and is incremented by one for every block and every EOF processed.

When creating a B-format tape from a mass storage, I, or SI binary format file, a block shorter than the noise size specified on the tape assignment statement is blank filled to the noise size. A noise block could also be generated when a block exceeding the maximum block size for the B-format tape is split into multiple blocks. If the P0=T parameter is specified, blocks exceeding the maximum block size are truncated.

When creating an E-format tape from a mass storage, I, or SI binary format file, blocks that exceed the maximum block size for the E-format tape are split into multiple blocks. If a continuation block contains only the end-of-line indicator (zero word), the continuation block is discarded. If the P0=T parameter is specified, blocks exceeding the maximum block size are truncated (all continuation blocks are discarded).

**TDUMP COMMAND**

The TDUMP command lists a file in hexadecimal, octal, or alphanumeric format. It dumps the entire file or the specified number of lines, records, or files. If more than one limit is set, the limit reached first overrides the others. If you are in ASCII mode (refer to the ASCII command in section 8) and the output file is assigned to your terminal, TDUMP interprets input and displays alphanumeric output as 6/12-bit display code.

**NOTE**

TDUMP produces unpredictable results when dumping an S-, L-, or F-format tape file. Use the COPY command to convert the S-, L-, or F-format tape file to a mass storage file or to an I or SI binary format tape file before attempting to dump the file using TDUMP.
Format:

\[
\text{TDUMP}, P_1, P_2, \ldots, P_n
\]

<table>
<thead>
<tr>
<th>Pi</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I=lfn_1</td>
<td>Specifies the local file to be dumped (default is TAPE1).</td>
</tr>
<tr>
<td>L=lfn_2</td>
<td>Specifies the local file to which the output is written (default is OUTPUT). If lfn_2 is not a local file, TDUMP creates it. It does not rewind lfn_2 before or after the dump.</td>
</tr>
<tr>
<td>H</td>
<td>Specifies a hexadecimal dump only.</td>
</tr>
<tr>
<td>O</td>
<td>Specifies an octal dump only.</td>
</tr>
<tr>
<td>A</td>
<td>Specifies an alphanumeric dump only.</td>
</tr>
</tbody>
</table>

If more than one of the H, O, or A parameters are specified, the last one overrides. If no H, O, or A parameter is specified, TDUMP lists a combined octal and alphanumeric dump.

| R=rcount | Specifies the maximum decimal number of records to be dumped. If R is omitted or set to zero, the dump continues to EOI. |

**NOTE**

The record count restarts at each EOF.

| F=fcount | Specifies the maximum decimal number of files to be dumped. If F is omitted, the dump continues to EOI. If F=0, the dump continues until an empty file (double EOF) or EOI is encountered. |
| N=lines | Specifies the maximum decimal number of lines to be dumped. If N is omitted or set to zero, the dump continues to EOI. The blank line output with the end-of-record, end-of-file, end-of-information, and ABOVE LINE REPEATED messages is included in the line count. |
| NR | Do not rewind file lfn_1 before the dump (default is to rewind lfn_1). |
| CW | Specifies that control words as well as data are to be dumped. If CW is omitted, control words are not dumped. |

Example:

Two lines, each containing the alphabet, were input to file X from an interactive terminal. File X was dumped to file Y producing the following output.

```
FILE DUMP -  TDUMP, INX, LNY, . yy/mm/dd., hh.mm.ss., PAGE 1.
F 1 R 1 W 0 0102 0304 0506 0710 1112 1314 1516 1720 2122 2324 2526 2730 3132 0000 0000 0102 0304 0506 0710 1112
ABCD EFGHIJKLMNOPQRSTUVWXYZ
F 1 R 1 W 4 1314 1516 1720 2122 2324 2526 2730 3132 0000 0000
KL MNOPQRSTUVWXYZ
-- END OF RECORD --
-- END OF INFORMATION --
-- END OF DUMP --
```
File X was then dumped to file Y using the CW parameter, producing the following output.

Note that when the CW parameter is used, EOR and EOF markers are dumped along with the data with no marked separation.

```
- FILE DUMP - TDUMP, I=X, L=Y, CW.
yy/mm/dd. hh.mm.ss. PAGE 1.
F 1 R 1 W 0- 0000 0100 0000 0036 0102 0304 0506 0710 1112 1314 1516 1720 2122

A B C D E F G H I J K L M N O P Q R S T U V W X Y
H
-- END OF INFORMATION --
-- END OF DUMP --
```

The prefix

```
F 1 R 1 W 0
```

means file 1, record 1, word 0. The zeros following each alphabet are the end-of-line indicators.

**UNLOAD COMMAND**

The UNLOAD command releases files assigned to the job and may release file space (depending on the file type).

Format:

```
UNLOAD, Ifn1, Ifn2, ..., Ifnn.
```

or

```
UNLOAD, *, Ifn1, Ifn2, ..., Ifnn.
```

**Parameter** | **Description**
---|---
Ifn1 | Specifies the name of a file assigned to your job.

The first format unloads the named files (Ifn1, Ifn2, ..., Ifnn). The second format unloads all files assigned to the job except the named files. If no files are named on the second format, the asterisk specification unloads all files assigned to the job. There are some exceptions. The UNLOAD command does not release any files that have checkpoint or no-auto-drop status. Certain system scratch files (for example, ZZZZZCO, ZZZZZC1, ZZZZZC2, and ZZZZZLD) have no-auto-drop status. You can give any local file this status by using the SETFS command.
The UNLOAD command performs the same function as the RETURN command except as noted below. Refer to the description of the RETURN command given earlier in this section to determine the operation performed for each file type.

If the file being unloaded is a magnetic tape file or a direct access file residing on an auxiliary removable pack and the job requires more than one tape or pack concurrently, the UNLOAD command differs from the RETURN command. It does not decrease the number of tapes or packs that were scheduled for the job with the RESOURC command. If the file is a magnetic tape file and if the previous operation was a write, the following operations are performed:

- If the tape is ANSI labeled, the system writes a tape mark, an EOFl label, and three tape marks and then unloads the tape.
- If the tape is unlabeled and the data format specified on the ASSIGN, LABEL, or REQUEST command is S, L, or F, the system writes four tape marks and then unloads the tape.
- If the tape is unlabeled and the data format is I or SI, the system writes a tape mark, an EOFl label, and three tape marks and then unloads the tape.

Refer to Magnetic Tape Files in section 2 and Tape Management commands in section 12 for further information about tape files, and to appendix G for a description of an EOFl label.
UNLOCK COMMAND

The UNLOCK command rescinds the LOCK command and clears the write interlock for the specified file. This command can only be used on local mass storage files.

Format:

\[ \text{UNLOCK,lfn}_1,\text{lfn}_2,\ldots,\text{lfn}_n. \]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn_1</td>
<td>Specifies the name of a local file.</td>
</tr>
</tbody>
</table>

Library files cannot be unlocked.

VERIFY COMMAND

The VERIFY command performs a binary comparison of all data from the current position of the files specified. The comparison is meaningful if the files are within the range of compatible formats listed in table 9-3. For output listing files not connected to your terminal, the VERIFY command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

\[ \text{VERIFY, lfn}_1,\text{lfn}_2,p_1,p_2,\ldots,p_n. \]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn_1</td>
<td>Specifies the name of the first file; if this parameter is omitted, TAPE1 is assumed.</td>
</tr>
<tr>
<td>lfn_2</td>
<td>Specifies the name of the second file; if this parameter is omitted, TAPE2 is assumed.</td>
</tr>
</tbody>
</table>

\[ p_i \]  

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the case of multifile files, specifies the number of files to verify. The default is N=1.</td>
</tr>
</tbody>
</table>

If you specify just the keyword N, verification proceeds until the end of information is reached on both files.

If you specify N=0, verification terminates whenever an empty file is encountered on either file.

\[ E=y \]  

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the maximum number of errors to list. The default is E=100. Specifying E has the same effect as E=0.</td>
</tr>
</tbody>
</table>

\[ L=\text{lfn}_3 \]  

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List errors on file lfn_3. If L is omitted, the system assumes L=OUTPUT.</td>
</tr>
</tbody>
</table>
**P1**

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
</tr>
<tr>
<td>R</td>
</tr>
<tr>
<td>C</td>
</tr>
<tr>
<td>C1</td>
</tr>
<tr>
<td>C2</td>
</tr>
<tr>
<td>BS=bsize</td>
</tr>
</tbody>
</table>

Whenever words on $lfn_1$ and $lfn_2$ do not match, the VERIFY command lists the following.

- Record number.
- Word number within the record.
- Words from both files that do not match.

**NOTE**

When printing output for text files, VERIFY uses the first seven characters of the first word of the record as the record name. VERIFY assumes that the record is in 6-bit display code. Therefore, if you attempt to display VERIFY output for a record in 6/12-bit display code while your terminal is in ASCII mode, the output display may be garbled. To avoid this problem, you should set your terminal to NORMAL mode before listing VERIFY output.

In a verification involving S, L, or F format tapes, the VERIFY command first clears the extraneous data in the last word of each block (as specified by the byte count and the unused bit count) and then makes the comparison. On these formats, every block is considered a record (returns EOR status).

If a verification of an L or F format tape requires additional field length, the VERIFY command increases the field length as needed.

The maximum block size for an L format tape is specified by the BS=bsize or its default. The maximum block size for an F format tape is calculated from the frame or character count specified on the command when the file is assigned.
### Table 9-3. Compatible File Structures for the VERIFY Command

<table>
<thead>
<tr>
<th>FIRST FILE (lfn₁)</th>
<th>Tape Formats</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mass Storage</td>
<td>I</td>
</tr>
<tr>
<td>Mass Storage</td>
<td></td>
</tr>
<tr>
<td>I</td>
<td>Yes</td>
</tr>
<tr>
<td>SI</td>
<td>Yes</td>
</tr>
<tr>
<td>S</td>
<td>No</td>
</tr>
<tr>
<td>L</td>
<td>No</td>
</tr>
<tr>
<td>F</td>
<td>No</td>
</tr>
</tbody>
</table>

**NOTE**

The No entries indicate that the logical structures of the files compared are incompatible. The VERIFY command may accept those combinations, but the results require you to make a knowledgeable correlation of results with the format descriptions in section 12. In some cases, the verification of an incompatible pair may result in a VERIFY GOOD message; otherwise, a VERIFY ERRORS message is listed.
WRITEF COMMAND

The WRITEF command directs the system to write a specified number of file marks on the named file.

Format:

WRITEF,lfn,x.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to be written on.</td>
</tr>
<tr>
<td>x</td>
<td>Specifies the number of file marks to be written. If this parameter is omitted, the system assumes x is 1. The maximum for x is 262143.</td>
</tr>
</tbody>
</table>

If the last operation to the file was a write that did not end with the writing of an EOR or EOF, WRITEF writes a record mark before it writes the specified number of file marks. For all other cases, WRITEF writes the file marks without a preceding record mark.

WRITER COMMAND

The WRITER command directs the system to write a specified number of empty records on the named file.

Format:

WRITER,lfn,x.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the name of the file to receive the empty records.</td>
</tr>
<tr>
<td>x</td>
<td>Specifies the number of empty records to be written. If this parameter is omitted, the system assumes x is 1. The maximum for x is 262143.</td>
</tr>
</tbody>
</table>
With permanent file commands, you can create, access, and purge permanent files. You can also control other users’ access to your files.

The following are the permanent file commands and their functions.

<table>
<thead>
<tr>
<th>Command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPEND</td>
<td>Appends data to an indirect access permanent file.</td>
</tr>
<tr>
<td>ATTACH</td>
<td>Assigns a direct access permanent file to a job.</td>
</tr>
<tr>
<td>CATLIST</td>
<td>Lists permanent file information.</td>
</tr>
<tr>
<td>CHANGE</td>
<td>Changes permanent file characteristics.</td>
</tr>
<tr>
<td>COMMON</td>
<td>Accesses library type files.</td>
</tr>
<tr>
<td>DEFINE</td>
<td>Creates a direct access permanent file.</td>
</tr>
<tr>
<td>DROPDS</td>
<td>Releases the disk space associated with a permanent file for which a valid alternate storage copy exists. The local file copy (if any) is also returned.</td>
</tr>
<tr>
<td>FTP</td>
<td>Provides file transfer capabilities between connected TCP/IP hosts.</td>
</tr>
<tr>
<td>GET</td>
<td>Retrieves a copy of an indirect access permanent file as a local file.</td>
</tr>
<tr>
<td>MFLINK</td>
<td>Transfers a file from one mainframe to another or alters the attributes of a file on another mainframe.</td>
</tr>
<tr>
<td>OLD</td>
<td>Retrieves a copy of an indirect access permanent file as the primary file.</td>
</tr>
<tr>
<td>PACKNAM</td>
<td>Specifies an auxiliary device from which permanent files are to be accessed.</td>
</tr>
<tr>
<td>PERMIT</td>
<td>Grants permanent file access permission to other users.</td>
</tr>
<tr>
<td>PURGALL</td>
<td>Purges all files having the specified characteristics.</td>
</tr>
<tr>
<td>PURGE</td>
<td>Purges the named files.</td>
</tr>
<tr>
<td>RECLAIM</td>
<td>Creates and manages tape and disk backup copies of permanent files.</td>

<tr>
<td>REPLACE</td>
<td>Copies a local file over an indirect access permanent file.</td>
</tr>
<tr>
<td>SAVE</td>
<td>Creates an indirect access permanent file.</td>
</tr>
<tr>
<td>SETPFAC</td>
<td>Changes the security access category set of a permanent file.</td>
</tr>
<tr>
<td>SETPFAL</td>
<td>Changes the security access level of a permanent file.</td>
</tr>
</tbody>
</table>
If an error occurs in an operation on one file of a multifile request, the operation is not performed on the subsequent files. For example, if an error occurs in the processing of file B on the following command:

GET,A,B,C,D.

files C and D are not processed.

On a secured system, your job may not access a permanent file unless the job is validated for the access level and access category set assigned to the file. For an alternate user access, such an access attempt is treated as a file-not-found error; for an access to one of your own files, it is treated as a security conflict.

In addition, your job may not change or access certain types of permanent file information. The following limitations apply:

- CHANGE, PERMIT, and SETPFAC requests are not allowed on files with an access level lower than that of the job.
- CATLIST requests for permit information are not allowed on files with an access level higher than that of the job. Normal CATLIST requests are allowed, but information on the password expiration date and access category set is not included in the CATLIST output. If a password exists, it is returned as seven asterisks (******).

For more information on permanent files, refer to Permanent Files, Mass Storage File Residence, and Alternate Storage in section 2.

To determine the meaning of a permanent file error message, refer to appendix B.

COMMON PARAMETERS

Some permanent file commands can process several files. Each file is identified by a one- to seven-character file name. The permanent file operation is performed on each file in the sequence specified on the command. If the NA parameter is not specified on the command and an error occurs while one of the files is being processed, the job step terminates.

When this happens, the files preceding the file in error are processed, but the files succeeding it are not. If the NA parameter is specified on the command, the job step does not terminate as a result of the error, and all files are processed except the file in error.

When a slash is used, it separates the file names from other parameters. The parameters specified after the slash are optional and order independent. Parameters specified after the slash affect all files named before the slash.

Permanent file access is controlled by the permit category (CT), user name (UN), file access password (PW), security access level (AL), and access mode (M) parameters. Permanent file residence is determined by the preferred residence (PR), auxiliary device (PN), and device type (R) parameters. Processing options include the no abort (NA), wait-if-busy (WB), subsystem selection (SS), and backup copy (BR) parameters.
In the following list, parameters common to more than one permanent file command are described in alphabetic order. For the format of each command, refer to the command descriptions following the parameter descriptions.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AL=level</td>
<td>Specifies the security access level you want assigned to the file. Unless changed by your site, level can be one of the following names: LVL0, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7. When used with the DEFINE command, the default for this parameter is the current job access level. When used with the SAVE command, the default is the access level of the local file being saved.</td>
</tr>
<tr>
<td>BR=br</td>
<td>Specifies the backup copy requirement. You can request that two backup copies, one backup copy, or no backup copy be kept of your permanent file. Depending on your site's configuration and procedures, a backup copy can be one of the following: • A cartridge alternate storage (MSE) copy. • A tape alternate storage copy. • A tape alternate storage secondary copy. • A PFDUMP tape copy. The following values can be specified for br:</td>
</tr>
<tr>
<td></td>
<td>Backup Requirement</td>
</tr>
<tr>
<td>br</td>
<td></td>
</tr>
<tr>
<td>Y</td>
<td>Two backup copies of the file must be kept.</td>
</tr>
<tr>
<td>MD</td>
<td>One backup copy of the file must be kept.</td>
</tr>
<tr>
<td>N</td>
<td>No backup copy of the file need be kept.</td>
</tr>
</tbody>
</table>

If BR=br is omitted, BR=Y is used by default. For more information, refer to Alternate Storage in section 2.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CT=ct</td>
<td>Specifies the file permit category. If CT=ct is omitted when the file is created, the file is private. The file category can be changed later.</td>
</tr>
</tbody>
</table>

### CT=ct

#### ct Category

- **P, PR, or PRIVATE**
  
  Private files; available for access only by their creator and by those granted explicit access permission by the file creator (refer to the PERMIT command).

  For each permitted user, the system records the number of accesses made and the date and time of the last access by each user. This information may be displayed with the CATLIST(LO=FP) command.

  The system also records the total number of accesses by all users, the date and time of the last access by any user, and the date and time of the last modification by any user. This information may be displayed with the CATLIST(LO=F) command.

- **S or SPRIV**

  Semiprivate files; available for access by any user who knows the file name, user name, and password. The file owner specifies the default permitted mode of access for all users. The file owner may also specify different permissions for different users with the PERMIT command.

  For each user who accesses the file, the system records the user name, the number of accesses made, and the date and time of the last access. This information may be displayed with the CATLIST(LO=FP) command.

  The system also records the total number of accesses by all users, the date and time of the last access by any user, and the date and time of the last modification by any user. This information may be displayed with the CATLIST(LO=F) command.
**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>PU or PUBLIC</td>
</tr>
</tbody>
</table>

Public files; available for access by all users who know the file name, user name, and password. The file owner specifies the default permitted mode of access for all users. The file owner may also specify different permissions for different users with the PERMIT command.

For each explicitly permitted user, the system records the number of accesses made and the date and time of the last access. This information may be displayed with the CATLIST(LO=FP) command.

The system also records the total number of accesses by all users, the date and time of the last access by any user, and the date and time of the last modification by any user. This information may be displayed with the CATLIST(LO=F) command.

**NA**

Specifies the no abort option. Normally, an error in command processing terminates the job. However, if NA is specified, the job does not terminate as a result of the error. The error is handled in one of two ways.

- If the error condition is temporary, job processing is suspended until the error condition ends (for example, when a requested direct access file is busy or a requested auxiliary device is not available). In a multitransfer environment, job processing may be suspended until some period after the error condition ends.

- If the error condition is not temporary, the job continues with the next operation. The job processes the next file listed on the command or, if no more files are listed, processes the next command.

You may not specify both the NA and WB parameters.
Parameter | Description
---|---
PN=packname | Specifies the 1- to 7-character pack name used in conjunction with the R parameter to identify the auxiliary device to be accessed in the permanent file request. This parameter is specified only when the file to be accessed resides on an auxiliary device.

An auxiliary device is a mass storage device that supplements the normal family of permanent file devices. A RESOURC command must be included in any job that concurrently uses two or more auxiliary disk packs or an auxiliary pack and a magnetic tape.

If you specify PN=0 on a permanent file command, it overrides any previously issued PACKNAM commands. You can then access files on the permanent file family device. PN=0 does not affect subsequent commands, only the current command.

PR=pr | Specifies the preferred residence. If PR=pr is omitted, no preference is assumed. For more information, refer to Alternate Storage in section 2.

<table>
<thead>
<tr>
<th>pr</th>
<th>Preference</th>
</tr>
</thead>
<tbody>
<tr>
<td>D</td>
<td>You prefer that the file remain on disk between accesses. However, the system might move the file to alternate storage despite the specified preferred reference.</td>
</tr>
<tr>
<td>L</td>
<td>The file is locked to disk and will not be moved to alternate storage. Special validation is required to specify this value.</td>
</tr>
<tr>
<td>M</td>
<td>You prefer that the file be moved to alternate storage between accesses. However, the system might not move the file to alternate storage despite the specified preference.</td>
</tr>
<tr>
<td>N</td>
<td>You have no preference.</td>
</tr>
<tr>
<td>T</td>
<td>You prefer that the file be moved to tape alternate storage between accesses. However, the system might not move the file to tape alternate storage despite the specified preference.</td>
</tr>
</tbody>
</table>

PW=password | Specifies the 1- to 7-character file password. If a password is assigned to the file, users other than the file creator must specify the password when accessing the file.

If only the keyword PW is specified, you must include the password as a single-line record in the input file. In an interactive job, the password is requested by a ? prompt at the terminal.
Parameter Description

R=r Specifies the device type on which the file resides or is to reside.

<table>
<thead>
<tr>

<td>844-21 Disk Storage Subsystem (l&lt;i&lt;8; full-track).</td>
</tr>
<tr>
<td>DLi</td>
<td>844-41 or 844-44 Disk Storage Subsystem (l&lt;i&lt;8; full-track).</td>
</tr>
<tr>
<td>DMI</td>
<td>885-11/12 Disk Storage Subsystem (l&lt;i&lt;3; half-track).</td>
</tr>
<tr>
<td>DN</td>
<td>9853 Disk Storage Subsystem (full-track; 2K sector).</td>
</tr>
<tr>
<td>DQi</td>
<td>885-11/12 Disk Storage Subsystem (l&lt;i&lt;3; full-track).</td>
</tr>
<tr>
<td>DPT†</td>
<td>Distributive data path to extended memory.</td>
</tr>
<tr>
<td>DV</td>
<td>819 Disk Storage Subsystem (single-density).</td>
</tr>
<tr>
<td>DW</td>
<td>819 Disk Storage Subsystem (double-density).</td>
</tr>
</tbody>
</table>

The value i denotes the number of units (spindles) required for a particular auxiliary disk file that you will access in your job.

The R parameter can be specified on any permanent file command to identify (along with the PN parameter or with a previous PACKNAM command) the auxiliary device on which the permanent file resides. R is specified only if the installation defines the auxiliary device as removable, and if the desired device type differs from the installation-defined default device type. R is not required if a previous PACKNAM command specified the R parameter. If the R parameter is specified without the PN parameter in a command, R is ignored on all commands except the DEFINE command (refer to the DEFINE command in this section).

†The job must be of system origin or you must have system origin privileges.
Parameter Description

SS=subsystem Specifies the interactive subsystem to be associated with the file. The subsystem can be specified on a SAVE or CHANGE command with one of the following entries or its abbreviation (the abbreviation is the first three characters of the entry).

<table>
<thead>
<tr>
<th>subsystem</th>
<th>Interactive Subsystem</th>
</tr>
</thead>
<tbody>
<tr>
<td>BASIC</td>
<td>BASIC</td>
</tr>
<tr>
<td>BATCH</td>
<td>Batch</td>
</tr>
<tr>
<td>EXECUTE</td>
<td>Execute</td>
</tr>
<tr>
<td>FORTRAN</td>
<td>FORTRAN 5</td>
</tr>
<tr>
<td>FTNTS</td>
<td>FORTRAN Extended 4</td>
</tr>
<tr>
<td>NULL</td>
<td>Null</td>
</tr>
</tbody>
</table>

If the SS keyword is specified without a subsystem, the currently active subsystem is associated with the file. If the SS keyword is omitted, no subsystem (null) is associated with the file, unless the file is the primary file. In that case, the currently active subsystem is associated with the file.

UN=username Specifies the user name. This parameter must be specified if the requested permanent file is in another user’s catalog. To access the file, you must have one of the following permissions.

- Explicit permission. The owner of the file granted access permission to the user with a PERMIT command.
- Implicit permission. The file is semiprivate or public and so can be accessed by users who know the file name, user name, and password and who have not been explicitly denied permission.
- Automatic permission. You have automatic permission to access files in the catalog of another user if your user name contains asterisks, and if all nonasterisk characters match characters in the other user’s user name.

The UN keyword establishes alternate access validation, unless the specified user name is the one under which the job is currently being run. In this case, the specified user name is ignored.
**Parameter** | **Description**
--- | ---
**WB** | Specifies the wait-if-busy option. WB causes the job to wait for busy files and the mounting of disk packs but to abort on other error conditions. You may not specify both the NA and WB parameters.

**XD=expiredate** | Specifies the expiration date for a file password or file permit. The value expiredate must be a six-digit string of the form yymmdd; where yy, mm, dd are two-digit year, month, and day designators, respectively. The latest date you can specify and the default expiration date are site-determined.

You must have special authorization to specify an expiration date for a file password or permit (refer to the LIMITS command).

**XT=expireterm** | Specifies the life of a file password or permit in days. If you specify 0, the file password or permit expires immediately. If you specify 4095 or *, the file password or permit does not expire. The default expiration term and the maximum expiration term are site-determined (no site can choose a value greater than 4095, however).

You must have special authorization to specify an expiration term for a file password or permit (refer to the LIMITS command).
APPEND COMMAND

The APPEND command adds information to the end of an existing indirect access file without retrieving the file. The APPEND command cannot append data to direct access files.

Format:

APPEND,pfn,lfn1,lfn2,...,lfn /UN=username, PW=password, PN=packname, R=r, NA, WB.

Parameter Description

pfn Specifies the name of the indirect access permanent file to which data is appended. You do not retrieve the indirect access file before the append operation, but you must have permission to access the file in append, modify, or write mode.

If a local copy of the indirect access file is assigned to the job, the append operation does not change the local copy.

lfn1 Specifies the name of a local mass storage file to be appended to pfn. The file must be assigned to the job.

The full descriptions of the following optional parameters are given at the beginning of this section.

Parameter Description

UN=username Specifies the user name. Specified if pfn is in another user’s catalog.

PW=password Specifies the file password. Specified if UN=username is specified and pfn has a password.

PN=packname Specifies the auxiliary device name. Specified if pfn resides on an auxiliary device.

R=r Specifies the device type. Specified if a removable auxiliary device on a device type other than the installation-defined default is to be used.

NA Specifies the no abort option. If NA is specified, processing errors do not terminate the job.

WB Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.

The logical structure of the files is retained; that is, EORs and EOFs are appended as well as data. The append operation removes the EOI mark at the end of file pfn, but keeps all EOR and EOF marks.
ATTACH COMMAND

The ATTACH command assigns a direct access permanent file to a job.

Format:

ATTACH, lfn_1=pfn_1, lfn_2=pfn_2, ..., lfn_n=pfn_n /M=m, UN=username, PW=password, PN=packname, R=r, NA, RT, WB.

Parameter | Description
---|---
lfn_1=pfn_1 | Specifies that the one- to seven-character file name lfn_1 references direct access file pfn_1 while the file is assigned to the job. If lfn_1 is omitted, the direct access file is referenced by its permanent file name, pfn_1. User access is directly to the permanent file; no working copy is generated.

If a local file name lfn_1 exists when this command is processed, it is discarded (even if command processing does not complete due to an error).

The full descriptions of the following optional parameters (except M=m and RT) are given at the beginning of this section.

Parameter | Description
---|---
M=m | File access mode requested. If M=m is omitted, M=READ is assumed.

If m is:
- E or EXECUTE (execute mode)
- R or READ (read mode)
- RU or READUP (read update mode)
- RA or READAP (read append mode)
- RM or READMD (read modify mode)

You can:
- Concurrently, other users can:
- Execute the file.
- Read or execute the file.
- Read or execute the file.
- Read or execute the file; one user can rewrite the file.
- Read or execute the file; one user can lengthen the file.
- Read or execute the file; one user can lengthen or rewrite the file.

† Special care should be taken when using modes RM, RA, or RU. Some programs do not anticipate that one user may be updating a file while other users are reading the same file. Specifically, CRM/AAM (refer to the CYBER Record Manager Advanced Access Methods Reference Manual) is not designed to handle concurrent reading and updating. If a program using CRM/AAM attempts to access a file attached in RM, RA, or RU mode while a second program using CRM/AAM is accessing the file in M, A, or U mode, one or both programs may be aborted with an error message stating that the file was ruined. In fact, the file may still be intact, but CRM cannot guarantee this and does not allow the access.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If m is:</td>
<td>You can: Concurrently, other users can:</td>
</tr>
<tr>
<td>U or UPDATE (update mode)</td>
<td>Read, execute, or rewrite the file.</td>
</tr>
<tr>
<td>A or APPEND (append mode)</td>
<td>Read, execute, or rewrite the file.</td>
</tr>
<tr>
<td>M or MODIFY (modify mode)</td>
<td>Read, execute, lengthen, or rewrite the file.†</td>
</tr>
<tr>
<td>W or WRITE (write mode)</td>
<td>Read, execute, lengthen, rewrite, or shorten the file.</td>
</tr>
<tr>
<td>UN=username</td>
<td>Specifies the user name. Specified if the permanent file(s) is in another user's catalog.</td>
</tr>
<tr>
<td>PW=password</td>
<td>Specifies the file password. Specified if UN=username is specified, and if the permanent file has a password.</td>
</tr>
<tr>
<td>PM=-packname</td>
<td>Specifies the auxiliary device name. Specified if the permanent file(s) resides on an auxiliary device.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type. Specified if a removable auxiliary device on a device type other than the installation-defined default is used.</td>
</tr>
<tr>
<td>NA</td>
<td>Specifies the no abort option. If NA is specified, processing errors do not terminate the job; the job also waits for the mounting of disk packs and busy files.</td>
</tr>
<tr>
<td>RT</td>
<td>Specifies the real-time processing option. If RT is specified, the job continues processing after requesting staging of a file from alternate storage to disk. If staging is not required (the file is already resident on disk), the file is assigned to the job. If the file must be staged, you must issue a second ATTACH command to assign the file to the job. If RT is omitted and the file resides only on alternate storage, job processing is suspended while the file is staged to disk and assigned to the job. For more information on alternate storage, refer to Alternate Storage in section 2.</td>
</tr>
</tbody>
</table>

†You cannot rewrite the file using the copying commands described in section 9. To rewrite the file while in modify or update mode, you must write your own program using the REWRITE macro (refer to Volume 4, Program Interface).
WB specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs and busy files.

If an auxiliary device has been previously specified by a PACKNAM command, the system attempts to find pfri on the auxiliary device rather than on a family device.

In the first column of table 10-1 is the access mode in which the first user attached a direct access file. The remaining columns are the access modes that may be requested by another user. At the intersection of the row and column is the access mode granted to the other user (assuming the user has the appropriate access permission). Busy means that the other user is sent a message that the file is busy and the job step is aborted unless NA or WB is specified.

Assuming that no user has the file attached in append, update, modify, or write mode, 16380 users can attach the file concurrently (4095 in read mode, 4095 in read append mode, 4095 in read update mode, and 4095 in read modify mode). If a user has the file attached in append mode, 8190 other users can attach the file (4095 in read append mode and 4095 in read modify mode). If a user attaches the file in update mode, 8190 other users can attach the file (4095 in read update mode and 4095 in read modify mode). If a user has the file attached in modify mode, 4095 other users can attach it in read modify mode. If a user has the file attached in write mode, no other user can attach the file.

CATLIST COMMAND

The CATLIST command lists information about your permanent files or the permanent files you can access in the catalogs of other users. For interactive terminals operating in screen mode, the system automatically reformats CATLIST output according to the page length set for your terminal.

Format:

    CATLIST,DN=dn,EF=ef,FN=fn, L=lfn,LO=option,NA,PN=packname,R=r,UN=username,WB.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DN=dn</td>
<td>Specifies the device number assigned to a device at system initialization. If specified, the CATLIST command lists catalog information from that device.</td>
</tr>
<tr>
<td>EF=ef</td>
<td>Specifies one or more excluded permanent file names. This parameter excludes these permanent files from being listed.</td>
</tr>
</tbody>
</table>

An asterisk (*) present in a file name indicates that a set of files is to be excluded. For example, EF=***OPL will exclude all the files with 6 character file names that end in OPL; EF=**M***** will exclude all the files with file names that start with the letter M.

Multiple file names may be specified, separated by slashes. For example, EF=A******/B*****/C***** will exclude all the files with names that begin with the letters A, B, or C.

The EF parameter may be specified together with the FN parameter. For example, FN=AB*****.EF=ABC**** will list information about all files with names that start with the letters AB, except for those files with names that start with the letters ABC.

This parameter is not allowed when listing permit information (LO=FP, LO=P), nor when listing security access categories (LO=X).
Parameter | Description
--- | ---
FN=fn | Specifies one or more permanent file names. This parameter specifies that catalog information is to be listed only for these permanent files.

An asterisk (*) present in a file name indicates that information for a set of files is to be listed. For example, FN=***OPL will list all the files with 6 character file names that end in OPL; FN=M****** will list all the files with file names that start with the letter M.

Multiple file names may be specified, separated by slashes. For example, FN=A******/B******/C****** will list all the files with names that begin with the letters A, B, or C.

The FN parameter may be specified together with the EF parameter. For example, FN=AB******,EF=ABC**** will list information about all files with names that start with the letters AB, except for those files with names that start with the letters ABC.

If a single file name with no asterisk (*) characters is specified together with LO=0, a message (fn FOUND.) indicates whether or not the specified file is found in the specified catalog. If such a file name is specified together with LO=P and UN=username, a message (username FOUND.) indicates whether or not permission to access that file has been granted to that user name.

This parameter is required when listing permit information (LO=FP, LO=P) or security access categories (LO=X). When LO=FP, LO=P, or LO=X is specified, only a single file name can be specified and no asterisk (*) characters can be used.

L=lfn | Specifies the output file name. lfn is the name of the file assigned to the job on which CATLIST information is written. If L=lfn is omitted, the system assumes L=OUTPUT.

lfn is not rewound before or after the CATLIST operation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LO=option</td>
<td>One of the following list options. If LO is omitted, LO=0 is assumed.</td>
</tr>
</tbody>
</table>

**option**  

**Description**  

| F | Lists detailed information about the file specified by the FN=fn parameter. If you do not specify an FN=fn parameter, the system lists information about each file in your catalog. An example of this list option is given following the parameter descriptions.  

If you specify an alternate user name (UN=username), you receive a listing of files you can access in the other user's catalog; however, the only files listed are those that the owner has explicitly permitted to be listed (using the AC parameter on a CHANGE, DEFINE, or SAVE command). The passwords for files in another user's catalog are not listed. Passwords must be obtained from the file owner. In addition, charge and project number information also is not listed in an alternate user CATLIST unless the calling user has system origin privileges.  

| PP | Lists the access permissions granted for the file specified on the FN=fn parameter. If a user name is also specified (UN=username), only the file permission granted to that user is listed.  

The user name, mode of permitted access, permission expiration date, number of accesses, and the date and time of the last access is listed for each user that has been granted explicit permission to access the file. For a semiprivate file, this information is also listed for all other users that have accessed the specified file. (User names are not recorded for accesses to public files.) An asterisk follows the user name/permission mode if explicit permission has been granted to this user. |
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>Lists the user names of users who have been granted explicit permission to access the specified file. For a semiprivate file, this option also lists the user names of all other users who have accessed the specified file. This option requires that a file name be specified (FN=fn).</td>
</tr>
<tr>
<td>X</td>
<td>Lists the security access categories associated with the file specified on the FN=fn parameter as well as the information returned by the LO=F parameter. You must specify the FN=fn parameter if you specify LO=X. For security reasons, the security access categories associated with a file will not be listed unless your current job security access level is at least as high as the current permanent file security access level of the file. Refer to the Security Features topic in section 3 of this manual for more information on security access levels and categories.</td>
</tr>
<tr>
<td>0 (zero)</td>
<td>Lists alphabetically the names of the indirect access files and direct access files in your catalog. If you specify a user name (UN=username), you receive a list of the files you can access in the other user’s catalog. A file name surrounded by parentheses indicates that the file resides on alternate storage rather than on disk. An asterisk preceding a file name indicates an error status is set in the catalog entry for the file. The cause of the error may be one of the following.</td>
</tr>
</tbody>
</table>

- EOI was altered during mass storage recovery.
- Error exists in file data or permit entries.

To clear an error status flag, refer to the CHANGE command in this section.
Parameter Description

NA Specifies the no abort option. If NA is specified, processing errors do not terminate the job. Do not specify both NA and WB.

PN=packname Specifies the auxiliary device name. This parameter specifies that CATLIST should use the catalog information on the named auxiliary device.

R=r Specifies the device type on which the permanent file catalog resides. R=r is used with the PN and NA parameters (refer to the R parameter description at the beginning of this section).

UN=username Specifies the user name. This parameter has two purposes:

- For list options LO=F and LO=O, it specifies the alternate catalog for which you desire catalog information.
- For list options LO=FP and LO=P, it requests the permission information recorded for the specified alternate user.

When the short list options, LO=O and LO=P, are specified, a message informs you whether or not the file or user name has been found.

WB Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs. Do not specify both NA and WB.

Example 1:

Listing of files in the catalog of STUDENT. The command is entered by user STUDENT in the form: CATLIST (it is not necessary to specify the LO=O option since it is the default value).

CATALOG OF STUDENT FM/NOSCLSH yy/mm/dd. hh.mm.ss.

INDIRECT ACCESS FILES
ADD (EXAM) GRADES ID MODIFY2 (RESEQ) XX
CAPITAL FIND *HEROFTN LIST PRIME T

DIRECT ACCESS FILES
(DIRFILE) DRFILE TV
11 INDIRECT ACCESS FILES ON DISK. TOTAL PRUS = 14.
2 DIRECT ACCESS FILES ON DISK. TOTAL PRUS = 2.
2 INDECTS ON ALTERNATE STORAGE. TOTAL PRUS = 2.
1 DIRECT ON ALTERNATE STORAGE. TOTAL PRUS = 2.

An asterisk preceding a file name indicates that the error flag is set. A file name surrounded by parentheses indicates that the file resides on alternate storage rather than on disk.
Example 2:
Listing of files that begin with the letters PROC in the catalog of FREE007. The command is entered by user FREE007 in the form: CATLIST,FN=PROC**.

CATALOG OF FREE007 FM/NOSCLSH yy/mm/dd. hh.mm.ss.
FILE NAME PROC**

INDIRECT ACCESS FILES
PROCART PROCFLI PROC1 PROC1A

4 INDIRECT ACCESS FILES ON DISK. TOTAL PRUS = 15.

Example 3:
Listing of files with 6-character and 7-character file names that end in BIN in the catalog of XYZ3320. The command is entered by user XYZ3320 in the form: CATLIST,FN=***BIN/***BIN.

CATALOG OF XYZ3320 FM/NOSCLSH yy/mm/dd. hh.mm.ss.
SELECTED FILES

DIRECT ACCESS FILES
CATLBIN PFA5BIN PFTBIN PL14BIN PURG BIN QACBIN SPFLBIN MABIN PFA6BIN PL13BIN

10 DIRECT ACCESS FILES ON DISK. TOTAL PRUS = 390.

Example 4:
Listing of files with 6-character and 7-character file names that end in BIN, except for those files with names that start with PF, in the catalog of XYZ3320. The command is entered by user XYZ3320 in the form: CATLIST,FN=***BIN/***BIN,EF=PF*****.

CATALOG OF XYZ3320 FM/NOSCLSH yy/mm/dd. hh.mm.ss.
SELECTED FILES

DIRECT ACCESS FILES
CATLBIN MABIN PL13BIN PL14BIN PURG BIN QACBIN SPFLBIN

7 DIRECT ACCESS FILES ON DISK. TOTAL PRUS = 269.
Example 5:

Listing of alternate users that have accessed file PRIME in the catalog of STUDENT. The command is entered by user STUDENT in the form: CATLIST,LO=P,FN=PRIME.

CATALOG OF STUDENT
FILE NAME PRIME
USER NAMES
CMK2011 JLX2015 KXK4277
3 USERS

Example 6:

Listing of detailed information about files in the catalog of SMITH. The command is entered by user SMITH in the form: CATLIST,LO=F.

CATALOG OF SMITH
FILE NAME FILE TYPE LENGTH DN CREATION ACCESS DATA MOD PASSWORD COUNT PERM. SUBSYS DATE/TIME DATE/TIME DATE/TIME EXPIRES LEVEL PR BR AC RS CHARGE NO. PROJECT NUMBER
1 CATX IND. PRIVATE 1 84/04/19. 84/04/20. 84/04/19.
   1 READ 09.10.23. 08.30.16. 09.10.23.
   LVLO N Y N D
2222 PRJ2201
2 TESTLIB DIR. PUBLIC 1 41 84/04/19. 84/04/19. 84/04/19.
   0 WRITE 09.11.05. 09.11.05. 09.11.05.
   LVLO N Y Y D
2222 PRJ2201
1 INDIRECT ACCESS FILE ON DISK.
1 DIRECT ACCESS FILE ON DISK. TOTAL PRUS = 1.
Example 7:

Listing of detailed information about the file XFILE, as well as listing of the security access categories associated with the file XFILE. The command is entered by user MLSUSER in the form: CATLIST, FN=XFILE, LO=X.

```
CATALOG OF MLSUSER

FILE NAME  FILE TYPE  LENGTH  DN  CREATION  ACCESS  DATA MOD  EXPIRES  LEVEL  PR  BR  AC  RS  CHARGE NO.  PROJECT NUMBER

1  XFILE  DIR. PRIVATE  212  *  88/02/25.  88/02/25.  88/02/25.  45  READ  11.11.48.  11.11.48.  11.11.48.  LVL3  N  Y  N  D  7305770

FILE ACCESS CATEGORY SET

CAT00  CAT01  CAT02  CAT04  CAT06
```
Column headings are printed when the LO=F or LO=X parameter is specified. For CATLIST listing files not connected to a terminal, you can control the print density and page length using the SET command and the PL and PD symbolic names.

The following are the column headings and their meanings.

<table>
<thead>
<tr>
<th>Heading</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILE NAME</td>
<td>Permanent file name.</td>
</tr>
<tr>
<td>FILE TYPE</td>
<td>The permanent file type, direct access (DIR) or indirect access (IND), followed by the file permit category (PRIVATE, SPRIV, or PUBLIC).</td>
</tr>
<tr>
<td>LENGTH</td>
<td>Length of the file in decimal PRUs.</td>
</tr>
<tr>
<td>DN</td>
<td>Device number of the mass storage device on which the direct access file is stored. If the file resides on the master device, this field contains an asterisk.</td>
</tr>
<tr>
<td>PASSWORD</td>
<td>File password. It is not listed if the file belongs to another user. If the system is a secured system and if the file has an access level higher than that of your job, a series of seven asterisks (******* replaces the file password.</td>
</tr>
<tr>
<td>COUNT</td>
<td>The number of times the file has been accessed.</td>
</tr>
<tr>
<td>PERM.</td>
<td>Permission mode allowed the user. The entry is WRITE, MODIFY, APPEND, UPDATE, READ, READMD, READAP, READUP, EXECUTE, or NULL.</td>
</tr>
<tr>
<td>SUBSYS</td>
<td>Interactive subsystem associated with the file. The possible entries are FORT., FTNTS, BASIC, EXEC, and BATCH. If this field contains no entry, a subsystem is not associated with the file (null).</td>
</tr>
</tbody>
</table>
| CREATION DATE/TIME | File creation date and time in the following format. 

   yy/mm/dd.
   hh.mm.ss. |
<p>| ACCESS DATE/TIME | Date and time of the last access to the file. |
| DATA MOD DATE/TIME | Date and time of the last modification of the file data. |
| EXPIRES | The expiration date of the file password. It is not listed if the file does not have a password, the password does not expire, or if the file belongs to another user. |
| LEVEL | The security access level of the file. On a secured system, it is always listed if the file belongs to you. On an unsecured system, it is only listed if the level is not null (an assignment has been made) and the file belongs to you. |
| PR | Preferred residence for this file. The possible values are L, D, M, N, and T. For more information, refer to the description of the PR parameter at the beginning of this section. |</p>
<table>
<thead>
<tr>
<th>Heading</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BR</td>
<td>Requested backup copy for this file. Y means tape backup, MD means alternate storage or tape backup, and N means no backup required. For more information, refer to the description of the BR parameter at the beginning of this section.</td>
</tr>
<tr>
<td>AC</td>
<td>Alternate CATLIST permission. Specifies whether alternate users may obtain information about the file using CATLIST. Y means that information on this file will appear in an alternate user's CATLIST display; N means that an alternate user cannot get information on this file.</td>
</tr>
<tr>
<td>RS</td>
<td>Actual residence of the file. The possible values are D, DC, DT, DCT, CT and T. If a D is present, a copy of the file exists on disk. If a C is present, a copy of the file exists on cartridge alternate storage (MSE). If a T is present, a copy of the file exists on tape alternate storage. For more information, refer to Alternate Storage in section 2.</td>
</tr>
</tbody>
</table>

**CHANGE COMMAND**

The CHANGE command changes certain characteristics of a permanent file. The file need not be assigned to the job.

Format:

```
CHANGE,nfn1=ofn1,nfn2=ofn2,...,nfnm=ofnm/PW=password,CT=ct,M=m,BR=br,PR=pr,
SS subsystem,PN=packname,R=r,NA,CE,WB,XD=expiredate,XT=expireterm,AC=ac,CP.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nfn1=ofn1</td>
<td>Specifies the file name nfn1 replaces old permanent file name ofn1. If no name change is desired, only ofn1 is specified.</td>
</tr>
</tbody>
</table>

The full descriptions of the following optional parameters (except CE and M=m) are given at the beginning of this section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PW=password</td>
<td>Specifies the new password. If PW=0 is specified, the CHANGE command clears the old password without setting a new password.</td>
</tr>
<tr>
<td>CT=ct</td>
<td>Specifies the new permit category for the file. Entries are P, PR, or PRIVATE for private; S or SPRIV for semiprivate; and PU or PUBLIC for public.</td>
</tr>
<tr>
<td>M=m</td>
<td>Specifies the new alternate user permission mode for semiprivate and public files. For direct access files, refer to the permission modes described in the DEFINE command description; for indirect access files, refer to the permission modes described in the SAVE command description.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>BR=br</td>
<td>Specifies the new backup copy selection; entries are Y (tape), MD (alternate storage), and N (no backup).</td>
</tr>
<tr>
<td>PR=pr</td>
<td>Specifies the new preferred residence; entries are M (alternate storage) and N (no preference).</td>
</tr>
<tr>
<td>SS=subsystem</td>
<td>Specifies the new interactive subsystem to be associated with the file; entries are BASIC, BATCH, EXECUTE, FORTRAN, FTNTS, and NULL.</td>
</tr>
<tr>
<td>PN=packname</td>
<td>Specifies the auxiliary device on which the file resides. This parameter cannot specify a new file residence.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type on which the file resides. This parameter cannot specify a new file residence.</td>
</tr>
<tr>
<td>NA</td>
<td>Specifies the no abort option. If NA is specified, processing errors do not terminate the job.</td>
</tr>
<tr>
<td>CE</td>
<td>Clears file error code. It clears the recovery error field in the catalog entry. If the job is system origin, it also clears the alternate storage file errors.</td>
</tr>
<tr>
<td>WB</td>
<td>Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.</td>
</tr>
<tr>
<td>XD=expiredate</td>
<td>Specifies the new expiration date for the file password. The value expiredate must be a six-digit string of the form yymmdd; where yy, mm, and dd are two-digit year, month, and day designators, respectively.</td>
</tr>
<tr>
<td>XT=expireterm</td>
<td>Specifies the new life of the file password in days. If you specify 0, the file password expires immediately. If you specify 4095 or *, the file password does not expire.</td>
</tr>
<tr>
<td>AC=ac</td>
<td>Specifies whether alternate users may obtain information about the file using CATLIST. Entries are Y (yes) and N (no). The default value is N.</td>
</tr>
<tr>
<td>CP</td>
<td>Specifies that the charge and project numbers for the file are to be replaced by the charge and project numbers currently in effect for your job.</td>
</tr>
</tbody>
</table>

**COMMON COMMAND**

The COMMON command accesses the system file SYSTEM.

Format:

```
COMMON,SYSTEM.
```

You must be authorized to access library files. If a file with the name SYSTEM is already local, no action is taken. Otherwise, the system searches for a library file with that name. If the system finds the file, it assigns the file to your job as a library type file.
DEFINE COMMAND

The DEFINE command creates an empty direct access permanent file. It can also change a file of the local file type into a direct access file. In this case, the file must reside on a device on which you can place direct access files (refer to secondary masks and NSAL CMRDECK entries in the NOS 2 Analysis Handbook or contact site personnel). When you create a file using the DEFINE command, the file is automatically saved under the charge number and project number currently in effect for your job.

Format:

DEFINE, lfn1=pfn1, lfn2=pfn2, ..., lfnn=pfnn/PW=password, CT=ct, M=m, BR=br, PR=pr, PW=packname, R=r, S=space, NA, WB, AL=level, XD=expiredate, XT=expireterm, AC=ac.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1=pfn1</td>
<td>The DEFINE command creates an empty direct access permanent file if pfn1 and lfn1 do not exist. If lfn1= is omitted, pfn1 is assumed to be the local file name and the permanent file name. Each file name can be from one to seven characters. If the DEFINE command defines an existing local file as a direct access file, lfn1 is the name of the local file, and pfn1 is its new permanent file name.</td>
</tr>
</tbody>
</table>

The full descriptions of the following optional parameters (except M=m and S=space) are given at the beginning of this section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PW=password</td>
<td>Specifies the 1- to 7-character password that others must specify to access the file.</td>
</tr>
<tr>
<td>CT=ct</td>
<td>Specifies the permit category of the defined file. Entries are P, PR, or PRIVATE for private; S or SPRIV for semiprivate; and PU or PUBLIC for public. If CT=ct is not specified, CT=PRIVATE is assumed.</td>
</tr>
<tr>
<td>M=m</td>
<td>Specifies the file access mode permitted to other users if the file is semiprivate or public, and if explicit access permission has not been granted to that user. If M=m is omitted, M=READ is assumed. Other users can attach the file in the following modes (refer to the ATTACH command description):</td>
</tr>
<tr>
<td>If m is:</td>
<td>value</td>
</tr>
<tr>
<td>E or EXECUTE</td>
<td>Execute.</td>
</tr>
<tr>
<td>R or READ</td>
<td>Read or execute.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>RU or READUP</td>
<td>Read update, read, or execute.</td>
</tr>
<tr>
<td>RA or READAP</td>
<td>Read append, read, or execute.</td>
</tr>
<tr>
<td>RM or READMD</td>
<td>Read modify, read append, read update, read, or execute.</td>
</tr>
<tr>
<td>U or UPDATE</td>
<td>Update.</td>
</tr>
<tr>
<td>A or APPEND</td>
<td>Append.</td>
</tr>
<tr>
<td>M or MODIFY</td>
<td>Modify, append, update, read modify, read append, read update, read, or execute.</td>
</tr>
<tr>
<td>W or WRITE</td>
<td>Write, modify, append, update, read modify, read append, read update, read, or execute.</td>
</tr>
<tr>
<td>N or NULL</td>
<td>None.</td>
</tr>
</tbody>
</table>

After a file is defined, it is always assigned to the job in write mode.

<table>
<thead>
<tr>
<th>BR=br</th>
<th>Specifies the backup copy requirement; Possible values are MD (one backup copy required), N (no backup required), or Y (two backup copies required). If BR=br is omitted, BR=Y is assumed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PR=pr</td>
<td>Specifies the preferred file residence; possible values are D (disk residence preferred), L (locked to disk), M (alternate storage residence preferred), N (no preference), or T (tape alternate storage residence preferred). If PR=pr is omitted, PR=N is assumed.</td>
</tr>
<tr>
<td>PN=packname</td>
<td>Specifies the name of an auxiliary device on which the direct access file is to reside. If PN=packname is omitted, the file residence is determined by the PR, R, and S parameters.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type on which the permanent file is to reside. Specify this parameter if a removable auxiliary device with a device type other than the installation-defined default is used. The device must be a permanent file mass storage device on which direct access files are allowed. If lfn already exists on a device other than that specified or if an invalid device type is specified, a dayfile message so informs you. If an auxiliary device name is not specified by the PN=packname parameter or a previous PACKNAM command, the file is defined on a family device.</td>
</tr>
<tr>
<td>S=space</td>
<td>Specifies the decimal number of PRUs requested for the file. It cannot be larger than your validation limit (refer to LIMITS Command in section 7). If no device has the specified amount of space available, a dayfile message so informs you.</td>
</tr>
</tbody>
</table>

†Special care should be taken when using modes RM, RA, or RU. Some programs do not anticipate that one user may be updating a file while other users are reading the same file. Specifically, CRM/AAM (refer to the CYBER Record Manager Advanced Access Methods Reference Manual) is not designed to handle concurrent reading and updating. If a program using CRM/AAM attempts to access a file attached in RM, RA, or RU mode while a second program using CRM/AAM is accessing the file in H, A, or U mode, one or both programs may be aborted with an error message stating that the file was ruined. In fact, the file may still be intact, but CRM cannot guarantee this and does not allow the access.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NA</td>
<td>Specifies the no abort option. If NA is specified, processing errors do not terminate the job.</td>
</tr>
<tr>
<td>WB</td>
<td>Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.</td>
</tr>
<tr>
<td>AL=level</td>
<td>Specifies the security access level you want assigned to the file. Unless changed by your site, level can be one of the following names: LVLO, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7. The default for this parameter is the current job access level.</td>
</tr>
<tr>
<td>XD=expiredate</td>
<td>Specifies the expiration date for the file password. The value expiredate must be a six-digit string of the form yymmdd; where yy, mm, and dd are two-digit year, month, and day designators, respectively. You can specify this parameter only if you also specify PW=password.</td>
</tr>
<tr>
<td>XT=expireterm</td>
<td>Specifies the life of the file password in days. If you specify 0, the file password expires immediately. If you specify 4095 or *, the file password does not expire. You can specify this parameter only if you also specify PW=password.</td>
</tr>
<tr>
<td>AC=ac</td>
<td>Specifies whether alternate users may obtain information about the file using CATLIST. Entries are Y (yes) and N (no). The default is N.</td>
</tr>
</tbody>
</table>

If lfn1 does not exist, the device on which pfnp resides depends on the R=r and S=space parameters.

<table>
<thead>
<tr>
<th>R=r</th>
<th>S=space</th>
<th>File Residence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified</td>
<td>Not specified</td>
<td>The file resides on the device of type r with the most space available.</td>
</tr>
<tr>
<td>Specified</td>
<td>Specified</td>
<td>The file resides on the device of type r with the most space available, provided that device has as many PRUs available as specified by the space parameter.</td>
</tr>
<tr>
<td>Not specified</td>
<td>Specified</td>
<td>The file resides on the device with the most space available, provided that device has as many PRUs available as specified by the space parameter.</td>
</tr>
<tr>
<td>Not specified</td>
<td>Not specified</td>
<td>The file resides on the device with the most space available.</td>
</tr>
</tbody>
</table>

If an auxiliary device has been previously specified by a PACKNAM command, the file resides on that auxiliary device rather than a family device.
After the DEFINE command has been processed, the new direct access file remains attached to the job in write mode. After the file is returned, you must issue an ATTACH command to access the direct access file. If you purge an attached direct access file, the file remains attached to the job, although it has been removed from your permanent file catalog. Until you return the purged file, you cannot define a direct access file having the same local file name as the purged file.

**DROPDS COMMAND**

The DROPDS command releases the disk space associated with one or more of your permanent files, provided that a valid alternate storage copy (on cartridge (MSE) or tape alternate storage) exists for each file. The local file copies of these files (if they are present) are also returned by this command.

Format:

```
DROPDS,lfn1=pfn1,lfn2=pfn2,...,lfnn=pfnn/PN=packname,R=r,NA,WB.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1=pfn1</td>
<td>Specifies that the permanent file disk space associated with the file named pfn1 should be released. The local file named lfn1 will be returned at the same time.</td>
</tr>
</tbody>
</table>

If lfn1 is omitted, the name of the local file is assumed to be pfn1.

The full descriptions of the following optional parameters are given at the beginning of this section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PN=packname</td>
<td>Specifies the auxiliary device name. Specified if the permanent file to be released resides on an auxiliary device.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type. Specified if a removable auxiliary device on a device type other than the installation-defined default is to be used.</td>
</tr>
<tr>
<td>NA</td>
<td>Specifies the no abort option. If NA is specified, processing errors do not abort the job.</td>
</tr>
<tr>
<td>WB</td>
<td>Specifies the wait-if-busy option. The job waits for the mounting of removable auxiliary disk packs.</td>
</tr>
</tbody>
</table>
FTP COMMAND

The File Transfer Protocol (FTP) is a DDN-defined protocol that provides file transfer capabilities between connected TCP/IP hosts. FTP allows you to access directories/files on a remote host and to perform common operations. Such operations include list and change working directories, list files at various levels, and rename directories and files.

Format:

FTP,I=input,O=output,P=ftpprlg.

or

CRECFC,I=input,O=output,P=ftpprlg.

Parameter | Description
--- | ---
I=input | Specifies the local file which contains the directives that FTP sends to the remote host. The file name must be from 1- to 7-alphanumeric characters. The system reads directives from the current position on the file to the next EOR. If you omit the I=input parameter, the default is to use local file INPUT.

0=output | Specifies the local file to receive the output generated by FTP. The file name must be from 1- to 7-alphanumeric characters. If you omit the O=output parameter, the default is to use local file OUTPUT. If you specify 0=0, then no output file is created.

P=ftpprlg | Specifies the prolog file. Values specified in the prolog file take precedence over those specified by FTP. The file name must be from 1- to 7-alphanumeric characters. Before being read, the file is rewound and cannot be assigned to a terminal. If the file is not local to the job, FTP attempts to acquire a permanent file of the same name. If the file is acquired, it is returned after prolog file processing is completed. If omitted, the default is to use file FTPPRLG. If you specify P=0, no prolog file is used.

FTP DIRECTIVES

The action taken by FTP depends on the directives you specify. Alternatively, you can specify a directives file with the I=input parameter.

For more information on the FTP command, refer to the CDCNET TCP/IP Usage manual.
**APPEND_FILE Directive**

The APPEND_FILE directive appends data from a local host file to a corresponding remote host file. If the remote host file does not exist, then one is created by the remote host's server.

**NOTE**

When you are specifying the embedded parameters (CS, FSC, and READEOI) found on the LOCAL_FILE parameter, and the destination host is a non-NOS system, it is necessary to explicitly specify the REMOTE_FILE parameter. Allowing the embedded parameters to default without specifying the REMOTE_FILE parameter may result in a file name error. The following example appends file PROCL from NOS to file PROCL on NOS/VE:

```
APPEND_FILE 'PROCL,CS=A,FSC=1,READEOI' PROCL
```

**Format:**

APPEND_FILE or
APPF or
APPEND or
APPE

LOCAL_FILE=local_name or
LOCAL_FILE='local name,CS=cset,FSC=n,READEOI'
REMOTE_FILE=local_name

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCAL_FILE or Name of the local host file.</td>
<td>LF</td>
</tr>
<tr>
<td>CS</td>
<td>Specifies the code set, data character size and format of the file on the NOS host. Files transmitted by FTP/NOS are mapped to network ASCII from the specified representation. This parameter is ignored unless the transfer type, as selected or defaulted by the CHANGE_TRANSFER_TYPE command, is ASCII (A). The following NOS FCOPY command compatible values are supported:</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>ASCII or A</td>
<td>ASCII 6/12 file with zero-byte-terminated records.</td>
</tr>
<tr>
<td>ASCII8 or 8</td>
<td>ASCII 8/12 file with TELNET end-of-line terminators.</td>
</tr>
<tr>
<td>ASCII88 or 88</td>
<td>ASCII 8/8 file with TELNET end-of-line terminators.</td>
</tr>
<tr>
<td>DIS or D</td>
<td>Display-coded file with zero-byte-terminated records.</td>
</tr>
</tbody>
</table>

If this parameter is omitted, the default is ASCII (A).
Parameter | Description
--- | ---
**FSC** | Specifies the number of files to be skipped before starting data transfer to the remote host. If this parameter is specified, n NOS end-of-file (EOF) marks are skipped before data transfer begins. Data transfer begins at file n+1 of a multifile set (BOI) of the file. If this parameter is omitted, the default is zero. Data transfer starts from the beginning-of-information (BOI) of the file.

**READEOI** | Specifies read to end-of-information (EOI). If this parameter is specified, all files of a multifile set from the current file position to the EOI of the file are transferred with NOS EOF marks ignored.

**REMOTE_FILE** | Specifies the name of the remote file; same name as specified by the LOCAL_FILE or LF parameter. This parameter is required if specifying the embedded parameters CS, FSC, and READEOI, and the remote host is a non-NOS system.

**CHANGE_AUTO_LOGIN_MODE Directive**
The `CHANGE_AUTO_LOGIN_MODE` directive controls automatic login operations when a connection to a remote host has been established.

Format:
```
CHANGE_AUTO_LOGIN_MODE or
CHAALM
    MODE=boolean
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MODE or M</strong></td>
<td>Setting the MODE parameter to ON, TRUE, or YES enables auto login mode. Setting the MODE parameter to OFF, FALSE, or NO disables auto login mode. The default is ON.</td>
</tr>
</tbody>
</table>

**CHANGE_BELL_MODE Directive**
The `CHANGE_BELL_MODE` directive controls the sending by FTP of an ASCII BEL character to interactive terminals with the input prompt.

Format:
```
CHANGE_BELL_MODE or
CHABM or
BELL
    MODE=boolean
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MODE or M</strong></td>
<td>Setting the MODE parameter to ON, TRUE, or YES enables bell mode. Setting the MODE parameter to OFF, FALSE, or NO disables bell mode. The default is OFF.</td>
</tr>
</tbody>
</table>
CHANGE_DEBUG_MODE Directive

The CHANGE_DEBUG_MODE directive controls the display of debug mode output.

Format:

```
CHANGE_DEBUG_MODE or
CHADM or
DEBUG
MODE=boolean-
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODE or M</td>
<td>Setting the MODE parameter to ON, TRUE, or YES enables debug mode. Setting the MODE parameter to OFF, FALSE, or NO disables debug mode. The default is OFF.</td>
</tr>
</tbody>
</table>

CHANGE_FILE_NAME Directive

The CHANGE_FILE_NAME directive renames a file on the remote host.

Format:

```
CHANGE_FILE_NAME or
CHAFN or
RENAME
FILE=current file name
NEW_FILE_NAME=new file name
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILE or F</td>
<td>Name of a remote host file.</td>
</tr>
<tr>
<td>NEW_FILE_NAME or NFN</td>
<td>Specifies a new name for the remote host file.</td>
</tr>
</tbody>
</table>

CHANGE_INPUT_FILE Directive

The CHANGE_INPUT_FILE directive allows the specification of a new default input file.

Format:

```
CHANGE_INPUT_FILE or
CHAIF
INPUT=file
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INPUT or I</td>
<td>Specifies the input source file. The default is INPUT.</td>
</tr>
</tbody>
</table>
CHANGE_OUTPUT_FILE Directive

The CHANGE_OUTPUT_FILE directive allows the specification of a new output file.

Format:

```
CHANGE_OUTPUT_FILE or
CHAOF
OUTPUT=file
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUTPUT or O</td>
<td>Specifies the new output file. The current file is flushed by writing an end-of-record (EOR) to it. The default is OUTPUT.</td>
</tr>
</tbody>
</table>

CHANGE_PORT_COMMAND_MODE Directive

The CHANGE_PORT_COMMAND_MODE directive specifies if the FTP PORT command should be sent to the remote host prior to a data transfer.

Format:

```
CHANGE_PORT_COMMAND_MODE or
CHAPCM
MODE=boolean
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODE or M</td>
<td>Setting the MODE parameter to ON, TRUE, or YES enables port command mode. Setting the MODE parameter to OFF, FALSE, or NO disables port command mode. The default is ON.</td>
</tr>
</tbody>
</table>

CHANGE_TRANSFER_TYPE Directive

The CHANGE_TRANSFER_TYPE directive defines to FTP the data of the file being transferred. When an FTP session is started, the default transfer type is ASCII.

Format:

```
CHANGE_TRANSFER_TYPE or
CHATT or
TYPE
TYPE=keyword
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE</td>
<td>Specifies the data type of the file to be transferred.</td>
</tr>
<tr>
<td>keyword</td>
<td>Description</td>
</tr>
<tr>
<td>ASCII or A</td>
<td>ASCII 6/12 file with zero-byte-terminated records.</td>
</tr>
<tr>
<td>BINARY or B or IMAGE or I</td>
<td>A mass storage file containing binary data, represented in 8-bit bytes.</td>
</tr>
</tbody>
</table>

The default is ASCII.
CHANGE_VERBOSE_MODE Directive

The CHANGE_VERBOSE_MODE directive controls the display status of FTP processing. For more information, refer to the FTP directive DISPLAY_LOCAL_HELP.

Format:

```
CHANGE_VERBOSE_MODE or
CHAVM or
VERBOSE
MODE=boolean
```

Parameter Description
--
MODE or Setting the MODE parameter to ON, TRUE, or YES enables VERBOSE_MODE.
M Setting the MODE parameter to OFF, FALSE, or NO disables VERBOSE_MODE. The default is OFF.

CREATE_HOST_CONNECTION Directive

The CREATE_HOST_CONNECTION directive establishes a connection with a remote host. An existing host connection must be deleted with the DELETE_HOST_CONNECTION directive before a new connection to another host can be made.

Format:

```
CREATE_HOST_CONNECTION or
CREHC or
OPEN
HOST=name
AUTO_LOGIN_MODE=boolean
```

Parameter Description
---
HOST or The name of the remote host where a connection is to be established.
H AUTO_LOGIN_ Specifies whether an automatic login attempt should be made when a
MODE or connection to a host has been established.
ALM Setting AUTO_LOGIN_MODE to ON, TRUE, or YES enables AUTO_LOGIN_MODE.
Setting AUTO_LOGIN_MODE to OFF, FALSE, or NO disables AUTO_LOGIN_MODE.

If automatic login is enabled and no login information for the specified host has been made available by the DEFINE_AUTO_LOGIN directive, then a prompt is issued for user name, password, and if required, account. Automatic login information is established with the DEFINE_AUTO_LOGIN directive. For more information, refer to the DEFINE_AUTO_LOGIN directive.

If this parameter is omitted, the default is ON.
### DEFINE_AUTO_LOGIN Directive

The DEFINE_AUTO_LOGIN directive associates login information with a host name, so when a connection to that host is established, the user can be automatically logged in.

**Format:**

```plaintext
DEFINE_AUTO_LOGIN or
DEFAL

HOST=name
USER=username
PASSWORD=password
FAMILY=family
ACCOUNT=account
PROJECT=project
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOST or H</td>
<td>Name of the remote host associated with the login information.</td>
</tr>
<tr>
<td>USER or U</td>
<td>The login user name.</td>
</tr>
<tr>
<td>PASSWORD or PW</td>
<td>Password associated with the login user name.</td>
</tr>
<tr>
<td>FAMILY or F</td>
<td>Family name associated with the login user name if different from the default family name used on the remote host.</td>
</tr>
<tr>
<td>ACCOUNT or A</td>
<td>Account associated with the login. This parameter specifies the nondefault account to which the resource usage on the remote host is charged.</td>
</tr>
<tr>
<td>PROJECT or P</td>
<td>Project associated with the login. This parameter specifies the nondefault project to which the resource usage on the remote host is charged. If this parameter is omitted, the default established by the server's host administrator is used.</td>
</tr>
</tbody>
</table>

### DELETE_FILE Directive

The DELETE_FILE directive deletes a file on the remote host.

**Format:**

```plaintext
DELETE_FILE or
DELF or
DELETE or
DELE

NAME=name
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME or N</td>
<td>Name of the remote host file to be deleted.</td>
</tr>
</tbody>
</table>
DELETE_HOST_CONNECTION Directive

The DELETE_HOST_CONNECTION directive terminates an existing connection with a remote host without terminating FTP.

Format:

DELETE_HOST_CONNECTION or
DELHC or
CLOSE

DISPLAY_COMMAND_INFORMATION Directive

The DISPLAY_COMMAND_INFORMATION directive displays information regarding a specific FTP directive.

Format:

DISPLAY_COMMAND_INFORMATION or
DISCI
COMMAND=FTP command

Parameter | Description
--- | ---
COMMAND | Name of an FTP directive for which information is required.

DISPLAY_DIRECTORY Directive

The DISPLAY_DIRECTORY directive displays a detailed list of files in the specified remote directories. The default is to display the current directory. If the name specified is a file name on the remote server host, current information on the file is displayed. To display the local directory, use the NOS/VE command DISPLAY_CATALOG or the NOS command CATLIST.

Format:

DISPLAY_DIRECTORY or
DISD or
DIR or LIST
NAME=name
OUTPUT=local_name

Parameter | Description
--- | ---
NAME or N | Remote host file name.
OUTPUT or O | Allows the specification of an output file other than the default. The default is OUTPUT.
DEFINE_AUTO_LOGIN Directive

The DEFINE_AUTO_LOGIN directive associates login information with a host name, so when a connection to that host is established, the user can be automatically logged in.

Format:

```
DEFINE_AUTO_LOGIN or
DEFAL
    HOST=name
    USER=username
        PASSWORD=password
        FAMILY=family
        ACCOUNT=account
        PROJECT=project
```

Parameter Description
---
HOST or N Name of the remote host associated with the login information.
USER or U The login user name.
PASSWORD or PW Password associated with the login user name.
FAMILY or F Family name associated with the login user name if different from the default family name used on the remote host.
ACCOUNT or A Account associated with the login. This parameter specifies the nondefault account to which the resource usage on the remote host is charged.
PROJECT or P Project associated with the login. This parameter specifies the nondefault project to which the resource usage on the remote is charged. If this parameter is omitted, the default established by the server's host administrator is used.

DELETE_FILE Directive

The DELETE_FILE directive deletes a file on the remote host.

Format:

```
DELETE_FILE or
DELF or
DELETE or
DELE
    NAME=name
```

Parameter Description
---
NAME or N Name of the remote host file to be deleted.
DELETE_HOST_CONNECTION Directive

The DELETE_HOST_CONNECTION directive terminates an existing connection with a remote host without terminating FTP.

Format:

```
DELETE_HOST_CONNECTION or
DELHC or
CLOSE
```

DISPLAY_COMMAND_INFORMATION Directive

The DISPLAY_COMMAND_INFORMATION directive displays information regarding a specific FTP directive.

Format:

```
DISPLAY_COMMAND_INFORMATION or
DISCI
COMMAND=FTP command
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND</td>
<td>Name of an FTP directive for which information is required.</td>
</tr>
</tbody>
</table>

DISPLAY_DIRECTORY Directive

The DISPLAY_DIRECTORY directive displays a detailed list of files in the specified remote directories. The default is to display the current directory. If the name specified is a file name on the remote server host, current information on the file is displayed. To display the local directory, use the NOS/VE command DISPLAY_CATALOG or the NOS command CATLIST.

Format:

```
DISPLAY_DIRECTORY or
DISD or
DIR or LIST
NAME=name
OUTPUT=local_name
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>Remote host file name.</td>
</tr>
<tr>
<td>N</td>
<td>The default is OUTPUT.</td>
</tr>
<tr>
<td>OUTPUT</td>
<td>Allows the specification of an output file other than the default.</td>
</tr>
<tr>
<td>0</td>
<td>The default is OUTPUT.</td>
</tr>
</tbody>
</table>
**DISPLAY_FILE_NAMES Directive**

The DISPLAY_FILE_NAMES directive displays a list of file names in a remote directory.

Format:

```
DISPLAY_FILE_NAMES or
DISFN or
LS or
NLST
NAME=name
OUTPUT=local_name
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME or N</td>
<td>Remote host file name.</td>
</tr>
<tr>
<td>OUTPUT O</td>
<td>Allows the specification of an output file other than the default. The default is OUTPUT.</td>
</tr>
</tbody>
</table>

**DISPLAY_FTP_OPTIONS Directive**

The DISPLAY_FTP_OPTIONS directive allows the user to obtain current information about the existing FTP connection.

Format:

```
DISPLAY_FTP_OPTIONS or
DISFO
```

**DISPLAY_LOCAL_HELP Directive**

The DISPLAY_LOCAL_HELP directive provides information about each command. The output contains the FTP command, a brief description of the command, and the aliases of the command.

Format:

```
DISPLAY_LOCAL_HELP or
DISLH or
HELP
```

FTP/NOS directly supports the DISPLAY_COMMAND_INFORMATION directive to display parameter information for a specific directive.
DISPLAY_REMOTE_HELP Directive

The DISPLAY_REMOTE_HELP directive provides help information from the remote FTP server.

Format:

DISPLAY_REMOTE_HELP or
DISRH or
REMOTEHELP
COMMAND=ftp_command

Parameter       Description
COMMAND or C   Identifies a specific FTP command for which a user wants help.

GET_FILE Directive

The GET_FILE directive retrieves a file from the remote host.

NOTE

When specifying the embedded parameters (CS and TRUNC) found on the LOCAL_FILE parameter, and the destination host is a non-NOS system, it is necessary to explicitly specify the REMOTE_FILE parameter. Allowing the embedded parameters to default without specifying the REMOTE_FILE parameter may result in a file name error.

The following example gets a file named PROCL on NOS/VE and makes it a local file on NOS.

GET_FILE PROCL "PROCL,CS=A,"
Format:

GET_FILE or
GETF or
GET or
RECV or
RETR
REMOTE_FILE=name
LOCAL_FILE=local_name or
LOCAL_FILE="local name,CS=cset,TRUNC"

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMOTE_FILE</td>
<td>Specifies the name of the remote file; same name as specified by the LOCAL_FILE or LF parameter. This parameter is required if specifying the embedded parameters CS and TRUNC, and the remote host is a non-NOS system.</td>
</tr>
<tr>
<td>LOCAL_FILE</td>
<td>Name of a local host file.</td>
</tr>
<tr>
<td>LF</td>
<td>Specifies the code set, data character size, and format of the file on the NOS host. Files transmitted by FTP/NOS are mapped to network ASCII from the specified representation. This parameter is ignored unless the transfer type, as selected or defaulted by the CHANGE_TRANSFERNETYPE command, is ASCII (A). The following NOS FCOPY command compatible values are supported:</td>
</tr>
<tr>
<td>CS</td>
<td>Specifies the code set, data character size, and format of the file on the NOS host. Files transmitted by FTP/NOS are mapped to network ASCII from the specified representation. This parameter is ignored unless the transfer type, as selected or defaulted by the CHANGE_TRANSFERNETYPE command, is ASCII (A). The following NOS FCOPY command compatible values are supported:</td>
</tr>
<tr>
<td>TRUNC</td>
<td>Specifies the deletion of pad bits from the file being received by FTP/NOS. This parameter is ignored unless the transfer type, as selected or defaulted by the CHANGE_TRANSFERNETYPE command, is IMAGE (I).</td>
</tr>
</tbody>
</table>

Value                | Description                                                                 |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII or A</td>
<td>ASCII 6/12 file with zero-byte-terminated records.</td>
</tr>
<tr>
<td>ASCII8 or 8</td>
<td>ASCII 8/12 file with TELNET end-of-line terminators.</td>
</tr>
<tr>
<td>ASCII88 or 88</td>
<td>ASCII 8/8 file with TELNET end-of-line terminators.</td>
</tr>
<tr>
<td>DIS or D</td>
<td>Display-coded file with zero-byte-terminated records.</td>
</tr>
</tbody>
</table>

If this parameter is omitted, the default is ASCII (A).
LOGIN_USER Directive

The LOGIN_USER directive sends login information to the remote host after a connection has been established.

LOGIN_USER or
LOGU or
USER
USER=username
PASSWORD=password
FAMILY=famly
ACCOUNT=account
PROJECT=project

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER or U</td>
<td>Login user name.</td>
</tr>
<tr>
<td>PASSWORD or PW</td>
<td>Password associated with the login user name.</td>
</tr>
<tr>
<td>FAMILY or F</td>
<td>Family name associated with the login user name if it is other than the default family for the remote host. The FAMILY parameter value is sent to the remote host in the PASS FTP protocol element (FTP command) by prefixing it with a comma acting as a delimiter and suffixing the result string to the PASSWORD parameter value. The FAMILY parameter is only applicable if the remote host is a CYBER host.</td>
</tr>
<tr>
<td>ACCOUNT or A</td>
<td>Account associated with the login. This parameter specifies the nondefault account to which the resource usage on the remote is charged.</td>
</tr>
<tr>
<td>PROJECT or P</td>
<td>Project associated with the login. This parameter specifies the nondefault to which the resource usage on the remote host is charged. If this parameter is omitted, the default established by the server's host administrator is used. This parameter is only valid if the remote host is a CYBER host.</td>
</tr>
</tbody>
</table>
QUIT Directive

The QUIT directive terminates execution of FTP.

Format:

QUIT or
QUI or
BYE or Q
ABORT=boolean

Parameter    Description
ABORT        Specifies whether to abort the current connection before terminating
             the execution of FTP.

Setting the ABORT parameter to ON, TRUE, or YES causes FTP to abort
the current connection before terminating; setting the ABORT parameter
to OFF, FALSE, or NO causes FTP to close any existing connection
before terminating.

If this parameter is omitted, by default FTP tries to close any
existing connection before terminating.
REPLACE_FILE Directive

The REPLACE_FILE directive sends data from a file on the local host to a file on the remote host. If the file does not exist on the remote host, it is created.

**NOTE**

When specifying the embedded parameters (CS, FSC, and READEOI) found on the LOCAL_FILE parameter, and the destination host is a non-NOS system, it is necessary to explicitly specify the REMOTE_FILE parameter. Allowing the embedded parameters to default without specifying the REMOTE_FILE parameter may result in a file name error.

The following example replaces file PROCL on NOS/VE with file PROCL on NOS.

```
REPLACE_FILE "PROCL,CS=A,FSC=1,READEOI" PROCL
```

Format:

```
REPLACE_FILE or
REPF or
PUT or
SEND or
STOR
LOCAL_FILE=local_name or
LOCAL_FILE='local name, CS=cset, FSC=n, READEOI'
REMOTE_FILE=name
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCAL_FILE or Name of a local host file.</td>
<td></td>
</tr>
<tr>
<td>LF</td>
<td></td>
</tr>
<tr>
<td>CS</td>
<td>Specifies the code set, data character size, and format of the file on the NOS host. Files transmitted by FTP/NOS are mapped to network ASCII from the specified representation. This parameter is ignored unless the transfer type, as selected or defaulted by the CHANGE_TRANSFER_TYPE command, is ASCII (A). The following NOS FCOPY command compatible values are supported:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII or A</td>
<td>ASCII 6/12 file with zero-byte-terminated records.</td>
</tr>
<tr>
<td>ASCII8 or 8</td>
<td>ASCII 8/12 file with TELNET end-of-line terminators.</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FSC</td>
<td>ASCII88 or 88</td>
<td>ASCII 8/8 file with TELNET end-of-line terminators.</td>
</tr>
<tr>
<td>DIS or D</td>
<td>Display-coded file with zero-byte-terminated records.</td>
<td></td>
</tr>
</tbody>
</table>

If this parameter is omitted, the default is ASCII (A).

#### SEND_FTP_COMMAND Directive

The SEND_FTP_COMMAND directive allows the sophisticated FTP user to directly send an FTP command to a remote host. It receives a single reply from the remote server. This command is used for debugging purposes by users who are familiar with the FTP protocol. This command does not work for FTP commands that initiate a data transfer (LIST, NLST, STOR, RETR, and APPE).

**Format:**

```
SEND_FTP_COMMAND or
SENFC or
QUOTE
    COMMAND=ftp_command
    PARAMETERS=command_parameters
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND</td>
<td>Sends 3- or 4-character FTP commands.</td>
</tr>
<tr>
<td>PARAMETERS</td>
<td>Sends additional parameters required for the given FTP command.</td>
</tr>
</tbody>
</table>
GET COMMAND

The GET command retrieves copies of indirect access permanent files for use as local files.

Format:

```
GET,lfn1=pfn1,lfn2=pfn2,...,lfnn=pfnn/UN=username,PW=password,PN=packname,
R=r,NA,RT, WB.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn_i=pfn_i</td>
<td>Specifies the local file name lfn_i given the retrieved copy of indirect access permanent file pfni. If lfn_i= is omitted, the local copy of the permanent file is called pfni. If no files are named, the system uses the primary file name for the permanent file.</td>
</tr>
</tbody>
</table>

The full descriptions of the following optional parameters are given at the beginning of this section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UN=username</td>
<td>Specifies the user name. Specified if the permanent file(s) is in another user's catalog. You must have permission to read or execute the file(s) (refer to SAVE Command in this section). If only execute permission has been granted, the file is retrieved in execute-only mode.</td>
</tr>
<tr>
<td>PW=password</td>
<td>Specifies the file password. Specified if UN=username is specified, and if the permanent file has a password.</td>
</tr>
<tr>
<td>PN=packname</td>
<td>Specifies the auxiliary device name. Specified if the permanent file(s) resides on an auxiliary device.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type. Specified if PN=packname is specified, or if a PACKNAM command has been processed and the device type is other than the system default.</td>
</tr>
<tr>
<td>NA</td>
<td>Specifies the no abort option. If NA is specified, processing errors do not terminate the job.</td>
</tr>
<tr>
<td>RT</td>
<td>Specifies the real-time processing option. If RT is specified, the job continues processing after requesting staging of a file from alternate storage to disk. If staging is not required (the file is already resident on disk), the file is assigned to the job. If the file must be staged, you must issue a second GET command to assign the file to the job.</td>
</tr>
<tr>
<td>WB</td>
<td>Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.</td>
</tr>
</tbody>
</table>
Each permanent file named must be an indirect access file. If the file, lfn, is assigned to the job before this command is processed, it is returned. The new local file is rewound after it is retrieved. More than one user can have local copies of an indirect access file assigned to their jobs simultaneously.

If your current primary file is specified as an lfn on the command, a copy of the associated permanent file, pf, becomes the primary file. The subsystem associated with the permanent file, pf, becomes the job's current subsystem (refer to section 8).

If an auxiliary device has been previously specified by a PACKNAM command, the system attempts to find pf on the auxiliary device rather than on the family device.

**MFLINK COMMAND**

The MFLINK command optionally transfers a file to or from another mainframe or creates, purges, or otherwise changes the attributes of a permanent file on another mainframe. You must be authorized to use the MFLINK command (refer to the LIMITS command).

**Format:**

MFLINK,lfn,ST=lid,I=dirfile,DD=dd,EP,RT,PC=c.

Parameter lfn is order-dependent, it must be the first parameter. If you omit lfn, you must have two consecutive delimiters after MFLINK. The other parameters are order-independent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Specifies the optional local file name to be used in any file transfers. The file name must be one to seven alphanumeric characters and lfn must reside on disk. If the transfer is from the local host to the remote host, lfn must be a local file before you enter the MFLINK command. If the transfer is from the remote host to the local host, MFLINK either overwrites the existing lfn, or if there is no local file, MFLINK creates a new file with the name lfn. If you omit lfn, but subsequent directives call for a file transfer, MFLINK uses LFILE as the default lfn. Some directives, such as CHANGE, PERMIT, and PURGE (for a NOS remote host) do not require an lfn, because they do not cause a file transfer. MFLINK rewinds lfn before and after the transfer.</td>
</tr>
<tr>
<td>ST=lid</td>
<td>Specifies the logical identifier (LID) of the remote host to which MFLINK is to send the directives record. The LID must be a three-character string defined by your site. You must specify the ST parameter on the first, and only the first, MFLINK command of a series of MFLINK commands (an MFLINK session) that are for the same remote host. The ST=lid specification remains in effect during the entire session. On subsequent MFLINK commands in the same session, any other parameters not specified revert to their default values. The occurrence of the ST=lid parameter on an MFLINK command initiates a new MFLINK session with the specified remote host. Once you have entered an MFLINK command with an ST=lid parameter, you can resume that MFLINK session at any time during your job by entering an MFLINK command without an ST=lid parameter.</td>
</tr>
</tbody>
</table>
Parameter | Description
--- | ---
I=dirfile | Specifies the local file which contains the directives that the system sends to the remote host. The file name must be one to seven alphanumeric characters. The system reads directives from the current position on the file to the next EOR. If you specify only the keyword I, file INPUT becomes the directives file. If you omit the I=dirfile parameter, the system reads directives from the lines immediately following the MFLINK command. In this case, the directives must all begin with a prefix character and the system reads directives until it comes to a line without the prefix character.

DD=dd | Specifies the data format of the file to be transferred. The DD=dd parameter both describes the character set of lfn on the host where it currently resides and also specifies the character set lfn is to have after the transfer.

For file transfers between NOS mainframes and between NOS/BE and NOS mainframes this parameter is effectively ignored. The file will have the same format on both mainframes.

The interpretation of the DD=dd parameter depends on the operating system(s) involved in the file transfer. The following paragraphs describe how NOS interprets the DD=dd parameter. For its interpretation by other operating systems, refer to the Remote Host Facility Usage manual.

On NOS, you can specify the following values for dd:

<table>
<thead>
<tr>
<th>dd</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>C6</td>
<td>The file contains character data in a 64-character (or less) subset of the ASCII 128-character set. The character code of lfn is 6-bit display code and its lines are zero-byte terminated.</td>
</tr>
<tr>
<td>C8</td>
<td>The file contains character data in a larger than 64-character subset of the ASCII 128-character set. The character code of lfn is the 7-bit ASCII code (right-justified in 12-bit fields) and its lines are zero-byte terminated.</td>
</tr>
<tr>
<td>US</td>
<td>Specifies that the file contains binary data in structured format with EORs and EOFs. The file is transmitted as a continuous string of binary data, broken only by EORs and EOFs as appropriate.</td>
</tr>
<tr>
<td>UU</td>
<td>Specifies that the file contains binary data without EORs and EOFs. NOS treats UU as US. If you send a file to a non-NOS or non-NOS/BE remote host with DD=UU specified and the file contains EORs or EOFs, the remote host may ignore them.</td>
</tr>
</tbody>
</table>
Parameter | Description
---|---
If the file is character data, you do not need to specify a DD=dd parameter. The remote host determines the format in which to read/write the file. If you transfer a binary file to or from a mainframe with a different word size than the model 170, the mainframe may add extra bits at EORs or EOFs.

EP | Specifies the error processing that ensues if network problems cause a loss of the connection during a file transfer. If you omit the parameter EP, the system retries the request. The EP parameter inhibits this retry. The system attempts to correct data transmission errors, regardless of the EP parameter.

RT | Specifies the real-time action the system is to take when network resources are temporarily unavailable. If you specify RT and some network resource necessary for you to connect to a remote host is unavailable, MFLINK aborts without any retries. If you do not specify RT, after an installation-defined period of time MFLINK retries until the connection is successful.

PC=c | Specifies the prefix character for MFLINK directives. The default prefix character is an asterisk (*). The prefix character can be any 6-bit display code character except a closing parenthesis, a dollar sign, a period, comma, or a colon. To avoid confusion between commands and routing directives, use caution in selecting alphabetic characters for the prefix character.

MFLINK DIRECTIVES

The action taken by MFLINK depends on the directives you specify. You can specify directives immediately following the MFLINK command if you prefix each directive with the prefix character. The system discards the prefix characters before forwarding the directives to the remote host. Alternatively, you can specify a directives file with the I=dirfile parameter. The directives in the directives file do not require the prefix character. The directives must be commands recognized by the remote host; for example, if the remote host is a NOS/BE system, your directives must be NOS/BE commands. NOS allows only a small subset of its commands to be used as MFLINK directives and, further, may require some directives to have a slightly different form or function from their command counterparts.

This section documents only those MFLINK directives valid for a NOS remote host. For other remote hosts, refer to the Remote Host Facility Usage manual.

NOS, as a remote host, processes directives of up to 80 characters. A directive longer than 80 characters terminates the processing of the current directives record. A directive can span more than one line as long as it does not exceed the 80-character limit. You indicate that the next line is a continuation line by ending the current line with a comma.
The MFLINK directives fall into the three categories of recovery directives, file transfer directives, and file alteration directives as follows:

<table>
<thead>
<tr>
<th>Recovery</th>
<th>File Transfer</th>
<th>File Alteration</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER</td>
<td>APPEND</td>
<td>CHANGE</td>
</tr>
<tr>
<td>CHARGE</td>
<td>ATTACH</td>
<td>PERMIT</td>
</tr>
<tr>
<td></td>
<td>DEFINE</td>
<td>PURGE</td>
</tr>
<tr>
<td></td>
<td>RECALL</td>
<td>PACKNAME</td>
</tr>
<tr>
<td></td>
<td>GET</td>
<td></td>
</tr>
<tr>
<td></td>
<td>REPLACE</td>
<td></td>
</tr>
<tr>
<td></td>
<td>SAVE</td>
<td></td>
</tr>
</tbody>
</table>

Recovery directives are directives that a host must send a remote host any time you initiate or resume an MFLINK session. File transfer directives are directives that transfer a file from one host to another. There can be only one file transfer directive in a given directives record.

The directives operate in a manner similar to that of their NOS command counterparts. One exception is the function of the NA keyword.

The NA option on an MFLINK directive works in a manner very similar to the NA option on NOS permanent file commands. The main difference is that the system does not suspend MFLINK processing indefinitely while it waits for a temporary error condition to clear. If APLO (removable pack option) is set to NONZERO (refer to the description of COMSPFM parameters in the Installation Handbook) and the temporary error condition persists beyond an installation-defined timeout period, MFLINK issues a message indicating that the timeout occurred and then continues. If APLO is set to ZERO, MFLINK will not wait for a pack to be mounted but will continue immediately.

The following directive descriptions show the format of each directive and describe the function of each directive whose function differs from that of its NOS command counterpart.

**APPEND Directive**

The APPEND directive adds the file specified on the MFLINK command (lfn) to the end of pfn.

Format:

```
APPEND,pfn/UN=username,PW=password,PN=packname,R=r,NA,WB.
```

**ATTACH Directive**

The ATTACH directive retrieves a copy of pfn from the remote host and makes that copy a temporary file with the name specified on the MFLINK command. No interlock is maintained between lfn and pfn, except during the file transfer (as if M=READ had been specified).

Format:

```
ATTACH,pfn/UN=username,PW=password,PN=packname,R=r,NA,RT,WB.
```

**CHANGE Directive**

The CHANGE directive operates the same as the NOS command.

Format:

```
CHANGE,ofn=ofn/PW=password,CT=ct,M=m,BR=br,PR=pr,PN=packname,
R=r,NA,CE,WB,XD=expiredate,XT=expireterm,AC=ac,CP.
```
CHARGE Directive

The CHARGE directive operates the same as its NOS command counterpart, including the handling of default charges.

Format:

\[ \text{CHARGE, chargenumber, projectnumber.} \]

If the CHARGE directive is required, it must immediately follow the USER directive.

DEFINE Directive

The DEFINE directive creates a direct access file named pfn on the remote host and copies onto it the file specified by lfn on the MFLINK command. There is no provision to copy over an existing direct access file; you must purge the existing file. No interlock is maintained between lfn and pfn, except during the file transfer (as if \( M=\text{READ} \) had been specified).

Format:

\[ \text{DEFINE, pfn/PW=password, CT=c, M=m, BR=br, PR=pr, PN=packname, R=r, S=space, NA, WB, AL=level, XD=expiredate, XT=expireterm, AC=ac.} \]

DROPDS Directive

The DROPDS directive releases the current copy of a permanent file from mass storage when a backup copy has been saved on a storage device.

Format:

\[ \text{DROPDS, pfn/PN=packname, R=r, NA, WB.} \]

GET Directive

The GET directive retrieves a copy of a permanent file from the remote host and gives it the name lfn, specified on the MFLINK command.

Format:

\[ \text{GET, pfn/UN=username, PW=password, PN=packname, R=r, NA, RT, WB.} \]

PACKNAM Directive

The PACKNAM directive operates the same as its NOS command counterpart. If you use the PACKNAM directive, it must precede any file transfer directive in the same directives record. The PACKNAM directive only applies to the directive record in which it appears.

Format:

\[ \text{PACKNAM, PN=packname, R=r.} \]

or

\[ \text{PACKNAM, packname, R=r.} \]
If you are authorized to access auxiliary devices, you can always access files on an auxiliary device that is already mounted. If you attempt an MFLINK access of a file on an unmounted auxiliary device, you get a DEVICE UNAVAILABLE message unless your site has enabled the wait-for-unmounted-device installation option. If this option is present on more than one mainframe in an RHF network, a deadlock situation is possible. If such a deadlock occurs, MFLINK would time-out the connection as discussed previously.

PERMIT Directive

The PERMIT directive operates the same as its NOS command counterpart.

Format:

\[ \text{PERMIT}, \text{pfu}, \text{username} = \text{m}, \text{PN} = \text{packname}, \text{R} = \text{r}, \text{NA}, \text{WB}, \text{XD} = \text{expiredate}, \text{XT} = \text{expireterm}. \]

PURGE Directive

The PURGE directive operates the same as its NOS command counterpart.

Format:

\[ \text{PURGE}, \text{pfu}/\text{UN} = \text{username}, \text{PW} = \text{password}, \text{PN} = \text{packname}, \text{R} = \text{r}, \text{NA}, \text{WB}. \]

REPLACE Directive

The REPLACE directive replaces pfu on the remote host with file lfn, as specified on the MFLINK command.

Format:

\[ \text{REPLACE}, \text{pfu}/\text{UN} = \text{username}, \text{PW} = \text{password}, \text{PN} = \text{packname}, \text{R} = \text{r}, \text{NA}, \text{WB}. \]

SAVE Directive

The SAVE directive creates an indirect access file named pfu on the remote host and copies onto it the file specified by lfn on the MFLINK command.

Format:

\[ \text{SAVE}, \text{pfu}/\text{PW} = \text{password}, \text{CT} = \text{ct}, \text{M} = \text{m}, \text{BR} = \text{br}, \text{PR} = \text{pr}, \text{PN} = \text{packname}, \text{R} = \text{r}, \text{NA}, \text{WB}, \text{AL} = \text{level}, \text{XD} = \text{expiredate}, \text{XT} = \text{expireterm}, \text{AC} = \text{ac}. \]

USER Directive

The USER directive specifies validation information for the remote host. It operates the same as its NOS command counterpart. The USER directive must be the first directive associated with an MFLINK command that has ST-lid specified. You do not need to specify this directive at any other time.

Format:

\[ \text{USER}, \text{username}, \text{password}, \text{familyname}. \]

If the remote host is a NOS Version 2.2 or higher system, the password specified must be the batch password.
INTERACTIVE USE OF MFLINK

When you use MFLINK in an interactive job, the system obtains the directives in one of the following ways:

- If you specify I=dirfile on the MFLINK command, the system reads the local file named dirfile. If dirfile is assigned to the terminal, the system prompts the terminal using the prefix character.

- If you omit the I=dirfile parameter, the system also prompts the terminal using the prefix character. If the MFLINK command is part of a procedure, the system reads the lines immediately following the command. If the first line following the command does not begin with the prefix character, the system prompts the terminal.

When reading from the terminal, the system prompts for directives until you enter an empty line (only a carriage return) or the prefix character in response to a prompt. The system then sends the directives (minus the prefix character) to the remote host. The remote host responds with messages indicating the success or failure of the operations.

Any time you enter an MFLINK command that has the ST=lid specified, the system initiates a new MFLINK session. If you enter the command without the ST=lid parameter, the system resumes the session with the remote host currently connected.

Examples: (NOS to NOS)

1. Assume you are at mainframe MFB. To transfer a file from mainframe MFA to MFB and purge it on MFA, you must enter commands and directives similar to the following:

   MFLINK, NEWFILE, ST=MFA.
   *USER, XYZ, ABC.
   *ATTACH, OLDFILE/PN=USER.
   *PURGE, OLDFILE/PN=USER.

2. Assume you are on mainframe MFB. To transfer four files from mainframe MFA, enter commands and directives similar to the following:

   MFLINK, FILE1, ST=MFA, I=DIRECTS.
   MFLINK, FILE2, I=DIRECTS.
   MFLINK, FILE3, I=DIRECTS.
   MFLINK, FILE4, I=DIRECTS.

The file DIRECTS has the following contents:

   USER, XYZ, ABC.
   CHARGE, 1234, 345N355.
   GET, LFN1.
   -EOR-
   GET, LFN2.
   -EOR-
   ATTACH, PFN1/PN=USER.
   -EOR-
   ATTACH, PFNS.
   -EOI-
OLD COMMAND

The OLD command retrieves a copy of an indirect access permanent file and makes it the primary file.

Format:

OLD, lfn=pfn/UN=username, PW=password, PN=packname, R=r, NA, ND, WB, RT.

Parameter Description

lfn=pfn Specifies the one- to seven-character file name lfn given to the primary file copy of indirect access permanent file pfn. If lfn= is omitted, the primary file is named pfn.

The full descriptions of the following optional parameters (except ND) are given at the beginning of this section.

Parameter Description

UN=username Specifies the user name. Specified if the indirect access permanent file is in another user's catalog.

PW=password Specifies the file password. Specified if UN=username is specified, and if the permanent file has a password.

PN=packname Specifies the auxiliary device name. Specified if the permanent file resides on an auxiliary device.

R=r Specifies the device type. Specified if an auxiliary device of a device type other than the installation-defined default is to be used.

NA Specifies the no abort option. If NA is specified, processing errors do not terminate the job.

ND Specifies the no drop option. If ND is specified, OLD changes the former primary file into a local file, but does not return any files. If ND is omitted, OLD returns all files that do not have checkpoint or no-auto-drop status.

WB Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.

RT Specifies the real-time processing option. If RT is specified, the job continues processing after requesting staging of a file from alternate storage to disk. If staging is not required (the file is already resident on disk), the file is assigned to the job. If the file must be staged, you must issue a second OLD command to assign the file to the job.

If RT is omitted and the file resides only on alternate storage, job processing is suspended while the file is staged to disk and assigned to the job. For more information on alternate storage, refer to Alternate Storage in section 2.
If an auxiliary device has been previously specified by a PACKNAM command, the system attempts to find the permanent file, pfnn, on the auxiliary device rather than on the family device.

If you do not specify the ND parameter, the system releases all files assigned to the job, except those with checkpoint or no-auto-drop status. Certain system files (for example, ZZZZZC0, ZZZZZC1, ZZZZZC2, and ZZZZZLD) always have no-auto-drop status. You can give any local file this status by using the SETFS command. A copy of the indirect access permanent file named on the OLD command becomes the primary file. The primary file is positioned at its BOI.

The primary file is rewound before every job step. Therefore, the file positioning commands have no effect on the primary file. Also, when two commands are issued to write on the primary file, the second writes over the data written by the first because the primary file is rewound between commands.

PACKNAM COMMAND

The PACKNAM command directs subsequent permanent file requests to the specified auxiliary device.

Format:

PACKNAM,PN=packname,R=r.

or

PACKNAM,packname,R=r.

or

PACKNAM.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PN=packname</td>
<td>Specifies the one- to seven-character identifier of the auxiliary device to be accessed in subsequent permanent file commands.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type of the auxiliary device specified by packnam. You specify this parameter if you want to use a removable auxiliary device whose device type differs from the installation-defined default. If you do not specify this parameter for a nondefault type pack, you must specify this parameter on each subsequent permanent file command. A full description of this parameter appears at the beginning of this section.</td>
</tr>
</tbody>
</table>
PACKNAM allows you to omit the PN=packname parameter on command requests for files that reside on the specified auxiliary device. However, to request permanent files on another auxiliary device, you must specify the PN=packname parameter on the file request or enter another PACKNAM command before the request (you must also specify the R=r parameter if the device type is different). Refer to Mass Storage File Residence in section 2 for information concerning auxiliary permanent file devices.

You can access permanent files residing on the family system devices while the PACKNAM request is in effect by specifying PN=0 on permanent file commands. To clear the effect of a PACKNAM command, include a PACKNAM command in either of the following formats.

PACKNAM.

or

PACKNAM,PN=0.

PERMIT COMMAND

The PERMIT command explicitly permits another user to access a private file in your permanent file catalog. The PERMIT command can also change the mode in which another user can access a semiprivate or public file.

Format:

```
PERMIT,pfn,username1=m1,username2=m2,...,username n=m n/PN=packname,R=r,NA, WB,
XD=expiredate,XT=expireterm.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pfn</td>
<td>Name of the file for which access permission is granted.</td>
</tr>
<tr>
<td>username i=m i</td>
<td>Specifies that user name username i is granted the access permissions indicated by access mode m i. If m i is omitted, the read access mode is assumed. If m i is NULL, the user is explicitly denied permission to access the file. For the available access modes, refer to the DEFINE Command or SAVE Command description in this section.</td>
</tr>
</tbody>
</table>

The full descriptions of the following optional parameters are given at the beginning of this section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PN=packname</td>
<td>Auxiliary device name. Specified if the permanent file resides on an auxiliary device.</td>
</tr>
<tr>
<td>R=r</td>
<td>Device type. Specified if a removable auxiliary device on a device type other than the installation-defined default is to be used.</td>
</tr>
</tbody>
</table>
**Parameter Description**

**NA**  
No abort option. If NA is specified, processing errors do not terminate the job.

**WB**  
Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.

**XD=expiredate**  
Specifies the expiration date for the file permit. The value expiredate must be a 6-digit string of the form yymmdd; where yy, mm, and dd are 2-digit year, month, and day designators, respectively.

**XT=expireterm**  
Specifies the life of the file permit in days. If you specify 0, the file permit expires immediately. If you specify 4095 or *, the file permit does not expire.

---

**PURGALL COMMAND**

The PURGALL command purges all permanent files in your catalog that satisfy the criteria specified by the parameters.

**Format:**

PURGALL, AD=ad, AF, CD=cd, CT=ct, DF, DN=dn, EF=ef, FN=fn, MD=md, NA, PN=packname, R=r, TM=tm, TY=ty, WB.

**Parameter**  
Description

**AD=ad**  
Specifies the last access date; its format is yymmdd. All files last accessed before this date are purged, unless the AF parameter is specified.

**AF**  
Specifies that files accessed after the date specified by the AD=ad parameter, modified after the date specified by the MD=md parameter, or created after the date specified by the CD=cd parameter are purged.

**CD=cd**  
Specifies the creation date; its format is yymmdd. All files created before this date are purged, unless the AF parameter is specified.

**CT=ct**  
Specifies the file category to be purged. Entries are P, PR, or PRIVATE for private; S or SPRIV for semiprivate; and PU or PUBLIC for public.

**DF**  
Specifies that a dayfile message will be issued for each file that is purged.

**DN=dn**  
Specifies the device number assigned to a device during system initialization. Only files on that device are purged.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EF=ef</td>
<td>Specifies one or more excluded permanent file names. This parameter excludes these permanent files from being purged. An asterisk (<em>) present in a file name indicates that a set of files is to be excluded. For example, EF=<em><strong>OPL will exclude from purging all the files with 6-character names that end in OPL; EF=M</strong></em></em>** will exclude from purging all the files with names that start with the letter M. Multiple file names may be specified, separated by slashes. For example, EF=A*****/B*****/C***** will exclude from purging all the files with names that begin with the letters A, B, or C. The EF parameter may be specified together with the FN parameter. For example, FN=AB*****,EF=ABC**** will purge all the files with names that start with the letters AB, except for those files with names that start with the letters ABC.</td>
</tr>
<tr>
<td>FN=fn</td>
<td>Specifies one or more permanent file names. This parameter restricts the purge to these permanent file names. An asterisk (<em>) present in a file name indicates that a set of files is to be purged. For example, FN=<em><strong>OPL will purge all the files with 6-character names that end in OPL; FN=M</strong></em></em>** will purge all the files with names that start with the letter M. Multiple file names may be specified, separated by slashes. For example, FN=A*****/B*****/C***** will purge all the files with names that begin with the letters A, B, or C. The FN parameter may be specified together with the EF parameter. For example, FN=AB*****,EF=ABC**** will purge all the files with names that start with the letters AB, except for those files with names that start with the letters ABC.</td>
</tr>
<tr>
<td>MD=md</td>
<td>Specifies the last modification date; its format is yymmd. All files last modified before this date are purged, unless the AF parameter is specified.</td>
</tr>
</tbody>
</table>
PARAMETER DESCRIPTION

NA Specifies the no abort option. If the specified auxiliary device is not available, the job is suspended until it becomes available.

PN=packname Specifies the name of the auxiliary device on which the files to be purged reside. The PN parameter cannot be specified if a device number is specified (DN=dn).

R=r Specifies the type of auxiliary device on which the files to be purged reside. The R parameter cannot be specified if a device number is specified (DN=dn).

TM=tm Specifies the time of day on the date specified by the AD, MD, or CD parameter; its format is hhmmss.

TY=ty Specifies the file type to be purged.

<table>
<thead>
<tr>
<th>ty</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>A or ALL</td>
<td>Purges all files.</td>
</tr>
<tr>
<td>D or DIRECT</td>
<td>Purges all direct access files.</td>
</tr>
<tr>
<td>I or INDIR</td>
<td>Purges all indirect access files.</td>
</tr>
</tbody>
</table>

If this parameter is omitted, but other parameters are specified, the system assumes ty is ALL. To purge all files if no other parameters are specified, you must specify TY=A.

WB Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.

To purge all files in your catalog, you must enter:

PURGALL,TY=A.

AF, CT, DF, DN, EF, FN, NA, PN, R, TM, TY, and one date (either AD, CD, or MD) can be entered on a single PURGALL command.

PURGE COMMAND

The PURGE command names files to be removed from the permanent file device.

Format:

PURGE,pfn1,pfn2,...,pfnn/UN=username,PW=password,PN=packname,R=r,NA,WB.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pfni</td>
<td>Specifies the name of a permanent file to be purged. If no file is named, and if a permanent file exists that has the same name as the primary file, that permanent file is purged; the primary file remains assigned to the job.</td>
</tr>
</tbody>
</table>

60459680 L
The full descriptions of the following optional parameters are given at the beginning of this section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UN=username</td>
<td>Specifies the user name. Specified if the file(s) to be purged is in another user's catalog. To purge a file, you must have write permission for that file.</td>
</tr>
<tr>
<td>PW=password</td>
<td>Specifies the file password. Specified if UN=username is specified, and if the permanent file to be purged has a password.</td>
</tr>
<tr>
<td>PN=packname</td>
<td>Specifies the auxiliary device name. Specified if the permanent file resides on an auxiliary device.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type. Specified if a removable auxiliary device on a device type other than the installation-defined default is to be used.</td>
</tr>
<tr>
<td>NA</td>
<td>Specifies the no abort option. If NA is specified, processing errors do not terminate the job.</td>
</tr>
<tr>
<td>WB</td>
<td>Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs and busy files.</td>
</tr>
</tbody>
</table>

When a PURGE command is issued for any direct access file, the file is purged and the permanent file catalog is altered accordingly. However, if the direct access file is attached to a job, it remains attached to the job until you return it.

**RECLAIM COMMAND**

The RECLAIM command performs a number of functions related to the transfer of NOS files between your job and a dump file. The dump file can be a magnetic tape or a mass storage (disk) file. Using RECLAIM you can selectively dump local or permanent files, retrieve files from a dump file, and list information about files previously dumped to tape or mass storage.

RECLAIM provides you with an easy way of making backup copies of local files or of direct and indirect access permanent files. It also gives you greater control over the size of your permanent file disk space. RECLAIM can be entered from a batch or interactive job.

Dumped files can be reloaded as local or permanent files. Reloaded permanent files have the same permissions, modes, permit categories, and so forth that they had when dumped. Note, however, that file history information for reloaded files (that is, file creation date, last date modified, last date accessed, etc.) is set to the date and time of loading. Files can be reloaded from tape by the file owner or by an alternate user.

Information about dumped files (such as file name, dump date, tape VSN, dump number, and so forth) can be stored in a dump database. This database is maintained as a direct access file in your permanent file catalog. RECLAIM automatically creates a dump database when you enter a DUMP directive unless you specify that you do not want a database for the dump.
If you do not specify a name for the database, RECLAIM uses the default name RECLDB. To get information on individual files in the database, enter a RECLAIM command with the LIST directive.

Multiple users can share a dump database. For example, alternate users can access a database in your catalog by entering a RECLAIM command specifying your database file name (on the DB parameter) and your user name (on the UN parameter). As with any other permanent file, alternate users must have WRITE permission to access and use your database file.

MAGNETIC TAPES

As previously mentioned, you can use RECLAIM to dump or retrieve files to or from magnetic tapes as well as mass storage media. You should be aware of the following special rules that apply when using tapes with RECLAIM:

- You do not need to enter a REQUEST command for RECLAIM dump tapes. RECLAIM issues its own REQUEST command internally when you enter a COMPACT, DUMP, LOAD, or COPY directive (RECLAIM directives are described below). RECLAIM uses the default parameter values for the REQUEST command.

  **NOTE**

  Since RECLAIM issues the REQUEST command internally, you must be prepared to wait for the tape mount if you enter a COMPACT, DUMP, LOAD, or COPY directive from an interactive job. Other alternatives are to submit the RECLAIM command from a batch job or to detach your interactive job using the Detach (ctD) command.

- RECLAIM dump tapes must be labeled; unlabeled tapes are not permissible.

- If you enter a LOAD, COPY, or LIST directive for a tape that is not already defined to the RECLAIM database, RECLAIM reads the entire tape and adds all files on the tape, or all files matching the specified user index if the UI processing option is specified, to the database. This feature lets you add the entire contents of a tape to the database without having to name each file individually.

- The tape processing options listed under Processing Options in section 12 are valid for RECLAIM tapes. Processing options are specified with the PO option.

- The permanent file tapes are written by the RECLAIM utility in a format compatible with both PF DUMP and PFLOAD. The NOS 2 Analysis Handbook describes these permanent file utilities.
COMMAND FORMAT

The parameters of the RECLAIM command are order-independent. The directives and the options are appended to the end of the command.

NOTE

For sites using the Tape Management System (TMS), there are additional directive options available on the RECLAIM command which are not described in this manual. For a description of the RECLAIM command under TMS, refer to the NOS Version 2 Tape Management System (TMS) User Reference manual.

Format:

RECLAIM,p1,p2,...,pn/directive1,options1/directive2,options2/directive_n,options_n.

Parameter Description

P_i Specifies any of the following optional parameters.

Parameter Description

DB=pf

Specifies the name of the direct access file that contains the RECLAIM database. The default file name for pf is RECLDB. If a value of 0 is entered for pf, no database is created or maintained.

Do not attach the database file before you call RECLAIM; RECLAIM attaches the file for you.

I=lfn_1

Specifies the name of the local file containing the RECLAIM input directives to be processed. The default file name for lfn_1 is INPUT.

L=lfn_2

Specifies the name of the local file to receive output listing. The default file name for lfn_2 is OUTPUT.

No abort option. Inhibits RECLAIM abort in case of a program error.

Inhibits RECLAIM from printing a header on file lfn_2.

Specifies that a dump is to be written at end-of-information (EOI), regardless of what precedes the EOI. If this parameter is omitted, RECLAIM will not write a dump beginning at EOI unless at least one valid RECLAIM dump precedes the EOI.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PN=packname</td>
<td>Specifies the auxiliary device name. You specify packname only if the database file resides on an auxiliary device.</td>
</tr>
<tr>
<td>PW=password</td>
<td>Specifies the file password for the database file; applicable only if the database file resides in an alternate user catalog.</td>
</tr>
<tr>
<td>R=devtype</td>
<td>Specifies the mass storage device type for database residence. This parameter is applicable only if the PN parameter is also specified. If PN is specified but R is not, the system default device type specified by IPRDECK entry DFPT is used.</td>
</tr>
<tr>
<td>UN=username</td>
<td>Specifies the user name of the database file owner; applicable only if the database file resides in an alternate user catalog. You must have WRITE permission to access files under an alternate user name.</td>
</tr>
<tr>
<td>Z</td>
<td>Specifies that the RECLAIM command contains input directives following the terminator. If the Z parameter is specified, the I parameter is ignored. Use of the Z parameter eliminates the need for an input file (lfni) when only a few directives are required.</td>
</tr>
</tbody>
</table>

**directive**

Specifies how RECLAIM is to manipulate files that meet the criteria set forth in the directive options. (RECLAIM directives and options are described below.)

**options**

Specifies a file characteristic or attribute RECLAIM is to use in selecting the file or files to be processed. (RECLAIM directives and options are described below.) Use a comma to separate individual options.

RECLAIM directives define the operation to be performed on a specified file or files. All directives except END can have one or more associated options. A comma is used as the separator between a directive and its associated options.

When you enter a RECLAIM command with the Z parameter, you type in the directives following the command terminator. The first character following the terminator must be the separator character used to separate individual directives. The separator character can be any character that does not appear within the directives. (We use the / character in the examples in this section.)
Following are descriptions of the RECLAIM directives. The description of the options for the directives immediately follows the description of the directives.

<table>
<thead>
<tr>
<th>Directive</th>
<th>Description</th>
</tr>
</thead>
</table>
| COMPACT   | Rewrites a dump file using only the active files from the database. All files logically deleted (using the DELETE directive) from your database are physically deleted from the dump file and the database. Options may also be specified which apply additional file selection criteria. Files which do not meet these additional criteria are also physically deleted. The database is updated to remove all inactive entries and update the dumpfile number for the remaining entries. COMPACT cannot be used on dump files that have no database file. The active files rewritten by the COMPACT directive are consolidated into a single dump before being rewritten; that is, the new dump file contains only one dump, unless existing dumps on the new dump file are preserved by specifying the EI or EI=Y option. Files are written to the new dump file at beginning-of-information (file is rewound) unless EI or EI=Y is specified. If EI or EI=Y is specified and RECLAIM determines that a dump file is empty or does not contain a RECLAIM dump, it sends the following message to the dayfile and the terminal:

UNKNOWN DUMP FILE WILL BE REWRITTEN.

If the COMPACT directive was entered interactively, RECLAIM issues the prompt:

IS THIS OK (YES OR NO)?

If you enter YES, the COMPACT directive proceeds normally. For a NO response, RECLAIM ignores the directive and prompts for the next one. In a noninteractive job, RECLAIM proceeds with the COMPACT directive.

You must specify one of the following options to indicate where the dump file to be created by COMPACT is to be stored:

- CF=clfn
- CN=cpfn
- CT=vsn
- OV

Either or both of the CF=clfn and CN=cpfn options must be specified in conjunction with the DT=MS option if a new mass storage file is to receive the dump.

The CT=vsn option must be specified if a new tape is to receive the dump. If you intend to enter a COMPACT directive specifying a new tape, you must issue a RESOURC command to allow RECLAIM to request the two tapes at once.
You must specify the OV option if the dump is to be rewritten on the original tape or file. To rewrite a dump tape, the compacted dump is first written to a disk scratch file, then copied to the original file.

If the OV option is specified, the EI or EI=Y option should not be used. If it is used, it will be ignored.

If you know or expect that a dump will require multiple reels, you must enter a VSN command before entering RECLAIM. The VSN command should specify as many VSNs as necessary and should associate the VSNs with the local file name specified by the CF option. If no CF option is specified, the default local file name NTAPE is used.

Creates local file copies of all dumped files that meet the criteria specified by the COPY directive options. (The COPY directive is the same as the LOAD directive except that the LOAD directive creates permanent files from dumped files.) The copied files are created using their original permanent file names unless they are explicitly renamed.

The COPY directive performs its own tape requests internally. If a copy is initiated for several files resident on a single tape, that tape is only requested once. If the copy specifies files on multiple tapes, multiple tape requests are initiated.

The COPY directive can be used to read files from a tape that is not listed in the RECLAIM database. When used in this way, RECLAIM reads all files from the tape (regardless of how many files are specified by the COPY directive options) and adds all files to the RECLAIM database.

The latest (most recently dumped) version of each file is copied unless you specify other characteristics. The following are examples of a COPY directive:

```
RECLAIM,Z./COPY,PF=ALPHA/COPY,PF=BETA/COPY,PF=SIGMA
```

or

```
RECLAIM,Z./COPY,PF=*/ALPHA,BETA,SIGMA
```

Either of the above commands copies the latest (most recently dumped) versions of files ALPHA, BETA, and SIGMA and makes them local files.

Disables all files in your database that meet the criteria specified by the DELETE directive options. Deleted files are not physically deleted from the database and can be restored to active status using the RESET directive. Use the LIST directive with the DE option to list deleted files. You can use DELETE to temporarily disable selected files, thus allowing you to load all files except those disabled. All files disabled by DELETE are physically removed from the dump file if a COMPACT directive is entered before the disabled files are reactivated (using RESET). The following is an example of a DELETE directive:

```
RECLAIM,Z./DELETE,DD=851204
```

The above example instructs RECLAIM to disable all files dumped on the date 12/4/85.
DUMP

Dumps to tape or mass storage all permanent files that meet the criteria specified by the DUMP directive options. Information that RECLAIM requires to perform future reloads from the dump file is stored in a database file within the specified user catalog. If the specified database file does not exist, RECLAIM creates it. You can inhibit the creation or use of a database file by specifying the DB=0 parameter.

Files are dumped in the order they appear in your permanent file catalog unless you specify the PF or FN option. Files are then dumped in the order they are listed for PF or FN. If a file is listed more than once for PF or FN, multiple copies are dumped, in the specified order.

Files dumped are written to the dump file at EOI unless EI=N is specified. If RECLAIM determines that a dump file is empty or does not contain a RECLAIM dump, it sends the following message to the dayfile and the terminal:

UNKNOWN DUMP FILE WILL BE REWRITTEN.

If the DUMP directive was entered interactively, RECLAIM issues the prompt:

IS THIS OK (YES OR NO)?

If you enter YES, the DUMP directive proceeds normally. For a NO response, RECLAIM ignores the directive and prompts for the next one. In a noninteractive job, RECLAIM proceeds with the DUMP directive.

The following is an example of a RECLAIM DUMP directive:

RECLAIM,Z./DUMP,TY=D,TN=001442

This example instructs RECLAIM to dump all direct access permanent files in your catalog to a magnetic tape with the VSN of 001442. If a database named RECLDB does not currently exist, RECLAIM creates it.

If you know or expect that a dump will require multiple reels, you must enter a VSN command before entering the RECLAIM command. The VSN command should specify as many VSNs as necessary and should associate the VSNs with the local file name specified by the DF option. The default name is TAPE. For example:

VSN,TAPE=001442/001501/001995.
RECLAIM,Z./DUMP,TN=001442,TY=D

The above example duplicates the previous example, but allows for a multi-reel dump.
Directive | Description
--- | ---
**END** | Ends the current RECLAIM session. At an interactive terminal, a blank line followed by a carriage return is equivalent to an END. In a directive file, an EOR has the same effect as an END directive.

You can use the F tape processing option (refer to Processing Options in section 12) to instruct RECLAIM to unload a tape when the END directive is entered. To do this, enter the following SET directive before you initiate any operation that would cause a tape to be mounted (such as a COPY, DUMP, or LOAD):

```
SET,PO=F
```

**LIST** | Lists RECLAIM database information about all dumped files that meet the criteria specified by the accompanying directive options. Files are listed in alphabetical order except for dump files without a database. Dump files with no database are listed in sequential order.

The LIST directive can be used to list files on a tape that is not listed in the RECLAIM database. When used in this way, RECLAIM adds all files on the tape to the RECLAIM database, regardless of how many files are specified by the LIST directive options.

**LOAD** | Loads into your permanent file catalog all of the files that meet the criteria specified by the LOAD directive options. (The LOAD directive is the same as the COPY directive except that the COPY directive creates only local files.) The latest (most recently dumped) version of each file is loaded unless you specify other characteristics. If a file name specified in a LOAD directive already exists in the catalog, the file will not be loaded unless the RP or RP=Y option is also specified.

The LOAD directive can be used to load files from a tape that is not listed in the RECLAIM database. When used in this way, RECLAIM loads all files from the tape (regardless of how many files are specified by the LOAD directive options) and adds all files to the RECLAIM database.

The LOAD directive performs its own tape requests internally. If a load is initiated for several files resident on a single tape, that tape is only requested once. If the load specifies files on multiple tapes, multiple tape requests are initiated. Following are examples of the LOAD directive:

```
RECLAIM,Z./LOAD,PF=MYFILE
```

The above LOAD directive loads into your catalog the most recently dumped version of MYFILE.

```
RECLAIM,Z./LOAD,DD=840112,NF=595
```

The above LOAD directive loads up to 595 files dumped on the date 1/12/84.
Either of the previous LOAD directives loads the latest version of file ALPHA with a modification date of 11/14/83. File ALPHA is loaded into your catalog as file BETA. If a permanent file called BETA already exists in your catalog, the file is not loaded. If a permanent file named ALPHA exists in the catalog, it does not affect, and is not affected by, this operation.

QUIT

Equivalent to END.

REMOVE

Permanently removes a tape volume serial number (VSN) from the database. This purges from the database all entries for the specified tape.

RESET

Reactivates all files previously disabled by the DELETE directive that meet the criteria specified by the RESET directive options.

SET

Redefines the RECLAIM defaults for any directive options. Typically, this directive is used during a long RECLAIM session to establish criteria for subsequent processing. If a SET directive is encountered without an accompanying option, it has no effect on current defaults.
The options that can be associated with RECLAIM directives are described below.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AA=ymmd</td>
<td>Instructs RECLAIM to process only those files accessed after a specified date. The AA option may be used in conjunction with AB to specify a date range. The option is used with DUMP. If DB=0, it may also be used with COPY, LIST, and LOAD.</td>
</tr>
<tr>
<td>AB=ymmd</td>
<td>Instructs RECLAIM to process only those files accessed before a specified date. The AB option may be used in conjunction with AA to specify a date range. The option is used with DUMP. If DB=0, it may also be used with COPY, LIST, and LOAD.</td>
</tr>
<tr>
<td>AD=ymmd</td>
<td>Instructs RECLAIM to process only those files accessed on a specified date. The AD option is used with DUMP. If DB=0, it may also be used with COPY, LIST, and LOAD.</td>
</tr>
<tr>
<td>CF=clfn</td>
<td>Specifies the name of the local file to receive the compacted dump. If clfn is omitted, the local file name is the name specified for the CN parameter. If the CN parameter is omitted, the default name NTAPE is used for clfn. This option is used with COMPACT.</td>
</tr>
<tr>
<td>CN=cpfn</td>
<td>Specifies the permanent file to receive the compacted dump if you do not want to overwrite the original dump file. (Use the OV option to overwrite the original dump file.) The CN option allows you to specify different names for the local and permanent file copies of the dump file. This option does not create, save, or replace the permanent file. These operations are the user's responsibility. This option is used with COMPACT.</td>
</tr>
<tr>
<td>CT=vsn</td>
<td>Specifies the VSN of the tape to which the compacted dump is to be written. The CT option is used with COMPACT.</td>
</tr>
<tr>
<td>D=den</td>
<td>Specifies tape density. Values that can be specified for den are as follows:</td>
</tr>
<tr>
<td></td>
<td>den</td>
</tr>
<tr>
<td></td>
<td>HI</td>
</tr>
<tr>
<td></td>
<td>HY</td>
</tr>
<tr>
<td></td>
<td>HD</td>
</tr>
<tr>
<td></td>
<td>PE</td>
</tr>
<tr>
<td></td>
<td>GE</td>
</tr>
</tbody>
</table>

The D option is used with COMPACT and DUMP.

<p>| DA=ymmd  | Instructs RECLAIM to process only those files dumped after a specified date. DA may be used in conjunction with DB to specify a date range. The DA option is used with COMPACT, COPY, DELETE, LIST, LOAD and RESET. |
| DB=ymmd  | Instructs RECLAIM to process only those files dumped before a specified date. DB may be used in conjunction with DA to specify a date range. The DB option is used with COMPACT, COPY, DELETE, LIST, LOAD and RESET. |
| DD=ymmd  | Instructs RECLAIM to process only those files dumped on a specified date. The DD option is used with COMPACT, COPY, DELETE, LIST, LOAD and RESET. |</p>
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DE</td>
<td>Instructs RECLAIM to process only those files that have been disabled by DELETE. If this option is omitted, only undeleted files are processed. The DE option is used with COMPACT, COPY, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>DF=dlfn</td>
<td>Specifies the name of the local file copy of a dump file. The default name for dlfn is TAPE. The DF option is used with DUMP.</td>
</tr>
<tr>
<td>DN=dpfn</td>
<td>Specifies the file to or from which files are to be processed. Only files on this dump file that meet other specified selection criteria are selected. The DN option is logically equivalent to and interchangeable with the TN option except if a DT, MT, or NT option is not specified. In this case, DN implies a mass storage dump file while TN implies a tape dump file (therefore, TN causes RECLAIM to issue an internal REQUEST command, whereas DN does not). The DN option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD, and RESET.</td>
</tr>
<tr>
<td>DT=dtype</td>
<td>Specifies the type of dump file to be created. Possible values for dtype are:</td>
</tr>
<tr>
<td></td>
<td>dtype</td>
</tr>
<tr>
<td>MS</td>
<td>The dump is placed on a mass storage (disk) file.</td>
</tr>
<tr>
<td>MT</td>
<td>The dump is placed on 7-track magnetic tape. (Same as MT option.)</td>
</tr>
<tr>
<td>NT</td>
<td>The dump is placed on 9-track magnetic tape. (Same as NT option.)</td>
</tr>
<tr>
<td>EI=option</td>
<td>Specifies whether RECLAIM is to write dumped files at the beginning of the dump file or write dumped files at the end of the dump file.</td>
</tr>
<tr>
<td>option</td>
<td>Description</td>
</tr>
<tr>
<td>Y</td>
<td>Files are to be written to the dump file at end-of-information.</td>
</tr>
<tr>
<td>N</td>
<td>Files are to be written to the dump file at beginning-of-information, thus destroying any existing information on the dump file.</td>
</tr>
</tbody>
</table>

If EI appears alone, it is equivalent to EI=Y. If EI is omitted, DUMP processing assumes EI=Y; COMPACT processing assumes EI=N. The EI option is used with COMPACT and DUMP.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EX=option</td>
<td>Specifies the use of exception processing for RECLAIM options. Values that can be specified for option are Y or N. Y indicates that exception processing is used; that is, only files that fail one or more selection criteria are processed. N indicates that normal processing is used; that is, only files that meet all selection criteria are processed. The EX option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD, and RESET.</td>
</tr>
<tr>
<td>F=format</td>
<td>Specifies any valid NOS tape format. The F option is used with COMPACT or DUMP.</td>
</tr>
<tr>
<td>FI=nn</td>
<td>Specifies the dump number (1 to 63) to which the dump file is to be positioned. A dump is the set of user files dumped to a file by a single DUMP or COMPACT directive. The FI option can be used in conjunction with the RC option to position the tape or file pointer to a particular file within a specified dump. (The FI value associated with a particular file is listed in the FI column of the RECLAIM output listing.) The FI option is used with COPY and LOAD.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>FN=filename</td>
<td>Processes files in the same manner as the PF option with one exception: When used with a DUMP directive, it first checks to see if a named file exists as a local file. If so, the local file is dumped. The TY option can be used with FN to specify whether named local files are to be dumped as direct access or indirect access files. The default is direct access. The FN option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD, and RESET. For all directives except DUMP, the FN and PF options are interchangeable.</td>
</tr>
<tr>
<td>GT=length</td>
<td>Instructs RECLAIM to process only those files that have a length in PRUs greater than the length specified. GT may be used in conjunction with LT to specify a size range. The GT option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>LT=length</td>
<td>Instructs RECLAIM to process only those files that have a length in PRUs less than the length specified. LT may be used in conjunction with GT to specify a size range. The LT option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>LV</td>
<td>Specifies that the most current version of the specified file is to be processed. This is the default for the COPY and LOAD directives. The LV option is used with COMPACT, COPY, DELETE, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>MA=ymmd</td>
<td>Instructs RECLAIM to process only those files modified after a specified date. MA may be used in conjunction with MB to specify a date range. The MA option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>MB=ymmd</td>
<td>Instructs RECLAIM to process only those files modified before a specified date. MB may be used in conjunction with MA to specify a date range. The MB option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>MD=ymmd</td>
<td>Instructs RECLAIM to process only those files modified on a specified date. The MD option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>MT</td>
<td>Specifies the use of a 7-track tape drive. The MT option is used with DUMP.</td>
</tr>
<tr>
<td>NF=num</td>
<td>Specifies the maximum number of files to be processed. If the NF option is omitted, there is no limit on the number of files processed, except for the DUMP directive. The limit for DUMP is 4095 files. The NF option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>NN=pfn</td>
<td>Specifies a new file name for the file named by the PF option. The NN option is used with COPY, DUMP and LOAD.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>NT</td>
<td>Specifies the use of a 9-track tape drive. The NT option is used with DUMP.</td>
</tr>
<tr>
<td>OV</td>
<td>Specifies that a compacted dump is to be written over the old dump tape. The OV option is used with COMPACT.</td>
</tr>
<tr>
<td>PF=pfn</td>
<td>Specifies the name of the permanent file or files to be processed by RECLAIM. If only one file is to be processed, pfn is any valid NOS file name. If PF and FN are both omitted, the files to be processed are determined by the other options which have been specified. If multiple files are to be selected by name, specify an asterisk (<em>) for pfn. When PF=</em> is specified, a file name list containing up to 999 file names may be entered. A line of file names ending with a comma indicates that the file name list is continued on the next line. For interactive requests, RECLAIM prompts you to enter the file names with the message:</td>
</tr>
<tr>
<td></td>
<td>ENTER FILE NAMES.</td>
</tr>
<tr>
<td></td>
<td>The file name list contains one entry for each file to be processed. Each entry consists of the name of the file to be processed, unless the file is to be renamed. If the file is to be renamed, the entry is in the format, newname=oldname. Entries are separated by commas. An entry not followed by a separator indicates the end of the list. A comma at end of line indicates that another line follows. Following is an example of a file name list:</td>
</tr>
<tr>
<td></td>
<td>RECLAIM,Z./DUMP,TN=MYVSN,PF=*/ALPHA,GAMMA=BETA</td>
</tr>
<tr>
<td></td>
<td>This command will cause RECLAIM to dump files ALPHA and BETA. The files will be identified in the dump and in the database as ALPHA and GAMMA. The PF option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD and RESET.</td>
</tr>
<tr>
<td>PO=plp2...pn</td>
<td>Specifies general tape processing options for a dump tape. Refer to Processing Options in section 12 for a description of dump tape processing options. Options I, P, and S are not accepted by RECLAIM. The PO option is used with COMPACT, COPY, LIST, LOAD, DUMP, and SET. The PO option is seldom required, as the RECLAIM defaults cover most situations adequately. PO=UR is the default for the COPY, LIST, and LOAD directives. PO=UW is the default for the COMPACT and DUMP directives.</td>
</tr>
<tr>
<td>RC=nnnn</td>
<td>Specifies the dump record number (1 to 4095) within a dump that indicates where the dump file is to be positioned. The RC option is used in conjunction with the FI option to specify the location of a file within a dump. (The RC value associated with a particular file is listed in the REC column of the RECLAIM listable output.) The RC option is used with COPY and LOAD.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>RP=option</td>
<td>Specifies that a file is to be loaded or copied from a dump file, even if a local or permanent file by the same name already exists. Possible values for option are Y, N, or C. When used with the LOAD directive, specifying RP or RP=Y indicates that an existing permanent file will be replaced by a file loaded from a dump. Specifying RP=N or omitting the RP option indicates that an existing permanent file will not be replaced by a loaded file. When used with the COPY directive, specifying RP or RP=Y indicates that a local file will be rewound and overwritten by a file copied from a dump. Specifying RP=C indicates that a file from a dump will be copied to an existing local file at its current location. If RP=N is specified, or if the RP option is omitted, RECLAIM returns the existing local file before copying the file from DUMP. The RP option is used with COPY and LOAD.</td>
</tr>
<tr>
<td>TN=vsn</td>
<td>Specifies the VSN of the tape to or from which files are to be processed (VSN of the first reel for a multi-reel dump). Only files on this tape which also meet any other specified selection criteria are processed. This option is logically equivalent to and interchangeable with the DN option except if a DT, MT, or NT option is not specified. In this case, DN implies a mass storage dump file while TN implies a tape dump file (therefore, TN causes RECLAIM to issue an internal REQUEST command, whereas DN does not). The TN option is used with COMPACT, COPY, DELETE, DUMP, LIST, LOAD, RESET and SET.</td>
</tr>
<tr>
<td>TO=username</td>
<td>User name. Refer to the NOS Version 2 Tape Management System (TMS) User Reference manual for a detailed description.</td>
</tr>
<tr>
<td>TY=type</td>
<td>Specifies the permanent file type to be processed. Values that can be specified for the TY option are: D (direct access) and I (indirect access). If this option is omitted, both file types are eligible for processing. The TY option is used with COMPACT, COPY, DELETE, LIST, LOAD, and RESET.</td>
</tr>
<tr>
<td>UI=user index</td>
<td>Instructs RECLAIM to process only files for the specified user index when the COPY, LIST, or LOAD directive is used to process a dump tape or file not on the database, or when no database is being used (DB=0). If this option is either omitted or specified as UI=0, the user index of files on the dump tape or file being processed will be ignored.</td>
</tr>
<tr>
<td>UN=username</td>
<td>Instructs RECLAIM to process files only for the specified user name on the RECLAIM database, when files are shared among multiple users. If this option is omitted, processing is performed only on the calling user's dumped files. Files for all users will be processed if UN=0 is specified. The UN option is used with COMPACT, COPY, DELETE, LIST, LOAD and RESET. If the UN option specifies a user name not originally in the RECLAIM database, RECLAIM loads all files (LOAD directive) or lists information about all dumped files (LIST directive) on a file set specified by the TN or DN options. Loaded files are recorded in the database under the user name specified by the UN option.</td>
</tr>
</tbody>
</table>
RECLAIM OUTPUT

All RECLAIM directives except END, QUIT and SET generate output listings in the following format:

```
RECLAIM Vvvv OP=ddddddd UN=username yy/mm/dd. hh.mm.ss. PAGE nn
PFN TYPE LAST MOD DUMP DATE LENGTH USERNAME TAPE FI REC
```

where:

- **vvv**: Current version of RECLAIM.
- **ddddddd**: Name of the RECLAIM directive being processed.
- **username**: User name of the calling user.
- **nn**: Current page number (not displayed for interactive users).
- **pfname**: Name of the permanent file being processed.
- **ty**: File type (I for indirect access or D for direct access).
- **len**: Length in PRUs of file pfname when dumped.
- **dmpuser**: The user name under which file pfname was originally dumped.
- **dumpid**: VSN of the tape or name of dump file containing file pfname (VSN of the first reel for a multi-reel dump).
- **fi**: The dump number on dumpid containing file pfname.
- **rc**: The record number on dump fi containing file pfname.

Entering a RECLAIM command with the NH parameter specified suppresses printing of the heading and the n FILES PROCESSED line; only the file information is printed.

Example 1

The following RECLAIM command lists a portion of dump file database MYDB, and terminates the RECLAIM session.

```
/reclaim,db=mydb,z./list,tn=01/end
```

```
RECLAIM V4.2 OP=LIST UN=OMEN 83/12/14. 13.03.34.
PFN TYPE LAST MOD DUMP DATE LENGTH USERNAME TAPE FI REC
```

```
DEMA  I  83/11/18  83/12/13  187  OMEN  01  1  2
DEMB  I  83/11/18  83/12/13  27  OMEN  01  1  1
```

2 FILES PROCESSED.

```
RECLAIM COMPLETE.
```
REPLACE COMMAND

The REPLACE command can purge an indirect access permanent file and replace it with a copy of a local file on mass storage. It can also save a copy of a local file on mass storage as a new indirect access permanent file.

Format:

REPLACE, lfn1=pfn1, lfn2=pfn2, ..., lfnn=pfnn/UN=username, PW=password, M=m, PN=packname, R=r, NA, WB.

Parameter Description

lfn1=pfn1 Specifies that a copy of local file lfn1 becomes an indirect access permanent file named pfn1 (one- to seven-character name). If an indirect access file named pfn1 already exists, it is replaced.

If lfn1 is omitted, the name of the local file is assumed to be pfn1. If no files are named, a copy of the primary file becomes an indirect access permanent file, replacing any existing indirect access permanent file by that name.

The full descriptions of the following optional parameters are given at the beginning of this section.

Parameter Description

UN=username Specifies the user name. Specified if the file to be replaced is in another user's catalog. To replace another user's file, you must have write permission and be validated to create indirect access permanent files (refer to LIMITS Command in section 7).

PW=password Specifies the file password. Specified if the UN=username is specified, and if the permanent file to be replaced has a password.

M=m Specifies the file access mode if the file does not already exist, or if you want to change the access mode. If M=m is omitted for a newly created file, M=READ is assumed. If the parameter is omitted for a previously existing file, the current access mode is retained.

PN=packname Specifies the auxiliary device name. Specified if the permanent file to be replaced resides on an auxiliary device.

R=r Specifies the device type. Specified if a removable auxiliary device on a device type other than the installation-defined default is to be used.

NA Specifies the no abort option. If NA is specified, processing errors do not terminate the job.

WB Specifies the wait-if-busy option. The job waits for the mounting of disk packs.

The local files, lfn1, are rewound before and after the replace operation.

The indirect access file created has the same access category as the file it replaces. Permission information and alternate user access data for the file are retained when a file is replaced. If the file created is a new file, it is created as a private file.
SAVE COMMAND

The SAVE command retains a copy of a local file on mass storage as an indirect access file. When you save a file using this command, the charge number and project number currently in effect for your job are associated with the file.

Format:

SAVE,lfn₁=pfn₁,lfn₂=pfn₂,...,lfnₙ=pfnₙ/PW=password,CT=ct,M=m,SS=subsystem,
BR=br,PR=pr,PN=packname,R=r,NA,WB,AL=level,XD=expiredate,XT=expireterm,AC=ac.

Parameter Description

lfn₁=pfn₁ Specifies that a copy of local file lfn₁ becomes an indirect access permanent file named pfn₁ (one- to seven-character name). If lfn₁ is omitted, the name of the local file is assumed to be pfn₁. If no files are named, a copy of the primary file becomes an indirect access permanent file with the same name as the primary file.

The full descriptions of the following optional parameters (except M=m) are given at the beginning of this section.

Parameter Description

PW=password Specifies the one- to seven-character password that other users must specify to access the file.

CT=ct Specifies the file permit category; entries are P, PR, or PRIVATE for private; S or SPRIV for semiprivate; and PU or PUBLIC for public. If CT=ct is omitted, CT=PRIVATE is assumed.

M=m Specifies the file access mode permitted to other users if the file is public or semiprivate, and if explicit access permission has not been granted to that user. If M=m is omitted, M=READ is assumed.

If m is: Other users can:
R or READ Retrieve a copy of the file. This copy can be read or executed.
RU or READUP
RA or READAD
RM or READMD
U or UPDATE
E or EXECUTE Retrieve a copy of the file. This copy can only be executed.
A or APPEND Append data to the file with the APPEND command.
M or MODIFY Retrieve a copy of the file or append data to the file. The user can enter GET, OLD, NEW, and APPEND commands, but not a REPLACE command, for the file.
W or WRITE Retrieve a copy of the file, append data to it, replace it, or purge it.
N or NULL No access is allowed.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SS=subsystem</td>
<td>Specifies the interactive subsystem associated with the file. This subsystem becomes associated with the permanent file pfn, and is selected automatically each time the file is retrieved for use as a primary file. If SS=subsystem is omitted, SS=NULL is assumed unless lfn is the primary file. In that case, the file is associated with the currently active subsystem. If SS is specified without a subsystem, the file is associated with the currently active subsystem.</td>
</tr>
<tr>
<td>BR=br</td>
<td>Specifies the backup copy requirement; possible values are MD (one backup copy required), N (no backup), or Y (two backup copies required). If BR=br is omitted, BR=Y is assumed.</td>
</tr>
<tr>
<td>PR=pr</td>
<td>Specifies the preferred file residence; possible values are D (disk residence preferred), L (locked to disk), M (alternate storage residence preferred), N (no preference), or T (tape alternate storage residence preferred). If PR=pr is omitted, PR=N is assumed.</td>
</tr>
<tr>
<td>PN=packname</td>
<td>Specifies the name of the auxiliary device on which the indirect access file is to reside.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type on which the indirect access file is to reside. The device must be a permanent file mass storage device on which indirect access files are allowed.</td>
</tr>
<tr>
<td>NA</td>
<td>Specifies the no abort option. If NA is specified, processing errors do not terminate the job.</td>
</tr>
<tr>
<td>WB</td>
<td>Causes the job to wait for the mounting of disk packs.</td>
</tr>
<tr>
<td>AL=level</td>
<td>Specifies the security access level you want assigned to the file. Unless changed by your site, level can be one of the following names: LVL0, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7 The default is the access level of the local file being saved.</td>
</tr>
<tr>
<td>XD=expiredate</td>
<td>Specifies the expiration date for the file password. The value expiredate must be a 6-digit string of the form yymmd; where yy, mm, and dd are 2-digit year, month, and day designators, respectively. You can specify this parameter only if you also specify the PW=password parameter.</td>
</tr>
<tr>
<td>XT=expireterm</td>
<td>Specifies the life of the file password in days. If you specify 0, the file password expires immediately. If you specify 4095 or *, the file password does not expire. You can specify this parameter only if you also specify the PW=password parameter.</td>
</tr>
<tr>
<td>AC=ac</td>
<td>Specifies whether alternate users may obtain information about the file using CATLIST. Entries are Y (yes) and N (no). The default is N. The local files, lfn_i, are rewound before and after the save operation.</td>
</tr>
</tbody>
</table>
SETPFAC COMMAND

The SETPFAC command changes the set of security access categories associated with a permanent file. You can either specify an entirely new category set or add to or delete from the current category set. By default on a secured system, the system associates all of the access categories for which you are authorized to any permanent file you create.

Format:

SETPFAC,pfn,AC=category1,category2,...,categoryn/PN=packname,R=r,NA,WB.

or

SETPFAC,pfn,AC=category1,category2,...,categoryn/PN=packname,R=r,NA,WB.

Parameter Description

pfn Specifies the permanent file whose access category set you want to change.

AC=0,... Specifies a new category set. Unless changed by your site, categoryi can be any of the following names:

categoryi CAT00,CAT01,...,CAT31

AC=... Specifies categories to add or delete from the current category set.

categoryi To add a category, prefix the category name with a plus sign or use no prefix at all. To delete a category, prefix the category name with a minus sign.

PN=packname Specifies the auxiliary device name. You must specify this parameter if pfn resides on an auxiliary device.

R=r Specifies the device type. You must specify this parameter if a removable auxiliary device on a device type other than the installation-defined default is to be used.

NA Specifies the no abort option. If NA is specified, processing errors do not terminate the job.

WB Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.

The first format creates a new access category set. The second format adds to or deletes from the current category set.

On a secured system, the categories you specify must be valid for your job (ENQUIRE,B returns this information). On an unsecured system, the system does not use the categories to monitor access to the file but does maintain the categories as a file attribute.
SETPFAL COMMAND

The SETPFAL command changes the security access level of a permanent file. By default, a direct access file inherits the access level of the creating job. An indirect access permanent file inherits the access level of the local file from which it was created. You can also explicitly set the access level when you create a permanent file by specifying the AL=level parameter on the command you use to create the file.

Format:

SETPFAL,pfn,AL=level/PN=packname,R=r,NA,WA,

The first two parameters are required and are order-dependent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pfn</td>
<td>Specifies the permanent file whose access level you want to change.</td>
</tr>
<tr>
<td>AL=level</td>
<td>Specifies the security access level you want assigned to the file. Unless changed by your site, level can be one of the following names: LVLO, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7</td>
</tr>
<tr>
<td>PN=packname</td>
<td>Specifies the auxiliary device name. You must specify this parameter if pfn resides on an auxiliary device.</td>
</tr>
<tr>
<td>R=r</td>
<td>Specifies the device type. You must specify this parameter if a removable auxiliary device on a device type other than the installation-defined default is to be used.</td>
</tr>
<tr>
<td>NA</td>
<td>Specifies the no abort option. If NA is specified, processing errors do not terminate the job.</td>
</tr>
<tr>
<td>WB</td>
<td>Specifies the wait-if-busy option. WB causes the job to wait for the mounting of disk packs.</td>
</tr>
</tbody>
</table>

On a secured system, the access level you specify must be valid for the job (ENQUIRE,B returns this information). In addition, to lower the access level of a file, you must be authorized to do so (refer to the LIMITS command).

On an unsecured system, the system does not use this access level assignment to monitor access to the file but does maintain this assignment as a file attribute.
The load/dump memory commands transfer information that resides in your job field length to a local file or transfer information from a load file into your job field length. The following commands are included in this category.

DMB  DMP  LOC  WBR
DMD  DMPECS  PBC
DMDECS  LBC  RBR

**NOTE**

For information concerning security restrictions associated with the use of these commands, refer to Security Control in section 3.

The DMB command dumps the exchange package, central memory, and extended memory in binary. The DMP and DMD commands dump the exchange package or central memory in octal representation or display code equivalences. Likewise, the DMDECS and DMPECS commands dump extended memory. These commands are particularly helpful in creating dumps for debugging purposes (refer to volume 2, Guide to System Usage). Other transfers of data from central memory use the PBC command, which dumps a binary record to PUNCHB, and the WBR command, which writes a binary record on a specified file.

Data is loaded to central memory by the LBC, LOC, and RBR commands. The LBC command is useful in loading binary data in an unknown format.

All numeric parameters for these commands may be expressed in octal (postradix is B) or decimal (postradix is D) notation. If no radix is specified, octal is assumed.

**DMB COMMAND**

The DMB command generates a binary dump of the exchange package, central memory, and extended memory associated with the current job. File ZZZZDMB receives the dump and is not rewound before or after the dump. If ZZZZDMB is assigned to the terminal before the dump, the system returns it and creates a mass storage file by that name. Each dump creates one logical record on ZZZZDMB. Refer to Express Deadstart Dump Interpreter in the NOS 2 Analysis Handbook for a description of how file ZZZZDMB can be formatted into a report.

Format:

```
DMB,ordinal,xmemory.
```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ordinal</td>
<td>Specifies the dump record name. The system appends this parameter to the letter D to form a seven-character dump record name. Allowable values of ordinal are 0 through 7777778. If the parameter ordinal is greater than 3777778, the job aborts after the dump completes. If you omit this parameter or specify a null entry, the record name becomes D000000.</td>
</tr>
<tr>
<td>xmemory</td>
<td>Determines whether the system dumps the extended memory assigned to the job. The parameter xmemory can be any whole number. If xmemory is zero or is omitted, the system dumps only the exchange package and central memory assigned to the job. If xmemory is nonzero, the system also dumps the extended memory assigned to the job.</td>
</tr>
</tbody>
</table>
You must not place another command (other than DMB, DMD, DMP, DMDECS, DMPECS, or EXIT) between the program to be dumped and the DMB command.

A logical record of ZZZZDMB has the following format:

<table>
<thead>
<tr>
<th>Column</th>

</table>
If an extended memory error occurs, the block in error will be filled with 4008 words of the following format:

<table>
<thead>
<tr>
<th>59</th>
<th>41</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>END</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The variable items in the preceding display have the following descriptions:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Octal number of central memory words assigned to the job.</td>
</tr>
<tr>
<td>m</td>
<td>Octal number of extended memory words assigned to the job.</td>
</tr>
<tr>
<td>△</td>
<td>Space (display code value 55).</td>
</tr>
<tr>
<td>nnnn</td>
<td>Word number of the block in error (starting with 1).</td>
</tr>
<tr>
<td>pgnr</td>
<td>Name of the system program called by DMB. Words 4 and 10 are blank-filled.</td>
</tr>
<tr>
<td>ccdr</td>
<td>An image of RA+70 to RA+75 of the field length dumped. This is usually a copy of the command being executed prior to the dump.</td>
</tr>
</tbody>
</table>
DMD COMMAND

The DMD command requests a dump similar to that of the DMP command but adds the display code equivalences to the right of the octal representations. If lines are duplicated, they are suppressed and an informative message is issued to the output file.

Formats:

DMD,fwa,lwa.
DMD,lwa.
DMD.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fwa</td>
<td>Specifies the first word address of memory to be dumped; fwa is relative to RA. If fwa is absent, dump mode depends on the presence or absence of lwa.</td>
</tr>
<tr>
<td>lwa</td>
<td>Specifies the last word address plus one of memory to be dumped; lwa is relative to RA. If lwa alone is present, DMD assumes fwa is 0. If neither fwa nor lwa is present, DMD dumps the exchange package and 40 locations before and after the program address in the exchange package. Only the lower 17 bits of the program address are used.</td>
</tr>
</tbody>
</table>

You must not place another command (other than DMD, DMB, DMP, DMDECS, DMPECS, or EXIT) between the program to be dumped and the DMD command.

In batch jobs, the dump is written on file OUTPUT. Central memory dumps are written four words per line.

In interactive jobs, DMD is effective only within procedure files or when specified on the ENTER command. A dump from a terminal is formatted for 72-column output and written on local file ZZZDUMP. DMD displays an informative message at the terminal. ZZZDUMP is not rewound before or after the dump.
DMDECS COMMAND

The DMDECS command requests a dump of extended memory on file OUTPUT. The dump is four words per line with display code equivalences to the right of the octal representations. If lines are duplicated, they are suppressed and an informative message is issued to the output file.

**NOTE**

The DMDECS command can dump only up to two million words of extended memory. If you want to dump more than two million words, use the DMB command (described in this section).

**Formats:**

- DMDECS,fwa,lwa.
- DMDECS,lwa.

**Parameter** | **Description**
---|---
**fwa** | Specifies the first word address of extended memory to be dumped; fwa is relative to the reference address of the field in extended memory being used by the job (RAE). If fwa is absent, DMDECS assumes fwa is 0.

**lwa** | Specifies the last word address of extended memory to be dumped; lwa is relative to RAE.

The DMDECS command must immediately follow a program to be dumped, except that another DMDECS or a DMPECS, DMB, DMP, DMD, or EXIT command may intervene.

Dumping always stops at the field length in extended memory (FLE) if lwa is greater than FLE.

If fwa is greater than FLE, fwa is set to FLE-10. If both fwa and lwa are greater than FLE, fwa is set to FLE-10 and lwa is set to FLE.
**DMP COMMAND**

The DMP command can request an exchange package dump or a central memory dump.

**Formats:**

- DMP,fwa,lwa.
- DMP,lwa.
- DMP.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fwa</td>
<td>Specifies the first word address of memory to be dumped; fwa is relative to the first word of the job's field length. If fwa is absent, the resulting dump depends on the presence or absence of lwa. If fwa is greater than the job's field length, fwa is set at the job's field length minus 108. If fwa is greater than or equal to 4000008, the first dump address is fwa minus 4000008, memory from the first dump address through lwa is dumped, and the job is aborted.</td>
</tr>
<tr>
<td>lwa</td>
<td>Specifies the last word address plus one of memory to be dumped; lwa is relative to the first word of the job's field length. If lwa alone is present, DMP assumes fwa is 0. If neither fwa nor lwa is present, DMP dumps the exchange package and 408 locations before and after the address in the program address register in the exchange package. Only the lower 17 bits of the program address are used. If lwa is greater than the job's field length, the dump stops at the end of the field length. If either fwa or lwa is nonnumeric, DMP dumps the exchange package and 408 locations before and after the program address register in the exchange package. If both fwa and lwa are greater than the job's field length, the last 108 words of the job's field length are dumped. If fwa equals lwa, the 108 words beginning at fwa are dumped. If fwa is greater than lwa, DMP issues an error message and terminates the job step.</td>
</tr>
</tbody>
</table>

You must not place another command (other than DMB, DMP, DMD, DMPECS, DMDECS, or EXIT) between the program to be dumped and the DMP command.

DMP suppresses duplicate lines and then issues an informative message. In batch jobs, the dump is written on file OUTPUT. Central memory dumps are written four words per line.

In interactive jobs, DMP is effective only within procedure files or when specified on the ENTER command. A dump from a terminal is formatted for 72-column output and written on local file ZZZDUMP. DMP displays an informative message at the terminal. ZZZDUMP is not rewound before or after the dump.
DMPECS COMMAND

The DMPECS command dumps the contents of extended memory of a job's field length on file OUTPUT or a user-specified file. The dump is four words per line. If lines are duplicated, they are suppressed and an informative message is issued to the output file.

NOTE

The DMPECS command can dump only up to two million words of extended memory. If you want to dump more than two million words, use the DMB command (described in this section).

A DMPECS command within an interactive job copies the contents of the extended memory of the job's field length to the local file ZZZDUMP and displays a message at the terminal informing you of the dump. ZZZDUMP is not rewound before or after the dump.

Formats:

DMPECS,fwa,lwa.
DMPECS,lwa.
DMPECS,fwa,lwa,f,lfn.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fwa</td>
<td>Specifies the first word address of extended memory to be dumped; fwa is relative to the reference address of the field in extended memory being used by the job (RAE).</td>
</tr>
<tr>
<td>lwa</td>
<td>Specifies the last word of extended memory to be dumped; lwa is relative to RAE.</td>
</tr>
<tr>
<td>f</td>
<td>Specifies the print format (included for compatibility with NOS/BE).</td>
</tr>
<tr>
<td>lfn</td>
<td>Specifies the file to dump to.</td>
</tr>
</tbody>
</table>

If the first format is used, the field in extended memory defined by fwa and lwa is dumped to the file OUTPUT. Display code equivalences do not appear.

If the second format is used, DMPECS assumes fwa is 0. Display code equivalences do not appear.

If the third format is used, the specified field in extended memory is dumped to lfn. The parameter f is ignored. Display code equivalences appear to the right of the octal representations, the same as the DMDECS command.

The DMPECS command must immediately follow a program to be dumped, except that another DMDECS or DMPECS, DMB, DMP, DMD, or EXIT command may intervene.

Dumping always stops at the field length in extended memory (FLE) if lwa is greater than FLE.

If fwa is greater than FLE, fwa is set to FLE-10. If both fwa and lwa are greater than FLE, fwa is set to FLE-10 and lwa is set to FLE.
**LBC COMMAND**

The LBC command is intended for loading binary data of unknown format.

Format:

```
LBC, addr.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>addr</td>
<td>Specifies the address relative to RA at which binary load begins; if addr is omitted, 0 (RA) is assumed.</td>
</tr>
</tbody>
</table>

LBC reads only one record from file INPUT. You must make an LBC call for each record of data to be loaded. If addr is specified in the program call, binary data is loaded beginning at that address; otherwise, loading begins at the reference address (RA).

**LOC COMMAND**

The LOC command reads octal line images from file INPUT and enters them in the job’s central memory field length.

Formats:

```
LOC, fwa, lwa.
LOC, lwa.
LOC.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fwa</td>
<td>Specifies the first word address of an area to clear (zero) before loading correction statements. If fwa is absent, LOC assumes 0.</td>
</tr>
<tr>
<td>lwa</td>
<td>Specifies the last word address plus 1 of the area to be cleared. If lwa is absent, LOC assumes 0.</td>
</tr>
</tbody>
</table>

To process the LOC command, the system reads correction statement images from the current INPUT record. A correction statement consists of an octal address and a data field. The address field specifies the location to be corrected, and the data field contains the data to be placed in that location. Both fields may start at any column as long as the address precedes the data. The address field consists of a one- to six-digit address. If it is five characters or less, it is separated from the data field by a nonoctal character (for example, a blank). If it is six characters, no separator is required.

The data field consists of 1 to 20 octal characters. If it is less than 20 characters, it is terminated by a nonblank, nonoctal character and is stored right-justified. If it is 20 characters, no terminator is required. Embedded blanks in the data field are ignored.

If both fwa and lwa are specified and both are nonzero, storage is cleared from fwa to lwa, and the octal line images are loaded at the specified addresses. If the current INPUT record is empty, LOC clears the indicated area of memory.
PBC COMMAND

The PBC routine writes one record from the specified area of central memory to file PUNCHB.

Formats:

PBC,fwa,lwa.
PBC,lwa.
PBC.

Parameter | Description
--- | ---
fwa | Specifies the address relative to RA at which the binary deck begins; if this parameter is omitted, the PBC operation depends upon the presence or absence of lwa.
lwa | Specifies the last word address of the binary deck. If lwa alone is present, PBC assumes that fwa is RA. If lwa equals fwa, and a nonzero value is specified, PBC adds 10g to lwa. If fwa and lwa are 0 or are omitted, lwa is set to the value in the lower 18 bits of RA. If the upper 12 bits of RA are 77008, lwa is the lower 18 bits of the location following the prefix (77) table plus the length of the prefix table.

Central memory is not altered by PBC.

RBR COMMAND

The RBR command loads one binary record from a specified file.

Format:

RBR,n,name.

Parameter | Description
--- | ---
n | Specifies that n is used in constructing the name of the file containing the binary record to be read. If n is less than four characters and is numeric, TAPEn is the file name. If n contains a nonnumeric character or is four or more characters long, n itself is used as the file name. If n is absent, TAPE is the file name.
name | Specifies the one- to seven-character name used in a record prefix.

The RBR command loads one binary record from the specified file into central memory starting at RA. If the name parameter is included, a record prefix is placed in central memory starting at RA. The record itself follows. The following is the format of the record prefix.
If the record is too long for available memory, memory is filled, excess data is skipped, and an error message is issued to the job's dayfile.

**WBR COMMAND**

The WBR command writes a binary record from central memory to a file at its current position.

**Format:**

WBR,n,rl.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>Specifies the n is used in constructing the name of the file on which the binary record is to be written. If n is less than four characters and is numeric, TAPEn is the file name. If n contains a nonnumeric character or is four or more characters long, n itself is used as the file name. If n is absent, TAPE is the file name.</td>
</tr>
<tr>
<td>rl</td>
<td>Specifies the record length in words. If rl is 0 or absent, the length is taken from the lower 18 bits of RA.</td>
</tr>
</tbody>
</table>

WBR begins writing from RA.
This section describes commands used with magnetic tape files. For additional information on NOS magnetic tape files, consult the glossary for definitions of terms; Magnetic Tape Files in section 2 for descriptions of tape labels and data formats; and appendix G for tape label formats. Section 7 describes the RESOURC command required in jobs that use more than one tape or removable auxiliary pack concurrently.

To write on unlabeled tapes, you must have special authorization (refer to the LIMITS command).

**NOTE**

The term file as used in this section may refer to a multifile file. Refer to table 2-1 for the EOR and EOF marks for tape files.

The commands described in this section are:

- **ASSIGN** Assigns a local file to a tape unit† (system origin jobs or jobs with system origin privileges only). Section 9 describes the ASSIGN command for nontape files.
- **BLANK** Blank labels a tape and may restrict access to the labeled tape.
- **LABEL** Assigns a local file to a magnetic tape, creates and verifies tape labels, and creates and accesses multifile set tapes.
- **LISTLB** Lists tape labels.
- **REQUEST** Assigns a local file to a magnetic tape device.
- **VSN** Associates a file name with one or more VSNs for later assignment by a LABEL or REQUEST command.

**TAPE ASSIGNMENT**

Whenever a tape is mounted, the system checks for labels. If the tape is labeled, the system records the volume serial number (VSN) read from the VOL1 label and the equipment on which the tape is mounted. When a tape assignment is requested by a LABEL or REQUEST command specifying an lfn and a VSN (or an lfn that has been named in a previous VSN command), the system compares the VSN with the VSNs read from mounted tapes. If a match is found, the system automatically assigns the tape to the requesting job, provided a deadlock would not occur.†† If the tape is not mounted, the system rolls out the job until a tape with the requested VSN is mounted.

†If you do not specify a VSN parameter or an MT or NT parameter on the tape assignment command, the operator can assign the file to any device.

††Refer to the RESOURC command in section 7.
For a mounted, unlabeled tape, the operator enters a command specifying the requested VSN. The system can then assign the tape. A VSN which contains nonalphanumeric characters should not be specified in a request for an unlabeled tape because nonalphanumeric characters cannot be entered with the operator command.

If a VSN is not associated with the requested lfn, the system directs the operator to assign an available device.

**COMMAND RULES**

On the tape assignment commands (LABEL, REQUEST, and ASSIGN), you can specify the tape label contents, tape density, track type, nine-track conversion mode, data format, noise size, and processing options. If any of these specifications are omitted, the system uses a default value.

**NOTE**

1. For nine-track tapes, the density specification given on the tape assignment is used only when the tape is written from load point. Otherwise, the tape is read or written using the density previously used for that tape. To ensure that a labeled tape is at load point for rewriting the tape at a new density, perform one of the following before the write operation.
   - Rewind the tape.
   - Specify the W parameter on the LABEL command used to assign the tape.
   - Assign the tape using a REQUEST or ASSIGN command.

2. Do not create labeled S or L format tapes with tape marks embedded in the data. Future adherence to ANSI standards will make these tapes nonstandard as the ANSI standard allows tape marks to be used only as delimiters of label groups.

Do not specify duplicate or equivalent parameters. When you specify a parameter, do not use = as a separator unless the parameter requires the keyword=value format.
You can use a continuation line for an ASSIGN, BLANK, LABEL, REQUEST, or VSN command when any one of these requires more than 80 characters. If, in processing one of these commands, the system does not encounter a termination character prior to the end of the line, it assumes the next line is a continuation line. A continuation line should be terminated with a valid terminator. The terminator for a continuation line must appear in or before column 80.

**NOTE**

The system accepts continuation lines from an interactive terminal only if they are within a procedure file.

You can use literals for parameters that contain nonalphanumeric characters. These parameters are FI/L, FA, SI/M, VA, FA, OFA, and VSN. Nonalphanumeric characters are characters other than letters, numbers, and asterisks.

A literal is a character string delimited by dollar signs. Blanks within literals are retained. If the literal is to contain a dollar sign, two consecutive dollar signs must be included. Thus, the literal

```
SA BS$41S
```

is interpreted as

```
A BS41
```

When continuation lines are used, a literal cannot extend from one line to another.

**PROCESSING OPTIONS**

The PO= parameter on the LABEL, ASSIGN, and REQUEST tape assignment commands specify one or more processing options that are to apply to that tape file. The characters representing the processing options and their meaning are listed below.

PO=S gives the default end-of-tape conditions. Default error recovery attempts to recover blocks having errors by repeatedly rereading the block. If the A, E, or N processing options are not specified, the program determines whether an error aborts the job or the program performs error processing (refer to the FET ep bit description in Volume 4, Program Interface).

<table>
<thead>
<tr>
<th>Pi</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Automatically aborts job on an irrecoverable read or write parity error (refer to the N option).</td>
</tr>
<tr>
<td>E</td>
<td>Specifies error inhibit. All hardware read/write errors are ignored and processing continues. The system does not attempt error recovery, issue error messages, or return error status. During a read operation, blocks less than noise size (refer to the NS parameter) are unconditionally bypassed. Use this option guardedly. Use it to recover portions of data from a bad tape, to check out hardware, and to write on tape without skipping bad spots; in the latter case, you are responsible for verifying that the data is written correctly.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>F</td>
<td>Forces unload. Unload at end of usage. (Refer to the U option.)</td>
</tr>
<tr>
<td>G</td>
<td>Disables all hardware error correction activity in GE (6250 cpi) write mode. An on-the-fly error while writing a GE tape results in standard error recovery processing. The system erases the defective portion of tape, thereby reducing the amount of data that can be stored on the tape. The default is installation-defined (refer to the H option).</td>
</tr>
<tr>
<td>H</td>
<td>Enables hardware error correction activity in GE (6250 cpi) write mode. The system allows certain types of single-track errors to be written that can be corrected when the tape is read (on-the-fly correction). This is the recommended mode because it provides efficient throughput, error recovery, and tape usage when writing GE tapes on a medium that is suitable for use at 3200 fci or 6250 cpi. The default option (G or H) is installation-defined.</td>
</tr>
<tr>
<td>I</td>
<td>Rewrites the block on which the end-of-tape occurred as the first block on the next volume, if the system senses the EOT during a write operation. During a read operation, the block on which the EOT occurred is ignored and reading continues on the next volume. If a tape mark and the EOT are sensed at the same time, the EOT is ignored. This option cannot be specified for 7-track I or SI format tapes. Refer to the P and S options.</td>
</tr>
<tr>
<td>L</td>
<td>Does not issue tape detailed status error messages to the user dayfile. The default is installation-defined (refer to the M option).</td>
</tr>
<tr>
<td>M</td>
<td>Issues only the first and last tape detailed status error messages to the user dayfile for each bad tape block. Numerous attempts are made to read each bad block, but only the messages for the first and last attempts are issued to the dayfile. The default is installation-defined (refer to the L option).</td>
</tr>
<tr>
<td>N</td>
<td>Specifies that the job is not automatically aborted on an irrecoverable read or write parity error (refer to the A option). Data is passed to the job on a read operation without error status set even if the program requested error processing. Use this option guardedly.</td>
</tr>
<tr>
<td>P</td>
<td>Writes a trailer sequence following the block on which the EOT was sensed, if the system senses the EOT during a write operation. Any data that occurs following the block on which EOT was sensed, yet before the tape mark, is ignored. During a read operation, the system transfers the block on which the EOT was sensed to the user job. The read operation resumes on the next reel. If a tape mark and the EOT are sensed at the same time, the EOT is ignored. Refer to the I and S options.</td>
</tr>
<tr>
<td>R</td>
<td>Enforces ring out. If the tape is mounted with the write ring in, job processing is suspended until the operator remounts the tape correctly.</td>
</tr>
<tr>
<td>S</td>
<td>Specifies where the system is to stop on an exit condition. For an unlabeled tape, it directs the system to stop at the first tape mark after the EOT is sensed. For a labeled tape, it directs the system to stop at the tape mark plus EOF1 or the tape mark plus EOFV1 when the EOT is encountered.</td>
</tr>
</tbody>
</table>
If, during a write operation, the system senses the end-of-tape, the system writes a trailer sequence following the block on which the EOT was sensed. This trailer sequence consists of a tape mark followed by an EOV1 label for labeled tapes and four tape marks for unlabeled tapes. The next block is written on the next volume. During a read operation, the EOT is noted and the system transfers to the user job the block on which the EOT was sensed plus all following blocks until a trailer sequence (as described previously) is recognized. Reading resumes on the next volume.

Inhibits unload. Do not unload at the end of usage. For system origin jobs and the RECLAIM command, the inhibit unload option is selected by default; for all other jobs, omission of the U option causes the tape to be unloaded at end of usage.

Enforces ring in. If the tape is mounted without the write ring in, job processing is suspended until the operator remounts the tape correctly.

Specifying QN=9999 on the LABEL command has the same effect for multifile tapes.

If both ring enforcement options (R and W) are specified or more than one EOT option (I, P, or S) is specified, the system issues a dayfile message and terminates the job step.

For further information on end-of-tape and end-of-reel conditions, refer to the CLOSER, REWIND, UNLOAD, and LABEL macros in Volume 4, Program Interface.

ASSIGN COMMAND

The ASSIGN command names a tape unit and the local file to be assigned to that unit. It can create an unlabeled tape file or access an existing labeled or unlabeled tape. It cannot create or verify tape labels.

NOTE

To assign a tape unit using the ASSIGN command, your job must be of system origin or you must be authorized to use magnetic tapes and to assign devices by EST ordinals.

Jobs that use this command without proper validation are aborted, and a dayfile message is issued.

Before performing the assignment, the system unloads the local file (refer to the UNLOAD command in section 9).

The following description applies only to magnetic tape files; for use of the ASSIGN command with devices other than magnetic tape, refer to section 9.
Format:

```
ASSIGN,nn,lfn,VSN=vsn, /vsn_2=...=vsn_{n-1}/vsn_n \{MT\}, \{D=den\}, \{F=format\}, \{LB=lb\},
\{FC=fc\}, \{CV=cv\}, \{C=c\}, \{N=ns\}, \{PO=p_1\}, \{p_2\}, \ldots \{p_n\}, \{CK\}, \{CB\}, \{AL=level\}.
```

Required parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nn</td>
<td>Device or device type to which the file lfn is assigned. nn can be the EST ordinal of a magnetic tape unit or one of the device types MT or NT. Specifying MT informs the operator to assign the file to a seven-track magnetic tape drive; NT informs the operator to assign the file to a nine-track magnetic tape drive. Omission of this parameter results in an error.</td>
</tr>
<tr>
<td>lfn</td>

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NS=ns</td>
<td>Noise size. Any block containing fewer than ns frames is considered as noise and is discarded. The NS parameter is not valid for I or SI format tapes or for other tape formats when either PE (9-track, 1600 cpi) or GE (9-track, 6250 cpi) density is specified. For PE and GE densities, the noise block size is zero. Default is 18 frames for other formats. Maximum value is 31 frames. If NS=0 is specified, the default is used.</td>
</tr>
<tr>
<td>PO=p1,p2...pn</td>
<td>A string of characters (not separated by commas) that specify processing options (refer to Processing Options in this section).</td>
</tr>
<tr>
<td>CK or CB</td>
<td>Specifies that lfn is to be used as a checkpoint file (refer to section 13).</td>
</tr>
<tr>
<td>AL=level</td>
<td>Specifies the security access level to assign to the file. Unless changed by your site, level can be one of the following names: LVL0, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7. The default is the current access level of the job.</td>
</tr>
</tbody>
</table>

On a secured system, the access level you specify must be valid for the job (ENQUIRE,B returns this information) and for the device to which you are assigning the file.

On an unsecured system, the parameter has no effect. The system does, however, check for valid parameter specifications.

When using this command to assign a file for checkpoint dumps on a secured system, use the AL=level parameter to assign the file at the highest access level valid for the job (ENQUIRE,B returns this information). The CKP command aborts the job if the checkpoint file is not at this access level.

**Example:**

```
ASSIGN,51,TAPE1,D=PE,F=SI.
```

This command assigns the file TAPE1 to the nine-track magnetic tape unit identified by EST ordinal 51.
BLANK COMMAND

The BLANK command writes the ANSI standard labels VOL1, HDR1, and EOF1 following the load point of a tape. The labels are written as follows (asterisks represent tape marks):

| VOL1 | HDR1 |  *  |  *  | EOF1 |  *  |  *  |

If the value of a labeled field is specified by a BLANK command parameter, that value is written; otherwise, the default value is used. Refer to appendix G for the tape label formats and default values.

NOTE

A BLANK command issued in a nonsystem origin job cannot overwrite a label containing an unexpired expiration date or a nonblank VA field.

If the FA field within the label is nonblank, a nonsystem origin job must specify the FA character using the OFA parameter. If the FA character is A, only the owner or a system origin job can overwrite the label.

Format:

BLANK,VSN=vsn, {^} , {^} , {^} , FA=fa, OFA=ofa, VA=va,
OWNER=username/familyname, LSL=lsl, U.

Parameter Description

VSN=vsn One- to six-character volume serial number that uniquely identifies the reel of tape. It is entered in the VOL1 label. It need not match the VSN previously recorded on the tape.

NOTE

Avoid specifying a volume serial number that matches a local file name attached to your job or the local file will be lost.

Omitting the VSN parameter discards any local file named BLKTAPE from your job.
**Parameter**  
**Description**

<table>
<thead>
<tr>
<th>MT or NT</th>
<th>Specifies seven-track (MT) or nine-track (NT) tape drive. Installation-defined default. Must not conflict with D=den specification.</th>
</tr>

<table>
<thead>
<tr>
<th>FA=fa</th>
<th>File accessibility character indicating who has access to the labeled tape. Value entered in HDR1 and EOFl labels.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>fa</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Blank</td>
<td>Unlimited access (default).</td>
</tr>
<tr>
<td>A</td>
<td>Only the owner of this NOS written tape can access it.</td>
</tr>
<tr>
<td>Other</td>
<td>In all future accesses of this tape, you must specify this character.</td>
</tr>
</tbody>
</table>

| OFA=ofa | Old file accessibility character on a labeled tape that is to be relabeled. This parameter must be specified if the FA field is currently other than A or blank. Future accesses of the tape must specify the character specified with the FA parameter. |

†Refer to Magnetic Tape Users in appendix A.
Parameter | Description
--- | ---
VA=va | Volume accessibility character indicating that the volume must be accessed as an ANSI-labeled tape (LB=KL). If VA is nonblank, only a system origin job can destroy V0L1 (for example, assign tape as unlabeled). Default is unrestricted access. Refer to the V0L1 format in appendix G.
OWNER=username/familyname | Owner identification entered in V0L1 label. Determines the owner for file accessibility (FA) parameter.
LSL=lsl | Label standard level entered in V0L1 label. Default is the number 1.

<table>
<thead>
<tr>
<th>lsl</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Tape labels and data format for this volume conform to the ANSI standard.</td>
</tr>
<tr>
<td>Blank</td>
<td>Tape labels and data format for this volume may or may not conform to the ANSI standard.</td>
</tr>
</tbody>
</table>

U | If U is specified, the tape is physically unloaded when returned after blank labeling. If U is omitted, physical unloading is inhibited.

An installation can use the BLANK command to restrict use of its labeled tapes. Once a tape has been blank labeled, you can modify the labels as follows:

1. If the volume accessibility field of V0L1 indicates unlimited access (that is, VA is blank), you can:
   - Include another BLANK command to change V0L1, HDR1, or EOF1 values.
   - Request the tape as unlabeled (with the parameter LB=KU) and write it in whatever format you specify.
   - Include a LABEL command to change HDR1 by specifying one or more of the parameters associated with that label and specifying the W parameter.

2. If the volume accessibility field is nonblank, you can:
   - Include a LABEL command to change HDR1. However, in requesting a tape in which VA is nonblank, you must specify an ANSI-labeled tape (with the parameter LB=KL), and therefore, cannot change or destroy the V0L1 label.
   - If validated, submit a system origin job to change V0L1.
LABEL COMMAND

Like ASSIGN and REQUEST commands, the LABEL command associates a file name lfn with a magnetic tape, usually identified by its VSN. Unlike the ASSIGN and REQUEST commands, the LABEL command can create and verify tape labels. It can also position a multifile set for access to any of its existing files or for appending a new file. The LABEL command can create and access unlabeled as well as labeled tapes.

NOTE

A LABEL command cannot overwrite a label with an unexpired expiration date (refer to appendix G).

To write the labels that begin a labeled tape (refer to Magnetic Tape Files in section 2), specify a write label (W) parameter. The W parameter always rewinds the tape to load point and rewrites the first label group. Overwriting the header labels for a tape file effectively destroys the data on the file. The label contents remain the same when a LABEL command with the W parameter names an lfn already assigned to a tape file.

If the tape was not previously part of a multifile set (the SI field in the first HDR1 label is blank), then specification of the SI and QN=9999 parameters rewrites the initial tape labels.

To position the tape after any HDR1 label other than the first HDR1 label (multifile set only), the SI parameter must be specified. When SI is specified, the R and W parameters are ignored unless QN=1 and the first file on the tape is to be written. The system determines where to position the tape by matching the SI, FI, and QN parameter values (if specified) to the corresponding values in the HDR1 label. (The HDR1 label format is given in appendix G.)

To write the EOF1 and HDR1 labels between two files in a multifile set (refer to figure 2-2), you specify the SI and QN=9999 parameters. The W parameter is ignored if specified when appending the file (QN=9999). Although the SI=sectid parameter must be specified when appending a file to a multifile set, the appended file will be given the same sectid as the preceding file regardless of the sectid value specified in the LABEL command. This is done to ensure that all files in a file set have the same set identifier.

If neither the MT nor NT parameter is specified and no VSN is named, the operator can assign the file to any equipment. You must be validated for the assigned equipment or the job is terminated.
Format:

LABEL,lfn,VSN=vsn_1/vsn_2=...=vsn_n-1/vsn_n, \[MT\],D=den,F=format,LB=lb,
| \( FC=fcount \) | \( CV=cv \) | \( N=cv \) | \( PO=p_1 \) | \( P_2=...P_n \) | \( CK=\) | \( SI=setid \) | \( CB=\) | \( M=setid \) |
| \( SN=secno \) | \( QN=seqno \) | \( P=seqno \) | \( FI=fileid \) | \( L=fileid \) | \( FA=fa \) | \( G=geno \) | \( E=gvn \) |
| \( CR=cdate \) | \( RT=yyddd \) | \( C=cdate \) | \( T=ddd \) | \( W=\) | \( R=\) | \( AL=level \) | \( AC=ac \) | \( CT=ct \) | \( MD=md \) | \( PW=password \) | \( TO=to \) | \( UN=username \).

Required parameter:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Name of the file that resides or is to reside on magnetic tape. If lfn is already assigned to a mass storage file, processing continues with the next command. To assign a previously assigned lfn, you must return lfn before its reassignment. If lfn is already assigned to a tape and R parameter is specified, the contents of the tape labels are compared to the command parameter specifications. If the label verification fails, the job aborts. Omission of lfn results in an error.</td>
</tr>
</tbody>
</table>

Optional parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VSN=vsn_1/vsn_2=...=vsn_n-1/vsn_n</td>
<td>One- to six-character volume serial number that uniquely identifies a reel of tape. If VSN is omitted, the operator assigns an available unit to lfn. Multiple VSNs can be specified if separated by / or = characters. If the VSNs are separated by the = character, LABEL assigns lfn to the first available VSN in the list. If the VSNs are separated by the / character, lfn is a multivolume file set, and LABEL assigns the volumes in the sequence given. If VSN=, VSN=0, or VSN=SCRATCH is specified, a scratch tape is assigned. If a scratch tape is unavailable, the job is suspended until a tape is available.</td>
</tr>

</tr>
</tbody>
</table>

**FC=fcount or C=ccount**

Whenever F format is specified, this parameter must be specified. It specifies the maximum block size in frames (no default value). Not applicable for other tape formats.

†NOS/BE system default tape format (binary mode only); used for tape interchange with NOS/BE systems.
### Parameter Description

**CV=cv or N=cv**

Conversion mode† for nine-track tapes; applies to both labels and data on coded tapes; applies only to labels on binary tapes. Installation-defined default. Ignored for unlabeled I or SI format binary tapes whose trailer labels are always ASCII. Must not be specified with MT or seven-track density specification.

<table>
<thead>
<tr>
<th>cv</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS</td>
<td>ASCII/display code conversion.</td>
</tr>
<tr>
<td>US</td>
<td>Same as AS.</td>
</tr>
<tr>
<td>EB</td>
<td>EBCDIC/display code conversion.</td>
</tr>
</tbody>
</table>

**NS=ns**

Noise size; any block containing fewer than ns frames is considered noise and is discarded. The NS parameter is not valid for I or SI format tapes or for other tape formats when either PE (9-track, 1600 cpi) or GE (9-track, 6250 cpi) density is specified. For PE and GE densities, the noise block size is zero. Default is 18 frames for other formats. Maximum value is 31 frames. If NS=0 is specified, the default is used.

**PO=p1p2...pn**

A string of characters (not separated by commas) that specifies processing options. Refer to Processing Options in this section.

**CK or CB**

Specifies that lfn is to be used as a checkpoint file (refer to section 13).

- **CK** Each dump is written at the previous EOI of lfn.
- **CB** Each dump is written at the BOI of lfn.

---

†Refer to Magnetic Tape Users in appendix A.
Optional tape label parameters (refer to appendix G):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SI=setid or M=setid</td>
<td>One- to six-character file set identifier; must be specified for file positioning within a multifile set. The system leaves the set identifier field in the HDR1 label blank if you omit the SI=setid parameter or if you specify blanks for setid. You must specify a nonblank file set identifier to build a multifile set. Hence, if you omit this parameter when you write the first file on the tape, the tape cannot then be a multifile set tape. When you append a file to a multifile set tape, you must specify this parameter to position the tape. Also, the specified set identifier must be the same as that of the first file in the multifile set.</td>
</tr>
<tr>
<td>SN=secno or V=secno</td>
<td>One- to four-digit file section number specifying the position of the volume within a multivolume file set (numbered consecutively from 0001). The default is 1.</td>
</tr>
<tr>
<td>QN=seqno or P=seqno</td>
<td>One- to four-digit file sequence number specifying the position of the file within the multifile set (numbered consecutively from 0001). The default is 1. QN must be set to 9999 to append a new file to a multifile set.</td>
</tr>
<tr>
<td>FI=fileid or L=fileid</td>
<td>A 1- to 17-character file identifier recorded in the HDR1 label (refer to appendix G). The default is blank.</td>
</tr>
<tr>
<td>FA=fa</td>
<td>File accessibility character indicating who has access to the labeled tape.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>fa</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blank</td>
<td>Unlimited access (default).</td>
</tr>
<tr>
<td>A</td>
<td>Only the owner of the tape can access it.</td>
</tr>
<tr>
<td>Other</td>
<td>To access the tape, you must specify the character in the FA field of the HDR1 label.</td>
</tr>
<tr>
<td>G=genno</td>
<td>One- to four-digit generation number. The number zero cannot be used. The default is 1.</td>
</tr>
</tbody>
</table>
Parameter | Description
--- | ---
E=gvn | One- to two-digit generation version number. The default is 0.
CR=cdate or C=cdate | Creation date in the form yyddd where 1 ≤ ddd ≤ 366. Used only on read operations; write operations always use the current date.
RT=yyddd or T=ddd | RT=yyddd specifies the expiration date where yy is the last two digits of the year, and ddd is the day of the year (1 ≤ ddd ≤ 366). T=ddd specifies the number of days the file is to be retained (0 ≤ ddd ≤ 999). The expiration date is entered in the HDR1 label. On or after this date the label and the file can be overwritten.
R or W | If R is specified, the system compares the values recorded on the file labels with the LABEL command parameter values. If the comparison fails, it terminates the job. R is the default.
If W is specified, the system writes ANSI standard labels on the tape. The labels contain the values specified with the LABEL command parameters or their default values. If the tape is mounted without the write ring, job processing is suspended until the operator remounts the tape correctly. If both the W and the FO=R parameters are specified, the job step aborts.
W and R are ignored when SI is specified and QN > 1. When QN = 1 (default value) and W are specified, the initial header label is rewritten.
AL=level | Specifies the security access level to assign to the file. Unless changed by your site, level can be one of the following names:
LVLO, LVLI, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7
The default is the current access level of the job.
On a secured system, the access level you specify must be valid for the job (ENQUIRE,B returns this information) and for the device to which you are assigning the file.
On an unsecured system, the parameter has no effect. The system does, however, check for valid parameter specifications.
When using this command to assign a file for checkpoint dumps on a secured system, use the AL=level parameter to assign the file at the highest access level valid for the job (ENQUIRE,B returns this information). The CKP command aborts the job if the checkpoint file is not at this access level.
<table>

</tr>
<tr>
<td>UN=username</td>
<td>User name. Refer to the NOS 2 Tape Management System (TMS) User Reference Manual for a detailed description.</td>
</tr>
</tbody>
</table>
Example 1 - Reading and Writing a Single-File File Set:

In the following job, the user reads data from one tape and writes data on another tape. Program input data previously written at 1600 cpi on a nine-track tape unit is read from tape TP01. Output data is written on tape TP02.

```
FTNJOB.
USER, USERNAM, PASSWRD.
RESOURC, PE=2.
FTN5.
LABEL, TAPE1, VSN=TP01, D=PE, PO=R.
LABEL, TAPE2, VSN=TP02, D=PE, PO=W, W.
LGO.
-ER-
   PROGRAM SORT
   END
-ER-
```

The RESOURC command schedules two nine-track, 1600-cpi tape units for concurrent use in the job. The tapes are not requested until after compilation of the program in case compilation errors occur.

Assuming the compilation completes without fatal error, the LABEL commands request that two tapes, TP01 and TP02, be mounted and assigned to the job. The tape files are called TAPE1 and TAPE2 within this job. PO=R is specified for the input tape, ensuring that the tape does not have a write ring. PO=W is specified for the output tape which requires a write ring. The W parameter on the second LABEL command specifies the writing of ANSI standard labels. Default values are used in the label fields.

Following completion of the job, the tapes are rewound and unloaded.

Example 2 - Reading and Writing a Multifile Set:

The following job writes the object programs produced by three compilations as three files of a multifile set. It then copies one of the files to mass storage and executes it.

```
SJOB.
USER, USERNAM, PASSWRD.
GET, BSORT, QSORT, LSORT.
LABEL, STAPE, VSN=TP03, D=PE, SI=BINSET, FI=BSORT, PO=W, W.
FTN5, I=BSORT, B=STAPE.
LABEL, STAPE, VSN=TP03, D=PE, SI=BINSET, FI=QSORT, QN=9999.
FTN5, I=QSORT, B=STAPE.
LABEL, STAPE, VSN=TP03, D=PE, SI=BINSET, FI=LSORT, QN=9999.
FTN5, I=LSORT, B=STAPE.
LABEL, STAPE, VSN=TP03, D=PE, SI=BINSET, QN=2.
COPYEI, STAPE, QSORTB.
QSORTB.
```
The GET command retrieves three indirect access files - BSORT, QSORT, and LSORT - containing FORTRAN source programs. The first LABEL command requests the mounting and assignment of tape TP03 to the job. The W parameter specifies the writing of ANSI standard labels. The set identifier and file identifier fields are written using the values specified on the SI and FI parameters. The B=STAPE parameter on the FTNS command specifies that the object program is to be written on the tape file.

The QN=9999 parameter on the second and third LABEL commands specifies that a file is to be appended to the tape. Although the same set identifier is used for all files within a file set, the SI parameter must be specified when positioning a multifile set. The second and third compilations write the second and third files of the file set.

The QN=2 parameter on the fourth LABEL command positions the tape at the second file of the file set. The tape could also have been positioned according to the file identifier (FI=QS0RT). The second file is copied to a local mass storage file, QSORTB, and executed.

Example 3 - Replacing a File within a Multifile Set:

To replace a file within a multifile set, you must first copy to temporary storage the files that follow the file to be replaced, then write the replacement file, and last rewrite the succeeding files in the file set.

```
R W J O B .
USER,USRNAME,PASSWORD.
GET,SORT2.
LABEL,STAPE,VSN=TP03,D=PE,SI=BINSET,QN=2,PO=W.
COPYEI,STAPE,SCRATCH.
LABEL,STAPE,VSN=TP03,D=PE,SI=BINSET,QN=1.
COPYEI,SORT2,STAPE.
LABEL,STAPE,VSN=TP03,D=PE,SI=BINSET,FI=QS0RT,QN=9999.
COPYEI,SCRATCH,STAPE.
```

The first LABEL command requests tape TP03 containing the multifile set created in example 2. The tape is mounted with a write ring inserted (PO=W) and is positioned at the second file of the file set (QN=2). The COPYEI command copies the second file to the mass storage file, SCRATCH.

The second LABEL command positions the tape at the first file. Although the contents of the first file are rewritten, the file labels remain unaltered.

The third LABEL command appends the second file to the file set (QN=9999). The labels are rewritten so you can change the label contents. The third COPYEI command writes the second file as stored on file SCRATCH.

The third file of the multifile set is lost, because it was not saved before the tape was rewritten.
LISTLB COMMAND

The LISTLB command lists the labels of an ANSI-labeled tape file. For a correct listing of labels, the data format specified on the tape assignment command must correspond to the format in which the tape was written. For output listing files not connected to your terminal, the LISTLB command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

LISTLB, lfn, {SI=setid}, {QN=seqno}, LO=ltype, L=out.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>File name assigned to tape file whose labels are to be listed. Default is file name TAPE. If you use the default name, assign TAPE to the labeled tape being read.</td>
</tr>
<tr>
<td>SI=setid or M=setid</td>
<td>One- to six-character file set identifier. If specified, only label groups whose HDR1 label contains this value are listed. You must specify this parameter to list the labels of a multifile set.</td>
</tr>
<tr>
<td>QN=seqno or P=seqno</td>
<td>One- to four-digit file sequence number. If seqno is specified, only the label group whose HDR1 label contains this value is listed. If seqno is specified, SI must be specified; otherwise, LISTLB terminates.</td>
</tr>
<tr>
<td>LO=ltype</td>
<td>Label type(s) to be listed. The default is R. Required and optional labels are listed in appendix G. Combinations of ltype mnemonics can be specified, such as LO=VH to list only the VOLn and HDRn labels.</td>
</tr>
<tr>
<td>L=out</td>
<td>File on which the labels are to be listed. Default is OUTPUT.</td>
</tr>
</tbody>
</table>
To list labels for a multifile set (lfn contains more than one HDR1/EOF1 label pair), you must specify the SI=setid parameter and the tape must be positioned at load point. LISTLB then positions the tape for reading the requested labels. It searches for labels through all volumes associated with lfn. At the end of the multifile set or if an expected label group is not found, the following dayfile message is issued. n is the sequence number of the last file found. (nnn should be ignored.)

MULTI-FILE NOT FOUND, lfn AT nnn.
REQUEST SECTION n+1.
FOUND SECTION n.

After issuing this dayfile message, LISTLB leaves the tape positioned after the last listed label. The next command processed for the tape file must be either RETURN, EVICT, UNLOAD, or LABEL.

For a tape file that is not a multifile set, there are two cases. If you specify trailer labels, LISTLB leaves the tape positioned before the trailer labels last listed. Otherwise, LISTLB leaves the tape positioned after the label last listed.

Example 1:
The following commands list the second label group of file set ABCDEF.

LABEL,T,VSN=EXAMP1,MT,D=HY,SI=ABCDEF.
LISTLB,T,SI=ABCDEF,QN=2.

Example 2:
To list only the volume and header labels (trailer labels omitted) of a multivolume file set, you must request a volume of the file set, list its labels, and return the file set, repeating the procedure for each volume of the file set.

LABEL,T,VSN=REEL1,MT,D=HY.
LISTLB,T,LO=VH.
RETURN,T.
LABEL,T,MT,D=HY,VSN=REEL2.
LISTLB,T,LO=VH.

Example 3:
To list all labels of the following file set, only one LISTLB command is required.

VSN,T=REEL1/REEL2.
LABEL,T,VSN=REEL1,D=HY.
LISTLB,T.

The LISTLB(T) command lists all labels on the volumes associated with T, that is, REEL1 and REEL2.
REQUEST COMMAND

The REQUEST command associates a file name, lfn, with a magnetic tape device. You can direct the operator to make the tape assignment by including a comment following the command terminator. This comment appears at the system console. However, if the tape is labeled and you previously specified a VSN via the VSN control command or included the VSN parameter on the REQUEST command, the system can automatically assign the tape. The REQUEST command can create unlabeled tape files and access existing labeled and unlabeled tape files. It cannot create or verify tape labels.

The LABEL command performs the same function as the REQUEST command. Unless you have reason to do otherwise, use the LABEL command. TMS does not support the REQUEST command.

Format:

REQUEST,lfn,VSN=vsn_1/vsn_2...=vsn_n-1/vsn_n,MT=MT,NT=NT,D=density,F=format,

LB=lb,FC=fcount,C=ccount,VC=vcv,N=ncv,NS=ns,PO=po1,p2...pn,CK=ck,CB=cb,
AL=level,comment

Required parameter:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Name of the file that resides or is to reside on magnetic tape. If lfn is already assigned to a mass storage file, processing continues with the next command. To assign a previously assigned lfn, you must return lfn before its reassignment. Omission of this parameter results in an error.</td>
</tr>
</tbody>
</table>

Optional parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VSN=vsn_1/vsn_2...=vsn_n-1/vsn_n</td>
<td>One- to six-character volume serial number uniquely identifying a reel of tape. You should specify a VSN for labeled and unlabeled tapes. If VSN is omitted, the operator must assign an available device to lfn. If VSN=, VSN=Q, or VSN=SCRATCH is specified, a scratch tape is assigned. If a scratch tape is unavailable, the job is suspended until a tape is available. Multiple VSNs can be specified if separated by a / or = character. If the VSNs are separated by the = character, the system assigns lfn to the first available VSN in the list. If the VSNs are separated by the / character, lfn is a multivolume file set, and REQUEST assigns the volumes in the sequence given.</td>
</tr>
</tbody>
</table>

†If you do not specify a VSN parameter or an MT or NT parameter on the command, the operator can assign any device to the file. If you are not authorized to use the assigned device, the job aborts.
<table>
<thead>
<tr>
<th>Parameter</th>

†NOS/BE system default tape format, (binary mode only): Used for tape interchange with NOS/BE systems.
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FC=ccount or C=count</td>
<td>Whenever F format is specified, this parameter must be specified. It specifies the maximum block size in frames (no default value). Illegal for other tape formats.</td>
</tr>
<tr>
<td>CV=cv or N=cv</td>
<td>Conversion mode† for nine-track tapes; applies to both labels and data on coded tapes; applies only to labels on binary tapes. Installation-defined default. Ignored for unlabeled I or SI format binary tapes whose trailer labels are always ASCII. Must not be specified with MT or seven-track density specification.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>cv</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AS</td>
<td>ASCII/display code conversion.</td>
</tr>
<tr>
<td>US</td>
<td>Same as AS.</td>
</tr>
<tr>
<td>EB</td>
<td>EBCDIC/display code conversion.</td>
</tr>
</tbody>
</table>

| NS=ns | Noise size. Any block containing fewer than ns frames is considered as noise and is discarded. The NS parameter is not valid for I or SI format tapes or for other tape formats when either PE (9-track, 1600 cpi) or GE (9-track, 6250 cpi) density is specified. For PE and GE densities, the noise block size is zero. Default is 18 frames for other formats. Maximum value is 31 frames. If NS=0 is specified, the default is used. |

| PO=p1p2...pn | A string of characters (not separated by commas) that specifies processing options. (Refer to Processing Options in this section.) |

<table>
<thead>
<tr>
<th>CK or CB</th>
<th>File lfn is to be used as a checkpoint file (refer to section 9).</th>
</tr>
</thead>
<tbody>
<tr>
<td>CK</td>
<td>Each dump is written at the previous EOI of lfn.</td>
</tr>
<tr>
<td>CB</td>
<td>Each dump is written at the BOI of lfn.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>AL=level</th>
<th>Specifies the security access level to assign to the file. Unless changed by your site, level can be one of the following names:</th>
</tr>
</thead>
<tbody>
<tr>
<td>LVL0, LVL1, LVL2, LVL3, LVL4, LVL5, LVL6, or LVL7</td>
<td>The default is the current access level of the job.</td>
</tr>
</tbody>
</table>

†Refer to Magnetic Tape Users in appendix A.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AL=level</td>
<td>On a secured system, the access level you specify must be valid for the job (ENQUIRE,B returns this information) and for the device to which you are assigning the file. On an unsecured system, the parameter has no effect. The system does, however, check for valid parameter specifications. When using this command to assign a file for checkpoint dumps on a secured system, use the AL-level parameter to assign the file at the highest access level valid for the job (ENQUIRE,B returns this information). The CKP command aborts the job if the checkpoint file is not at this access level. The comment appears at the system console. In the comment field, you can direct the operator to make the requested assignment.</td>
</tr>
</tbody>
</table>

Example:

To send a message to the operator requesting that volume XYZ be mounted on tape unit NT62 and assigned to lfn TAPE1, you could issue the following command.

```
REQUEST,TAPE1. NEED VSN=XYZ ON NT062.
```
**VSN COMMAND**

The VSN command associates a file name lfn with one or more volumes of tape.† An lfn/VSN association allows the system to assign the specified VSN to lfn without reference to a VSN parameter on the LABEL or REQUEST command or to an operator command. Once declared, an lfn/VSN association remains until the file is returned by an operation such as an EVICT, RETURN, or UNLOAD command.

Format:

\[ \text{VSN}, lfn_1=vsn_1, lfn_2=vsn_2, \ldots, lfn_n=vsn_n. \]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn_i</td>
<td>File name to be associated with vsn_i. This parameter is required if parameters are specified.</td>
</tr>
<tr>
<td>vsn_i</td>
<td>One or more one- to six-character volume serial numbers to be associated with lfn_i. If vsn_i contains nonalphanumeric characters, it must be a literal delimited by dollar signs ($).</td>
</tr>
</tbody>
</table>

- **Omitted**
  - An available scratch tape is automatically assigned to lfn_i.
- **0**
  - Same as omitted.
- **SCRATCH**
  - Same as omitted.
- **vsn_a=vsn_b=\ldots=vsn_z**
  - Names duplicate volumes, any of which may be used with lfn_i.††
- **vsn_a/vsn_b/\ldots/vsn_z**
  - Successive volumes to be assigned to lfn_i. The system assigns volumes in the order listed.

With a VSN command you can:

- Omit the VSN keyword from your LABEL or REQUEST commands and specify lfn/VSN associations on the VSN command instead. This allows you to specify new VSNs without changing LABEL or REQUEST command.
- Override the VSN specified on subsequent ASSIGN, LABEL, REQUEST, or VSN commands. For example, the sequence

  ```
  VSN, FILEA=123.
  VSN, FILEA=124.
  LABEL, FILEA.
  ```

†Up to 60 VSNs can be specified for a single file name in any combination of duplicate reel and/or multireel specifications.

††All subsequent volumes must have the same characteristics as the first volume in the sequence. (Characteristics include labels, track type, density, and conversion mode.) It is recommended that all volumes be blank labeled (refer to the BLANK command) before use in a multivolume sequence.
directs the system to assign FILEA to the tape with VSN 123. However, by returning
file lfn, you can specify another lfn/VSN association. Thus, the following sequence
directs the system to assign FILEA to the tape with VSN 124.

\[
\begin{align*}
\text{VSN, FILEA}=123. \\
\text{RETURN, FILEA.} \\
\text{VSN, FILEA}=124. \\
\text{LABEL, FILEA.}
\end{align*}
\]

- Associate the VSNs of two or more duplicate volumes with one file name. For
example, the following command indicates that either the tape with VSN VOL100 or the
tape with VSN V0L101 can be assigned to FILE1.

\[
\text{VSN, FILE1}=\text{VOL100}=\text{VOL101}.
\]

- Specify the VSNs of a multivolume file set. For example, the following command
indicates that FILE2 may extend through the three volumes identified by VSN23,
VSN24, and VSN25.

\[
\text{VSN, FILE2}=\text{VSN23}/\text{VSN24}/\text{VSN25}.
\]

- Specify alternate volumes within a multivolume file set.

\[
\text{VSN, FILE3}=\text{VSNA}=\text{VSN1}/\text{VSN2}/\text{VSNB}=\text{VSN3}=\text{VSN4}.
\]

The first volume of the set can be either VSNA or VSN1. The second volume is VSN2.
The third volume can be either VSNB, VSN3, or VSN4, depending on which is available.
A job may terminate as the result of system, operator, or programmer error. For some jobs, it becomes more advantageous to accept the overhead of checkpoint procedures than to run the risk of losing the entire job output. The checkpoint/restart feature is implemented through the CKP command and the RESTART command.

**NOTE**

For information concerning security restrictions associated with the use of these commands, refer to Security Control in section 3.

**CKP COMMAND**

The CKP command causes a checkpoint dump to be taken.

**Format:**

```
CKP, lfn1, lfn2, ..., lfnn.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Specifies a file to be included in the checkpoint dump. If no files are specified, all files local to the job at the time the CKP command is processed are checkpointed.</td>
</tr>
</tbody>
</table>

Each time a CKP command is processed, the system takes a checkpoint dump. The dump is written on the tape or mass storage checkpoint file specified on a REQUEST, ASSIGN, or LABEL command with the CK or CB parameter. The dump consists of a copy of the job's field length in central memory, the system information used for job control, and the names and position and/or contents of all assigned files explicitly or implicitly identified by the CKP command. These files are:

- **INPUT, OUTPUT, PUNCH, PUNCHB, PB, CCCCCCO, and LGO.** These files are always included in the checkpoint dump. Procedure scratch files ZZZZZC0, ZZZZZC1, and ZZZZZC2 are also included if present. Data files using the default names ZZCCLAA, ZZCCLAB, ..., and ZZCCLZZ are also included if present.

- **Library type files, working copies of indirect access files, and some direct access files.** If one of these types of files is specified on the CKP command, it is included in the checkpoint dump, and all other files of that type are excluded. If no files are specified, all files of these types assigned to the job are included in the dump.

The system does not include global library set files (ZZZZZLD and your library files) unless you specify them on the command.

Each checkpointed mass storage file is copied according to the last operation performed on it. If the last operation was a write, the file is copied from the BOI to its position at checkpoint time; only that portion is available at restart time. The file is positioned at the latter point.
If the last operation on a mass storage file was a read and the EOI was not detected, the file is copied from its position at checkpoint time to the EOI; only that portion is available at restart time. The file is positioned at the former point. If the last operation was a read and the EOI was detected, no copy is performed.

The exception to this rule is the type of operation performed on execute-only direct access files. If a dump is specified for this type of file, its name and associated system information are copied but the contents of the file itself is not copied. Thus, if you attempt to resume from such a dump, RESTART is unable to retrieve that file and aborts. You can avoid this by selecting the NA and FC options of the RESTART command and retrieving the file yourself.

When procedure scratch files are copied, they are copied from BOI to EOI.

For checkpointed magnetic tape files, only the relative position of the tape is captured so that the tape can be properly positioned during restart. Mixed mode 7-track tapes are not supported when using CHECKPOINT or RESTART.

If the checkpoint file is to reside on mass storage, you must include a SAVE or DEFINE command in the checkpoint job and a GET or ATTACH command in the restart job.

If the checkpoint file is to reside on magnetic tape, care should be taken to use a labeled or nonblank tape. An unlabeled blank tape (one which has never been used) cannot be specified as the checkpoint file since the checkpoint program attempts to read the tape to determine the number of the last checkpoint. The tape subsystem then aborts the job with a blank tape read message.

The system numbers checkpoints starting at 1 and increases by 1 to a limit of 4095. At this point, a second cycle of numbering begins, again starting at 1. An example showing how to restart from a specific checkpoint is given in the RESTART command section.

**RESTART COMMAND**

The RESTART command directs the system to restart a previously terminated job from a specified checkpoint.

Format:

```
RESTART, lfn, nnnn, x.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Identifies the checkpoint file; you must have write permission to lfn.</td>
</tr>
<tr>
<td>nnnn</td>
<td>Number of the checkpoint from which to restart; if nnnn is *, the last available checkpoint on lfn is used; if nnnn is omitted, the first checkpoint is used. The nnnn parameter can be obtained from the CHECKPOINT nnnn COMPLETE messages issued to the user's dayfile in response to CKP command.</td>
</tr>
</tbody>
</table>
**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x1</td>
<td>Any of the following in any order:</td>
</tr>
<tr>
<td>RI</td>
<td>If this parameter is included, the command file on lfn is not restored. The command file of this restart job at its current position is used instead. The procedure scratch files ZZZZZC0, ZZZZZC1, and ZZZZZC2 are not restored from the checkpoint file. The values of the symbolic names EFG, EF, R1G, R1, R2, R3, and DSC of this restart job are used, not the values from the checkpoint file CPA. If this parameter is not included, the entire command file of the checkpointed job is restored and set to its position at checkpoint time; any command following RESTART is not processed.</td>
</tr>
<tr>
<td>NA</td>
<td>If this parameter is included, RESTART does not abort if a required file is not available. Also, if NA is included and a read parity error occurs in an attempt to obtain a file from checkpoint nnnn, RESTART selects checkpoint nnnn-1 if it is available.</td>
</tr>
<tr>
<td>FC</td>
<td>Normally RESTART restores all mass storage files included in the specified checkpoint. This option does not restore ZZZZZC0, ZZZZZC1, or ZZZZZC2. However, if this option is selected, RESTART first checks if a file is already local to the restart job. If it is, RESTART does not replace it with the file on the checkpoint dump.</td>
</tr>
</tbody>
</table>

Before you enter the RESTART command, do the following:

- Assign the checkpoint file to the job. You must include a REQUEST, ASSIGN, or LABEL command if the checkpoint file resides on magnetic tape. You can use a GET or ATTACH command if the checkpoint file resides on mass storage.

- Assign to the job all necessary magnetic tape files to be used by the restarted job. You can use the LABEL command.

Checkpoint dumps are numbered in ascending order from 1 to 4095. When nnnn equals 4095, the numbering sequence begins again at nnnn equal to 1. The value of nnnn depends on the structure of the checkpoint file, as defined by the CK and CB parameters of the REQUEST, ASSIGN, or LABEL commands.

If CK was specified when the checkpoints occurred, each dump is appended to the checkpoint file, and therefore, all dumps up to the time the job aborted are available for restart. You may specify a particular checkpoint dump in the following manner.
Assume a CK file of the name CHKFILE is being used and checkpoint number 4095 has been passed. The job is terminated at checkpoint number 10 in the second cycle of numbering. To restart the job from checkpoint 4 of the second numbering cycle, the following commands can be used.

**SKIPR,CHKFILE,8196.** There are two records for every checkpoint, and 4098 checkpoints must be skipped to reach checkpoint 4 of the second numbering cycle.

**COPYBR,CHKFILE,AA,2.** The fourth checkpoint is copied to file AA. At this point, file CHKFILE is not positioned correctly for subsequent checkpoints. If you intend to continue checkpointing on this file, a

**BKSP,CHKFILE.**

command should be included.

**RESTART,AA... .** The job is restarted from file AA using the fourth checkpoint.

If the CB parameter was specified on the ASSIGN, LABEL, or REQUEST command naming the checkpoint file, each dump is written over the preceding dump, and therefore, only the last dump is available. If two REQUEST, ASSIGN, or LABEL commands with CB specified are submitted, successive dumps are alternated between two files; therefore, the last two dumps are available.†

All files copied by RESTART are made local to the restart job. Therefore, you must make sure that any direct access files are not lost. For example, assume that direct access files X, Y, and Z are attached to a job. The job is then checkpointed and X, Y, and Z are copied to the checkpoint file lfn. To retain these files as direct access files during restart, you should include the following sequence of commands.

**PURGE,X,Y,Z.**

**DEFINE,X,Y,Z.**

**RESTART,lfn,nnnn,x.i.**

If the information table associated with a file was included on the checkpoint file, but the file itself was not copied, RESTART issues the appropriate commands to attempt to retrieve the file unless one of the following is true:

- You specified the FC parameter and the file is already local to the restart job.
- The file resides on magnetic tape.

†If alternate checkpoint files are used and a read parity error occurs in an attempt to read the last checkpoint, RESTART aborts even if the NA option was selected.
NOS provides the following utilities for file maintenance and screen formatting.

**EDIT**
Edits a text file.

**FSE**
Edits a file in line or screen mode.

**KRONREF**
Generates a cross-reference listing of system symbols.

**MODIFY**
Edits a Modify-formatted program library file.

**OPLEDIT**
Removes modification decks and identifiers from a Modify-formatted program library file.

**PDU**
Compiles a panel definition file and loads it in a user library.

**PROFILE**
Enables a master user to update and inquire about a profile file.

**UPDATE**
Edits an Update-formatted program library file.

**XEDIT**
Edits a text file.

### EDIT COMMAND

The EDIT command calls the Text Editor utility. The Text Editor manipulates data on a specified mass storage file through use of special input directives called edit commands.

Format:

```
EDIT, lfn1,m, lfn2, lfn3.
```

or

```
EDIT, FN=lfn1, M=m, I= lfn2, L=lfn3.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Name of file to be edited (referred to as edit file). This specification is required for batch origin jobs.</td>
</tr>
<tr>
<td>m</td>
<td>Mode of file processing:</td>
</tr>
<tr>
<td></td>
<td>ASCII or AS ASCII mode edit file.</td>
</tr>
<tr>
<td></td>
<td>NORMAL or N NORMAL mode edit file.</td>
</tr>
<tr>
<td>lfn2</td>
<td>File from which directives (edit commands) are to be read. If omitted, INPUT is assumed.</td>
</tr>
<tr>
<td>lfn3</td>
<td>File to which output is to be written. If omitted, OUTPUT is assumed.</td>
</tr>
</tbody>
</table>
FSE COMMAND

The FSE command calls the full screen editor FSE. For a complete description of the features of FSE and its parameters and directives, refer to the NOS Version 2 Full Screen Editor User’s Guide.

Format:

FSE,FN=filename,OP=access,I=input,L=output,IP=procedure,WF=workfile.directives

or

FSE,filename,access,input,output,procedure,workfile.directives

The first format is the order-independent format for parameters. The second is the order-dependent format.

Parameter | Description
---|---
FN=filename | Specifies the file you want to edit. The file can be a local file or a permanent file. The default is the file most recently edited during your job.

OP=access | Specifies the character set code and the location of the file to be edited. The following entries are valid:

<table>
<thead>
<tr>
<th>Access</th>
<th>Abbreviation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISPLAY</td>
<td>D</td>
<td>Selects 6-bit display code. This is the default if your terminal is NORMAL mode.</td>
</tr>
<tr>
<td>or</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NORMAL</td>
<td>N</td>
<td>Selects 6/12-bit display code. This is the default if your terminal is in ASCII mode.</td>
</tr>
<tr>
<td>ASCII</td>
<td>A</td>
<td>Selects 7-bit ASCII code right-justified in a 12-bit byte.</td>
</tr>
<tr>
<td>ASCII8</td>
<td>8</td>
<td>Specifies that the file is a direct access or an indirect access permanent file.</td>
</tr>
<tr>
<td>GET</td>
<td>G</td>
<td></td>
</tr>
</tbody>
</table>

To specify both a character set and the location of the file, you must specify two values. For example, OP=8G and OP=AG are valid.

To specify the OP=access parameter, you must also specify the FN=filename parameter.

I=input | Specifies an input file for directives. The default is file INPUT.
L=output | Specifies an output file. The default is OUTPUT.
**Parameter**  
**Description**  

**IP=procedure**  
Specifies a file to be the FSE procedure library. The default procedure library is FSEPROC. If file FSEPROC is not a local file, FSE automatically retrieves it. If FSEPROC is not one of your indirect access permanent files, FSE retrieves a copy from user name LIBRARY.

**WF=workfile**  
Specifies a work file for FSE. The default is ZZZWORK.

**directives**  
Specifies FSE directives to be executed before FSE executes those in the input file. Use semicolons to separate directives.

If you specify both an input directive file (using the I=input parameter) and an output listing file (using the L=output parameter), FSE is said to be in batch mode. When operating in batch mode, the input directive file must be coded in 6/12-bit display code.

**NOTE**

When FSE is executing in batch mode, or when the FSE command is included in a batch job, you can significantly increase processing efficiency by disabling UNDO processing (using the SET UNDO directive). This action inhibits FSE from keeping a record of each operation performed.
KRONREF COMMAND

The KRONREF command generates a cross-reference listing of system symbols used by decks on a Modify OPL. For output listing files not connected to your terminal, the KRONREF command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

**NOTE**

Before entering a KRONREF command specifying both OPL and NOSTEXT, you must enter an RFL command to reserve sufficient memory to contain systems text and OPL contents.

Format:

```
KRONREF,P=lfn1,L=lfn2,S=lfn3,G=lfn4.
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P=lfn1</td>
<td>OPL input from file lfn1. If the P option is omitted or P alone is specified, file OPL is assumed.</td>
</tr>
<tr>
<td>L=lfn2</td>
<td>List output on file lfn2. If the L option is omitted or L alone is specified, file OUTPUT is assumed.</td>
</tr>
<tr>
<td>S=lfn3</td>
<td>System text from overlay lfn3. The system text must contain symbol definitions. If the S option is omitted or S alone is specified, file NOSTEXT is assumed. If S=0 is specified, only the common deck references and statistics are listed.</td>
</tr>
<tr>
<td>G=lfn4</td>
<td>System text from local file lfn4. The system text must contain symbol definitions. If G is omitted, system text is acquired as specified or defaulted by the S option. If G alone is specified, local file TEXT is used. Use of the G option overrides any S specification.</td>
</tr>
</tbody>
</table>

The names of programs on the OPL are listed for those decks that reference the following:

- PP direct cell locations defined in lfn3 or lfn4.
- PP resident entry points defined in lfn3.
- Monitor functions.
- Mass storage table words.
- Global or local file name table words and ordinals.
- Central memory pointers (in low central memory) defined in lfn3 or lfn4.
- Central memory locations (in low central memory) defined in lfn3 or lfn4.
- Control point area words defined in lfn3 or lfn4.
- Executing job table, equipment status table, or queue file table.
- Negative field length symbols and dayfile message options.
- File types and mass storage constants.
- Job origin types and queue types.
- Error flags referenced.
- Common deck calls.
- PP packages called.
- Special entry points.
MODIFY COMMAND

The MODIFY command edits a Modify-formatted program library file. For output listing files not connected to your terminal, the MODIFY command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

MODIFY,P1,P2,...,Pn

The following optional parameters can be specified in any order.

<table>
<thead>
<tr>
<th>Pi</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Write the compile file in compressed format.</td>
</tr>
<tr>
<td>C=lfn1</td>
<td>Write compile output on lfn1. If you specify only C or omit this parameter, lfn1 is COMPILE. C=0 results in no compile output.</td>
</tr>
<tr>
<td>CB=lfn2</td>
<td>Write binary output on lfn2. This parameter is equivalent to the B=lfn parameter on a compiler or assembler call command. If you specify only CB or omit this parameter, LGO is the binary output file. CB=0 produces no binary output. This parameter is meaningful only if you specify the Q=processor or X=processor parameter.</td>
</tr>
<tr>
<td>CG=lfn3</td>
<td>Load system text from lfn3. This parameter is equivalent to the G=lfn parameter on a compiler or assembler call command. Load system text from SYSTEXT. CG=0 loads no system text. By default, the system uses the CS=lfn5 parameter. This parameter is meaningful only if you specify the Q=processor or X=processor parameter.</td>
</tr>
<tr>
<td>CL=lfn4</td>
<td>Write full listing on lfn4. CL=lfn4 is equivalent to the L=lfn parameter on a compiler or assembler call command. If you specify only CL, OUTPUT is the list file. If you omit this parameter or specify CL=0, a short listing is written on OUTPUT. This parameter is meaningful only if you specify the Q=processor or X=processor parameter.</td>
</tr>
<tr>
<td>CS=lfn5</td>
<td>Take system text from lfn5. This parameter is equivalent to the S=lfn parameter on a compiler or assembler call command. If you omit this parameter or specify only CS, the system text is taken from SYSTEXT overlay. CS=0 produces no system text. This parameter is meaningful only if you specify the Q=processor or X=processor parameter.</td>
</tr>
<tr>
<td>CV=cv</td>
<td>Convert the library to the character set specified by cv (63 or 64). By default, no conversion occurs.</td>
</tr>
</tbody>
</table>

NOTE

When CV=63 or CV=64 is specified, Modify prevents compile file generation (C=0).
Do not abort the job on a directive error. (This parameter is referred to as debug mode.) This parameter does not affect fatal error processing. By default, the job aborts on a directive or fatal error.

Edit all decks on the library and write them on new program library, compile file, and source file if the respective options are selected. (This parameter is referred to as full edit mode.) By default, the U parameter or EDIT directives determine the decks to be edited.

Take directives from next record on lfn6. INPUT is the default. The system reads no directives if you specify I=0.

Write list output on lfn7. OUTPUT is the default. L=0 generates no list output file.

Select list options $c_i$. In an interactive job, the default is $L_0=E$ if the list output file is assigned to the terminal. Otherwise, the default is $L_0=ECTMWD$. You can specify a maximum of seven list options $c_i$.

Write new program library on lfn8. If you specify only the keyword $N$, the system uses file NPL. If you omit this parameter or specify $N=0$, the system generates no new program library.

If a new program library is being generated, the system performs an evict operation on the file specified by the $N=lfn8$ parameter.
NR
Do not rewind compile file. By default, the system rewinds compile file at beginning and end of Modify run.

P=lfn9
Take program library input from lfn9. If you do not specify a file, the system takes the input from OPL. P=0 results in no input file for the program library.

Q=processor
Set LO=E and the A parameter at the beginning of the Modify run and call the assembler or compiler specified by processor at the end of the run. The system does not rewind the directives file or the list output file. If you do not specify this parameter or specify Q=0, no call is made to an assembler or compiler.

If you specify only the keyword Q, the system sets LO=E and the A parameter at the beginning of the Modify run and calls the COMPASS assembler at the end of the run. When this option is selected, the CB=lfn2, CL=lfn4, CS=lfn5, and CG=lfn3 parameters are meaningful. Compiler input is assumed to be COMPIL. All other parameters are set by default. If CL is not specified with Q, lines beginning with an asterisk in column 1 are not written to the compile file (compile file directives are processed).

S=lfn10
Write source output on file lfn10. If you specify only the keyword S, the file SOURCE is used. If you omit this parameter or specify S=0, the system generates no source output file.

Do not specify this parameter if you specify the A, Q=processor, or X=processor parameter.

U
Edit only decks for which the directives file contains deck directives and write them on the compile file, new program library, and source file (if their respective parameters are selected). F, if specified, takes precedence. By default, decks to be edited are determined by EDIT directives or by the F parameter.

X
Process the same as Q=processor parameter, except that modify directives input (I parameter) and list output (L parameter) files are rewound before processing.

Z
Read the input directives following the terminator of the MODIFY command; the input file is not read. This eliminates the need for a separate input file for the directives when only a few directives are needed. The first character following the command terminator is the separator character for all directives on the command. Any display code character that is not used in any of the directives, including a space, can be used as the separator character. The directives can extend to column 80 on the command. Continuation lines are not permitted. If Z is omitted, the command does not contain the input directives.

NOTE
Do not place another terminator after the directives.

For a detailed description of the Modify utility, refer to the Modify Reference Manual.
OPLEDIT COMMAND

The OPLEDIT command removes modification decks and identifiers from a Modify-formatted program library file. For output listing files not connected to your terminal, the OPLEDIT command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

OPLEDIT, P1, P2, ..., Pn

<table>
<thead>
<tr>
<th>Pi</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I=lnf1</td>
<td>Use directive input from file lnf1. Take input directives from file lnf1. INPUT is the default. I=0 indicates that there are no input directives.</td>
</tr>
<tr>
<td>P=lnf2</td>
<td>Use file lnf2 for the old program library. Use file lnf2 for the old program library. OPL is the default. P=0 indicates that there is no old program library.</td>
</tr>
<tr>
<td>N=lnf3</td>
<td>Write new program library on file lnf3. Write the new program library on lnf3. If you specify only the keyword N, NPL is used. If you omit this parameter or specify N=0, the system writes no new program library.</td>
</tr>
<tr>
<td>L=lnf4</td>
<td>List output on file lnf4. Place list output on file lnf4. OUTPUT is the default. L=0 generates no list output.</td>
</tr>
<tr>
<td>M=lnf5</td>
<td>Write output from *PULLMOD directives on file lnf5. If this option is omitted, M=MODSETS is assumed.</td>
</tr>
<tr>
<td>L0=c1c2...cn</td>
<td>Selects up to five list options c1.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ci</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E</td>
<td>Errors.</td>
</tr>
<tr>
<td>C</td>
<td>Input directives.</td>
</tr>
<tr>
<td>M</td>
<td>Modifications made.</td>
</tr>
<tr>
<td>D</td>
<td>Deck status.</td>
</tr>
<tr>
<td>S</td>
<td>Statistics.</td>
</tr>
</tbody>
</table>

If this parameter is omitted or just L0 is specified, it selects all list options. If the output file is assigned to the terminal in an interactive job and this parameter is omitted or just L0 is specified, list option E is selected.
Modify all decks.

Debug; ignore errors.

Generate *EDIT directives for all decks; meaningful only for *PULLMOD executions.

Generate no *EDIT directives. If the U option is omitted, generate *EDIT directives for common decks. This is meaningful only for *PULLMOD execution.

Read the input directives that follow the terminator. The input file is not read. This eliminates the need to use a separate input file for the directives when only a few directives are needed. The first character following the command terminator is the separator character. If Z is omitted, the command does not contain the input directives.

**NOTE**

Do not place another terminator after the directives.

For a complete description of the OPLEDIT utility, refer to the Modify Reference Manual.
PDU COMMAND

The PDU command compiles a panel definition file and stores the compiled panel in a user library. Refer to the NOS Version 2 Screen Formatting Reference manual for information on panels.

Format:

PDU,I=panel,L=listing,C=capsule,LIB=library,REC=recname,RW=option.

or

PDU,panel,listing,capsule,library,recname,option.

The first format is the order-independent format for the parameters. The second is the order-dependent format. Only the first parameter is required.

Parameter Description
I=panel Specifies the name of the panel definition file. The file must be local. You must specify this parameter.
L=listing Specifies the name of the listing file. The default is OUTPUT. If you specify L=0, no listings are generated.
C=capsule Specifies the name of the capsule file, the file on which the system writes the compiled panel. The default is CAPSULE. If you specify C=0, no capsule is generated.
LIB=library Specifies the name of the local file to receive the capsule. The default user library is PANELIB. If you specify LIB=0, the system does not store the compiled panel in a user library.
REC=recname Specifies the name of the panel definition record to be selected for processing from the panel definition file. If an asterisk (*) is entered, all records are processed. If REC is omitted, the current record is processed with no regard to the record name.
RW=option Specifies if the panel definition file and listing file are to be rewound before and after processing.

<table>
<thead>
<tr>
<th>option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO or N</td>
<td>Files are not rewound.</td>
</tr>
<tr>
<td>YES or Y</td>
<td>Files are rewound.</td>
</tr>
</tbody>
</table>

If RW is omitted, the files are rewound.

The PDU command is an interactive procedure. Hence, you can get help information for the command and its parameters and be prompted for parameters. If you enter

PDU?

the system gives you information about the command itself and prompts you for parameters. If you enter

PDU,parameter?

the system gives you information about the specified parameter and prompts you for parameters.
PROFILE COMMAND

The PROFILE command enables the master user to update and inquire about a project profile file for user profile control. Other capabilities of PROFILE (available only to system origin jobs) are described in the NOS Version 2 Administration Handbook. For output listing files not connected to your terminal, the PROFILE command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

PROFILE,P1,P2,...,Pn.

The following optional parameters can be specified in any order.

<table>
<thead>
<tr>
<th>Pi</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>I=1fn1</td>
<td>File 1fn1 contains input directives for an update (OP=U). If omitted, file INPUT is assumed.</td>
</tr>
<tr>
<td>L=1fn2</td>
<td>File 1fn2 receives output listings. If omitted, OUTPUT is assumed.</td>
</tr>
<tr>
<td>P=1fn3</td>
<td>File 1fn3 is the project profile file. If omitted, file PROFILC is assumed.</td>
</tr>
<tr>
<td>CN=cn</td>
<td>Charge number inquiry. All project numbers valid for charge number cn are written to output file. Valid only if the OP=I option is specified.</td>
</tr>
<tr>
<td>PN=pn</td>
<td>Project number inquiry. The control values and all valid user names for project number pn are written to the output file. The OP=I and CN=cn options must also be specified to use the PN option.</td>
</tr>
<tr>
<td>OP=opt</td>
<td>PROFILE processing option. One of the following:</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>opt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>L</td>
<td>Lists portions of the profile file as specified by the LO=op parameter.</td>
</tr>
<tr>
<td>U</td>
<td>Updates the project profile file with directives supplied by the input file. U is the default value for the master user if the OP option is omitted.</td>
</tr>
<tr>
<td>T</td>
<td>Interactive update. Processing is the same as OP=U, but preliminary instructions are suppressed.</td>
</tr>
<tr>
<td>I</td>
<td>Inquire option. Output is dependent upon the CN or PN=pn parameter specified.</td>
</tr>
</tbody>
</table>
LO=op
PROFILE list option (OP=L must be specified). One of the following:

Description

FM  Full list of everything accessible on the profile file by the master user. This is the default for a nonsystem origin job if the LO=op parameter is omitted.

CM  Charge number list of all charge numbers accessible on the profile file by the master user.

PM  Project number list of all project numbers accessible on the profile file by the master user.

Directives are available to the master user as input to PROFILE to add or update information concerning each charge number. The input file for a PROFILE update (OP=U) is divided into groups of entries that each begin with a charge number directive. Each directive following a particular charge number entry applies only to that charge number, until another charge number entry occurs.

Each line of the input file can contain one or more directives (up to 72 characters per line) in the following format.

dir1,dir2,...,dirn

Each directive is separated by a delimiter which can be any special character (display code greater than 44g) except an asterisk (*).

An end-of-line or end-of-card also delimits directives. The following directives are available to the master user for PROFILE input.

Description

APN=pn  Adds or activates project number pn.

AUN=un  Adds user names un (must be preceded by PN directive).

/cn  Specifies the charge number cn to which the following directives apply. If this form of charge number specification is used (refer to CN=cn directive), it must begin in column 1 with the slant (/).

CN=cn  Same as /cn except that it can begin in any column.

DPN=pn  Deactivates project number pn. This directive does not delete the specified project number entry but sets its status such that it cannot be specified by users.

DUN=un  Deletes user name un from the list of those who may access the project number (must be preceded by PN directive).

EFN=fn  Specifies the indirect access permanent file that contains the epilogue to be associated with the specified project. The epilogue can be a procedure or a binary program. A null entry, which is the default, clears the project epilogue.
<table>
<thead>
<tr>
<th>dir</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EPW=pw</td>
<td>Specifies the file password associated with the project epilogue file. A null entry, which is the default, indicates that no password is associated with the file.</td>
</tr>
<tr>
<td>EUN=un</td>
<td>Specifies the user who owns the project epilogue file. A null entry, which is the default, indicates that the owner of the project epilogue file is the user on whose behalf the epilogue is to run.</td>
</tr>
<tr>
<td>ISV=x</td>
<td>Sets x as the maximum SRU accumulation for any job using the charge number and project number specified by preceding CN and PN directives.</td>
</tr>
<tr>
<td>PCR=option</td>
<td>Defines the conditions under which the system sets a charge-required state after the project prologue executes. You can specify one of the following values:</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>U</td>
<td>Set a charge-required state unconditionally.</td>
</tr>
<tr>
<td>A</td>
<td>Sets a charge-required state only if the project prologue aborts.</td>
</tr>
<tr>
<td>null</td>
<td>Does not set a charge-required state. This is the default.</td>
</tr>
<tr>
<td>PEX=ymmd</td>
<td>Specifies expiration date for project number of preceding PN directive. If PEX=0 is entered, the project number is not limited by an expiration date.</td>
</tr>
<tr>
<td>PFN=fn</td>
<td>Specifies the indirect access permanent file that contains the prologue to be associated with the specified project. The prologue can be a procedure or a binary program. A null entry, which is the default, clears the project prologue.</td>
</tr>
<tr>
<td>PN=pn</td>
<td>Project number for which the following directives (until the next PN directive) apply.</td>
</tr>
<tr>
<td>PPW=pw</td>
<td>Specifies the file password associated with the project prologue file. A null entry, which is the default, indicates that no password is associated with the file.</td>
</tr>
<tr>
<td>PUN=un</td>
<td>Specifies the user who owns the project prologue file. A null entry, which is the default, indicates that the owner of the project prologue file is the user on whose behalf the prologue is to run.</td>
</tr>
<tr>
<td>SMA=acc</td>
<td>Sets the current number of accumulated SRUs the project number has used (PN directive required). This accumulator is updated at the end of a job or terminal session and each time a CHARGE command is entered. When the SMA value surpasses the SML value, the project is not available to users until either the limit or accumulator is respecified.</td>
</tr>
<tr>
<td>SML=lim</td>
<td>Specifies the maximum number of accumulated SRUs the project (PN directive) may use. SML=0 implies no restriction.</td>
</tr>
</tbody>
</table>
**TI=ti**

Specifies the time of day before which the project number specified by the PN directive cannot be used. The time is specified in 24-hour clock notation. For example, a ti specification of 1315 indicates the project number cannot be used before 1:15 in the afternoon.

**TO=to**

Specifies the time of day after which the project number specified by the PN directive cannot be used. The time is specified in 24-hour clock notation. For example, a to specification of 1315 indicates that the project number cannot be used after 1:15 in the afternoon.

**UPDATE COMMAND**

The UPDATE command creates, edits, or copies an Update-formatted program library file. For complete information on Update directives and processing, refer to the Update Reference Manual.

**Format:**

`UPDATE, P1, P2, ..., Pn`

The parameters are optional and can be specified in any order.

For file-specifying parameters (those associated with the keywords C, G, I, K, N, O, S, or T), you can append either the digit 6 or 8 (but not both) to the keyword. Each file-specifying parameter has its own default for the character code set of the file (refer to Character Sets in appendix A). The digit 6 or 8 overrides this default. The digit 6 directs the system to represent the file in the 6-bit display code set. The digit 8 directs the system to represent the file in the 7-bit ASCII code set. However, the system uses the ASCII code set only if the digit 8 is appended to the keyword and if the input file is also represented in the 7-bit ASCII code set. For example, C8=FILE directs the system to write the decks on the compile file FILE in the ASCII code set.

**P1**

<table>
<thead>
<tr>
<th>Description</th>
<th>A</th>
<th>B</th>
<th>C=lfnn1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copies the old sequential access program library to a new random access program library.</td>
<td></td>
<td></td>
<td>Specifies the compile file. Unless otherwise specified, the compile file has the same character code set as the old program library. C=PUNCH implies the D and 8 parameters. C=0 implies no compile file. If you omit this parameter or specify the keyword only, COMPILE becomes the compile file. If you specify the K=lfnn1 parameter, the C=lfnn1 parameter is ignored.</td>
</tr>
</tbody>
</table>

†The digit 8 directs the system to represent the file in the 6/12-bit display code set if the job is interactive and the file is an input or output file.
**P1**

**Description**

**D**

Sets the width of the compile file to 80 characters. The default is 72.

**E**

Edits the old program library. To completely edit the library, specify the E parameter on two UPDATE commands. The first occurrence of the E parameter causes the system to rearrange the directory to reflect the actual order of the decks on the library and to remove previously purged identifiers. The second occurrence of the E parameter causes the system to remove the identifiers that exist only as directory entries.

**F**

Specifies full Update mode.

**G=lfn2**

Specifies the output file for the FULLMOD directive. Unless otherwise specified, the character code set of lfn2 is the same as that of the old program library. If you do not specify lfn2, the output from the FULLMOD directive is appended to the source file (specified by the S=lfn8 parameter).

**H=n**

Specifies whether a 63- or 64-character character set is to be used in the Update run.

<table>
<thead>
<tr>
<th>n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>A 63-character character set.</td>
</tr>
<tr>
<td>4</td>
<td>A 64-character character set.</td>
</tr>
<tr>
<td>omitted</td>
<td>Character set that was used in the old program library.</td>
</tr>
</tbody>
</table>

**I=lfn3**

Specifies the primary input file. The default is INPUT. The default character code set is 6/12-bit ASCII code if INPUT is associated with the terminal. Otherwise, it is display code.

**K=lfn1**

Specifies the compile file and specifies that the decks are written to that file in their order of appearance in the COMPILE directives. The default is file COMPILE. The default character code set is 6-bit display code.
L=c1c2...cn Specifies one or more of the following list options.

<table>
<thead>
<tr>
<th>c1</th>
<th>List Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Lists deck names and correction set identifiers, COMDECK directives, definitions, and decks written on the compile file.</td>
</tr>
<tr>
<td>F</td>
<td>Uses all list options except 0.</td>
</tr>
<tr>
<td>0</td>
<td>Suppresses all listing.</td>
</tr>
<tr>
<td>1</td>
<td>Lists lines in error.</td>
</tr>
<tr>
<td>2</td>
<td>Lists active Update directives.</td>
</tr>
<tr>
<td>3</td>
<td>Notes on each line that changed status during current execution.</td>
</tr>
<tr>
<td>4</td>
<td>Lists text lines.</td>
</tr>
<tr>
<td>5</td>
<td>Lists active compile file directives.</td>
</tr>
<tr>
<td>6</td>
<td>Lists active and inactive lines.</td>
</tr>
<tr>
<td>7</td>
<td>Lists all active lines.</td>
</tr>
<tr>
<td>8</td>
<td>Lists all inactive lines.</td>
</tr>
<tr>
<td>9</td>
<td>Lists correction history of all lines selected by list options 5, 7, and 8.</td>
</tr>
</tbody>
</table>

The default depends on the nature of the Update processing. For a creation run, the default is options A, 1, and 2. For a correction run, the default is A, 1, 2, 3, and 4. For a copy run, the default is A and 1.

M=1fn4 Merges 1fn4 and the old program library. If you specify only the keyword M, the system merges the file MERGE and the old program library. The two libraries must have the same character code set. If the parameter is omitted, no merging occurs.

N=1fn5 Specifies the new program library. If you do specify a new program library on a correction run, no new program library is generated. Otherwise, the default is the file NEWPL. The default character code of the new program library is the same as that of the old program library unless the primary input file is in 7-bit ASCII code and the old program library is in 6-bit display code. In this case, the default is the 7-bit ASCII code set.
**P**

O=lfnl

Specifies the output file. The default is OUTPUT. The default character code is the same as that of the old program library.

\[P=lfn/s_1/s_2/\ldots/s_7\]

Specifies file lfn as the old program library. If just the keyword P is specified, file OLDPL is assumed. If \(s_1/s_2/\ldots/s_7\) is specified, secondary old program libraries will reside on files \(s_1,s_2,\ldots,s_7\).

**Q**

R=clc2...c4

Processes only decks on COMPILE directives (quick mode).

Rewind specified files before and after the Update run.

**C**

Files

- Compile file.
- New program library.
- Old program library and merge library.
- Source and PULLMOD files.

If C is omitted, no files are rewound. If R=clc2...c4 is omitted, the old program library, new program library, compile file, source file, and PULLMOD file are rewound.

\[S=lfng\]

Specifies the name of the source file. If you specify the keyword only, the file SOURCE becomes the source file. If you omit the parameter, the system does not write a source file unless you specify the T=lfng parameter. The default character code set of the source file is the same as that of the old program library.

\[T=lfng\]

Functions the same as the S=lfng parameter, except that it excludes common decks from the source file. This parameter takes precedence over the S=lfng parameter.

**U**

Specifies that Update processing is to continue even if normally fatal errors occur.

**W**

The new program library is written in sequential access format. If W is omitted, the new program library is written in random access format unless the file is on magnetic tape.

**X**

Writes the compile file in compressed format. If X is omitted, the compile file is not compressed.

**8**

Writes compile file output as 80-character line images. If 8 is omitted, the compile file is written as 90-character line images.
**Description**

* = char

The master control character (first character of each directive) for this Update run is char, which can be any character having a 6-bit display code octal value in the range 01 through 54 except for 51 and 52 (the open and close parentheses). If this option is omitted, the master control character is *.

/=char

The comment control character for this Update run is char, which can be A through Z, 0 through 9, or + -*/$=. The character should not be changed to one of the abbreviated forms of the directives unless NOABBREV is in effect. If this option is omitted, the comment control character is a slant bar.

**XEDIT COMMAND**

The XEDIT command calls the text editor, XEDIT. For a complete description of XEDIT parameters and directives, refer to the XEDIT Reference Manual.

**NOTE**

When XEDIT encounters lines longer than 150 characters it truncates those lines without warning; therefore, you should use caution when calling XEDIT to edit a file that may contain lines longer than 150 characters or when editing an ASCII file in NORMAL mode.

**Format:**

```
XEDIT,lfn1,P1,P2,...,Pn.directives
```

All parameters are optional. The following are brief parameter descriptions.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Use lfn1 as the name of the file to be edited or created. If lfn1 is omitted (indicated by two separators before other parameters), the primary file is edited.</td>
</tr>
<tr>
<td>P1</td>
<td>Description</td>
</tr>
<tr>
<td>AS</td>
<td>Edit lfn1 in ASCII interactive mode. After the XEDIT job step, processing returns to the original mode.</td>
</tr>
<tr>
<td>B</td>
<td>Process the job as a batch origin job.</td>
</tr>
<tr>
<td>C</td>
<td>Create a new file lfn1.</td>
</tr>
<tr>
<td>FR</td>
<td>Take the first editing directive from the first line of lfn1.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>I=(lfn_2)</td>
<td>Take editing directives from (lfn_2). By default, directives are taken from file INPUT. If you specify I=0, the system takes all directives from the trailing delimited directive sequence. (If the PR parameter is also specified, the system processes the delimited directive sequence after processing directives from the first line of (lfn_1).)</td>
</tr>
<tr>
<td>L=(lfn_3)</td>
<td>Put all XEDIT output on the specified file. OUTPUT is the default. If you specify L=0, the system suppresses all output.</td>
</tr>
<tr>
<td>LK</td>
<td>XEDIT processes the edit file in look-only mode. The edit file can be examined, but not modified.</td>
</tr>
<tr>
<td>NH</td>
<td>Suppress printing of the XEDIT header.</td>
</tr>
<tr>
<td>P</td>
<td>Retrieve and edit permanent file (lfn_1). Direct access files are attached in write mode. If P is omitted, the file (lfn_1) is assumed to be a local file.</td>
</tr>
</tbody>
</table>

**directives**

Process the directives that follow the command terminator. The first character that follows the terminator delimits the directives. The value directives has the following form (the semicolon serves as the delimiter):

\[;\text{directive}_1;\text{directive}_2;\ldots;\text{directive}_n\]

Do not place a terminator after the last directive.
A library is a file containing records that are accessed individually. This section describes the creation and maintenance of user libraries. User libraries are not to be confused with program libraries. User libraries are created using the LIBGEN, ULIB, PDU, or TDU commands. A user library can be named in an LDSET or a LIBRARY command to establish a local or global library set. Program libraries are source code libraries, created and edited using either the Modify utility or the Update utility.

This section describes file access methods, library record types, and the following commands and their functions.

<table>
<thead>
<tr>
<th>Command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATALOG</td>
<td>Describes the records on a file.</td>
</tr>
<tr>
<td>COPYL and COPYLM</td>
<td>Copies an old file to a new file, updating the records from a replacement file.</td>
</tr>
<tr>
<td>GTR</td>
<td>Appends records selected from one file to another file.</td>
</tr>
<tr>
<td>ITEMIZE</td>
<td>Describes the records on a file.</td>
</tr>
<tr>
<td>LIBEDIT</td>
<td>Generates a file containing records from one or more other files. The records may be of several types.</td>
</tr>
<tr>
<td>LIBGEN</td>
<td>Generates a user library; that is, a library of relocatable, capsule, absolute, CP overlay, or procedure file records that can be accessed by the CYBER Loader.</td>
</tr>
<tr>
<td>LIBRARY</td>
<td>Specifies a global library set for the job.</td>
</tr>
<tr>
<td>ULIB</td>
<td>Creates or modifies a local copy of a user library.</td>
</tr>
<tr>
<td>VFYLIB</td>
<td>Compares the records in two files and lists their differences.</td>
</tr>
</tbody>
</table>

We recommend that, except for files consisting solely of S-type and/or U-type records, only the CATALOG and ITEMIZE commands be used on files structured by the CYBER Record Manager (CRM). Because of certain incompatibilities with NOS file structures, the output from commands other than CATALOG and ITEMIZE may not reflect the CRM file structure accurately.

**LIBRARY FILE ACCESS METHODS**

The methods used to access records within NOS files are sequential access and random access.

To access a record sequentially, NOS rewinds the file to BOI and then reads records until it finds the requested one. To replace, insert, or delete records from a sequential access file, NOS must rewrite the entire file. (Records can be appended at EOI without rewriting the file.)
To access a record randomly, the file must be on mass storage and must have a directory containing the address of each record (figure 15-1). The GTR, LIBGEN, and LIBEDIT commands can generate random access directories. Records within a file can then be replaced, inserted, or deleted by rewriting the directory instead of rewriting the entire file. Records within a random access file can also be accessed sequentially.

**LIBRARY RECORD TYPES**

NOS determines the type and the name of a record from information contained within the record. If the record begins with a prefix table, the record name (if any) is obtained from that table and the type of the record is determined from the first word following the prefix table. Otherwise, the type and name (if any) of the record are determined from the first and second words of the record.

Prefix tables exist, unless they have been specifically suppressed, for:

- Assembled or compiled programs.
- System text overlays.
- User library header records and directory records.
- Modify program library decks, common decks, or directory records.

The prefix table consists of a header word with an octal table type identifier followed by varying amounts of control information.

The prefix table is identified by octal digits 7700 in bits 59 through 48 of its first word; consequently, it is often referred to as a 77 or 7700 table. Information in the prefix table, which originates with the assembler, compiler, or other program that creates the table, can specify items such as the date created and the system on which the job was processed (refer to the CYBER Loader Version 1 Reference Manual).
If a prefix table is not present, the first word in a record is examined. If a record meets the criteria for a given type of record, the utilities identify it as such. For instance, a load file beginning with a Job command may be identified as type TEXT, depending on the particular characters in the Job command.

Although some of the records may contain display coded data (loader directives, for example), they are considered binary records.

The following record types can be specified on the COPYX, GTR, and LIBEDIT commands and are recognized by the CATALOG and VFYLIB commands. You determine the record types contained in a file by issuing a CATALOG command naming the file. VFYLIB lists the differences between the record types of two files. LIBGEN generates a user library from relocatable (REL) capsule (CAP), absolute (ABS), CP overlay (OVL), or procedure file (PROC) records.

<table>
<thead>
<tr>
<th>Record Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABS</td>
<td>Central processor overlay capsule containing multiple entry points.</td>
</tr>
<tr>
<td>CAP</td>
<td>CYBER Loader capsule.</td>
</tr>
<tr>
<td>OPL</td>
<td>Old program library deck created by Modify.</td>
</tr>
<tr>
<td>OPLC</td>
<td>Old program library common deck created by Modify or LIBEDIT.</td>
</tr>
<tr>
<td>OPLD</td>
<td>Old program library directory created by Modify or LIBEDIT.</td>
</tr>
<tr>
<td>OVL</td>
<td>Central processor overlay.</td>
</tr>
<tr>
<td>PP</td>
<td>Peripheral processor program.</td>
</tr>
<tr>
<td>PPU</td>
<td>Peripheral processor unit (first-level peripheral processor) program.</td>
</tr>
<tr>
<td>PROC</td>
<td>Procedure file.</td>
</tr>
<tr>
<td>REL</td>
<td>Relocatable central processor program.</td>
</tr>
<tr>
<td>TEXT</td>
<td>Data file (none of the other record types).</td>
</tr>
<tr>
<td>ULIB</td>
<td>User library directory.</td>
</tr>
</tbody>
</table>

The following record types are recognized by COPYL, COPYLM, and ITEMIZE commands.

<table>
<thead>
<tr>
<th>Record Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABS</td>
<td>Central processor overlay capsule containing multiple entry points.</td>
</tr>
<tr>
<td>ACF</td>
<td>Modify compressed compile file. It has no record name. This record type is determined by a nonzero value in bits 17 through 0 in the second word of the 77 table.</td>
</tr>
<tr>
<td>CAP</td>
<td>CYBER Loader capsule.</td>
</tr>
<tr>
<td>OPL</td>
<td>Old program library deck created by Modify.</td>
</tr>
<tr>
<td>OPLC</td>
<td>Old program library common deck created by Modify.</td>

<td>6000 series peripheral processor program.</td>
</tr>
<tr>
<td>7PP</td>
<td>7000 series peripheral processor program.</td>
</tr>
<tr>
<td>8PP</td>
<td>CYBER 180 peripheral processor program.</td>
</tr>
</tbody>
</table>

CATALOG COMMAND

The CATALOG command lists information about each record in a file assigned to the job. The record types recognized by CATALOG are listed in Library Record Types in this section.

NOTE

CATALOG produces unpredictable results when attempting to catalog an S, L, or F format tape. Use the COPY command to convert the S, L, or F format tape to a mass storage file or to an I or SI binary format tape before attempting to catalog the file.

Format:

CATALOG, lfn, p1, p2, ..., pn.

Parameter | Description
--- | ---
lfn | Specifies the file to be cataloged. The default is FILE.
p1 | pi can be any of the following:

<table>
<thead>
<tr>
<th>p1</th>
<th>Description</th>
</tr>
</thead>
</table>
| N=n | Catalogs n files. If n is 0, the system catalogs the file until an empty file is encountered (two consecutive EOFs). If you specify only the keyword N, the system catalogs until it encounters the EOI. The default is N=1.
| L=fname | Specifies the name of the output file; if L=fname is omitted, CATALOG assumes L=OUTPUT.
| T | Lists the entire text record if the record name begins with any of the following characters:

- APRD
- IPRD
- CMRD
- LIBD
- EQPD

If you omit T, the system does not list the contents of the text record. If the text record name begins with OVERLAY, the system always lists the first line of the record.

| U | Lists all records within a user library. If file lfn is a user library and you omit U, CATALOG lists only the ULIB record.
| D | Suppresses the comments field; suppresses all page headings after the initial page heading for each file.
| CS | Suppresses character set indicator (63 or 64) for OPL and OPLC records.
| R | Rewinds lfn before and after cataloging; if R is omitted, lfn is not rewound.
The listing for each file of a multifile file begins on a new page with a page heading for that file. If the D option has been specified, the page heading appears only once, at the beginning of the file. For CATALOG listing files not connected to a terminal, you can control the print density and page length using the SET command and the PL and PD symbolic names. The information listed under each heading is as follows:

<table>
<thead>
<tr>
<th>Heading</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>REC</td>
<td>Record number (zero-length records and EOF marks are counted).</td>
</tr>
<tr>
<td>NAME</td>
<td>Record name [the contents of the name field from the second word of the prefix (77) table, if present; otherwise, the first seven characters of the record]. For ABS and REL records, the entry points are listed beneath the record name.</td>
</tr>
<tr>
<td>TYPE</td>
<td>Record type (refer to Library Record Types in this section).</td>
</tr>
<tr>
<td>LENGTH</td>
<td>Record length in words, printed as an octal number. For TEXT records, this includes the prefix table length. For PROC records, this contains the actual record length. For other record types, the prefix table length is not included.</td>
</tr>
<tr>
<td>CKSUM</td>
<td>A checksum (that is, a value used to verify that the contents of a record were copied correctly). Except for TEXT records, the checksum does not verify the contents of the prefix table.</td>
</tr>
<tr>
<td>DATE</td>
<td>Record creation date (taken from the third word of the prefix table, if present).</td>
</tr>
<tr>
<td>COMMENTS</td>
<td>Comments are taken from the comments field of the prefix table. A zero byte or a COPYRIGHT comment in the comments field of the table terminates the listing. This field is not shown when CATALOG Output is assigned to a terminal file.)</td>
</tr>
</tbody>
</table>

CATALOG lists additional information depending on the record type. Entry points are listed for REL and ABS records. The character set used, correction identifiers, and their YANK status (refer to the Modify Reference Manual) are listed for OPL and OPLC records.

NOTE

When printing output for text files, CATALOG uses the first seven characters of the first word of the record as the record name. CATALOG assumes that the record is in 6-bit display code. Therefore, if you attempt to display CATALOG output for a record in 6/12 display code while your terminal is in ASCII mode, the output display may be garbled. To avoid this problem, you should set your terminal to NORMAL mode before listing CATALOG output.

A ULIB record suppresses listing of the other records in the user library unless the U parameter is specified on the command.

If an OPLD record in the user library is not encountered before an EOF or EOI within the cataloged file, the following message is output before the *EOF* or *EOI* line.

**OPLD MISSING**
When a zero-length record is encountered, the length since the last zero-length record is
given. If an EOR does not precede an EOF or EOI within the cataloged file, the following
message is output before the *EOF* or *EOI* line.

*EOR MISSING*

The ITEMIZE command is similar to the CATALOG command, but ITEMIZE recognizes additional
record types (refer to Library Record Types, earlier in this section).

Example:

Compilation of the FORTRAN program SUBROUT and its subroutines SUB1, SUB2, and SUB3 wrote
relocatable object code on file LGO. The following is a catalog of file LGO (refer to the
heading definitions given earlier).

<table>
<thead>
<tr>
<th>REC</th>
<th>CATALOG OF LGO NAME</th>
<th>FILE TYPE</th>
<th>LENGTH</th>
<th>CHKSUM</th>
<th>DATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SUBROUT</td>
<td>REL</td>
<td>44</td>
<td>6215</td>
<td>yy/mm/dd.</td>
</tr>
<tr>
<td></td>
<td>SUBROUT</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>A</td>
<td>REL</td>
<td>41</td>
<td>7424</td>
<td>yy/mm/dd.</td>
</tr>
<tr>
<td></td>
<td>A</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>B</td>
<td>REL</td>
<td>41</td>
<td>0465</td>
<td>yy/mm/dd.</td>
</tr>
<tr>
<td></td>
<td>B</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>C</td>
<td>REL</td>
<td>41</td>
<td>5525</td>
<td>yy/mm/dd.</td>
</tr>
<tr>
<td></td>
<td>C</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>* EOF *</td>
<td>SUM</td>
<td>207</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

COPYL AND COPYLM COMMANDS

The COPYL and COPYLM commands copy an old file to a new file, substituting records from a
replacement file for the matching records on the old file. Records on the replacement file
which do not match records on the old file are either ignored or appended to the new file
according to your parameter specifications. Records are considered to match if they have
the same type and same name. However, you may specify that the record type be ignored. The
COPYL and COPYLM commands are commonly used to maintain files of procedures or relocatable
records.

The COPYL and COPYLM commands differ only in the handling of multiple occurrences of a
record on the old file. The COPYL command uses each record on the replacement file only
once, replacing the first matching record from the old file. The COPYLM command uses the
first matching record encountered on the replacement file to replace each matching record
from the old file. The COPYL command can be used to replace multiple occurrences of the
same record if multiple occurrences of the record are in the replacement file.

The old file and the replacement file must reside on mass storage or an I or SI format
tape. Only a single file terminated by an end-of-file marker is processed by a single call
to the COPYL or COPYLM command unless you request processing to the end-of-information by
using the E processing option. When working with multifile files, you must be sure to
position the multifile file to the file that is to be processed.

The order of the records on the replacement file is not significant except when you use the
COPYL command to replace multiple occurrences of the same record (with multiple occurrences
of that record on the replacement file). The system copies the records to the new file in
the same order as they are on the old file.
The COPYL and COPYLM commands issue dayfile messages during processing; no other printed output is produced. The dayfile messages list which replacement records were copied and which replacement records were not copied to the new file.

The COPYL and COPYLM commands replace only the record types listed in Library Record Types, earlier in this section. Any record on the old file that is not recognized as one of the listed types is copied to the new file without further processing. Any replacement file record type that is not listed in Library Record Type, is ignored without comment.

Format:

COPYL,oldlfn,replfn,newlfn,last,flag.    Single replacement.

or

COPYLM,oldlfn,replfn,newlfn,last,flag.    Multiple replacement.

All parameters are optional and order-dependent. You denote an omitted parameter by consecutive commas.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oldlfn</td>
<td>File name of the old file. Default name is OLD.</td>
</tr>
<tr>
<td>replfn</td>
<td>File name of the replacement file. Default name is LGO.</td>
</tr>
<tr>
<td>newlfn</td>
<td>File name of the updated file. Default name is NEW.</td>
</tr>
<tr>
<td>last</td>
<td>Name of the last record on oldlfn to be processed. If last is not specified, all records on oldlfn are processed from its current position to the next EOF (or EOI if the E processing option is used).</td>
</tr>
<tr>
<td>flag</td>
<td>Processing options.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Append to the end of newlfn all replfn records that do not match any records on the oldlfn. If A is not selected, records on the replacement file that do not match any records on the oldlfn are ignored and a dayfile message is issued.</td>
</tr>
<tr>
<td>E</td>
<td>Process oldlfn until the end-of-information.</td>
</tr>
<tr>
<td>R</td>
<td>Rewind oldlfn and newlfn files before processing. (The replfn file is always rewound before and after processing. oldlfn and newlfn are not necessarily rewound to beginning-of-information in multilfile files. Refer to explanation below.)</td>
</tr>
<tr>
<td>T</td>
<td>Check for matching name of record, but omit check for matching type of record. If T is not selected, records match only if both the type and name of the records are the same.</td>
</tr>
</tbody>
</table>

These options can be specified by combining one or more letters in any order, such as TRA, AR, ERTA, or TR.

The COPYL and COPYLM commands check only the first four flag options. If more than four are specified, the remaining characters are ignored.
The R option affects file positioning of the old and new files before processing. If R is specified, the old and new files are rewound before processing. In a multifile file, if there is one or more end-of-file markers between the current position of the file and the beginning-of-information, the R option rewinds the file to the first preceding EOF. In the absence of R, you are responsible for positioning the oldlf and newlf files. The R option does not affect the file of replacement records, since the current file of the replacement file always is rewound to the beginning-of-information before and after processing.

The E option causes the old file to be processed to the end-of-information. Each end-of-file encountered on the old file causes a matching end-of-file to be written on the new file. Records that are added to the new file as a result of combining the A and E options are appended with an end-of-file prior to the end-of-information. In this case, such appended records will follow an end-of-file if both end-of-file and end-of-information existed at the end of the old file.

Processing stops after an end-of-file, end-of-record, or end-of-information is reached, depending on the structure of the old file and the processing options selected. If processing stopped because end-of-file or end-of-record was reached, the old file is positioned after that EOF or EOR. If processing stopped because end-of-information was reached, the old file is positioned just prior to the end-of-information.

COPYL and COPYLM add an end-of-file to the new file even if no end-of-file is encountered on the old file. No further positioning of the new file takes place.
Example:

The following COPYL command updates OLDFILE with replacement records from REPFILE and writes them on NEWFILE. The A option appends to the end of NEWFILE any records in REPFILE that do not match a record on OLDFILE.

COPYL,OLDFILE,REPFILE,NEWFILE,,A.

The following dayfile segment shows that COPYL updated the record named B and appended the record named C.

08.53.23.COPYL,OLD FILE,REPFILE,NEWFILE,,A.
08.53.24. UPDATED — PROC / B
08.53.24. APPENDED — PROC / C
08.53.24. COPYL COMPLETE.

The ITEMIZE command show the record information for all records in OLDFILE, REPFILE, and NEWFILE.

**GTR COMMAND**

The GTR command extracts records selected from one file and writes them on another file. The records are selected according to directives specifying their type and name. (Refer to Library Record Types in this section for the list of valid record types.) Records can be accessed randomly (default if a directory exists) or sequentially. If specified, a random access directory is appended to the changed file. The system writes an EOF after the directory.

Positional format:

```
GTR,lfn1,lfn2,d,NR,S,NA,T.directive1,directive2,...,directive_n
```

Keyword format:

```
GTR,lfn1,lfn2/p1,p2,...,pn.directive1,directive2,...,directive_n
```

**NOTE**

In positional format, the parameters must be in the order shown. Parameters are identified by their position, not by keywords. An omitted parameter is denoted by consecutive commas.

In keyword format, parameters preceding the / are still processed in positional format, but those which follow it (p1,p2,...,pn) are recognized by keyword, and may occur in any order. The keywords are the same as the suggested values for the positional format parameters: U, D, NR, S, NA, and T. Keywords U and D are covered under positional parameter "d" in the explanation of parameters which follows.

In either format, do not place blanks between the terminator (right parenthesis or period) and directive1. Also, do not place a terminator after directive_n.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>File which is searched for the requested records; if lfn1 is omitted, file OLD is assumed. lfn1 is always rewound before the GTR operation.</td>
</tr>
<tr>
<td>lfn2</td>
<td>File on which the selected records are written; if lfn2 is omitted, file LGO is assumed. For disk files, GTR always positions lfn2 at EOI before copying the selected records. GTR only appends records to tape files when you specify the NR parameter. Otherwise, GTR starts writing on tape files at their BOI.</td>
</tr>
</tbody>
</table>
**Parameter**

| d | Random access directory parameter. If d is specified, lfn2 must be a mass storage file. GTR cannot append records after a directory. |

If lfn1 has a random access directory and if sequential access (the S parameter) is not specified, the lfn2 directory record is given the same name as the lfn1 directory record. Otherwise, the lfn2 directory record is named lfn2.

<table>
<thead>
<tr>
<th>d</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>omitted</td>
<td>No new random access directory (OPLD) is added to lfn2. If the directives specify the user library record type (ULIB), the first record of the user library (ULIB) is not copied to lfn2. The second and subsequent records are copied, and the last record (OPLD) is copied without alteration. The system does not write an EOF at the end of the file.</td>
</tr>
<tr>
<td>U</td>
<td>No new random access directory (OPLD) is added to lfn2. If the directives specify the user library record type (ULIB), the first record of the user library (ULIB) is copied without alteration to lfn2 along with the remainder of the library, including the OPLD. The system does not write an EOF at the end of the file.</td>
</tr>
<tr>
<td>D or other</td>
<td>Writes a new random access directory (OPLD) at the end of lfn2. If the directives specify the user library record type (ULIB), the first record of the user library (ULIB) is copied without alteration to lfn2 along with the remainder of the library, including the OPLD. The system writes an EOF after the new directory.</td>
</tr>
</tbody>
</table>

**NOTE**

The new random access directory contains entries only for records specified on the current GTR command. To build a new random access directory which contains entries for all records on lfn2, use LIBEDIT.

| NR | No rewind option. lfn1 is not rewound after the operation; lfn2 is not rewound before or after the operation. If lfn1 has a directory, the directory is copied to lfn2. |

If NR is omitted, both files are rewound after the operation, but only when lfn2 is a tape file is lfn2 rewound before the operation.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>lfn₁ is searched sequentially; no attempt is made to read a directory.</td>
</tr>
<tr>
<td>NA</td>
<td>No abort option. If specified, GTR does not search for an EXIT command when an error occurs. It issues a dayfile message for the error and continues GTR processing at the next directive.</td>
</tr>
<tr>
<td>T</td>
<td>TEXT record name removal option. If specified, the line containing the record name (the first line of the record) is removed for each selected TEXT type record when the record is written to lfn₂.</td>
</tr>
<tr>
<td>directive</td>
<td>Specifies a record or group of records to be retrieved. One or more of the following formats can be used. Valid record types are listed under Library Record Types in this section. The default type is the last type specified on a directive, or if none is specified, TEXT. The record name is the first seven characters of the record, or if a prefix table is present, the contents of the name field in its second word.</td>

</tbody>
</table>

GTR searches file $lfn_1$ for the records specified by the selection directives. If GTR cannot find a record specified by type and name, it issues the following dayfile message.

**GTR ERRORS.**

If also issues this message when the record specified is within a user library and when the GTR command syntax is incorrect.

If $lfn_1$ has a directory (OPLD) record, GTR writes the selected records on $lfn_2$ in the order specified on the GTR command. If $lfn_2$ does not have a directory record, GTR writes the selected records in the order that it finds them on $lfn_1$, rather than in the order specified on the command.

If $lfn_2$ is on tape, the selected records are copied from the current file position; if $lfn_2$ is on mass storage, the copy starts at the current EOI of the file. If an EOF exists before the EOI, GTR appends the records as a file following the existing EOF.

Examples:

- **GTR,SYSTEM,BIN,D.PP/***

  GTR copies all PP records from file SYSTEM to file BIN. It then builds a random access directory and writes it as the last record on BIN.

- **GTR,OPL,NEW,,NR.OPLC/COMCARG,0,COMCCIO**

  GTR retrieves common decks COMCARG and COMCCIO from file OPL. It then writes COMCARG, a zero-length record, and COMCCIO at the current position of file NEW. NEW is not rewound before the operation; OPL and NEW are not rewound following the operation.
GTR, SYSTEM, SYSLIB, D.ULIB/SYSLIB

GTR copies the user library SYSLIB from file SYSTEM to the end of file SYSLIB.

GTR.REL/A

GTR retrieves the relocatable record A from file OLD and copies it to file LGO.

ITEMIZE COMMAND

ITEMIZE lists pertinent information about each record of a binary file in a format suitable for printing. Earlier in this section, Library Record Type describes the types of records processed by ITEMIZE.

ITEMIZE processes mass storage files or I or SI format tape files. A file can be processed from beginning-of-information through end-of-information.

Format:

ITEMIZE, lfn, L=listlfnn, BL, PW=n, PD, NR, N=n, E, U.

The first parameter is order-dependent; if lfn is omitted, its position must be indicated by a comma. All the other parameters are optional and order-independent.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>Name of file to be itemized; default name is LGO.</td>
</tr>
<tr>
<td>L=listlfnn</td>
<td>List output on file listlfnn; default is L=OUTPUT.</td>
</tr>
<tr>
<td>BL</td>
<td>Burstable listing; each file output starts at the top of a page. Default is a compact listing in which a page eject occurs only when the current page is nearly full.</td>
</tr>
<tr>
<td>PW=n</td>
<td>Print either 136-character lines or 72-character lines, depending on the value of the decimal integer n. If n ≥ 136, print 136-character line. If n &lt; 136, print 72-character lines.</td>
</tr>
<tr>
<td></td>
<td>If just PW is specified, print 72-character lines regardless of the listing file device.</td>
</tr>
<tr>
<td></td>
<td>If PW=n is omitted, the default value is 72-character lines if the listing file is a terminal; otherwise, the default value is 136-character lines.</td>
</tr>
<tr>
<td>PD</td>
<td>Print density at eight lines per inch; default is six lines per inch.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is to produce the desired result, you must ensure that output appears at a printer capable of eight lines per inch.</td>
</tr>
<tr>
<td>NR</td>
<td>No rewind of lfn before or after processing; default is rewind before and after processing.</td>
</tr>
<tr>
<td>N=n</td>
<td>Itemize n files, where n is a decimal integer; default is N=1.</td>
</tr>
<tr>
<td></td>
<td>If just N is specified, itemize until end-of-information.</td>
</tr>
<tr>
<td></td>
<td>If N=0, itemize until an empty file is processed.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| E         | Expand output to list further information; default is no expansion.  
For record types CAP and REL, list entry points.  
For types OPL and OPLC, list modification set names and their YANK status.  
For record types UPL, list correction identifier names. |
| U         | Itemize all records within a user library; default is list only the user library directory (ULIB type record).  
If both E and U are selected for ULIB type records, all records in the library are itemized; and for REL type records, their entry points are listed. |

Output from ITEMIZE is affected by the type of record and parameters selected. A header appears for each file terminated by an end-of-file marker within the file specified by the file name. The first line of the header identifies the file name, file position within that file, and the date and time of the run. It also includes the FI field if the file is a multifile set tape file (refer to the LABEL command). The second line of the header has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REC</td>
<td>Position of the record within the file.</td>
</tr>
<tr>
<td>NAME</td>
<td>Record name obtained from the second word of the prefix table or from the first word of the record.</td>
</tr>
<tr>
<td>TYPE</td>
<td>Type of record. Refer to Library Record Type, earlier in this section, for a description of the record types.</td>
</tr>
<tr>
<td>LENGTH</td>
<td>Number of words (octal) in the record, excluding the prefix table (except TEXT records for which the prefix table is included).</td>
</tr>
<tr>
<td>CKSUM</td>
<td>Logical checksum (octal), excluding the prefix table (except TEXT records for which the prefix table is included).</td>
</tr>
<tr>
<td>DATE</td>
<td>Date record was created as stored in the prefix table.</td>
</tr>
<tr>
<td>COMMENTS</td>
<td>Contents of the comments field in the prefix table.</td>
</tr>
</tbody>
</table>

If no prefix table is present, the associated fields are blank.

**NOTE**

When printing output for text files, ITEMIZE uses the first seven characters of the first word of the record as the record name. ITEMIZE assumes that the record is in 6-bit display code. Therefore, if you attempt to display ITEMIZE output for a record in 6/12-bit display code while your terminal is in ASCII mode, the output display may be garbled. To avoid this problem, you should set your terminal to NORMAL mode before listing ITEMIZE output.
Additional information listed depends on the type of record:

<table>
<thead>
<tr>
<th>Record Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABS</td>
<td>Entry point names are listed.</td>
</tr>
<tr>
<td>OPL, OPLC, UPL</td>
<td>Deck names are listed.</td>
</tr>
<tr>
<td>OVL</td>
<td>Overlay level is listed (octal).</td>
</tr>
<tr>
<td>TEXT</td>
<td>Entire record is listed if the name of the record is OVERLAY APRDxxx, CMRDxxx, EQPDxxx, IPRDxxx, LIBDxxx or COMMENT.</td>
</tr>
<tr>
<td>6PP</td>
<td>Lists the octal equivalent of the load address.</td>
</tr>
<tr>
<td>7PP</td>
<td>Lists the octal equivalent of the load address.</td>
</tr>
</tbody>
</table>

The E parameter can select further details about several types of records (refer to the example that ends the ITEMIZE command description).

The last record in each file is the end-of-file marker, which appears on the listing as the characters *EOF*. The SUM= identification is the total length, in words, for all records in the file, including the prefix table lengths.

Any zero-length record in the file appears with the record name (00). When a zero-length record is encountered, a sum of the lengths of the records encountered since the beginning of the file, or since the last sum was taken, is listed on the output. The length includes prefix tables. Record numbering is not restarted until a new file is encountered.

If a record of type UPL has more correction identifier names and/or deck names than can be accommodated within ITEMIZE, the following message appears on the listing in place of the excess names:

TRUNCATED - REQUESTED LIST TOO LONG

In this instance, the Update utility must be used to obtain a complete list of identifiers and deck names.

A dayfile message is issued when ITEMIZE completes execution.
Example:

A FORTRAN program named SUBROUT has three subroutines. The following ITEMIZE command lists the records of the binary object file LGO. The E option lists the entry point for each REL type record listed.

```
/itemize,lgo,e
```

<table>
<thead>
<tr>

</tbody>
</table>

* EOI *  
SUM = 264

ITEMIZE COMPLETE.

LIBEDIT COMMAND

LIBEDIT is a general-purpose utility that generates a file containing records copied from one or more other files (figure 15–2). LIBEDIT can build a random access directory for the new file. It recognizes the record types listed in Library Record Types in this section. LIBEDIT can edit a library according to directives requesting addition, deletion, or replacement of specified records from one or more replacement files.

LIBEDIT executes in two phases. During the first phase, it reads directives and replacement records. It groups directives by type and file and groups changes when several insertions take place relative to the same record.

During the second phase, LIBEDIT writes the new file. If LIBEDIT cannot process the specified combination of directives, and debug mode was not specified (refer to the description of the D parameter under Command Format), LIBEDIT lists its interpretation of the conflicting directives, issues an error message, and aborts the job step. If debug mode was specified, LIBEDIT continues processing the directives.

For output listing files not connected to your terminal, the LIBEDIT command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.
COMMAND FORMAT

The following command calls LIBEDIT. Its parameters specify options and files used for the call as illustrated in figure 15-2.

Format:

LIBEDIT, p1, p2, ..., pn.

Optional parameters p_i can be in any order. Each parameter cannot be specified more than once.

<table>
<thead>
<tr>
<th>P_i</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>B=1fn4</td>
<td>Use records from file 1fn4 for insertions and replacements. The default is LGO. B=0 indicates that there is no replacement file.</td>
</tr>
<tr>
<td>C</td>
<td>Copy the new file over the old file after LIBEDIT processing.</td>
</tr>
<tr>
<td>D</td>
<td>Do not abort LIBEDIT processing because of errors. (This parameter is referred to as debug mode.)</td>
</tr>
<tr>
<td>I=1fn3</td>
<td>Take the new directives from the next record of file 1fn3. The default is INPUT (INPUT is connected to the terminal in interactive jobs). I=0 indicates that there are no directives.</td>
</tr>
<tr>
<td>L=1fn5</td>
<td>List output on file 1fn5. The default is OUTPUT. L=0 specifies no output.</td>
</tr>
</tbody>
</table>

Figure 15-2. LIBEDIT Input and Output
**LO=listopt**  
Use list option listopt.

<table>
<thead>
<tr>
<th>listopt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>List directives.</td>
</tr>
<tr>
<td>E</td>
<td>List errors.</td>
</tr>
<tr>
<td>F</td>
<td>Give a full listing (enable all list options).</td>
</tr>
<tr>
<td>M</td>
<td>List modifications.</td>
</tr>
<tr>
<td>N</td>
<td>List records written to new file.</td>
</tr>
</tbody>
</table>

You can combine the list options. For example, LO=CM or LO=CE. The default is LO=EM for interactive jobs, and LO=F for all other jobs.

**NA**  
Do not abort on directive errors.

**NI**  
Do not insert unreplaceable records at EOF of the new file.

**NR**  
Do not rewind the old or new file before or after LIBEDIT processing. By default, the system rewinds the old file and new file.

**NX=n**  
Include cross-references in the library directory of the new user library if n is 0. If n is nonzero, do not include cross-references. This parameter is meaningful only if you specify the U parameter or the *LIBGEN directive. The default is NX=0.

**N=lfn2**  
Write the new file on lfn2. The default is NEW.

**P=lfn1**  
Edit old file lfn1. The default is OLD. P=0 directs the system to create the new file from replacement files.

**NOTE**

Although LIBEDIT can write the new file (lfn2) directly to tape, the directory that LIBEDIT writes on such a tape contains tape PRU random addresses rather than disk PRU random addresses. If this tape is subsequently copied to disk, the directory will not be processed correctly by programs such as GTR and Modify. Therefore, if you intend to copy the file back to disk at a later time, you should specify a temporary disk file for the LIBEDIT new file (lfn2) and then use the COPY utility to copy the new file to tape.

**U=record**  
Require the old file to be a user library, add any new records from the replacement file to the new file, and make the new file a user library by calling LIBGEN. This parameter overrides the V parameter. The value record becomes the name of the user library directory record. If you specify only the keyword U or omit the parameter entirely, the default record name is ULIB.

**V**  
Verify the new file against the old file after LIBEDIT processing by calling VFYLIB. The default is no call to VFYLIB. The U parameter overrides this parameter.
Take the directives from the command line. The directives immediately follow the command terminator. The first character following the terminator is the separator character used to separate the directives in the sequence. It can be any character not used in the directives. For example:

```
LIBEDIT,Z.#*DELETE REL/PROG1#*ADD PROG2
```

The Z parameter overrides the I=1fn3.

**LIBEDIT DIRECTIVES**

You can specify directives to control LIBEDIT processing. These directives can be in a record on file INPUT (terminal input for interactive jobs), can be on the file specified by I=1fn3 parameter of the command, or can follow the terminator of the command when the Z parameter is specified. Directives are not required.

Unless specified otherwise by parameters or directives, LIBEDIT compares the name and type of each record on the old file with those of the records on the replacement file (specified by the B parameter). If a record with the same name and type appears on the replacement file, LIBEDIT writes that record on the new file and skips the record on the old file unless you specified the *NOREF directive. If I=0 and B=0 are specified, LIBEDIT copies the old file to the new file until it encounters an EOF mark or an OPLD directory on the old file.

Records on a replacement file which do not appear on the old file with the same name and type are considered unreplaceable. Such records are inserted at EOF of the new file, unless the NI parameter or *NOINS directive is specified. If a record with the same name or type appears on more than one replacement file or appears more than one on a replacement file, the extra copies are treated as unreplaceable records.

LIBEDIT processing of user libraries beginning with a ULIB record differs depending on whether or not the LIBGEN directive is specified. If no LIBGEN directive is specified, the user library is processed as one record (from ULIB header to OPLD). In this case, the only part of the user library that can be manipulated by LIBEDIT is the ULIB header. The records within the user library are transparent to LIBEDIT and cannot be referenced by directives. If the LIBGEN directive is specified, LIBEDIT deletes the ULIB header and OPLD records from all user libraries encountered. In this case, LIBEDIT directives can reference any records within the user library but cannot reference the ULIB header.

LIBEDIT directives take precedence over the parameters of the command when conflicting specifications occur.
LIBEDIT recognizes the following directives.

<table>
<thead>
<tr>
<th>Directive</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>*ADD</td>
<td>Inserts records before a zero-length record within the file.</td>
</tr>
<tr>
<td>*BEFORE or *B</td>
<td>Inserts record before the named record.</td>
</tr>
<tr>
<td>*BUILD</td>
<td>Builds a directory at the end of the new file.</td>
</tr>
<tr>
<td>*COMMENT</td>
<td>Adds a comment to the prefix table.</td>
</tr>
<tr>
<td>*COPY</td>
<td>Copies the new file to the old at the end of editing.</td>
</tr>
<tr>
<td>*DATE</td>
<td>Adds the date and a comment to the prefix table.</td>
</tr>
<tr>
<td>*DELETE or *D</td>
<td>Does not copy specified records to the new file.</td>
</tr>
<tr>
<td>*FILE</td>
<td>Declares a file to be a replacement file.</td>
</tr>
<tr>
<td>*IGNORE</td>
<td>Ignores records when reading the replacement file.</td>
</tr>
<tr>
<td>*INSERT or *I or *AFTER or *A</td>
<td>Copies record from the replacement file after copying the specified old file record.</td>
</tr>
<tr>
<td>*LIBGEN</td>
<td>Generates a user library by calling LIBGEN after LIBEDIT processing.</td>
</tr>
<tr>
<td>*LIST</td>
<td>Specifies a list file and list options.</td>
</tr>
<tr>
<td>*NEW</td>
<td>Specifies a new file.</td>
</tr>
<tr>
<td>*NOINS</td>
<td>Prevents the insertion of unreplaceable records at EOF of the new file.</td>
</tr>
<tr>
<td>*NOREP</td>
<td>Does not automatically replace old file records with records from the specified file.</td>
</tr>
<tr>
<td>*NOREW</td>
<td>Prevents the old file and the new file from being rewound before and after LIBEDIT processing.</td>
</tr>
<tr>
<td>*OLD</td>
<td>Specifies an old file.</td>
</tr>
<tr>
<td>*RENAME</td>
<td>Renames record.</td>
</tr>
<tr>
<td>*REPLACE</td>
<td>Replaces the named records from the old file with records from the replacement file.</td>
</tr>
<tr>
<td>*REWIND</td>
<td>Names file to be rewound before and after editing.</td>
</tr>
<tr>
<td>*TYPE or *NAME</td>
<td>Sets default record type.</td>
</tr>
<tr>
<td>*VFYLIB</td>
<td>Verifies the new file against the old file by calling VFYLIB after LIBEDIT processing (overridden by *LIBGEN).</td>
</tr>
<tr>
<td>*/</td>
<td>Specifies a directive file comment.</td>
</tr>
</tbody>
</table>
A directive begins with an asterisk in column 1 followed immediately by the directive identifier. The directive identifier and the first parameter are both delimited by a comma or one or more spaces. If a directive does not begin with an asterisk and a directive identifier, LIBEDIT assumes that the operation is a continuation of the previous directive operation. If an asterisk and directive identifier do not begin the first line of the directives record, LIBEDIT prefixes the following to the first line.

*BEFORE,*

Parameters other than the first parameter are delimited by a space, an end-of-line, or a comma. A hyphen (-) indicates a record group. Record group identifiers (gid entries) cannot be split between lines. For example, the lines

*B,0VL/P1,0VL/P2,0VL/
P3

do not constitute a valid directive. The last entry would not be processed as 0VL/P3. On the other hand, the lines

*B,0VL/P1,0VL/P2
0VL/P3

do constitute a valid directive and would be processed as

*B,0VL/P1,0VL/P2,0VL/P3

Parameters common to many directives are the reference record identifier (rid) and the record group identifier (gid). Valid record types for these parameters are listed in Library Record Types in this section. The default type is the last type specified in a directive; if none are specified, TEXT is the default. The record name is the first seven characters of the record, or if a prefix table is present, the name in its second word. The first character of a record name specified in a directive must not be an asterisk.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>Reference record identifier specifying the reference point for the requested change. It can have the following formats.</td>
</tr>
<tr>
<td></td>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>type/name</td>
<td>Reference record has the specified type and name.</td>
</tr>
<tr>
<td>name</td>
<td>Reference record has the specified name and is of the default type.</td>
</tr>
<tr>
<td>*</td>
<td>Reference point is an end-of-file mark (used with *BEFORE directive only).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>gid</th>
<th>Record group identifier indicating a record or group of records to be inserted, deleted, or replaced. It can have the following formats.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>type/name</td>
<td>Record with the specified type and name.</td>
</tr>
<tr>
<td>name</td>
<td>Record with the specified name of the default type.</td>

<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>type_1/name_1-name_2</td>
<td>Group of records beginning with name_1 of type_1 and ending with name_2 of type_1.</td>
</tr>
<tr>
<td>name_1-name_2</td>
<td>Group of records beginning with name_1 of the default type and ending with name_2 of the default type.</td>
</tr>
<tr>
<td>type/name-*</td>
<td>All records of the specified type beginning with the named record.</td>
</tr>
<tr>
<td>name-*</td>
<td>All records of the default type beginning with the named record.</td>
</tr>
<tr>
<td>type/*</td>
<td>All records of the specified type.</td>
</tr>
<tr>
<td>*</td>
<td>All records of the default type.</td>
</tr>
<tr>
<td>0</td>
<td>A zero-length record is inserted.</td>
</tr>
</tbody>
</table>

LIBEDIT checks the syntax of directives during an interactive session and reprompts you for a directive in error.
ADD Directive

The ADD directive inserts records before a zero-length record. A CATALOG listing of the old file numbers each group of records ending with a zero-length record (called a library on the listing). This number on the ADD directive identifies the record group.

NOTE

Adding a zero-length record does not change the directory.

Format:

*ADD LIBn,gid1,gid2,...,gidn

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIBn</td>
<td>Specifies the record group to which the records are appended. Values for n are 1 to 63 and can be determined from a CATALOG listing of the old file.</td>
</tr>
<tr>
<td>gid1</td>
<td>Identifies the records or groups of records from the current replacement file that are to be inserted before the zero-length record.</td>
</tr>
</tbody>
</table>

Example:

The following is a CATALOG listing of file Q.

<table>
<thead>
<tr>
<th>REC</th>
<th>NAME</th>
<th>TYPE</th>
<th>LENGTH</th>
<th>CKSUM</th>
<th>DATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

<td></td>
<td>Q</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
BEFORE Directive

A BEFORE directive inserts records or groups of records before a specified reference record on the old file. An old file record with the same name and type as an inserted record is not copied to the new file.

Formats:

*BEFORE rid,gid1,gid2,...,gidn

or

*B rid,gid1,gid2,...,gidn

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>Names the old file record before which the specified replacement file records are to be inserted.</td>
</tr>
<tr>
<td>gid1</td>
<td>Identifies records or groups of records from the current replacement file that are to be inserted before the reference record (rid).</td>
</tr>
</tbody>
</table>

If the first line of the LIBEDIT directives record does not begin with an asterisk and directive name, LIBEDIT assumes that the line is the gid parameters following a *BEFORE*, directive.

BUILD Directive

A BUILD directive constructs and appends a random access directory to the new file. The directory is in Modify format (an OPLD record). If the old file has an OPLD directory, LIBEDIT constructs a directory for the new file with or without a BUILD directive. BUILD can also be used to change the directory name.

Format:

*BUILD dname

dname Specifies the name for the directory record. The name must be one to seven alphanumeric characters. No default.
COMMENT Directive

The COMMENT directive adds a comment to the prefix (77) table of a record written on the new file.

Format:

*COMMENT rid comment

Parameter Description
rid Name of a record to be written on the new file.
comment A string of up to 70 characters that appears in the comment field of the prefix table. Additional characters are truncated.

COPY Directive

The COPY directive directs LIBEDIT to copy the new file over the old file after it has processed all directives. It performs the same function as the C parameter on the LIBEDIT command. This directive has no parameters.

DATE Directive

The DATE directive adds the current date and the specified comment to the prefix (77) table of a record written on the new file.

Format:

*DATE rid comment

Parameter Description
rid Record to be written on the new file.
comment A string of up to 70 characters to be written in the comment field of the prefix table. Additional characters are truncated.
DELETE Directive

The DELETE directive suppresses copying of the specified records from the old file to the new file.

Formats:

*DELETE gid1,gid2,...,gidn

or

*D gid1,gid2,...,gidn

gid_i Identifies records or groups of records that are not to be copied from the old file to the new file.

Example:

*DELETE OVL/LAD-REL/RUN

This directive requests LIBEDIT not to copy the sequence of records starting with overlay LAD through relocatable CPU program RUN.

FILE Directive

The FILE directive names a file assigned to the job that contains replacement records. LIBEDIT directives following the FILE directive refer to records on the declared replacement file.

Format:

*FILE lfn

lfn Specifies the name of a replacement file. If lfn is an asterisk (*), LIBEDIT uses the replacement file specified by the LIBEDIT command. If the B parameter was omitted from the command, LGO is used.
IGNORE Directive

The IGNORE directive requests LIBEDIT to ignore a record or group of records on the current replacement file.

Format:

\*IGNORE gid_1,gid_2,...,gid_n

Parameter | Description
---|---
gid_i | Identifies records or groups of records on the replacement file that are to be ignored.

Example:

\*FILE ALPHA
\*IGNORE C-*

LIBEDIT ignores the sequence of records on file ALPHA starting with record C of the default type and including all records of the default type from C to the EOF mark.

INSERT or AFTER Directive

The INSERT or AFTER directive requests LIBEDIT to copy the specified records or groups of records from the current replacement file after it has copied the specified old file record onto the new file. Any record on the old file that has the same name and type as an inserted record is not copied to the new file.

Formats:

\*INSERT rid,gid_1,gid_2,...,gid_n

or

\*I rid,gid_1,gid_2,...,gid_n

\*AFTER rid,gid_1,gid_2,...,gid_n

or

\*A rid,gid_1,gid_2,...,gid_n

Parameter | Description
---|---
rid | Names the old file record to be written on the new file.
gid | Identifies records or groups of records on the replacement file that are to be copied.

Example:

\*INSERT OPL/K,TEXT/L

This directive requests LIBEDIT to copy the replacement file TEXT record L to the new file after it has copied the old file OPL record K.
LIBGEN Directive

The LIBGEN directive specifies that the new file will be a user library. The U parameter of the LIBEDIT command performs the same function. The LIBGEN directive overrides the VFYLIB directive.

Format:

*LIBGEN recordname

Parameter Description
recordname Specifies the name of the new user library directory record. The default is ULIB.

LIST Directive

The LIST directive changes the list file and the list option (refer to the L=lfn5 and LO=listopt parameters of the LIBEDIT command described earlier).

Format:

*LIST listfile,listopt

Parameter Description
listfile Specifies the list file.
listopt Specifies the list option.

NEW Directive

The NEW directive specifies the name of the new file. The N=lfn2 parameter of the LIBEDIT command performs the same function.

Format:

*NEW newfile

Parameter Description
newfile Specifies the name of the new file.

NOINS Directive

The NOINS directive prevents the insertion of unreplaceable records at EOF of the new file. The NI parameter of the LIBEDIT command performs the same function. This directive has no parameters.

Format:

*NOINS
NOREP Directive

The NOREP directive declares the specified files to be no-replace files. A no-replace file is a replacement file whose records do not automatically replace old file records having the same name and type. The user selects records to be written on the new file from no-replace files by specifying the file on a FILE directive and then naming the records on *AFTER, *BEFORE, *INSERT, and *REPLACE directives.

Format:

*NOREP lfni,lfn2,...,lfnn

Parameter Description

lfni Specifies the no-replace files.

NOREW Directive

The NOREW directive prevents the old file and new file from being rewound before and after LIBEDIT processing. The NR parameter of the LIBEDIT command performs the same function. This directive has no parameters.

Format:

*NOREW

OLD Directive

The OLD directive specifies the name of the old file. The P=lfni parameter of the LIBEDIT command performs the same function.

Format:

*OLD oldfile

Parameter Description

oldfile Specifies the name of the old file.

RENAME Directive

The RENAME directive assigns a new name to a record written on the new file. If the renamed record is referenced by another directive in the directive record, the old name should be used. A RENAME is not allowed on a PROC or TEXT type record.

Format:

*RENAME rid,name

Parameter Description

rid Specifies the name of the replacement file record or old file record to be renamed.

name Specifies the name of the record. The name can be one to seven alphanumeric characters.
REPLACE Directive

The REPLACE directive requests LIBEDIT to replace the old file records having the specified names and types with the replacement file records having matching names and types. This directive is used when the current replacement file has been declared a no-replace file (refer to the NOREP directive description). If the replacement file is not a no-replace file, LIBEDIT performs the replace operation automatically.

Format:

\*REPLACE gid1,gid2,...,gidn

**Parameter** | **Description**
---|---
\*gidn | Specifies records or groups of records that appear on both the old file and the current replacement file.

Example:

The old file contains text records A, B, C, and D; the replacement file RF also contains text records named A, B, C, and D. Either of the following directive sequences writes records A and B from the old file and records C and D from file RF onto the new file.

| Sequence 1 | Sequence 2 |
---|---|
\*FILE RF | \*FILE RF |
\*NOREP RF | \*IGNORE A-B |
\*REPLACE C-D | |

REWIND Directive

The REWIND directive tells LIBEDIT to rewind the specified file before and after processing.

Format:

\*REWIND lfn

**Parameter** | **Description**
---|---
\*lfn | Specifies the name of the file to be rewound.

TYPE or NAME Directive

A TYPE or NAME directive sets the default record type.

Formats:

\*TYPE type
\*NAME type

**Parameter** | **Description**
---|---
type | Specifies default record types. Valid record types are listed in Library Record Types in this section.
The default record type can also be set by an explicit record type specification within a directive. In either case, the default record type setting remains in effect until another record type is explicitly named. If a default record type is not declared in the directive sequence, the default is TEXT. For example, the following two directive sequences are equivalent.

<table>
<thead>
<tr>
<th>Sequence 1</th>
<th>Sequence 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>*TYPE REL</td>
<td>*INSERT REL/X,Y</td>
</tr>
<tr>
<td>*INSERT X,Y</td>
<td>*DELETE FILE1-FILE4</td>
</tr>
<tr>
<td>*DELETE FILE1-FILE4</td>
<td></td>
</tr>
</tbody>
</table>

VFYLIB Directive

The VFYLIB directive verifies the new file against the old file by calling VFYLIB after LIBEDIT processing. The V parameter of the LIBEDIT command performs the same function. This directive has no parameters. The LIBGEN directive or U parameter overrides the VFYLIB directive.

Format:

*VFYLIB

*/Directive (Comment Directive)

The */ directive allows comments to be inserted into the LIBEDIT directive file.

Format:

*/ text

Parameter Description

text Specifies the comments (up to 80 characters in length) that are copied to the list file.

LIBEDIT OUTPUT

LIBEDIT interprets all directives in the directive record before beginning directive processing. If one or more errors are found, LIBEDIT issues the dayfile message

DIRECTIVE ERROR(S).

and aborts the job step (unless the D parameter is specified on the command or the job is interactive). The following LIBEDIT output shows the results of a directive syntax error (the FILE directive is not followed by a space or comma).

DIRECTIVE ERRORS. yy/mm/dd. hh.mm.ss. PAGE 1

*ERROR* *FILE RF1

Directives which cannot be executed are listed as LIBEDIT interpreted them. The following LIBEDIT run called for a replacement file not assigned to the job.

DIRECTIVE ERRORS. yy/mm/dd. hh.mm.ss. PAGE 1

*ERROR* DIRECTIVE CARD CAN NOT BE PERFORMED
*FILE RF1
*BEFORE TEXT/*,TEXT/X

60459680 K 15-31
Nonfatal errors are listed in an error directory following the listing of records written to the new file. The RECORDS NOT REPLACED error shown in the following example could be corrected by including an *IGNORE directive naming the records not to be replaced.

**DIRECTIVE ERRORS.**

*FILER F2
*B *,REC1

**RECORDS WRITTEN ON FILE NEW**

<table>
<thead>
<tr>
<th>RECORD</th>
<th>TYPE</th>
<th>FILE</th>
<th>DATE</th>
<th>COMMENT</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>REC4</td>
<td>TEXT</td>
<td>RF2</td>
</tr>
</tbody>
</table>

If you are using LIBEDIT from an interactive job, the BRIEF command suppresses the printing of title lines on the output.

**LIBGEN COMMAND**

The LIBGEN command generates a user library of routines for use with the CYBER Loader.

Format:

```
LIBGEN,P1,P2,...,Pn.
```

Any of the following parameters may be specified in any order (only one instance of each).

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F=lfn1</td>
<td>Specifies the source file containing absolute (ABS), overlay (OVL), procedure (PROC), relocatable (REL), or capsule (CAP) records for the user library. Other record types are ignored. If the file F does not contain any of the record types specified, no library is generated. The default for this parameter is LGO.</td>
</tr>
<tr>
<td>N=name</td>
<td>Specifies the name of the user library generated, name is entered in ULIB and OPLD records. The default is the user library name determined by the P=lfn2 parameter.</td>
</tr>
<tr>
<td>NX=n</td>
<td>Specifies whether or not to include cross-references in the ULIB directory. If n is not zero, no cross-references are included in the ULIB directory. If n is zero, cross-references are included. The latter case is the default.</td>
</tr>
<tr>
<td>P=lfn2</td>
<td>Specifies the file on which the user library is to be written. The default is ULIB.</td>
</tr>
</tbody>
</table>
If the F=fn1 and P=fn2 parameters specify the same file, LIBGEN issues a dayfile message and does not generate a user library.

Figure 15-3 illustrates the structure of a user library. To generate a user library, the system rewinds and scans the input file. It then builds a directory of all entry points, program names, and external references in the records of the file. Adding the ULIB and OPLD records, the system then copies the input file to the user library file.

![Figure 15-3. User Library Structure](image)

Unless the NX=n parameter specifies otherwise, the ULIB directory contains the external reference/entry point linkage between routines in the user library. When the CYBER Loader loads a routine from the user library, it loads (at the same time) all user library routines referenced by the requested routine. All externals for user library routines are satisfied from the user library, if possible. If desired, you can request with the NX=n parameter that the ULIB directory contains no cross-linking of records. In that case, when a routine from the user library is requested, only that routine is loaded. Loading in this manner is typically slower than using the cross-reference linkage option.

Example 1:

File RELB contains relocatable routines that are used for execution of several applications. To enable loading of these routines as needed during execution of an application program, the user generates a user library using the following command.

```
LIBGEN,F=RELB,P=MYLIB,N=APPLIB.
```

This creates user library APPLIB on file MYLIB. The following loader sequence allows use of the APPLIB routines during execution of a compiled FORTRAN 5 program on file LGO.

```
LDSET,LIB=MYLIB.
LOAD,LGO.
EXECUTE.
```

The program is loaded and executed with externals satisfied first from user library MYLIB and then from the system default library SYSLIB. Refer to the CYBER Loader Reference Manual for more information on library search procedures.
Example 2:

If a routine has no external references, no entry is made in the ULIB directory. To load this routine, you must include the loader command LDSET(USEP=pname) in a loader sequence.

Suppose a FORTRAN 5 contains a BLOCK DATA subroutine without external references to any of its entry points. The user has not named the block, and it has the default name BLKDAT. To load this routine, you must include the following command in the loader sequence.

LDSET,USEP=$BLKDAT.$.

ULIB COMMAND

The ULIB command creates a user library or adds a record to, deletes a record from, or replaces a record in an existing user library. ULIB changes affect only the local copy of a user library. You can use the SAVE or REPLACE command, or copy the new library file to a direct access permanent file, to make the user library file permanent.

Format:

ULIB,OP=operation,REC=record,LIB=library.

or

ULIB,operation,record,library.

All parameters are required. The first format is the order-independent format for the parameters. The second is the order-dependent format.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP=operation</td>
<td>Specifies the library operation to be done. You can specify one of the following values:</td>
</tr>
<tr>
<td>REC=record</td>
<td>Specifies the name of the record to be added, deleted, replaced, or copied. The record name must be the name of a local file.</td>
</tr>
<tr>
<td>LIB=library</td>
<td>Specifies the name of the local library file to be created or modified. Except in the case of OP=C or OP=F, ULIB returns the original library file and creates a new local file. Hence, ULIB cannot be used to directly modify a library on a direct access file.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Add a record to the user library (same as R).</td>
</tr>
<tr>
<td>C</td>
<td>Create a new user library.</td>
</tr>
<tr>
<td>D</td>
<td>Delete a record from the user library.</td>
</tr>
<tr>
<td>F</td>
<td>Copy a record from the user library and make the copy a local file with the same name as the record.</td>
</tr>
<tr>
<td>R</td>
<td>Replace a record in the user library (same as A).</td>
</tr>
</tbody>
</table>
The ULIB command is an interactive procedure. You can get help information for the command and its parameters and be prompted for parameters. If you enter

ULIB?

the system gives you information about the command itself and prompts you for parameters. If you enter

ULIB,parameter?

the system gives you information about the specified parameter and prompts you for parameters.

VFYLIB COMMAND

The VFYLIB command rewinds two files, compares their records, and lists the differences. VFYLIB does not perform a bit-by-bit comparison of the two files. It only compares such entries as name, type, length, and checksum for the records of the two files. For a binary comparison of two files, use the VERIFY command. For output listing files not connected to your terminal, the VFYLIB command honors the page length and print density set for your job using the SET command and the PL and PD symbolic names.

Format:

VFYLIB,lfn1,lfn2,lfn3,NR.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn1</td>
<td>Name of the first file; if this parameter is omitted, VFYLIB assumes file OLD.</td>
</tr>
<tr>
<td>lfn2</td>
<td>Name of the second file; if this parameter is omitted, VFYLIB assumes file NEW.</td>
</tr>
<tr>
<td>lfn3</td>
<td>Name of the output file; if this parameter is omitted, VFYLIB assumes file OUTPUT.</td>
</tr>
<tr>
<td>NR</td>
<td>If specified, lfn1 and lfn2 are not rewound after verification.</td>
</tr>
</tbody>
</table>

The record types that VFYLIB recognizes are listed in Library Record Types in this section. VFYLIB lists changes in residence (between record groups separated by zero-length records), replacements, deletions, and insertions. A record is defined as being replaced when its name and type remain the same, but its contents differ. VFYLIB does not compare prefix (77) table information such as last modification date and last assembly date. VFYLIB does not consider a difference in record order as a difference between the two files.

NOTE

When printing output for text files, VFYLIB uses the first seven characters of the first word of the record as the record name. VFYLIB assumes that the record is in 6-bit display code. Therefore, if you attempt to display VFYLIB output for a record in 6/12-bit display code while your terminal is in ASCII mode, the output display may be garbled. To avoid this problem, you should set your terminal to NORMAL mode before listing VFYLIB output.
Example:

The following are CATALOG listings of file OLD and file NEW.

<table>
<thead>
<tr>
<th>REC</th>

D TEXT 2
LIBRARY PROCESSING EXAMPLES

The following examples illustrate the use of CATALOG, LIBEDIT, and LIBGEN commands. To duplicate the examples, you should execute the jobs in sequence.

Example 1:

The following submit job builds a program library from a replacement file of relocatable binary (REL) records.

```
/JOB
LIBTEST1.
/USER
FTN5,L=0.
DEFINE,TESTLIB.
CATALOG,LGO,R.
LIBEDIT,P=0,N=TESTLIB.
CATALOG,TESTLIB,R.
/EOR
```

```
SUBROUTINE A
STOP
END
SUBROUTINE D
STOP
END
SUBROUTINE C
STOP
END
SUBROUTINE B
STOP
END
```

The FORTRAN compilation produces relocatable binaries on the default file LGO. The DEFINE command creates a direct access permanent file TESTLIB on which the new program library is written. The first CATALOG command lists the LGO file as follows:

```
FILE  yy/mm/dd. PAGE 1
LENGTH
CHKSUM
DATE
COMMENTS
41 7424 yy/mm/dd. SUBROUTINEOPT=0,ROUND= A/ S/ M
41 6566 yy/mm/dd. SUBROUTINEOPT=0,ROUND= A/ S/ M
41 5525 yy/mm/dd. SUBROUTINEOPT=0,ROUND= A/ S/ M
41 0465 yy/mm/dd. SUBROUTINEOPT=0,ROUND= A/ S/ M
```

The P=0 in the LIBEDIT command indicates that no old program library exists. The N parameter indicates that the new program library is written on file TESTLIB. The replacement file is the default LGO. The directives are on the default INPUT file.
LIBEDIT reads the binaries from LGO and the directives from INPUT. On the basis of the directive specifications, the binaries are inserted before the end-of-file on file TESTLIB in the order specified in the directives (A, B, C, D). The directory record created is given the name LIBRARY as a result of the *BUILD directive. It is written before the end-of-file on the new program library TESTLIB.

The directives are written to OUTPUT. The records on file TESTLIB are listed on the next page of OUTPUT. The following listing consists of these two pages.

LIBEDIT DIRECTIVES.

*BUILD LIBRARY
*B,*,REL/A,B,C,D

RECORDS WRITTEN ON FILE TESTLIB

<table>
<thead>
<tr>
<th>RECORD</th>
<th>TYPE</th>
<th>FILE</th>
<th>DATE</th>
<th>COMMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>INSERTED A</td>
<td>REL</td>
<td>LGO</td>
<td>yy/mm/dd.</td>
<td>SUBROUTINEOPT=0</td>
</tr>
<tr>
<td>INSERTED B</td>
<td>REL</td>
<td>LGO</td>
<td>yy/mm/dd.</td>
<td>SUBROUTINEOPT=0</td>
</tr>
<tr>

</tr>
<tr>
<td>ADDED LIBRARY</td>
<td>OPLD</td>
<td>*****</td>
<td>yy/mm/dd.</td>
<td></td>
</tr>
</tbody>
</table>

**EOF**

The second CATALOG command produces the following listing of information about the records on TESTLIB.

<table>
<thead>
<tr>
<th>CATALOG OF TESTLIB</th>
<th>FILE 1</th>
<th>yy/mm/dd. hh.mm.ss.</th>
<th>PAGE 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>REC</td>
<td>NAME</td>
<td>TYPE</td>
<td>LENGTH</td>
</tr>
<tr>
<td>1</td>
<td>A</td>
<td>REL</td>
<td>41</td>
</tr>
<tr>
<td>2</td>
<td>B</td>
<td>REL</td>
<td>41</td>
</tr>
<tr>
<td>3</td>
<td>C</td>
<td>REL</td>
<td>41</td>
</tr>
<tr>
<td>4</td>
<td>D</td>
<td>REL</td>
<td>41</td>
</tr>
<tr>
<td>5</td>
<td>LIBRARY</td>
<td>OPLD</td>
<td>13</td>
</tr>
<tr>
<td>6</td>
<td><em>EOF</em></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Example 2:

This submit job builds a new program library from an old program library by inserting new relocatable routines into and deleting routines from the old program library created in example 1 (TESTLIB).

```
/JOB
LIBTES2.
/USER
FTNS5,L=0.
ATTACH,OLD=TESTLIB.
DEFINE,NEW=TES2LIB.
LIBEDIT.
CATALOG,NEW,R.
/EOR
SUBROUTINE BONE
  STOP
END
SUBROUTINE NEWC
  STOP
END
/EOR
*TYPE REL
*I,B,BONE
*D,C
/EOF
```

Three relocatable binaries (BONE, D, and NEWC) are produced via a FORTRAN compilation. The old program library (TESTLIB) is attached in read mode and referenced as OLD. A direct access file (TES2LIB) is created for the new program library. This file is referenced as NEW.

LIBEDIT reads the binaries from the replacement file LGO and the input directives from file INPUT. It writes the modified old program library (OLD) to the new program library (NEW). BONE and NEWC are inserted after records B and C, respectively, and record C is deleted. Record D, which already existed on the old program library, is replaced by record D from the replacement file LGO. The following action is taken on file NEW.

```
LIBEDIT DIRECTIVES.       yy/mm/dd. hh:mm.ss.       PAGE 1

*TYPE REL
*I,B,BONE
*D,C
```

```

Example 3:

This submit job uses LIBGEN to generate a user library file from the program library file TES2LIB created in example 2.

/JOB
LIBTES3.
/USER
ATTACH,TES2LIB.
DEFINE,LIBFILE.
LIBGEN,F=TES2LIB,P=LIBFILE,N=LOADLIB.
CATALOG,LIBFILE,R,U.
/EOF

The program library TES2LIB is attached to the job. A direct access file LIBFILE is defined for writing the user library file.

LIBGEN scans TES2LIB and builds a ULIB directory of entry points, program names, and external references for relocatable (REL) records in the file. ULIB is copied to the file LIBFILE, followed by the records from TES2LIB. A file index of addresses for each record in the file is added as the last record of LIBFILE. LOADLIB is the name of the ULIB and OPLD records.

The CATALOG output of the user library file LIBFILE shows the following content.

<table>
<thead>
<tr>
<th>REC</th>
<th>NAME</th>
<th>TYPE</th>
<th>FILE</th>
<th>LENGTH</th>
<th>yy/mm/dd.</th>

CATALOG OF LIBFILE

yy/mm/dd. hh:mm.ss. PAGE 1

SUM = 275
Example 4:

This submit job illustrates a method for deleting records from a user library.

/JOB
LIBTES4.
/USER
ATTACH,LIBFILE/M=W.
LIBEDIT,P=LIBFILE,U,Z,#*D,REL/NEWC
CATALOG,NEW,R,U.
/EOR

LIBEDIT references the program library LIBFILE and the directive following the command, deletes NEWC, and writes this modified file on the default NEW. The output shows the LIBEDIT processing.

LIBEDIT DIRECTIVES.

```
*D,REL/NEWC
```

RECORDS WRITTEN ON FILE NEW

```
RECORD  TYPE    FILE    DATE    COMMENT
A        REL     LIBFILE  yy/mm/dd. SUBROUTINEOPT=O,ROUND= A/ S/ M
B        REL     LIBFILE  yy/mm/dd. SUBROUTINEOPT=O,ROUND= A/ S/ M
BONE     REL     LIBFILE  yy/mm/dd. SUBROUTINEOPT=O,ROUND= A/ S/ M
D        REL     LIBFILE  yy/mm/dd. SUBROUTINEOPT=O,ROUND= A/ S/ M
DELETED-(NEWC) REL     LIBFILE  yy/mm/dd. SUBROUTINEOPT=O,ROUND= A/ S/ M
ADDED    LOADLIB OPLD     ***** yy/mm/dd.
**EOF**  LIBFILE
```

LIBGEN generates a new user library on the file NEW. It uses LIBFILE as the source and names the new user library ULIB.
LIBRARY COMMAND

The LIBRARY command specifies a global library set for your current job. Once you specify a
global library set, you can execute any program or procedure on a global library file by
entering the entry point name for the program or procedure name. Special entry points ARG=,
NPC=, RFL=, and SDM= are also honored. (Refer to Volume 4, Program Interface for more
information.) A program can load overlays randomly from this global library set.

Format:

LIBRARY, file1, file2, ..., fileN/directive

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file1</td>
<td>Specifies a file containing a user library. The file must be a local file or a system library.</td>
</tr>
<tr>
<td>directive</td>
<td>Specifies if file1, file2, ..., fileN are to be added to, to be deleted from or to replace the global library set.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Add the specified files to the global library set.</td>
</tr>
<tr>
<td>D</td>
<td>Delete the specified files from the global library set.</td>
</tr>
<tr>
<td>R</td>
<td>Replace the existing global library set with the specified files. R is the default.</td>
</tr>
</tbody>
</table>

To clear your global library set, specify no parameters:

LIBRARY.

NOTE

A no-auto-drop status is set for any file inserted in the global library set. The no-drop-status is cleared when a library is removed from the global library set. Refer to SETFS command for an explanation of no-auto-drop status.

MAXIMUM SIZE OF GLOBAL LIBRARY SET

The maximum number of libraries allowed in your global library set varies with the number of
nonsystem libraries you specify. Figure 15-4 shows the various possibilities:

<table>
<thead>
<tr>
<th>User libraries</th>
<th>Number of system libraries allowed</th>
<th>Maximum number of libraries</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>24</td>
<td>24</td>
</tr>
<tr>
<td>1</td>
<td>13</td>
<td>14</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>4</td>
</tr>
</tbody>
</table>

Figure 15-4. Maximum Size of Global Library Set
Nominally, you can never specify more than two user libraries (nonsystem libraries). However, you can circumvent this restriction by making the local file name of a user library the same as that of a system library. The system libraries USRLIB1, USRLIB2,..., and USRLIB8 are available for this purpose.

LIBRARY SEARCH ORDER

The system searches the libraries in the global library set in the order in which you specified them in the LIBRARY command. If an entry point name appears in multiple libraries, the system uses its first occurrence. If you want to further control the library search order, use the LIBLOAD and SATISFY commands, described in the CYBER Loader Reference Manual.

EXAMPLES

Suppose you want to write a command to yield the date and another to yield your social security number. This example uses a procedure to produce the date and a FORTRAN 5 program to display your social security number.

File DATPROC has the following contents:

```
.PROC,DATE*I.
  DISP,$TODAY'S DATE IS:$,DATE*.
  REVERT,NOLIST.
---eor---
.PROC,DISP*I,STRING1,STRING2.
  NOE.+STRING1 STRING2
  REVERT,NOLIST.
```

File SSPROG has the following contents:

```
PROGRAM SSNUM
PRINT*,'MY SOCIAL SECURITY NUMBER IS 530-82-7161.'
END
```

The following command entries establish your global library set:

```
/get,datproc,ssprog.
/ftn5,i=ssprog,l=0.
  0.009 CP SECONDS COMPILATION TIME.
/libedit,n=mylib,u,z,**file datproc
  RECORDS WRITTEN ON FILE MYLIB
  TYPE    FILE    DATE    COMMENT
  ADDED    SSNUM    REL    LGO    yy/mm/dd.
  ADDED    DATE    PROC    DATPROC
  ADDED    DISP    PROC    DATPROC
  LIBRARY GENERATION COMPLETE.
```

```
/library,mylib
 LIBRARY,MYLIB.
```
The FTN5 command creates file LGO and LIBEDIT creates user library MYLIB, containing the procedure and compiled program. The LIBRARY command specifies your global library set.

The following sequence tests your commands:

```
/date
TODAY'S DATE IS: yymmdd
/ssnum
  MY SOCIAL SECURITY NUMBER IS 530-82-7161.
  0.003 CP SECONDS EXECUTION TIME.
```

Suppose you wish to include three of your own user libraries in the global library set for your current job. You can accomplish this with the following commands:

```
/get, myLib1, myLib2, myLib3.
/library, myLib1, myLib2, myLib3.
TOO MANY USER LIBRARIES SPECIFIED.
/rename, usrLib1 = myLib3.
/library, myLib1, myLib2, usrLib1.
LIBRARY, MYLIB1, MYLIB2, USRLIB1.
```

Note that it was necessary to use the name of a system library USRLIB1 for the third library MYLIB3 in order to use more than two libraries at once.

The following command produces a display of your global library set:

```
/enquire,L
```

```
  LOADER INFORMATION.
  MAP OPTIONS = DEFAULT
  DEBUG = OFF
  GLOBAL LIBRARY SET IS -
  MYLIB1, MYLIB2, USRLIB1
```
This section distinguishes NAM/CCP network functions from IAF functions to aid in error checking and to allow you to carry over knowledge of the network to other products (RBF or TAF, for example). If you are connected to a CDCNET network, refer to the CDCNET Terminal Interfaces Usage manual for a description of terminal input and output. The network interface is largely invisible to the IAF user. In most cases, you can ignore the existence of the network and proceed as if you are communicating exclusively with IAF. However, certain commands which involve communication only with the network are available to the IAF user (appendix J). These network commands change the characteristics of a terminal (for example, changing the backspace character or initiating paper tape operations), change the character code set of a terminal, and send messages to the local operator. Unlike other system commands, these network commands can be used any time a data connection exists between the terminal and the communications network, including prior to the completion of login.

TERMINALS

IAF and the network provide support for 18 terminal classes. Each terminal class corresponds to an actual terminal or terminals as follows:

<table>
<thead>
<tr>
<th>Class</th>
<th>Terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>M33, M35, M37, M38 teletypes</td>
</tr>
<tr>
<td>2</td>
<td>CDC 713-10, 722, 751-1, 752, 756</td>
</tr>
<tr>
<td>3</td>
<td>CDC 721, 722-30</td>
</tr>
<tr>
<td>4</td>
<td>IBM 2741</td>
</tr>
<tr>
<td>5</td>

</tr>
<tr>
<td>13</td>
<td>CDC 714-10/20</td>
</tr>
<tr>
<td>14</td>
<td>HASP protocol pre-print format control</td>
</tr>
</tbody>
</table>

†Terminals of all classes can be connected to NOS. Some terminals in terminal classes 1, 2, 3, and 5 through 8 can be connected to a packet switching network (PSN) with a connection established to NOS.
Class  Terminal
15    CDC 731-12, 732-12, 734
16    IBM 2780
17    IBM 3780
18    IBM 3270

A computer site may support terminals other than those listed. Consult local site personnel to determine if terminal types not listed are supported and to obtain additional operating instructions for supported nonstandard terminals.

Associated with each terminal class are specific terminal operating characteristics. Default values are listed in appendix J. A site can change these default values. If it does, it should provide you with a list of the new values. You can also change terminal characteristics with the TRMDEF command (section 8) and with the terminal definition commands (appendix J). Important characteristics which may vary from terminal to terminal include:

- Abort output block character (AB).
- Backspace character (BS).
- Cancel character (CN).
- Control character (CT).
- End-of-line character (EL).
- End-of-block character (EB).
- Interruption character (Bl).
- Termination character (B2).

INPUT/OUTPUT CONVENTIONS

There are many standards and conventions that apply to input and output. Some features, however, vary according to terminal class as this section indicates. The information in this section pertains to line mode operations only.

INPUT FROM TERMINAL

The system normally issues you input prompts. However, you need not wait for an input prompt before entering the next input line (refer to Entering Input Before Prompts later in this section). Any input from the terminal halts output to the terminal until you enter a .

A question mark (?) output to the terminal is usually a request from an executing program for user input. You can enter terminal definition commands in response to any request for input. For example, when you are in text mode or are using Text Editor or FSE. If you enter a terminal definition command following a request for input, the system does not send a new prompt.

If you are at a PSN terminal, however, you must wait for output to cease before entering more input.
LENGTH OF OUTPUT/INPUT LINES

A logical input line can consist of a maximum of 2500 characters, but the system does not impose a limit on the length of a logical output line. The current page width determines the maximum number of characters in a physical output line. If a logical output line exceeds the current page width, the system places the additional characters on the next physical line. If you enter a logical input line (terminated by a carriage return) longer than 2500 characters, the system discards the entire logical line and issues the *0VL* message.

TERMINATING INPUT LINE

The line feed key, which terminates physical lines, and the carriage return key, which terminates logical lines, vary with terminal class. Appendix K lists the carriage return, line feed, and message transmission keys for the various terminal classes. Line feed and carriage return are generic terms which represent characters that terminate a line of text. The logical end-of-line character can be changed by you (refer to the EL command in appendix J), your application, or by your local site.

You must terminate each logical line of input by entering a carriage return. This tells the system that the current logical line is complete. The system may respond by positioning the carriage (or cursor) at the beginning of the next line. You can then enter additional input information on the new line.

You continue a logical line on a new physical line by entering a line feed. The system responds by positioning the carriage (or cursor) at the beginning of the next line.

CORRECTING INPUT LINE

You can correct entry errors in the input line before pressing by using the backspace character. One character (including spaces) is deleted for each backspace character entered. If the beginning of the physical line is reached, further backspace characters are ignored. For example, when the input line contains

BAX—SJX<— IC

it is interpreted by the system as the BASIC subsystem selection command (or a line of text interpreted as the word BASIC, if you are in text mode).

The backspace character can be changed by you (refer to the BS command in Appendix J), your application, or by your site.

†This applies only to IAF and can be changed by your site.
††This characteristic varies with the terminal class. You can change this characteristic with the TRMDEF command (section 8) or with one of the terminal definition commands (appendix J).
†††A PSN does not normally reposition its terminals to the next line until it sends the next output message. You must reposition the carriage on terminals connected to a PSN (for example, by entering a carriage return in local mode in order to enter input before the system prompts for it).
DELETING INPUT LINE

When you discover an error in the command or other input before pressing @, you can delete the current logical input line by entering the cancel line character followed by a carriage return. For most terminals, this is CTRL/X or the { character. Default values for each terminal class are given in appendix J.

The network responds to the cancel line character by printing *DEL* on the next line and positioning the carriage or cursor to the beginning of a new line. The following example illustrates the use of the cancel line character.

READY.
10 program t
20 print 6
30 6 format 9'this is a test
*DEL*
30 6 format ('this is it')
40 end
list

10 PROGRAM T
20 PRINT 6
30 6 FORMAT ('THIS IS IT')
40 END

READY.

ENTERING INPUT BEFORE PROMPTS

Under IAF, you normally wait for an input prompt before entering data or commands. This prompt appears as either a READY message, a slant (/), a question mark (?), or a program-defined prompt. You can, however, enter input before receiving a prompt; the system processes the input in the order that you enter it. The prompts the system issues after processing individual commands still appear at the terminal in their normal manner. If you enter too many commands before receiving an input prompt, the system issues the following message:

WAIT..

You should then reenter the unprocessed commands after the system issues its REPEAT.. prompt.

Even if it is currently processing another command, the system processes these three types of input immediately: terminal definition commands, interactive status commands, and user break sequences (interruption and termination sequences).

Terminal definition commands change the terminal's characteristics. Appendix J gives a detailed description of terminal definition commands.

Interactive status commands get an immediate status response from the system. The interactive status commands, ctD, ctE, and ctS, use the network control character defined for your terminal (refer to table J-1). Detailed descriptions of ctD, ctE, and ctS appear in section 8.

*This characteristic varies with the terminal class. You can change this characteristic with the TRMDEF command (section 8) or with one of the terminal definition commands (appendix J).
PAGE WAIT

Each terminal class defines a certain number of lines of output as a page.† For a display terminal with page wait enabled, output stops at each page boundary. To display the next page, you can enter a carriage return.‖ For a printing terminal with page wait enabled, the system inserts six line feeds at each page boundary and output continues. If output ceases and the message

OVER.

is displayed at the end of the output, while the present page is not full, another page exists and can be viewed by pressing ††.

SUSPENDING OUTPUT

The procedure for suspending output varies with the terminal type. To suspend output on asynchronous terminals (terminal classes 1 through 8), you can press the BREAK key (the BREAK key is sometimes labeled INT, INTRPT, or ATTN). You can also suspend output by pressing any other key.‖‖ You can then enter the cancel line character (CN)† followed by a carriage return to continue output and to avoid having the keyed entry interpreted as input.

Synchronous terminals do not have a BREAK key. You cannot suspend output on these terminals, except through the normal page wait controls.

After suspending output with the BREAK key, you can either abort the current output block, interrupt the current job step, or terminate the current job step. The next three subsections define the procedures for each of these options. If you enter input other than the controls described in the following sections, the system resumes output.

ABORTING OUTPUT BLOCK

To abort the current output block, first suspend output by pressing the BREAK key and then enter the abort block character followed by a carriage return.‖‖‖

†This characteristic varies with the terminal class. It can be changed using the TRMDEF command (section 8) or one of the terminal definition commands (appendix J).
‖For mode 4 terminals, enter the network control character (ct) followed by a carriage return to see the next page.
‖‖On asynchronous terminals connected to a PSN, you can only suspend output by using the BREAK key, which might result in the loss of data the PSN holds.
‖‖‖A PSN does not support the abort output block feature for its terminals.
INTERRUPTING JOB STEP

To interrupt a job step, you enter the interruption character† followed by a carriage return. For most terminals, the interruption character is CTRL/F, CTRL/P, or a colon (:). Appendix J lists the default values for each terminal class. The interruption sequence is also called the user break 1 sequence. IAF responds with the message:

*INTERRUPTED*

and discards any input you may have previously entered.

If the system is transmitting output to the terminal, first suspend output by pressing the BREAK key and then enter the interruption sequence. To interrupt output on synchronous terminals, you can enter the interruption sequence only when output ceases at a page boundary. You must have already enabled page wait.

TERMINATING JOB STEP

To terminate a job step, enter the termination character† followed by a carriage return. For most terminals, the termination character is CTRL/T or a right parenthesis. Appendix J lists the default values for each terminal class. The termination sequence is also called the user break 2 sequence. IAF responds with

*TERMINATED*

and discards any input you may have entered previously.

If the system is transmitting output to the terminal, first suspend terminal output by pressing the BREAK key and then enter the termination sequence. To terminate output on synchronous terminals, you enter the termination sequence only when output ceases at a page boundary. You must have already enabled page wait.

NOTE

You cannot enter the interruption or termination sequence if output has been suspended with a key other than the BREAK key or the interruption or termination character.

†This characteristic varies with the terminal class. It can be changed using the TRMDEF command (section 8) or one of the terminal definition commands (appendix J).
CONTINUING A SUSPENDED JOB

After you have suspended your job during program execution by entering the interruption sequence, you can enter one of the following:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Z</td>
<td>Continues output. A portion of the output is lost if the program was transmitting output to the terminal when suspended. When output is complete, program execution continues.</td>
</tr>
<tr>
<td>P</td>
<td>Proceeds. If the program was transmitting output to the terminal when suspended, the system discards the data generated by the program prior to the interruption sequence. The amount of output discarded depends on the program being executed. Program execution continues.</td>
</tr>
<tr>
<td>Other</td>
<td>Stops. Terminates the job step.</td>
</tr>
</tbody>
</table>
The following example illustrates the use of the interruption sequence to interrupt a FORTRAN 5 program.

```
list
00100 PROGRAM DO
00110 INTEGER E
00120 DO 10 E=1,300
00130 PRINT*,E
00140 10 CONTINUE
00150 READ*,I,J
00160 PRINT*,I,J
00170 STOP
00180 END
READY.
run
1
2
3

*INTERRUPTED*
®
110
111
112

*INTERRUPTED*
®
p®
193
194
195
196

*INTERRUPTED*
p®
? 4,5
 4 5
SRU 0.863 UNTS.
RUN COMPLETE.
```

You interrupt with the BREAK key to stop output and enter the interruption sequence to suspend the job. You continue by pressing ® (some output is lost).

You again press the BREAK key to stop output and enter the interruption sequence to suspend the job.

You enter P®, directing the system to discard data. As execution continues, more data is printed at the terminal.

You again suspend the job.

You enter P® directing the system to discard data. All output has been generated. Program execution continues.

The number of times you would have to interrupt a program and enter P before all output has been generated depends on the program.

**USING ATTN ON IBM 2741 TERMINALS**

You must press the ATTN key before entering the network control character, abort block character, interruption character, or termination character or after entering the cancel character. For further information about these characters, refer to appendix J.
CONTROL BYTES

You can design an interactive program to control terminal activity by including control bytes in your output. Control bytes perform operations such as controlling the positioning of the printing element and defining alternate input modes.

A control byte is a 12-bit quantity, right-justified in bit position 0, 12, 24, 36, or 48 of a central memory (CM) word. You must be careful since data can be mistaken for a control byte. For example, the 64-character set characters :D at the beginning of a line and followed by an end-of-line may log out your job if written to the terminal output file, since the code 0004 is transmitted. The following control bytes are available.

<table>
<thead>
<tr>
<th>Byte</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>End-of-block.</td>
</tr>
<tr>
<td>0002</td>
<td>Auto input.</td>
</tr>
<tr>
<td>0003</td>
<td>Disconnect terminal from IAF and the host.</td>
</tr>
<tr>
<td>0004</td>
<td>Initiate ASCII input mode.</td>
</tr>
<tr>
<td>0005</td>
<td>Initiate transparent input mode.</td>
</tr>
<tr>
<td>0006</td>
<td>Initiate transparent output mode.</td>
</tr>
<tr>
<td>0007</td>
<td>NAM/CDCNET terminal redefinition.</td>
</tr>
<tr>
<td>0010</td>
<td>NAM/CCP terminal redefinition.</td>
</tr>
<tr>
<td>0011</td>
<td>Initiate ASCII output mode.</td>
</tr>
<tr>
<td>0013</td>
<td>End-of-string.</td>
</tr>
<tr>
<td>0016</td>
<td></td>
</tr>
</tbody>
</table>

The use of these control bytes is described in detail in section 12 of Volume 4, Program Interface. For additional information, refer to the EFFECT macro description in Volume 4.
A character set is composed of graphic and control characters. A code set is a set of codes used to represent each character within a character set.

A graphic character may be displayed at a terminal or printed by a line printer. Examples are the characters A through Z and the digits 0 through 9. A control character initiates, modifies, or stops a control operation. An example is the backspace character that moves the terminal carriage or cursor back one space. Although a control character is not a graphic character, a terminal may produce a graphic representation when it receives a control character.

All references within this manual to the ASCII character set or the ASCII code set refer to the character set and code set defined in the American National Standard Code for Information Interchange (ASCII, ANSI Standard X3.4-1977). References in this manual to the ASCII character set do not necessarily refer to the ASCII code set.

NOS supports the following character sets.

- CDC graphic 64- (or 63-) character set.
- ASCII 128-character set.
- ASCII graphic 64- (or 63-) character set.
- ASCII graphic 95-character set.

Each installation selects either the 64-character set or the 63-character set. The differences between the two are described in Character Set Anomalies in this appendix. Any reference in this appendix to the 64-character set implies either the 63- or 64-character set, unless otherwise stated.

NOS supports the following code sets.

- 6-bit display code.
- 6/12-bit display code.
- 7-bit ASCII code.

Display code is a set of 6-bit codes from 008 to 778.

The 6/12-bit display code is a combination of 6-bit codes and 12-bit codes. The 6-bit codes are 008 through 778, excluding 748 and 768. (Refer to Character Set Anomalies for the interpretation of the 008 and 638 codes.) The 12-bit codes begin with either 748 or 768 and are followed by a 6-bit code. Thus, 748 and 768 are considered escape codes and are never used as 6-bit codes within the 6/12-bit display code set. The 12-bit codes are 74018, 74028, 74048, 74078, and 76018 through 76778. All other 12-bit codes (74xx8 and 76008) are undefined.
The 7-bit ASCII code (as defined by ANSI Standard X3.4-1977) is right-justified in a 12-bit byte. Assuming that the bits are numbered from the right starting with 0, bits 0 through 6 contain the ASCII code, bits 7 through 10 contain zeros, and bit 11 distinguishes the 00008 code from the end-of-line byte. The 7-bit codes are 00018 through 01778 and 40008.

CHARACTER SET ANOMALIES

NOS interprets two codes differently when the installation selects the 63-character set rather than the 64-character set. In tables A-1, A-2, and A-3, the codes for the colon and percent graphic characters in the 64-character set are unshaded; the codes for the colon and percent graphic characters in the 63-character set are shaded.

If an installation uses the 63-character set, the colon graphic character is always represented by a 638 code, and the 008 code is undefined. However, if the installation uses the 64-character set, output of 6/12-bit display codes 74048 or 6-bit display code 008 produces a colon. In ASCII mode for interactive jobs, a colon can be input only as a 74048 6/12-bit display code.

When using either the 63- or 64-character set, the use of undefined 6/12-bit display codes in output files produces unpredictable results and should be avoided.

On input, NOS recognizes alternate 029 punch codes of 11-0 for the right bracket (]) and 12-0 for the left bracket ([]). The alternate codes support the COBOL sign overpunch convention and are not recommended for other uses. Refer to COBOL 5 Reference Manual.

Also, two 008 codes may be confused with an end-of-line byte and should be avoided (refer to appendix F for further explanation).

Translation of 7-bit ASCII to 6-bit display code causes character set folding from the 128-character ASCII set to the 63- or 64-character ASCII subset. The following special character substitutions occur:

<table>
<thead>
<tr>
<th>7-Bit ASCII Code</th>
<th>Character</th>
<th>6-Bit Display Code Code</th>
<th>Character</th>
<th>7-Bit ASCII Code</th>
<th>Character</th>
</tr>
</thead>
<tbody>

CHARACTER SET TABLES

This appendix contains character set tables for interactive jobs, batch jobs, and jobs involving magnetic tapes. Table A-1 is for interactive jobs, and table A-2 is for batch jobs. Table A-3 is a conversion table used to cross-reference 7-bit ASCII codes and 6/12-bit display codes and to convert ASCII codes from octal to hexadecimal.

Tables A-4, A-5, and A-6 list the magnetic tape codes and their display code equivalents.
The character set tables are designed so that you can find the character represented by a code (such as in a dump) or find the code that represents a character. To find the character represented by a code, look up the code in the column listing the appropriate code set and then find the character on that line in the column listing the appropriate character set. To find the code that represents a character, you first look up the character and then find the code on the same line in the appropriate column.

**INTERACTIVE JOBS**

Table A-1 shows the character sets and code sets available to you at an ASCII code terminal. When in NORMAL mode (specified by the NORMAL command), NOS displays the ASCII graphic 64-character set and interprets all input and output as 6-bit display code. When in ASCII mode (specified by the ASCII command), NOS displays the ASCII 128-character set and interprets all input and output as 6/12-bit display code.

To determine the octal or hexadecimal ASCII code for a character, refer to table A-3. (Certain terminal definition commands require specification of an ASCII code.)

On output, the US code is reserved for network use and defined as an end-of-line. Use of this character, except in transparent mode, causes incorrect formatting and possible loss of output characters.

**BATCH JOBS**

Table A-2 lists the CDC graphic 64-character set, the ASCII graphic 64-character set, and the ASCII graphic 95-character sets. It also lists the code sets and card punch codes (026 and 029) that represent the characters.

The 64-character sets use display code as their code set; the 95-character set uses 7-bit ASCII code. The 95-character set is composed of all the characters in the ASCII 128-character set that can be printed at a line printer (refer to jobs using Line Printers). Only 7-bit ASCII code files can be printed using the ASCII graphic 95-character set. To print a 6/12-bit display code file (usually created by an interactive job in ASCII mode), you must convert the file to 7-bit ASCII code. To do this, you enter the FCOPY command (section 9). The 95-character set is represented by 7-bit ASCII codes 00408 through 01768.

**JOBS USING LINE PRINTERS**

The batch character set printed depends on the print train used on the line printer to which the file is sent. In addition, you may choose from one of several subsets of the characters on the print train by specifying the print train image (for information on specifying print train images, refer to the ROUTE command in section 9).

The following table lists the print trains according to the associated ROUTE command EC parameter values.
<table>
<thead>
<tr>
<th>Print Train</th>
<th>ROUTE EC Values That Will Print</th>
<th>ROUTE EC Values That Will Not Print</th>
<th>Suggested Print Band</th>
</tr>
</thead>
<tbody>
<tr>
<td>0†</td>
<td>NONE,B4,B6</td>
<td>A4,A6,A9</td>
<td>595-1/596-1</td>
</tr>
<tr>
<td>1</td>
<td>NONE,B4,B6</td>
<td>A4,A6,A9</td>
<td>595-1/596-1</td>
</tr>
<tr>
<td>2†</td>
<td>NONE,B4,B6</td>
<td>A4,A6,A9</td>
<td>595-1/596-1</td>
</tr>
<tr>
<td>3†</td>
<td>NONE,B4,B6</td>
<td>A4,A6,A9</td>
<td>595-1/596-1</td>
</tr>
<tr>
<td>4</td>
<td>NONE,A4,A6,A9</td>
<td>B4,B6</td>
<td>595-6/596-6</td>
</tr>
<tr>
<td>5</td>
<td>NONE,A4,A6</td>
<td>B4,B6,A9</td>
<td>595-4/596-4 or 595-5/596-5</td>
</tr>
<tr>
<td>6</td>
<td>A9</td>
<td>NONE,B4,B6,A4,A6</td>
<td>595-6/596-6</td>
</tr>
<tr>
<td>7</td>
<td>NONE,B4,B6,A4,A6,A9</td>
<td></td>
<td>595-6/596-6</td>
</tr>
</tbody>
</table>

†These print trains are reserved for future use. If specified, they have the same effect as if print train 1 had been specified.

For PSU printers, the batch character sets and associated print bands are as follows:

<table>
<thead>
<tr>
<th>Character Set</th>
<th>533/536 Print Band</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASCII graphic 64-character set</td>
<td>530-1</td>
</tr>
<tr>
<td>ASCII graphic 95-character set</td>
<td>530-2</td>
</tr>
</tbody>
</table>

The characters of the default 596-1 print train are listed in the table A-2 column labeled CDC Graphic (64 Char); the 596-5 print train characters are listed in the table A-2 column labeled ASCII Graphic (64 Char); and the 596-6 print train characters are listed in the table A-2 column labeled ASCII Graphic (95 Char).

If a transmission error occurs when printing a line, the system prints the line again. The CDC graphic print train prints a concatenation symbol (\(\r\)) in the first printable column of the repeated listing of the line. The ASCII print trains print an underline (\(\_\)) instead of the concatenation symbol.

If an unprintable character exists in a line (that is, a 7-bit ASCII code outside the range 0040O through 01768), the number sign (#) appears in the first printable column of a print line, and a space replaces the unprintable character.

To route and correctly print a 6/12-bit display code file on a line printer with the ASCII graphic 95-character set, you must convert the 6/12-bit display code file to a 7-bit ASCII code file with the FCOPY command (refer to section 9). The resulting 7-bit ASCII file can be routed to a line printer (refer to the ROUTE command in section 9) but cannot be output at an interactive terminal.

JOBS USING MAGNETIC TAPES

Coded data to be copied from mass storage to magnetic tape is assumed to be represented in display code. NOS converts the data to external BCD code when writing a coded seven-track tape and to ASCII or EBCDIC code (as specified on the tape assignment command) when writing a coded nine-track tape.

Because only 63 characters can be represented in seven-track even parity, one of the 64 display codes is lost in conversion to and from external BCD code. The following shows the differences in conversion depending on the character set (63 or 64) which the system uses. The ASCII character for the specified character code is shown in parentheses. The output arrow shows how the 6-bit display code changes when it is written on tape in external BCD. The input arrow shows how the external BCD code changes when the tape is read and converted to 6-bit display code.

### 63-Character Set

<table>
<thead>
<tr>
<th>6-Bit Display Code</th>
<th>External BCD</th>
<th>6-Bit Display Code</th>
</tr>
</thead>
<tbody>

<tr>
<td>63 (%)</td>
<td>16 (%)</td>
<td>63 (%)</td>
</tr>
</tbody>
</table>

If a lowercase ASCII or EBCDIC code is read from a nine-track coded tape, it is converted to its uppercase 6-bit display code equivalent. To read or write lowercase ASCII or EBCDIC characters, you must assign the tape in binary mode and use FCOPY to read or write the tape.

Tables A-4 and A-5 show the character set conversion for nine-track tapes. Table A-4 lists the conversions to and from the 7-bit ASCII character code and 6-bit display code. Table A-5 lists the conversions between the EBCDIC character code and the 6-bit display code. Table A-6 shows the character set conversions between external BCD and 6-bit display code for seven-track tapes.

</table>

†When these characters are copied from/or to a tape, the characters remain the same but the codes change from one code set to the other.
‡These characters do not exist in 6-bit display code. Therefore, when the characters are copied from a tape, each 7-bit ASCII character is changed to an alternate 6-bit display code character. The corresponding codes are also changed. Example: When the system copies a lowercase "a", 6116, from tape, it writes an uppercase A, 018.
††A 6-bit display code space always translates to a 7-bit ASCII space.

</table>

†When these characters are copied from/or to a tape, the characters remain the same (except EBCDIC codes 4A, 4F, 5A, and 5F) but the codes change from one code set to the other.

‡These characters do not exist in 6-bit display code. Therefore, when the characters are copied from a tape, each EBCDIC character is changed to an alternate 6-bit display code character. The corresponding codes are also changed. Example: When the system copies a lowercase a, 81j5, from tape, it writes an uppercase A, 01g.

†††All EBCDIC codes not listed translate to 6-bit display code 55g (space). A 6-bit display code space always translates to an EBCDIC space.

†As explained previously in this section, conversion of these codes depends on whether the tape is being read or written.
This appendix contains an alphabetical listing of the messages that may appear in your dayfile. Lowercase characters are used to identify variable names or fields. All messages are sorted according to the first nonvariable word or character. Messages beginning with special characters (such as hyphens or asterisks) are sorted as if the special characters were not present. For example, the message

    filename ALREADY PERMANENT.

is listed with the messages beginning with A, and the message

    ****ENDING SUPPORT OF LFM FUNCTION nnB.

is listed with the messages beginning with E.

Dayfile messages usually issued only to COMPASS programs are listed in appendix B of Volume 4, Program Interface.

If you encounter a diagnostic or informative message that does not appear in this appendix, consult the NOS Version 2 Diagnostic Index. This publication catalogs all messages produced by NOS and its products and specifies the manual or manuals in which each message is fully documented.

All pages are at revision level L (without change bars).

ARGUMENT ERROR.

ARGUMENT ERRORS.

ARITHMETIC ERROR.

ARITHMETIC INDEFINITE.

ARITHMETIC OVERFLOW.

ARITHMETIC UNDERRFLOW.

ASL = nnnnn, JSL = nnnnn.

ASL = nnnnn, JSL = nnnnn.

ASSIGN, ASSIGNED TO filename.

ASSIGN, ASSIGNED TO filename.

ATTRIBUTES ASSIGNED EXCEED DEMANDS.

ATTRIBUTE COMMANDS MUST BE OF ONE NETWORK TYPE.

BAD CATALOG/PERMIT SECTOR.

BAD DATA IN GLDPL HEADER.

**SIGNIFICANCE**

In the process of aborting a CM recovery, ICK was called to process all outstanding checkpoint requests.

You have already saved or defined a file with the name specified.

It is not possible to drop the disk space associated with the specified permanent file, since an error exists on the alternate storage copy of the file.

The record with type and name on the replacement file was not matched; it has been appended to the new file. A option selected.

You entered an APPFW command that did not specify a secondary application.

The requested application is currently not available for use.

Four unsuccessful attempts were made to enter a legal application name, after which the terminal was disconnected.

Your program specified incorrect arguments when it called LDG to load an overlay.

The command syntax is incorrect. Specification of duplicate parameters (more than one occurrence of a keyword) or mutually exclusive parameters (such as MT/NT, CS/CK, F/L/R/W, P/R/PW, and so forth) is not allowed on an ASET assignment command. The address parameter on AMSCS, OMSCS, LSC, LGC, LBC, or WSR must be numeric.

The ENQUIRE command's syntax is incorrect.

An arithmetic hardware error occurred.

The CPU floating-point arithmetic unit attempted to use an indefinite operand.

The CPU floating-point arithmetic unit received an operand too large for computation.

The CPU floating-point arithmetic unit received an operand too small for computation.

Informative message issued after a SETASL or SETJSL command indicating the current value of the account block SRU limit [ASL] and job step SRU limit [JSL].

Informative message issued after a SETASL or SETJSL command indicating the current value of the account block SRU limit [ASL] and the job step SRU limit [JSL].

Informative message specifying EST ordinal est was assigned to file filename.

Equipment type tt with EST ordinal est was assigned to file filename.

System error. The resources actually assigned to the job with the specified job sequence name exceed the resources demanded on a RESUSE command.

Terminal attributes unique to NAM/CCP and to NAM/CCNET were specified on the same TANDEF command.

PFM has encountered a catalog or permit sector which does not have a valid sector length. This indicates corruption of system areas on disk.

The file is a program library but is not of a recognizable format.

**ACTION**

Level 0 deadstart is required.

Save or define file using different file name or purge existing file.

Inform site analyst.

None.

Reenter the command with the appl parameter specified.

Enter the name of another application or log off and try later.

Check the accuracy of the entry. If problems persist, contact installation personnel.

Correct and retry.

Reenter command using the correct parameters and syntax.

Reanalyze the job output and dumps to determine the cause of the error.

Analyze the job output and dumps to determine the cause of the error. 

None.

CHECK FILE.

RECLAIM.

RECLAIM.

None.

None.

None.

None.

None.

None.

None.

On the TANDEF command, check to ensure that all terminal attributes are supported by your network type.

Inform site analyst.

Inform site analyst.

Try rebuilding the file if ITEMIZE possible. Inform site analyst.

BREAKPOINT IN DEBUGGER.

BUFFER ARG. ERROR.

BUFFER ARGUMENT ERROR, filename AT address.

BUFFER ARGUMENT ERROR ON filename AT address.

MESSAGE

SIGNIFICANCE

FCOPY tables are in error.

Blocks not meeting X or S1 conversion requirements have been encountered on input.

A binary command was found to be out of sequence and the job was terminated without
ERROR processing. Error on command cxyyy of record xxx.

The tape labels written on the blank tape could not be verified, probably due to
hardware failure.

A blank tape was read. Blank tape is
defined as more than 25 feet or erased tape.

The block length recorded in the file did not match the length of the block read or
the block number recorded in the file did not match the system block count (this
message applies to I format tapes only).

 Either the CC or BS parameter was specified
on a COPY command for which neither the
input nor output file was an S or L format
or the CC parameter was specified on a
COPYB command without the S or L conversion
parameter specified.

5 tape block size exceeds maximum for that
format (10000) and COPY or character count
for E or B tape COPYB exceeds maximum for
that format (6120 characters).

On F to F tape copy, the maximum frame
count for the first file exceeds that of
the second file. On S and L tape copy,
block size is less than noise size. On E
and B tapes, block size is less than the
corresponding S tape noise size.

The tape being read contained a data block
greater in size than that allowed by the
specified format or by your specification.

Indicates an abnormal tape position.

The job executed an address for which a
breakpoint was requested by the system.

You specified a breakpoint address within
the breakpoint itself.

CM address in call is less than the
field length minus the word count; buffer
extends past the job's field length.

For tape operations, this message indicates
one of the following:

- FET less than 7 words long for S/L format
- MLR greater than 1000 octal for S format
- POSMF issued and no HDR label found in
  FET or extended label buffer

Refer to Volume 4 of the MSX Version 2
Reference Set.

If the message was caused by the FCOPY
command, it indicates that the product of
the fixed line length (FL parameter) and
lines per block (LB parameter) was
greater than 340.

A buffer pointer did not conform to the
following constraints:

FIRST .LE. IN
FIRST .LE. OUT
IN AND OUT .LT. LIMIT .LE. FL

Refer to Volume 4 of the MSX Version
2 Reference Set.

ACTION

Write a PSR and include
support materials to
allow CDC to duplicate
the problem.

Check tape format for
errors.

Examine sequencing of
binary deck and correct
error.

Request that the
input label be labeled
the tape using a
different tape drive.

Ensure correct tape is
specified on command.

None.

Ensure accuracy of
format parameter (F)
and label parameter
(LB) on command or
macro. If problem
still exists, clean
tape drive or use a
new tape.

Reduce the block size or
character counts.

Increase block size so
it is greater than
the noise size. On F to
F tape copy, increase
output file block size
so it is greater than
the block size of the
input file.

Ensure accuracy of
format parameter (F)
and label parameter
(LB) command or
macro. If the
problem still exists,
clean the tape drive
or user a new tape.

Inform site analyst if
persistent.

Contact CYBER
Software Support.

Correct address and
reenter command.

Verify that the
operation does not
reference an address
beyond end of buffer
or job's field
length.

Examine program to
determine error.

Examine program to
determine error in
buffer pointers.

### ROUTINE

CCL
MESSAGE | SIGNIFICANCE | ACTION | ROUTINE
--- | --- | --- | ---
CCL155- OPERAND OR OPERAND SEQUENCE ERROR | You made one of the following errors: | Implement the action that matches the error. | CCL
- Sequence of adjacent operators is incorrect. For example, 3/4 is not allowed.
- An operand is adjacent to a left or right parenthesis. Implied multiplication is not allowed. For example, 3(B+1) is incorrect. | CCL
CCL158- STRING TOO LONG -string | The listed character string (string) is too long. A character string may not be longer than 10 characters, excluding 8 delimiters for literals, unless it appears within the STR function. | Shorten character string to 10 characters or less, or enclose it within the STR function. | CCL
CCL159- UNKNOWN NAME -string | The alphanumeric character string is not a symbolic name recognized by the system. | Replace string with a valid symbolic name. | CCL
CCL160- OPERATOR/TERMINATOR MUST FOLLOW FUNCTION [DT, FILE, LEN, NUM, STR, STRB, STRD] | A function was properly formed and positioned within a command, but it was not followed by an operator, separator, or terminator. | Place an operator, separator or terminator after function. | CCL
CCL161- FIRST PARAMETER INCORRECT IN SET COMMAND | The first parameter in the SET command was not one of the following symbolic names: DC, EF, EFG, R1, R2, R3, R1G, or SS. | Replace first parameter with a valid symbolic name. | CCL
CCL163- SUBSYSTEM REFERENCE ERROR | The system does not recognize the name associated with the symbolic name SS. | Refer to section 6 for a list of valid symbolic names. | CCL
CCL164- PAGE PARAMETER ERROR | A character string may not be longer than 10 characters, excluding 8 delimiters for literals, unless it appears within the STR function. | Check expression for errors and correct. If no errors, simplify expression or break it apart so that two or more commands have same effect as one. | CCL
CCL165- CONCATENATION MUST HAVE STRING OPERANDS | One or both of the operands for a string concatenation (//) were not within one of the string functions. | Enclose the operand in question within an STR, STRB, or STRD function. | CCL
CCL200- PROCEDURE NESTING LEVEL xx EXCEEDED | The current procedure call forced procedure nesting to exceed the limit of xx, which is defined by installation. | Reposition procedure calls so limit xx is not exceeded. | CCL
CCL201- PROCEDURE NAME MORE THAN 7 CHARACTERS | A procedure name cannot be greater than 7 characters. | Rename procedure. | CCL
CCL202- PROCEDURE FILE IS EXECUTE ONLY MODE | The procedure file was attached prior to the call in execute-only mode. The procedure file may have been saved prior to the call in execute-only mode. | Return file and attach with default mode. | CCL
CCL203- PROCEDURE FILE NAME NOT SPECIFIED OR INCORRECT | You made one of the following errors: | Implement the action that matches the error. | CCL
- File name specified on procedure call was greater than 7 characters.
- File parameter on procedure call was null. Your site does not have a default for pfile.
CCL204- MULTIPLE EQUIVALENCE SPECIFICATIONS FOR xx | The keyword xx has been specified more than once on a procedure call. The last specification is used. | If a proceeding specification is desired, remove succeeding specifications. Otherwise no action is required. | CCL
CCL205- FORMAL PARAMETER LIST DOES NOT INCLUDE -x | While in equivalence mode, the system discovered a keyword x on the procedure call that was not specified on the procedure header directive. | Remove keyword x from procedure call. | CCL
CCL206- SYMBOLIC SPECIFICATION INCORRECT xxx | A parameter, xxx, on the procedure call is followed by a plus sign. A plus sign indicates that the system is to convert the value to display code and is valid only when preceded by a symbolic name and followed by a D, B, or a null field. (Example: R1+B is a valid value, but 37*R1 is not.) | If plus sign is part of a character string, the entire character string should be converted. If plus sign should convert a symbolic name to display code, replace xxx with a valid symbolic name. Refer to section 6 for a list of valid symbolic names. | CCL
MESSAGE

CCL207- PROCEDURE NAMED BEGIN IS INCORRECT

The name of the procedure must not be named BEGIN.

CCL211- SPECIFICATION EXCEEDS XX CHARACTERS

The value on a procedure call or default value on a procedure header directive is greater than xx characters. xx is defined by installation.

CCL212- SEPARATOR INCORRECT STRING S

s is an incorrect separator and string is the character string that precedes s. Any of the following conditions produces this error:

- On a procedure call, the separator preceding a formal keyword or a positionally specified value is not a comma.
- Invalid separator is part of a character string. If a valid separator immediately precedes incorrect separator s, the string is null.
- #DATA, #FILE, or #PRIMARY has been specified on the procedure call.

CCL213- END OF INFORMATION ON PROMPTED INPUT

The user assigned INPUT to a file that is at the end of information and CCL needs to prompt for a parameter. The INPUT file probably contains faulty data.

CCL214- NOT ENOUGH FL - CHECK **CCFL** IN **PPCM**

There is insufficient field length to execute CCL when called by VALES during preprolog processing. This is caused by the symbol **CCFL** in **PPCM** being set too low.

CCL230- PROCEDURE FILE NOT FOUND

The file named on the procedure call was not assigned to the job and the installation chose to inhibit automatic retrieval of a permanent file with that name.

CCL231- PROCEDURE NOT FOUND

The local or permanent file indicated on the procedure call was found, but the system could not find the procedure on the file.

CCL232- PROCEDURE FILE IS BUSY

The CCL ATTFCH found a file busy status on the procedure file.

CCL233- PROC HEADER MUST LEAD LIBRARY PARTITION/PNAME MUST EQ PARTITION NAME

The name of the procedure must match a partition in the library where the procedure resides. The procedure header must be the first entry in the partition.

CCL234- UNABLE TO LOCATE LIBRARY PARTITION - XXX

The system could not find procedure XXX, specified on the call-by-name command, on the currently defined library set.

CCL235- FORMAL PARAMETER GT XX CHARACTERS

The number of characters in a keyword on the procedure header directive exceeds xx, as defined by installation.

CCL236- SPECIAL DEFAULT SPECIFICATION UNKNOWN

The number sign (#), which specifies a special default option on the procedure header directive, must be followed by FILE, PRIMARY, or DATA.

CCL237- SEPARATOR FOLLOWING SECOND DEFAULT IS */*

In form keyword=default1/default2/ on the procedure header directive, the second / is incorrect.

CCL238- FORMAL PARAMETER LIMIT XX EXCEEDED

The number of parameters on the procedure header directive has exceeded xx, as defined by installation.

CCL239- PROCEDURE HEADER MUST BE TERMINATED BY A PERIOD

The procedure header directive was not terminated by a period, and no commands were found after the header directive.

CCL240- MAY NOT APPEAR IN FORMAL PARAMETER NAME

A keyword containing an asterisk was found on the procedure header.

CCL249- DATA FILE LFN EXCEEDS 7 CHARACTERS - filename

The file name specified on a .DATA directive is longer than seven characters. Use of a right arrow (or the underline character in ASCII) produced a linked string of more than xx characters or a string of xx characters with a following separator. xx is equal to I.F.SCL. (Default is 150).

CCL250- CONCATENATED STRING EXCEEDS XX

A concatenated string exceeds xx characters - STRING TERMINATED BY A PERIOD

CHARACTERS - filename

The number of characters in a string terminated by a period, and no characters were found after the period.

SIGNIFICANCE

A procedure must not be named BEGIN.

ACTION

Select another procedure name.

Specify a value with xx or fewer characters.

Implement the action that applies to the condition that produced the error.

- Change separator s to a comma.
- $-delimit character string.
- Remove #DATA, #FILE, or #PRIMARY from procedure call and specify it on procedure header directive.

SIGNIFICANCE

Correct the file contents or supply the CCL parameters interactively.

Modify the value of CCL or the separator than the FL required for the CCLBREW overlay of CCL, resolve **HOSTFILE** and VALES, and rebuild the NDS system.

Check file name for errors and correct. If name is correct, retrieve file prior to procedure call.

Check procedure name for errors and correct. If name is correct, check file for procedure.

Clear file busy condition and resubmit procedure.

Rebuild library with the procedure header as the first entry in the named partition.

Check procedure name for errors and correct. If name is correct, check library for procedure.

Define a keyword with xx or fewer characters.

If number sign is part of a character string, enclose the character string with dollar signs. If a special default option is desired, follow the number sign with either DATA, FILE, or PRIMARY.

If / is part of default2, enclose the character string with dollar signs. If not, either remove it or replace it with a comma or period.

Remove parameters from procedure header directive until xx or fewer parameters remain.

Terminate procedure header with a period and add at least one command to procedure.

Redefine the keyword without any asterisks.

Specify a shorter file name.

Reduce number of linked characters.

</table>
MESSAGE

CCL327- EXPECTING VALUE AFTER PATTERN ON HEADER
The syntax immediately following the equal sign in the checklist is incorrect. The system expects an alphanumeric value, a literal, or a special name as a value.
ACTION Correct header and resubmit.
ROUTINE CCL

CCL328- HEADER PARAMETER DESCRIPTION TOO LARGE
A procedure header parameter description exceeds 40 8/12-bit display code or 80 8-bit display code characters.
ACTION Reduce the size of the description string.
ROUTINE CCL

CCL329- MISC AFTER HEADER PARAMETER DESCRIPTION
The only characters allowed to follow the terminating quotation mark of a parameter description are equal sign, period, right parenthesis, slant, reverse slant, or comma.
ACTION Correct procedure header and resubmit.
ROUTINE CCL

CCL330- EXPECTING . ) OR . AFTER CHECKLIST PATTERN
The pattern part of a checklist item can only be followed by another pattern preceded by a comma, a replacement value preceded by an equal sign, or a right parenthesis to indicate the end of the checklist.
ACTION Correct procedure header and resubmit.
ROUTINE CCL

CCL331- EXPECTING . ) OR . AFTER PATTERN VALUE
The replacement value part of a checklist item can only be followed by another pattern preceded by a comma or a right parenthesis to indicate the end of a checklist.
ACTION Correct procedure header and resubmit.
ROUTINE CCL

CCL332- WRITE SET AS 'SN(SET)' ON PROC HEADER
A set pattern in a checklist must be written as 'S' followed by an optional unsigned integer in the range 1-40 followed by up to 40 characters enclosed in parentheses.
ACTION Correct procedure header and resubmit.
ROUTINE CCL

CCL333- DUPLICATE +K PATTERN IN CHECKLIST
CCL333- DUPLICATE +/D PATTERN IN CHECKLIST
CCL333- DUPLICATE +K PATTERN IN CHECKLIST
A single checklist may not contain more than one +K, +/D, or +K.
ACTION Correct procedure header and resubmit.
ROUTINE CCL

CCL334- MISSING QUOTE - PROMPT/TITLE/DESCRIPTION
A prompt, title, or description string on the procedure header must begin and end with a quote and cannot extend onto another line.
ACTION Start the string with a left bracket ['] and terminate it with a right bracket ['].
ROUTINE CCL

CCL335- DESCRIPTION MISSING ] BRACKET
The terminating right bracket [ ] on a description string was not found.
ACTION Correct procedure header and resubmit.
ROUTINE CCL

CCL336- PATTERN OR VALUE ON PROC HEADER GT 40
A single checklist item may contain literal patterns and replacement values [values which stand for themselves]. These values may not exceed 40 characters after evaluation.
ACTION Correct procedure header and resubmit.
ROUTINE CCL

CCL337- EXPECTING . ) OR . AFTER CHECKLIST PATTERN
An +K checklist pattern can only be followed by another pattern preceded by a comma or a right parenthesis indicating the end of the checklist.
ACTION Correct procedure header and resubmit.
ROUTINE CCL

CCL352- HELP PARAMETER NAME NOT FOUND
If a comma follows the .HELP directive, the system expects to find a parameter name or the parameter NOLIST.
ACTION Correct directive and resubmit.
ROUTINE CCL

CCL353- ONLY COMMA ALLOWED AFTER .HELP
The system found something other than a comma after .HELP directive.
ACTION Correct directive and resubmit.
ROUTINE CCL

CCL354- HELP DIRECTIVE INCORRECTLY WRITTEN
The .HELP directive can have one of four formats:
- .HELP.
- .HELP.keyword.
- .HELP.keyword,NOLIST.
- .HELP.
ACTION Correct directive and resubmit.
ROUTINE CCL

CCL355- NO .ENDHELP FOR .HELP
The system found an end of record before it encountered a .ENDHELP directive.
ACTION Add an .ENDHELP directive and resubmit.
ROUTINE CCL

CCL357- DUPLICATE HELP DIRECTIVES IN PROC BODY
Either more than one .HELP directive with no parameter name or more than one .HELP directive with the same parameter name was found.
ACTION Delete duplicate .HELP directives and retry.
ROUTINE CCL

CCL373- EXPECTING . ) OR . AFTER .IF .ELSE .ENDIF
A .IF, .ELSE, or .ENDIF directive in the procedure body must have a left parenthesis or a comma immediately following the directive name.
ACTION Insert a left parenthesis or a comma.
ROUTINE CCL

CCL374- EXPECTING PERIOD AFTER .EX
A period must follow the .EX directive name in the procedure body.
ACTION Insert a period after the directive name.
ROUTINE CCL

CCL375- COMMAND IS NULL ON .EX DIRECTIVE
You have not specified a command on the .EX directive.
ACTION Specify a command on the directive.
ROUTINE CCL

CCL376- .IF DIRECTIVE HAS INCOMPLETE EXPRESSION
A .IF directive in the procedure body is incomplete.
ACTION Complete the expression and add a label or command to the directive.
ROUTINE CCL

CCL377- EXPECTING . ) OR . AFTER .IF EXPRESSION
A comma, period, or right parenthesis must follow the expression on a .IF directive in the procedure body.
ACTION Insert a comma, period, or right parenthesis after the expression.
ROUTINE CCL

CCL378- OR . ) MUST FOLLOW .DIRECTIVE NAME
A procedure directive is missing the comma or left parenthesis separator.
ACTION Place separator after the directive name.
ROUTINE CCL

CCL379- NO .ENDIF FOR .IF/.ELSE LABEL .... LAST LINE SKIPPED.
A .ENDIF directive with a label matching the .IF/.ELSE directive label was not found.
ACTION Add a .ENDIF directive or correct label on existing .ENDIF.
ROUTINE CCL
MESSAGE  SIGNIFICANCE  ACTION  ROUTINE

CCL380- EXPECTING TITLE OR , AFTER *M ON HEADER  A title, if there is one, or a comma was not found immediately following the *M on a menu procedure.  Place a title surrounded by quotes after the *M or also place a comma after *M.  CCL

CCL381- KEYWORD MISSING ON MENU HEADER  You must specify a formal parameter keyword after the procedure name in the procedure header of a menu-generating procedure.  Insert a parameter keyword.  CCL

CCL382- PROMPT ON PROC HEADER IS TOO LARGE  A prompt/description string on your procedure header is greater than 40 / 12-bit display code or 60 8-bit display code characters.  Reduce the size of the prompt string.  CCL

CCL383- MISSING SELECTION ON MENU HEADER  Your procedure header checklist has a null specification.  Specify a checklist selection.  CCL

CCL384- TITLE ON PROC HEADER IS TOO LARGE  A title string on a menu procedure header is greater than 40 / 12-bit display code or 60 8-bit display code characters.  Reduce the size of the title string.  CCL

CCL385- EXPECTING ; AFTER KEYWORD ON HEADER  An equal sign must follow the parameter keyword on your procedure header.  Insert an equal sign after the parameter keyword.  CCL

CCL386- EXPECTING COMMA AFTER HEADER TITLE  A character other than a comma was found following the title on the procedure header.  Place a comma after the title.  CCL

CCL387- BEGINNING OF HEADER CHECKLIST NOT FOUND  Either your procedure header does not contain a checklist or the checklist begins with a special character other than a left parenthesis.  Specify a checklist beginning with a left parenthesis.  CCL

CCL388- EXPECTING INTEGER HEADER SELECTION OPTION  You specified a noninteger selection in your procedure header checklist. A selection must be a 1- to 10-digit integer.  Make all menu selection integers.  CCL

CCL389- EXPECTING , OR ) AFTER CHECKLIST SELECTION  You specified a special character other than comma or right parenthesis after a menu selection on your procedure header.  Replace the special character with a comma or terminate the checklist with a right parenthesis.  CCL

CCL390- EXPECTING , OR ) AFTER HEADER PROMPT  You specified a special character other than comma or right parenthesis after a prompt/description string on your procedure header.  Replace the special character with a comma or terminate the checklist with a right parenthesis.  CCL

CCL391- EXPECTING PERIOD AFTER HEADER CHECKLIST  You specified either no period or a special character other than a period following a procedure header checklist.  Insert a period after the checklist.  CCL

CCL392- TOO MANY HEADER SELECTIONS SPECIFIED  You specified more than 50 menu selections in your procedure header checklist.  Reduce the number of selections.  CCL

CCL393- HEADER SELECTION EXCEEDS 10 CHARACTERS  In your procedure header, a menu selection number contains more than 10 digits.  Use 10 or fewer digits for your selection.  CCL

CCL394- EXPECTING , OR [ AFTER .DIRECTIVE  A character other than a comma [ ] or right parenthesis [ ] was specified with the directive name and its parameters.  Place a comma [ ] or right parenthesis [ ] after the directive name.  CCL

CCL395- EXPECTING INHIBIT CHARACTER - .IC DIRECTIVE  The .IC directive is missing a special character which would replace the current inhibition character.  Specify a special character as a replacement.  CCL

CCL396- EXPECTING CONCATENATION CHARACTER - .CC DIRECTIVE  The .CC directive is missing a special character which would replace the current concatenation character.  Specify a special character as a replacement.  CCL

CCL397- EXPECTING TERMINATOR ON DIRECTIVE  A CCL directive was not terminated by a period or right parenthesis.  Terminate the directive with a period or right parenthesis.  CCL

CCL398- EXPECTING OR/Off .EXPAND DIRECTIVE  The only arguments allowed for .EXPAND are ON and OFF. The argument must be preceded by a comma or left parenthesis and followed by a period or right parenthesis. The argument may be omitted.  Correct the argument or syntax and resubmit.  CCL

CCL399- USE NUMERIC MIN. MAX VALUES IN RANGE  A non-numeric minimum or maximum range was found within a checklist on the procedure header.  Use a numeric minimum or maximum range.  CCL

CCL400- USE CONSECUTIVE PERIODS MIN. MAX IN RANGE  A range was specified on the procedure header without 2 consecutive periods separating the minimum and maximum.  Use consecutive periods to specify a range.  CCL

CCL401- MINIMUM EXCEEDS MAXIMUM IN RANGE  A checklist range on the procedure header has a minimum larger than the maximum.  Change either the minimum or maximum and resubmit the procedure.  CCL

CCL402- *F OR *P RANGE MUST BE .GE. 1 AND .LE. 7  The *F and *P checklist patterns specify a file name, which cannot exceed 7 characters.  Correct range maximum to 7 or less.  CCL

CCL403- *A RANGE MUST BE .GE. 1 AND .LE. 40  The range for the *A checklist pattern was zero or greater than 40.  Correct the *A checklist range.  CCL

CCL404- *SN (SET) OR *SN/M FOR SET ATTRIBUTES  The *S checklist pattern has two forms. The first is *SN{SET} and the second is *SN{M} (described as *SN{n/M} in section 4). The *S specification on the procedure header does not conform to either.  Correct the *S checklist pattern.  CCL

The system will phase out support of this function.

ENQUIRE has been aborted as a result of a system error.

MESSAGE

DUMP FILE MALFUNCTION-EOI ENCOUNTERED.
SIGNIFICANCE
An EOI was encountered before the specified dump file or record was found; the tape has probably been overwitten.
ACTION
Check the contents of the dump tape.
ROUTINE
RECLAIM

DUMP FILE MALFUNCTION-FILE NAME MISMATCH.
SIGNIFICANCE
The specified file name does not match the file name found at the specified position on the dump tape; the tape has probably been overwitten.
ACTION
Check the contents of the dump tape.
ROUTINE
RECLAIM

DUMP FILE MALFUNCTION-POSITION LOST.
SIGNIFICANCE
The PFC for the dumped file is incorrect; either the tape is bad or has been overwitten.
ACTION
Inform site analyst.
ROUTINE
RECLAIM

DUMP FILE MALFUNCTION-UNRECOGNIZABLE PFC.
SIGNIFICANCE
A DUMP or COMPACT was attempted using a mass storage dump file which was attached in some mode other than WRITE mode.
ACTION
Attach the dump file in WRITE mode and retry.
ROUTINE
RECLAIM

DUMP FILE MUST BE IN WRITE MODE
SIGNIFICANCE
A LOAD or COPY was attempted and the mass storage dump file indicated by the data base could not be found. The file may have been purged or may never have been made permanent.
ACTION
Check your options. If they are correct, you may have to load your files from an alternate source. Check with your site analyst.
ROUTINE
RECLAIM

DUMP FILE NOT FOUND
SIGNIFICANCE
An attempt was made to dump a local file with the same name as a RECLAIM scratch file, dump file, INPUT, or OUTPUT.
ACTION
Retry using a different local file name.
ROUTINE
RECLAIM

END DUPLICATE CHARACTER
SIGNIFICANCE
The value you specified in the terminal definition command and conflicts with another terminal definition.
ACTION
Try another value.
ROUTINE
CPP

DUPLICATE FILE NAME.
SIGNIFICANCE
The file specified already exists in the system.
ACTION
Use different name in request.
ROUTINE
LPM

DUPLICATE FILE NAME.
SIGNIFICANCE
A duplicate file name was encountered on a single directive.
ACTION
Correct directive.
ROUTINE
EDIT

DUPLICATE UJN - MUST SPECIFY JSN.
SIGNIFICANCE
Two of your jobs have the same UJN.
ACTION
Specify a JSN instead of (or in addition to) the UJN.
ROUTINE
DROP

DUPLICATE UJN - MUST SPECIFY JSN.
SIGNIFICANCE
More than one job exists with the specified UJN.
ACTION
Check your validation with the LIMITS command.
ROUTINE
CPM

DUPLICATED LINES.
SIGNIFICANCE
Duplicate lines, which would have been printed during a dump operation, were suppressed.
ACTION
Check your options. If they are correct, you may have to load your files from an alternate source. Check with your site analyst.
ROUTINE
RECLAIM

EC NOT VALIDATED.
SIGNIFICANCE
The number of extended memory blocks specified on the JOB command either exceeds what for which you are authorized or exceeds the machine size available to user jobs.
ACTION
Try a different value.
ROUTINE
CPP

EDITING COMPLETE.
SIGNIFICANCE
Library editing is complete.
ACTION
Verify that file contains data and retry.
ROUTINE
PFP

filename EMPTY.
SIGNIFICANCE
The file specified on a SAVE, REPLACE or APPEND contains no data.
ACTION
None.
ROUTINE
PURCALL

EMPTY CATALOG.
SIGNIFICANCE
There are no permanent files in your catalog.
ACTION
Submit a PSR with information on how to duplicate the problem.
ROUTINE
EDIT

EMPTY CATALOG.
SIGNIFICANCE
If the UN parameter was not specified, no files exist in your catalog. If the UN parameter was specified, either no files exist which belong to that user, or you are not permitted to access any of the files belonging to that user.
ACTION
Correct and rereum.
ROUTINE
SORT

EMPTY FILE (SSF).
SIGNIFICANCE
Internal error.
ACTION
Correct and rereum.
ROUTINE
SORT

EMPTY SORT INPUT FILE.
SIGNIFICANCE
Dayfile message indicating that the file specified on the SORT command contains no data.
ACTION
Return the tape via a RETURN, UNLOAD, or EVICT command, or reposition the tape with the LABEL command.
ROUTINE
INT

END EST. mn.
SIGNIFICANCE
The operator ended batch equipment set for nn copies.
ACTION
Ensure that the correct file manipulation operation is specified.
ROUTINE
SFP

END OF SET INCORRECT REQUEST, filename AT ADDRESS.
SIGNIFICANCE
A multiliste set tape is positioned at the end of set after searching for a file set that was not found. Until the tape is returned or repositioned within the multiliste set, all other tape operations on this tape are incorrect.
ACTION
Consult the site analyst to find a different method to obtain the required data.
ROUTINE
ENQUIRE

END OF TAPE, filename AT ADDRESS.
SIGNIFICANCE
The end-of-tape was encountered.
ACTION
Write a PSR and include support materials to allow CDC to duplicate the problem.
ROUTINE
ENQUIRE

- You specified both XD and XT parameters in a command.
- You specified an XD or XT parameter in a command other than CHANGE, DEFINE, or SAVE.
ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

The system did not recognize one or more
parameters.

SIGNIFICANCE

You specified an XD or XT parameter in a
DEFINE or SAVE command without
specifying a PM parameter.

ACTION

Compare the parameters specified with the
command description.

ROUTINE

MFFILES

ERROR IN KRONREF ARGUMENTS.

- The command entered contained an incorrect
  parameter.

The LIBRARY command has an incorrect
argument or the format of the command is
incorrect.

You specified an incorrect file type.

ERROR IN LIBRARY ARGUMENTS.

- Dayfile message indicating that parameters
  other than LIMIT were included on the LIMITS
command.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

The system did not recognize one or more
parameters.

ERROR IN ARGUMENTS.

- One or more of the following command errors
  were detected:

  - More than one date was entered.
  - No options were selected.
  - The parameter was incorrect or could not
    be recognized.
  - The TM option was selected but no data
    was specified.
  - Both the device number parameter and the
    pack name or auxiliary device parameter
    were selected; auxiliary devices do not
    have device numbers.
  - Both the NA and WB parameters were
    specified; select one or the other.

ERROR IN ARGUMENTS.

- The option specified on the BR parameter on
  the DEFINE, CHANGE, or SAVE command is
  incorrect.

ERROR IN BACKUP REQUIREMENT.

- Either the number of arguments was
  incorrect, an incorrect argument was
  specified, or a numeric parameter was
  nonnumeric.

ERROR IN DATE.

- The format of the date (dd, mm, or cc)
  parameter in a PURGALL request was
  incorrect.

ERROR IN DEFAULT CHARGE.

- A default charge number is defined for
  this user, but no default project number
  is defined.

ERROR IN DEVICE NUMBER.

- The file residency as specified by the
  device number parameter was incorrect.

ERROR IN DOCUMENT ARGUMENTS.

- An error was found among the numbers that
  were entered as parameters.

ERROR IN EXPIRATION DATE.

- One of the following occurred:

  - You specified an expiration date
    that is before the current date.
  - You specified a date with the month
    not in the range 1-12 or the day not
    in the range 1-31.
  - You specified an XT parameter
    greater than the maximum allowed.

ERROR IN FCOPY ARGUMENTS.

- The format of the FCOPY command is in error.

ERROR IN FILE CATEGORY.

- The option specified on the CT parameter is
  incorrect.

ERROR IN FILE DATA.

- When the specified file was loaded from
  tape, an error was encountered in the date.

ERROR IN FILE TYPE.

- You specified an incorrect file type.

ERROR IN FILENAME LIST.

- A syntax error was found in the list of
  file names entered using the PFL option.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN汜NAMES LIST.

- A syntax error was found in the list of
  file names entered using the PFL option.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN LIMITS ARGUMENT.

- You specified an XD or XT parameter in a
  DEFINE or SAVE command without
  specifying a PM parameter.

ERROR IN LIBRARY ARGUMENTS.

- The LIBRARY command has an incorrect
  argument or the format of the command is
  incorrect.

ERROR IN LIMITS ARGUMENT.

FIP - CONNECTION BROKEN ON ACN acn.
The network connection has been broken unexpectedly. The system has halted the file transfer.

acn Application connection number (octal)

FIP - CONVERT MODE N/A FOR filename.
The application timed out waiting for resources to become available.

filename The affected file

FIP - DISABLE WARNING RECEIVED.
The system has halted the file transfer because the network is shutting down immediately.

FIP - GT 4 FILE TRANSFERS INITIATED.
The system is attempting too many file transfers simultaneously. The system has not initiated the file transfer you are requesting.

FIP - INITIATING XFR OF filename.
The system has initiated the transfer of file filename.

An internal error occurred during your file transfer. The file transfer was not completed successfully.

FIP - NETOFF DURING FILE TRANSFER.
NETXFR aborted the application after finding all internal tables in use.

FIP - NETXFR ERROR, INVALID cmd. xxx FOR COMMAND yy.
NETXFR aborted the application after finding a faulty internal attribute value.

xxxx Attribute value (hexadecimal) yy Associated command value (decimal)

FIP - NETXFR ERROR, BAD INTERNAL TRANSFER STATE: xxb.
NETXFR detected an internal fault and aborted the application.

xx Internal transfer state (octal)

FIP - NETXFR ERROR, BAD PARAMETER DD: xxb.
NETXFR detected a faulty DD parameter in the application's NETXFR call and aborted the application.

xx DD parameter value (octal)

FIP - filename ON INVALID DEVICE.
File filename is assigned to an inaccessible device. The system has halted the file transfer.

filename File being transferred

FIP - OUTPUT BLOCK NOT DEL ON ACN acn.
The remote system did not receive the network message or data block before the time-out period elapsed. The system has halted the file transfer.

acn Application connection number (octal)

FIP - PREMATURE TERMINATION RCVD ON ACN acn.
The system detected an error during a file transfer and halted the file transfer.

acn Application connection number (octal)

FIP - PROTOCOL ERROR DETECTED.
An unrecognized or unexpected network message has been received. The file transfer is no longer possible.

FIP - RHF I/O ERROR xxb ON filename. reason
NETXFR has terminated file transfer because of a fault while reading or writing file data to or from the network.

filename The affected file

xx RHF I/O error code (octal) [Refer to the Remote Host Facility Access Method Reference Manual for the descriptions of the error codes.]

reason Abbreviated error description:

- BLOCK NOT 80-BIT MULTIPLE
- BLOCK LENGTH MISMATCH
- CONTROL WORD FORMAT ERROR
- HOST ABN MISMATCH
- INVALID PARTIAL BLOCK
- LAST BLOCK TOO BIG
- NETWORK ABN MISMATCH
- RHF FET PARAMETER ERROR
- UNKNOWN BLOCK ERROR

FIP - SECOND FILE XFR ON ACN acn.
The system attempted a file transfer on a connection that already has a file transfer in progress. The system halted the second file transfer.

acn Application connection number (octal)

FOLLOW UP:
- Retr y your job. Inform site analyst.
- Try again. If problem persists, inform site analyst.
- Ret r y the file transfer after the network is reactivated.

INCORRECT ARGUMENT.  |
INCORRECT ARGUMENT VALUE.  |
INCORRECT CHARACTER.  |
INCORRECT CHARACTER NUMBER.  |

SIGNIFICANCE  |
---|---|---
Your validated job I/O limits have been exceeded during the current RECLAIM session.  |
You attempted to load an overlay from an execute-only file, but your main overlay was not loaded from the same file.  |
Action was requested on a local file that was busy.  |
You attempted to perform a function on a local file before another function on the same file was complete.  |
The system is waiting for you to enter a command.  |
The value specified with the PW command option is not numeric.  |
You specified an invalid value in the terminal definition command and.  |
You did not specify the correct file accessibility on the LABEL command or macro, or volume accessibility was set and you attempted to assign the tape as unlabeled from a non-system origin job.  |
You have entered an incorrect family name, user name, or password during login.  |
You entered incorrect or insufficient validation information.  |
A CHARGE command is required to continue.  |
You have specified a level outside of the equipment access level limits.  |
On a SETFAL, SETJAL, SETFAC, or SETFAL command, you specified an incorrect argument other than access level or access category.  |
A directive keyword was equated to an incorrect value such as a file name longer than seven characters or an alphabetic character in a numeric string.  |
Incorrect character read from 8-track tape. If a 1 is detected in bit 7 of a translated character, the character is incorrect. The data file message STATUS ERROR, filename AT address precedes this message and specifies the file [filename] and the address.  |
In a copy request, one of the following was detected:  
* Last character position was less than first character position.  
* Last character position was greater than 100.  
* Either first character position or last character position was unrecognizable.  |

ACTION  |
---|---|---
Log in and retry the operation. If it fails again, check your validated I/O limits for tape mounts to ensure that you have not exceeded your limits.  |
Do not attempt to load overlays from an execute-only file if the main overlay was not loaded from the same file.  |
Write a PSR.  |
Modify program to wait until each function is complete before attempting another.  |
Enter a command.  |
Correct the parameter and retry.  |
Obtain accurate login information before attempting to log in. Inform site analyst if problem persists.  |
Choose a valid value (refer to appendix J).  |
Ensure accuracy of request.  |
Check parameters and retry.  |
Verify that the USER command precedes rest of job (followed by CHARGE, if required) and is the first command after the Job command.  |
Enter a CHARGE command.  |
Contact site personnel and write a PSR.  |
Use access level within required equipment's access level limits or use equipment with access level required.  |
Request the command with correct arguments.  |
Verify the following:  
* Tape contains coded data rather than binary.  
  If binary, use binary copy operation.  
* Tape is ASCII rather than EBCDIC.  
  If EBCDIC, specify CV* in LABEL command.  
* Tape is 7-bit rather than 8-bit ASCII.  
  If 8-bit, use FCOPY to convert to 7-bit.  
If all the above are verified (that is, tape is 7-bit ASCII), notify site analyst.  |
Ensure accuracy of command parameters.  |

MESSAGE

ITF, RHF NETWORK SHUTDOWN.
The subsystem is terminating immediately.
All connections are aborted.

ITF, Termnn, TERMINAL CONNECTION ABORTED BY HOST pid.
Message indicates state of terminal connection.

ITF, Termnn, TERMINAL CONNECTION ABORTED TO HOST pid.
Message indicates state of terminal connection.

ITF, Termnn, TERMINAL CONNECTION ENDED BY HOST pid.
Message indicates state of terminal connection.

ITF, Termnn, TERMINAL CONNECTION ENDED TO HOST pid.
Message indicates state of terminal connection.

ITF, TERMINAL TIMEOUT.
Terminal inactivity forced disconnection.

ITF, TERMINAL WILL DISCONNECT IN ONE MINUTE.
Due to lack of activity, your terminal will be disconnected.

ITF, WAITING FOR HOST pid TO RESPOND.
Message indicates state of connection to host pid.

IX OR OX NOT DEFINED.
The IX or OX parameter was not specified in conjunction with the R input parameter on an L072 command.

JOB ACTIVE.
The system is unable to process the command because the previous command has not completed.

JOB ALREADY WAITING ON SERVICE CLASS.
Change cannot be made because the job is already waiting for a CLASS command in the job to complete.

JOB CANNOT ACCESS FILE.
The permanent file being processed has either an access level or access category that is not valid for your job.

JOB COMMAND ERROR.(jobname)
The job command of a routed job contains an error.

JOB COMMAND ERROR.
The job command on the file being submitted is in error.

JOB DROP IN PROCESS.
You have issued a DROP,J request which is being processed.

JOB HUNG IN AUTO RECALL.
System error.

JOB HUNG IN AUTORECALL.
System detected an autorecall call to an incomplete word and there was no activity to make the word complete.

JOB IN NORERUN STATE ON RECOVERY.

or

JOB IN NO RERUN STATE ON RECOVERY.
Identifies a job recovered on level 0 or level 3 deadstart that was aborted because it was in a norerun mode (due to NORERUN command or macro).

JOB NOT DETACHED.
Condition encountered during terminal job recovery attempt. The job specified is not associated with a job.

JOB NOT FOUND.
Condition encountered during terminal job recovery attempt.

JOB NOT RECOVERABLE.
Condition encountered during terminal job recovery attempt.

JOB NOT RERUN.
The system was unable to successfully rerun a job because of a mass storage read error or because the OPT is full.

JOB NOT SYSTEM ORIGIN.
The job must be of system origin type.

JOB NOT VALID ON REMOTE MAINFRAME.
A batch job was entered from a card reader or routed from another mainframe with an ST parameter on the job command, but the job could not run on the specified remote mainframe.

JOB NOT VALIDATED TO USE LINK.
A batch job was entered from a card reader or routed from another mainframe with an ST parameter on the job command, but the job could not run on the specified remote mainframe because the specified user name was not validated to transfer queue files.

JOB REPRIEVED.
The job has been successfully reprieved.

JOB REJRN.
The job has been terminated and requested for input.

SIGNIFICANCE

None.

ACTION

Check the description of the L072 command in section 3.

Retry when current operation is complete.

Wait and retry later.

None. Your job cannot access the file.

Correct the Job command and retry.

Compare the Job command in error with the Job command description in section T. Also check your validation limits.

Wait for the user prompt. HELLO?

Inform site analyst.

Correct the program to issue a correct recall request.

Refer to the NORERUN command or macro description.

Retry command.

Retry command.

Retry command.

Resubmit the job to the system.

None.

Contact site personnel concerning your validations.

Contact site personnel concerning your validations.

LOST 7000 COMMUNICATIONS.
LSTLID COMPLETE.
LSTLID ERROR.
MASS STORAGE DIRECTORY NOT WRITTEN.
MASS STORAGE ERROR.
MASS STORAGE LIMIT.
MAXIMUM FL ENCOUNTERED - JOB LIST INCOMPLETE.

SIGNIFICANCE
An incorrect list option was specified for the *LO* parameter in the LIBEDIT command. A fatal error occurred while processing the LISTLD command. Informative message indicating that the LISTLD operation has finished. An incorrect argument was specified. *$If-explanatory.* 1AJ could not find BEGIN or LDR. The file could not be attached because a local file already exists with the name xxxxxxx. The job tried to create too many local files. Your ATTACH, GET, or OLD request cannot be processed, because you already have the maximum number of local files. DDD cannot assign a PP to process an entry at this time. Communications between NOS and the SCOPE 2 system have been temporarily lost. Informative message indicating that the program has completed processing. The longitudinal redundancy check character was read incorrectly (9-track NRZI). The dayfile message STATUS ERROR, filename AT address precedes this message and specifies the file (filename) and the address. The magnetic tape executive is not executing. One of the following occurred during a magnetic tape request: - There was no UDT address in the FST. - The UDT address in the FST was incorrect. - The MAG subsystem was not present. Prompt requesting the ID of the SCOPE 2 mainframe you want to access. The mainframe you requested is not available. The mainframe you specified is not currently available. Some or all of the previous good blocks used to create the recovery block ID window cannot be read with error correction enabled during repositioning of the tape for write recovery. The tape is marginal and will possibly fail on a read. The job will terminate to prevent the possibility of bad data in the library. On a CRT command, you have requested that a mass storage directory record be written on a nonmass storage file. An error was encountered in reading a portion of the permanent file catalog or permit information (error log and dayfile message). This indicates a hardware problem with a disk pack or disk drive. Job was terminated without exit processing. You have exceeded your mass storage validation limits. The system has found too many recoverable jobs.

ACTION
Change the *LO* parameter to specify only valid options. Refer to dayfile for cause of problem. None. Correct and retry. Correct parameter and retry. Contact your site Support or CYBER Software Support. Use a different name in the request or return the local file. Reduce local file usage. Erase command and retry. Inform site analyst if the problem persists. Enter a RESUME directive to attempt recovery. None. Retry or inform site analyst. Inform site operator. Bring up MAGNET. Contact site operator to have MAGNET brought up. Otherwise, contact CYBER Software Support. Enter a valid SCOPE 2 mainframe ID. Enter an alternate mainframe ID or type END to terminate the HELLO? session. Enter a QUEUE? ID command to list PIDs currently active. Then reenter the command with an active mainframe PID. Clean the tape drive. Make the tape cleaned and certified or use a new tape. Ensure that file resides on mass storage. Inform site analyst. If many of these errors occur, the site analyst should perform a full PPSTOP, total INITIALIZE, and full PLOAD on the device. Resubmit job. Return all unneeded files and try again. If the message occurs again, your validation limit is too low to allow the operation you are attempting. Proceed as normal or wait for other jobs to time out and try again.

SIGNIFICANCE
Insufficient field length has been specified for KRONREF to execute.
The number of messages issued by the job has exceeded the limit for which you are authorized. Message functions issued by compilers, applications, or messages that run in the job's field length are also counted as job day file messages and thus are subject to your dayfile message limit.
To use extended memory, you must have a required minimum amount of central memory field length. This message indicates that you do not have the required central memory field length.
MFLINK request was less than CONTROL'S RFL value. CONTROL'S RFL value is used for this MFL request, thus allowing further MFL requests.
The connection with the remote host was broken by the network or remote host.
The remote host did not respond in the allotted time.
The operator has disabled PTF for the network subsystem (RHF or NAM).
The file filename does not have read permission. The file type is not supported by MFLINK or the file does not exist.
The file filename does not have write permission or the file type is not supported by MFLINK.
Informative message. You are being connected to the remote host you specified.
The continuation block did not follow.
The network subsystem (RHF or NAM) detected a logic error in communication.
The remote host has sent a break with reason code rc.
MFLINK was unable to transmit a block after a system-defined number of attempts. Each attempt was rejected by the network subsystem (RHF or NAM).
The remote host has requested that the host retransmit the file.
No mainframe in the network has the specified logical identifier (LID), or the LID specified contains an illegal character or is not three characters long.
Your user name does not have the required validation to access the remote mainframe.
The system received an invalid command [cmd] from the remote host or received a command out of sequence.
You specified an incorrect parameter or value on the MFLINK command.
You specified an incorrect DO/ddd parameter on the MFLINK command.
You specified an incorrect lidd=file parameter on the MFLINK command.
The file name you specified on the MFLINK command is incorrect.
The file you attempted to transfer to a remote host does not have a local file type.
The remote host or the network sent an incorrect or unsupported supervisory message.
The network subsystem (RHF or NAM) is unable to complete the connection to the remote host.

ACTION
Increase field length with MFL command and retry.
Split job into two or more jobs and retry.
Increase central memory field length.
Check the description of field length control in section 3.
Inform site analyst. MFLINK retries until EP specified.
Contact site operator. MFLINK retries unless AT specified.
Correct and resubmit.
None.
Inform remote analyst.
Inform site analyst.
Inform site analyst.
Inform site analyst.
Inform site analyst.
Use the LISTLID command to select the proper LID.
Contact your site administrator to get the authorization.
Inform site analyst.
Correct the MFLINK command and retry.
Correct the MFLINK command and retry.
Correct the MFLINK command and retry.
Ensure that the file has the correct type and retry.
Inform site analyst.
Contact site operator. MFLINK retries unless AT specified.

### SIGNIFICANCE

Refer to the READ ID BURST FAILURE message.

Refer to the WRITE ID BURST FAILURE message.

Refer to the BLOCK TOO LARGE message.

Unit was still busy after one second.

Refer to the CHANNEL MALFUNCTION message.

Connect reject; unable to connect to unit. Unit turned off.

Refer to the ERASE LIMIT message.

Function ffff was rejected by the controller; yyyy is the address in INT where the function was initiated.

The length (babbbb) and block number (nnnnn) read from trailer bytes in block did not match the actual length or the block number read given in previous message line.

Load sequence failed on the unit. LCH identifies LOAD CHECK.

Indicates controller failure. Channel has been logically turned off and maintenance is required. MDW identifies MARGINAL DOWN.

Unit has been logically turned off because of read/write failure. This occurred when a special function to check the read/write path to a unit failed during initial label scan. Maintenance is required. MDW identifies MARGINAL OFF.

Refer to the MARGINALY WRITTEN TAPE message.

A noise block was skipped on the tape. NBE identifies NOISE.

No end-of-operation detected from unit within 1 second.

Tape unit dropped ready status.

Refer to the WRONG PARITY message.

Error was corrected as the data was read. OPF identifies ON THE FLY.

Refer to the POSITION LOST message.

Refer to the REPOSITION CORRECTED ERROR message.

Previously reported error has been successfully recovered. REC identifies RECOVERED.

Single block misposition error occurred during tape positioning backward. This message is informative and the error is not fatal. SGE identifies BID RECOVERY-B.

Single block misposition error occurred during tape positioning forward. This message is informative and the error is not fatal. SGE identifies BID RECOVERY-B.

Error type cannot be determined so actual controller status is returned. STE identifies STATUS.

Refer to the TAPE CLEANER FAULT message.

Refer to the WRITE TAPE MARK FAILURE message.

Refer to the WRITE VERIFY FAILURE message.

Refer to the separate listing of the last line message [MT....,typ.].

MESSAGE

**uwn NOT FOUND.**
The system could not find a file with the specified user job name (uwn).

**JSN NOT FOUND.**
The system could not find the job with the specified JSN.

**uwn NOT FOUND.**
The system could not find the job with the specified uwn.

**XXX NOT IN PP LIB.**
Dayfile message indicating that PP package XXX was not found in PP libraries.

**XXX NOT IN PP LIB. CALLED BY yyy.**
Dayfile message indicating that PP package XXX, which was called by package yyy, was not found in the PP libraries.

**NOT MULTI-MAINFRAME ENVIRONMENT**
The user called QUEUE in a non-Multi-mainframe environment.

**filename NOT ON MASS STORAGE.**
The file to be saved is not on mass storage; the first track of the file is not recognisable.

**filename NOT ON MASS STORAGE.**
Filename was not processed because it could not be found on mass storage.

**JSN NOT RECOVERABLE - SECURITY CONFLICT.**
The specified job had a higher access level than the current job, and therefore could not be recovered by the current job.

**NOT VALID TO DOWNGRADE DATA.**
You attempted to lower the access level of a permanent file, but you are not validated to downgrade files.

**NOT VALIDATED FOR REQUESTED ACCESS LEVEL.**
User has specified an access level outside the user's access level validation.

**NOT VALIDATED FOR WRITING UNLABELED TAPES.**
User has not been validated for writing on unlabeled tapes.

**NOT VALIDATED TO SET XD/XT.**
You specified an XD or XT parameter in a CHANGE, DEFINE or PERMIT command or macro without having validation to use these parameters.

**NOTICE *** DATA READ ERROR.**
Read error caused loss of words in the dayfile.

**NT test, ASSIGNED TO filename, VSNN*vsn.**
See NT test, ASSIGNED TO filename, VSNN*vsn.

**NT DENSITY CONFLICT.**
8-track tape unit specified by EST ordinal on ASSIGN command does not support the required density.

**NT DRIVE CONFLICT.**
One of the following occurred:
- 8-track tape unit specified by EST ordinal on ASSIGN command does not support the required density.
- Increased resource demands (RESOURC command) cannot be satisfied due to conflicts with currently assigned resources (job would deadlock itself).

**nnnnn OF tttttt FILES PURGED.**
Out of a total of tttttt files in your permanent file catalog, nnnnn files were purged.

**OFFSW, x FROM JOB jsn**
An OFFSW command was issued to the job by the job jsn. x represents the sense switches that have been turned off.

**OFFSW, x FROM OPERATOR**
An OFFSW command was issued to the job by the console operator. x represents the sense switches that have been turned off.

**OLD MASTER FILE EMPTY OR MISPOSITIONED**
None of the replacement file records were copied to the new file.

**ONLY CORRECT PARAMETERS ARE *ON* OR *OFF*.

</tr>
</tbody>
</table>
PTFS - CHARGE RESTRICTED TO DEFAULT.

Both ring enforcement options (PO+R and PO+D) or more than one first option (PO+I, PO+I, PO+P, and PO+D) has been specified. This message can also occur if PO+I or PO+P is specified for an 1- or 81-binary format tape.

PTFS - APPLICATION CONNECTION TIMEOUT.

The processing options PO+R and PO+D are allowed only on a COPY command copying from mass storage or an 1- or 81-binary format tape to an 8 or 1 format tape. The processing option PO+T is allowed on a COPY command that generates an E or B format tape.

PROCESSOR DETECTED MALFUNCTION.

A hardware error (error code=20) such as a data or address parity error, an odd bit error has occurred.

PROCESSOR STATE ERROR.

An error (E, S, or B) occurred. Either CPU state error or software error resulting in a hardware error, occurred.

PROGRAM FILE EMPTY.

A load of an empty file was attempted.

PROGRAM STOP.

The system processed a program step [00] instruction.

PROGRAM STOP AT ADDRESS.

The monitor detected a program step instruction at the specified address.

PROJECT EPILOGUE NOT FOUND.

The project prologue defined for your charge and project numbers could not be found.

PROJECT NUMBER EXPIRED.

The local file ZZZZPRL was returned prior to the time that it was needed.

PROJECT PROLOGUE FILE NOT LOCAL.

The local file ZZZZPRP was returned prior to the time that it was needed.

PROJECT PROLOGUE NOT FOUND.

The project file defined for your charge and project numbers could not be found.

PROLOGUE AND SHELL CONFLICT.

A shell program with the no-abort option set was active at the time you attempted to specify charge and project numbers which had a prologue defined.

PRU LIMIT.

The job's mass storage PRU limit was exceeded during preparation of a local copy or an indirect access file.

PRU LIMIT.

The specified queue file could not be attached to your job, because you have used too much local file space.

PRU LIMIT, FILE filename AT address.

The job's mass storage PRU limit was exceeded during an attempt to write or extend this file.

PRUS REQUESTED UNAVAILABLE.

On a DEFINE, no device currently has available the amount of space requested by the S parameter. On a secured system, no device with the proper access level currently has the amount of space requested.

PTFS - APPLICATION CONNECTION TIMEOUT.

The remote host did not respond in the allotted time.

PTFS - CHARGE REQUIRED.

You must specify a CHARGE directive and you did not do so.

PTFS - CHARGE RESTRICTED TO DEFAULT.

On a CHARGE command, you specified a charge and project number which was not the default that you were validated for and your validation restricts you to that default.

PTFS - DEFAULT CHARGE IS NULL.

The default charge number for the current user name is undefined and a charge is required.

PTFS - DIRECTIVE TOO LONG.

Your directive is too long. A directive cannot exceed 80 characters.

Either one or both of the following occurred on a SAVE or a DEFINE directive on a MLP LINK command:
- You specified both ED and XP parameters.
- You specified an ED or XP parameter without specifying a PW parameter.

MESSAGE

OTF[S], '-n' qfn CONNECTION ESTABLISHED.
Indicates state of connection to remote host partner.

OTF[S], '-n' qfn CONNECTION TIMED OUT.
Remote host partner did not respond within the allowed time span. Transfer will be retried.

OTF[S], '-n' qfn CONNECTION TO pid ABORTED.
Indicates state of connection to remote host partner.

OTF[S], '-n' qfn CONNECTION TO pid ENDED.
Indicates state of connection to remote host partner.

OTF[S], COUNTER OF ACTIVE CONNECTIONS DECREMENTED BELOW ZERO.
The application received a disconnect but had no paths active.

OTF[S], '-n' qfn ERROR IN FILE TRANSFER.
Transfer of file qfn was unsuccessful.

OTF[S], '-n' qfn FC/BRK RECEIVED.
The remote host partner broke the network connection. Usual cause is detection of an unrecoverable protocol anomaly.

OTF[S], '-n' qfn FC/NAK RETRY COUNT EXCEEDED.
The subsystem was unable to deliver a network message.

OTF[S], '-n' qfn FIRST KEYWORD IS NOT 'ROUTE'.
The IFQQUEUE routing directive must begin with the keyword 'ROUTE'.

OTF[S], '-n' qfn INCORRECT EC FOR THIS QUEUE TYPE.
The external characteristic (EC) value specified on an IFQQUEUE routing directive does not match the disposition code of the file.

OTF[S], '-n' qfn INCORRECT VALUE (xxx).
You specified an incorrect keyword xxx on an IFQQUEUE routing directive.

OTF[S], '-n' qfn INCORRECT VALUE (xxx=yyy).
You specified an incorrect value yyy for keyword xxx on an IFQQUEUE routing directive.

OTF[S], '-n' qfn INVALID ATTRIBUTE IGNORED.
OTFS received a network message from the remote host OTF with an unrecognized parameter. Transfer may continue.

OTF[S], '-n' qfn INVALID SEQUENCE RECEIVED.
A network message from the remote host partner was received that was not in sequence.

OTF[S], JOB ORIGIN ERROR.
OTF or OTFS was improperly initiated by user command.

OTF[S], '-n' qfn MESSAGE FROM REMOTE HOST - OTF[S], '-n' qfn xxx.
xxx is the text of a message received from the remote host partner.

OTF[S], '-n' qfn NETWORK BLOCKS OUT OF SEQUENCE.
A network message from the remote host partner was received that was not in sequence.

An unexpected reason code was received.

(CONTACT SITE ANALYST).

An unexpected reason code was received.

PROTOCOL ERROR.
The remote host partner detected a protocol anomaly.

TIME-OUT MATURED.
The remote host partner did not receive message within the allowed time span.

SEND PROBLEMS.
Unspecified problems were encountered on the sending (OTF) side.

RECEIVER PROBLEMS.
Unspecified problems were encountered on the receiving (OTFS) side.

FILE SIZE TOO BIG.
The file is too large to be accommodated on the remote host or not enough space was preallocated.

INVALID USERNAME/ACCOUNT.
An invalid or missing account or username was detected by the remote host partner.
MESSAGE

UNSPECIFIC TRANSFER
Insufficient information was received by the remote host partner to allow the transfer to continue.

QUEUE TYPE UNAVAILABLE.
The disposition code requested on the ROUTE command or RQUEUE routing directive could not be processed on the remote host. For example, a print file was attempted to be transferred to a CYBER 200 remote host.

UNACCEPTABLE ATTRIBUTES.
An invalid attribute value was received by the remote host partner.

OTF(S), -n- qfn UNKNOWN PI= PARAMETER, DEFAULT USED.
The remote NOS 2 system received a print file with an unknown PI [print-image] parameter. The file will be printed using the default PI parameter.

n OTF connection number
qfn Queued file name

OTF(S), -n- qfn UNKNOWN STATE-OF-TRANSFER SENT BY REMOTE HOST.
OTF(S), -n- qfn REASON CODE + nnnnnn - [CONTACT SITE ANALYST].
An unrecognized value, nnnnnn, for the state-of-transfer attribute was received on a network message from the remote host partner.

n OTF connection number
qfn Queued file name

OTF(S), -n- qfn UNRECOGNIZED COMMAND RECEIVED xx.
The command sent by the remote host partner is not recognized.

n OTF connection number
qfn Queued file name
xx Command number received

OTF(S), -n- qfn UNRECOGNIZED MESSAGE RECEIVED.
The network message received from the subsystem is not recognized.

n OTF connection number
qfn Queued file name

QUEUE LIMITS EXCEEDED ON REMOTE MAINFRAME.
A batch job was entered from a card reader or routed from another mainframe with an ST parameter on the job command, but the job could not run on the specified remote mainframe because the user had too many jobs active on that mainframe already.

QUEUE? ARGUMENT ERROR
You entered the QUEUE? command incorrectly.

RANDOM INDEX ERROR.
The random disk address of the permit sector is in error (error log and dayfile message). This may be a problem with your program.

READ AFTER WRITE, filename AT address.
You attempted to read a tape on which the last operation was a write.

READ FILE BUSY - filename

READ FILE EMPTY.
The read file is found to be busy (direct access file only).

READ ID BURST FAILURE, filename AT address.
This message occurs if either of the following is true:
• The tape is assigned to a control point in PE (1800 cpi) mode and the drive is unable to read the ID burst at load point.
• The tape is assigned to a control point in CE (2250 cpi) mode and one of the following has occurred:
  • The drive is unable to read the ID burst at load point.
  • The drive is unable to get the automatic gain control using the automatic read amplitude [ARA] burst.

READY.
The system is ready to process the next command. This message is not issued in the BATCH subsystem.

READY DROP, filename AT address.
Unit dropped ready status.

RECLAIM ABORTED.
RECLAIM has been aborted due to an error or user intervention.

SIGNIFICANCE

ACTION

RETRY APPLICATION SWITCH.

An attempt to switch applications failed due to software error.

RESEX FAILURE.

You entered the interrupt or terminate sequence. The system performs appropriate cleanup procedures before termination.

RESERVED FILE NAME.

A parameter which is supposed to be numeric contains a nonnumeric character.

RESERVED FILE NAME.

Read or destination file name matches an internal scratch file (ZZZ22260-ZZZ22261).

RESOURCE DEMAND ERROR.

You attempted to decrease the number of scheduled units to less than the number of currently assigned units or increase the number of scheduled units to a point where a deadlock would occur.

RESOURCE DEMAND ERROR.

You specified an incorrect resource type.

RESOURCE DEMAND ERROR.

You attempted to decrease the number of scheduled units to less than the number of currently assigned units or increase the number of scheduled units to a point where a deadlock would occur.

RESOURCE ENVIRONMENT ERROR.

System error.

RESOURCE ENVIRONMENT ERROR.

The resource executive (RESEX) has detected a fatal error.

RESEX ABORT - OPERATOR TERMINATION.

The operator entered a STOP, KILL or RESTART command. The system performed appropriate cleanup procedures before termination.

RESEX ABORT - OPERATOR TERMINATION.

You entered the interrupt or terminate sequence. The system performs appropriate cleanup procedures before termination.

RESEX ABORT - TERMINAL INTERRUPT.

You entered the interrupt or terminate sequence. The system performs appropriate cleanup procedures before termination.

RESEX NUMERIC PARAM ERROR.

A parameter which is supposed to be numeric contains a nonnumeric character.

REQUIRED PL EXCEEDS VALIDATED LIMIT.

The job requires more field length than you are authorized to have.

RECOVERY DUMP FILE.

RECLAIM is requesting the dump file specified by the TN or OK option. RECLAIM will try to read it and rebuild the database entries for this dump file.

RESOURCE DEMAND ERROR.

You attempted to decrease the number of scheduled units to less than the number of currently assigned units or increase the number of scheduled units to a point where a deadlock would occur.

RESOURCE DEMAND ERROR.

You specified an incorrect resource type.

RESOURCE SCRATCH FILE ERROR.

An empty entry has been found in the overcommitment algorithm scratch file.

RESOURCE STRING.

A string is too long to be handled.

RESERVED FILE NAME.

A parameter which is supposed to be numeric contains a nonnumeric character.

REQUIRED PL EXCEEDS VALIDATED LIMIT.

The job requires more field length than you are authorized to have.

RETRY APPLICATION SWITCH.

An attempt to switch applications failed due to software error.

RESEX ABORT - SYSTEM RESOURCE LIMIT.

The job terminated prematurely due to job time limit, SBU limit, or track limit. The system performs appropriate cleanup procedures before termination.

RESEX ABORT - SYSTEM RESOURCE LIMIT.

The operator entered a STOP, KILL or RESTART command. The system performed appropriate cleanup procedures before termination.

REQUIRED PL EXCEEDS VALIDATED LIMIT.

The job requires more field length than you are authorized to have.

RESERVED FILE NAME.

A parameter which is supposed to be numeric contains a nonnumeric character.

REQUIRED PL EXCEEDS VALIDATED LIMIT.

The job requires more field length than you are authorized to have.

SIGNIFICANCE

The application with job name or job sequence name jobn requested an RHF function before requesting a NETON to RHF. RHF aborts the application.

Two NETON requests were made for the same application without an intervening NETOFF request. RHF aborts the application.

An application issued an invalid RHF call. The call may contain an incorrect RHF function, a request (other than NETON) from an application with an end-of-job connect status, or an incorrect word count in the RHF call. RHF aborts the application.

An application issued a NETON request using an application name that was not in RHF's configuration or that contained incorrect characters. RHF aborts the application.

In an RHF call, an application used an incorrect application table address. The address may be out of range or may point to another application table. RHF aborts the application.

An application is not validated to do a NETON request. RHF aborts the application.

An application exceeded the maximum number of supervisory messages that are queued in RHF. RHF aborts the application.

Format of the command is incorrect.

A ROUTE command with DC*EC specified has successfully removed a file from a queue.

A ROUTE command placed a job or file in a queue. The routed job or file has the job sequence name jobn.

You specified a DC/EC combination that is not valid.

The D0/id parameter on the ROUTE command has an incorrect format.

You specified an incorrect external characteristics code on the ROUTE command.

You specified an incorrect internal characteristics code on the ROUTE command.

You specified a JSN which was not exactly three characters long.

Command contains a duplicate or incorrect keyword.

A system table contains an incorrect value for the job's origin type.

The SCxW parameter on the ROUTE command specified a spacing code greater than 770.

ACTION

None.

Remove the second NETON request or add the missing NETOFF request.

Correct error in application and retry.

Correct name in the application NETON call or add the application name to RHF's configuration.

Correct error in application.

Inform site analyst.

Inform site analyst.

Inform site analyst.

Modify the application to issue more frequent NETOFFs for the supervisory messages queued in RHF.

Check the ROUTE command format in section 9.

None.

None.

If the EC parameter implies a print or punch disposition, the EC parameter must correspond.

Correct the format of your D0/id specification.

Correctly specify the EC*EC parameter on the ROUTE command.

Check the command format and reenter command.

Correctly specify the EC*EC parameter on the ROUTE command.

Specify a three-character JSN.

Check the ROUTE command format in section 9.

Write a PSR and include support materials to allow CDC to duplicate the problem.

Correct the spacing code specified on the ROUTE command.

USER PROLOGUE NOT FOUND. | Although a user prologue was defined, it could not be accessed. | The user should either delete the prologue definition or create a prologue file. | VALEX
USER PROLOGUE NOT FOUND. | The prologue file defined for your user name could not be found. | Recreate your user prologue file. | VALEX
USER RETRY LIMIT. | Four unsuccessful attempts at login were made after which the terminal was disconnected from the system. | Obtain accurate login information before attempting to log in. Inform site analyst if problem persists. | NETVAL
USER SECURITY COUNT EXHAUSTED. | The security count for the user name specified has been decremented to zero. You are denied all access to the operating system until the operator resets your security count. | Contact site personnel to reestablish access. | CPM
USER SECURITY COUNT EXHAUSTED. | A batch job was entered from a card reader or routed from another mainframe which could not execute because the user security count for the specified user name had been exhausted. | Contact site personnel concerning your user security count. | IAJ
USER VALIDATION ERROR. | You are not validated for this subsystem. | Try a different subsystem or contact your site administrator to get validated for the desired subsystem. | IAPEX
USER VALIDATION LIMIT EXCEEDED. | A validation limit has been reached for a job step or account block. The limit is either a time limit or an SRU limit. | If appropriate, have site administrator increase validation limits. | IAPEX
VALIDATION FILE BUSY - TRY AGAIN LATER | The validation routine [MODVAL] was unable to access the validation file to perform the requested UPRC, PASSWORD, or CHVAL operation. | Try again later. | MODVAL
end VALUE INAPPROPRIATE | The value you specified in the terminal definition command end is not appropriate for your terminal. | Choose an appropriate value (refer to appendix J). | CCP
VE ENTRY REQUIRED | A level 0 deadlock is required to add or change a CRNDECK VE entry. | Level 0 deadlock is required. | REC
VERIFICATION ERROR. PASSWORD NOT CHANGED. | Password was entered incorrectly when verification of the new password was requested. | Retype PASSWORD with the correct password. | MODVAL
VERIFY ARGUMENT ERROR. | One or more of the parameters specified in a VERIFY was not recognized. | Compare the parameters specified with the command description. | VERIFY
VERIFY ERRORS. | Verification errors were encountered during comparison of data/records/files. | Check output file for errors. | VERIFY
VERIFY FILE NAME CONFLICT - filename. | Either you tried to process the file having the same name or you specified a reserved file name. | Correct the command so all files have a unique name. | VERIFY
VERIFY FL ABOVE USER LIMIT. | Field length for L or F tape verify exceeds your current maximum. | Use MPL to increase maximum field length or reduce block size on L or F tapes. | VERIFY
VERIFY GOOD. | Verify completed with no errors found. | None. | RESEX
VSN FILE ERROR. | System error (VSN file entry does not match job identification). | Reenter the command or rerun the job. If the problem reoccurs, inform your site analyst or contact CYBER Software Support. | RESEX
WAIT | The system is waiting for system resources to become available. | None. | IAPEX
WAIT. | The network is unable to accept any further data from your terminal. Data that was entered is discarded. This is normally a temporary situation caused by buffer shortages in the host or the network. | Wait for the REPEAT. message. | CCP
pfn WAITING ALTERNATE STORAGE EXEC. | The file must be staged from alternate storage to disk and the alternate storage executive is not currently available to perform the stage operation. | Wait for executive to become available or terminate RECLAIM processing. | PFM
WAITING FOR DATABASE NON-BUSY. | The specified database is busy (for example, it may be attached in write mode to another job). RECLAIM continues to attempt to attach the file at ten second intervals until the file becomes available or you interrupt RECLAIM. | Wait for the specified database to become available or terminate RECLAIM processing. | RECLAIM
WAITING FOR DOWN TAPE UNIT. | The job is waiting for a DOWN tape unit to be turned ON. | Wait for the operator to turn on the tape unit or terminate the job. | RESEX

04599000 L
MESSAGE

WAITING FOR MAGNET.
The job is waiting for the magnetic tape subsystem to be activated.

WAITING FOR NPL.
Informative message stating that your job has been delayed and/or rolled out waiting for NPL space. The job has not been aborted; it will eventually continue. The message is visible via ENQUIRE.

WAITING FOR PH+packname, type.
The job is waiting for the operator to mount pack packname on device type type.

WAITING FOR RESOURCE FILE.
The job is waiting for the resource demand file or VSN file to become available.

WAITING FOR RESOURCES.
The job is waiting for sufficient resources to allow assignment of the tape/pack without causing a system deadlock.

WAITING FOR SERVICE LIMIT.
The job has reached its service limit and a job is waiting for a place in it.

WAITING FOR STORAGE.
Issued to SSD B and J displays. BID is waiting to increase its field length or for a Buffer to become available.

WAITING FOR STORAGE (CM).
The job is waiting for additional central memory to be made available.

WAITING FOR STORAGE (EM).
The job is waiting for additional extended memory to be made available.

WAITING FOR VALIDATION FILE.
The job is waiting for the validation file to become available to process a UPCODE, PASSWR, or ENVAL command.

WAITING FOR VSN+ vsn, type.
The job is waiting for the operator to mount the tape with VSN vsn on the specified type (MT, HD, RE, or GE). VSN SCRAMCH indicates that any scratch tape is acceptable.

WAITING - INACCESSIBLE DEVICE.
Your job has been rolled out waiting for an inaccessible mass storage device. The device is off, down, or is encountering hardware errors.

WAITING - INACCESSIBLE DEVICE.
Access to your permanent file is not possible at this time because a permanent file device has SUSPECT, OFF or DOWN status. Self-explanatory.

WAITING - INACCESSIBLE DEVICE.
The job is waiting for additional tracks on the family device containing the resource demand and VSN files.

WAITING - SERVICE LIMIT.
The job has reached a service limit for central memory or extended memory field length.

WRITE-DOWN OF DATA PROHIBITED.
Message resulted from one of the following:

- On an APPEND or REPLACE command or macro, the access level of the local file is higher than the access level of the permanent file.
- On a DEFINE command or macro, the access level of a local file having the same name as the file specified has a lower access level than the job.
- On a CHANGE, PERMIT, or SETPFAC command or macro, the access level of the specified permanent file is lower than that of the job.

WRITE IS BURST FAILURE, fileame AT address.
The tape driver is unable to correctly write the PE (1000 cpi) or GE (9200 cpi) identification tracks or the automatic read amplitude (ARA) burst at load point.

SIGNIFICANCE

The job is waiting for the magnetic tape subsystem to be activated.

ACTION

Wait for the operator to activate MAGNET or terminate the job.

WAITING - SERVICE LIMIT.
The job has reached a service limit for central memory or extended memory field length.

</tbody>
</table>
Abort

To terminate a program, job or job step when an error condition (hardware or software) exists from which the program or computer cannot recover.

Access Category

Refer to File Access Category, Job Access Category Set, and System Access Category Set.

Access Level

A property of each file, job, and equipment on a secured system that is used to indicate the sensitivity of information in the file or job, or the sensitivity of information that can be processed by the equipment. On a secured system, there are up to eight access levels corresponding to increasing levels of sensitivity. You are authorized to access some or all of those levels. Refer also to Equipment Access Levels, File Access Level, Job Access Level, and System Access Levels.

Access Level Limits

Refer to Job Access Level Limits.

Account Block

That portion of a session from login to logoff or entry of a CHARGE command which signals a new account block.

Allocatable Device

A storage device allocated by the system without operator intervention that can be shared by more than one job.

Alphanumeric

Consisting of alphabetic or numeric characters only.

Application

A program resident in a host computer that provides an information storage, retrieval, or processing service to a remote user via the data communication network. IAF is an example of an application.

Application Switching

The process of leaving the control of one application and entering the control of another, without going through another complete login sequence.

Argument

Refer to Parameter.

ASCII

American National Standard Code for Information Interchange. The standard character set and code used for information interchange between systems.

Auxiliary Device

Mass storage permanent file device used to supplement storage provided by the normal permanent file devices associated with the system (refer to Family Device).

BASIC

1. Beginner's All-Purpose Symbolic Instruction Code, an elementary programming language.

2. The subsystem that uses the BASIC compiler.
Beginning-of-Information (BOI)

A file boundary that marks the beginning of a file. You can reference the BOI by name. For a labeled tape file on a single volume, the HDRl represents BOI. If the file is a multivolume (multireel) tape file, BOI is the HDRl label of the first volume. If the tape file is an ANSI multifile file, BOI is the HDRl associated with the beginning of the multifile.

Bit

An abbreviation of binary digit. It is a single digit, 0 or 1, in a binary number. Also used to represent the smallest unit of information. A central memory word (one storage location) contains 60 bits.

Block

Blocking is the grouping of user records for efficiency in transfer between memory and storage devices. For magnetic tapes, it is the information between interrecord gaps.

BOI

Refer to Beginning-of-Information.

bpi

An abbreviation for bits per inch. Refer to fci.

Byte

A group of 12 bits. Five bytes comprise a 60-bit central memory word. Bytes are numbered 0 to 4 from the left.

Catalog

The list of names of permanent files belonging to a particular user name; this list also contains information about the permanent files.

Character

Any alphabetic, numeric, or special symbol that can be encoded. This term applies to the graphic characters for an input or output device, and to uniquely encoded control characters used by a terminal.

Checkpoint

The process of writing to a magnetic tape or mass storage file a copy of your job's central memory, the system information used for job control, and the names and contents of all assigned files that are identified in a CHECKPT request.

Checkpoint File

File on which the results of a partially completed job are dumped when a checkpoint request is processed.

Command

A sequence of words and characters that call a system routine to perform a job step. The command must conform to format specifications. You can usually place a comment after the command terminator.

Command Record

The first, and possibly only, record of a job file consisting of command images that start with the Job command and end with the first EOR, EOF, or EOI. Also refers to a procedure containing commands.

Compile

To translate a program from a higher level programming language (for example, FORTRAN or BASIC) into machine instructions called object code.

Control Character

1. A terminal-dependent character that is a part of interactive status commands and terminal definition commands. It gives these commands a preemptive status so that they are processed immediately.

2. A character whose occurrence within a file queued for printing, affects carriage control. Examples are the carriage return and line feed characters.

Control Point

The portion of central memory that is assigned to a job. When a job is allocated a portion of central memory, it becomes eligible for assignment to the central processor for execution.
Control Statement

Refer to Command.

Control Statement Record

Refer to Command Record.

cpi

Characters per inch. A measure of density.

CYBER Loader

The utility that prepares programs for execution by placing program instruction and data blocks in central memory.

CYBER Record Manager (CRM)

A software product that allows a variety of record types, blocking types, and file organizations to be created and accessed. Products like COBOL 5, FORTRAN Extended 4, FORTRAN 5, Sort/Merge 4, Sort/Merge 5, ALGOL 5, and DMS 170 use CRM to manage execution time input/output. Neither the input/output of the operating system nor that of most of the system utilities such as COPY or SKIPF is implemented through CYBER Record Manager. All CYBER Record Manager file processing requests ultimately pass through the operating system input/output routines.

Dayfile

A chronological file created during job execution which forms a permanent accounting and job history record. Dayfile messages are generated by operator action or, with some exceptions, when commands are processed. A copy of the dayfile is printed with the output for each job. You must explicitly request it in an interactive job.

Deadstart

The process of initializing the system by loading the operating system library programs and any of the product set from magnetic tape or disk. Deadstart recovery is reinitialization after system failure.

Default

A system supplied option used when you do not supply the option.

Detached Job

An interactive origin job that you have dissociated from your terminal by using the DETACH command. It continues to execute under system control. You can reattach an executing detached job with the RECOVER command.

Device

Peripheral equipment.

Direct Access File

A NOS permanent mass storage file that can be attached to the your job. All changes to this file are made on the file itself rather than a temporary copy of the file (compare with Indirect Access File).

Directive

An instruction subordinate to a system command.

Display Code

A 6-bit character code set used to represent alphanumeric and special characters.

Disposition Code

A two-character mnemonic that indicates the manner in which the system is to dispose of a queued file. The DC=dc parameter of the LDI, QGET, ROUTE, SETJOB, and SUBMIT commands specify a disposition code.

EBCDIC

Extended Binary Coded Decimal Interchange Code. An 8-bit code which represents a set of 256 characters.

ECS

Extended Core Storage. Refer to Extended Memory.
Empty PRU/Record

A PRU that contains no user data. Refer also to Zero-Length PRU.

End-Of-File (EOF)

A boundary within a sequential file, but not necessarily the end of a file that can be referenced by name. The actual end of a named file is defined by EOI. For labeled tape, EOF and EOI (denoted by the EOLF label) are the same. For multifile tape files, EOF and EOI do not correspond. In the product set manuals, an end-of-file is also referred to as an end-of-partition.

End-Of-Information (EOI)

The end of data on a file. Information appearing after this point is not considered part of file data. In card decks, a card with a 6/7/8/9 multiple punch in column one. On mass storage devices, the position of the last written data. On labeled tape, it is the EOLF label. CYBER Record Manager defines end-of-information in terms of file residency and organization.

End-Of-Record (EOR)

An indicator that marks the end of a logical record. Also referred to as end-of-section.

End-Of-Tape (EOT)

A reflective strip near the end of a magnetic tape. It is used to signal termination of operations on a particular tape volume. At least 5.5 meters (18 feet) of tape must follow this marker.

Entry Point

A location within a program or procedure that can be referenced from other programs. Each entry point has a unique name with which it is associated.

EOF

Refer to End-Of-File.

EOI

Refer to End-Of-Information.

EOR

Refer to End-Of-Record.

EOT

Refer to End-Of-Tape.

Epilogue

A program that executes at the end of your job or, in the case of a project epilogue, at the end of an account block.

Equipment Access Levels

A range of access levels specified for each equipment on a secured system. In order for a file to be stored or output on a given equipment, the file's access level must be within the equipment access levels for the defined equipment.

Error Flag

A character or bit that signals the occurrence or presence of an error.

EST Ordinal

The number designating the position of an entry within the equipment status table (EST) established at each installation. Devices are identified in operator commands by EST ordinals. The EST ordinal is sometimes referred to as equipment number.

Exchange Package

A table that contains information used during job execution. It is printed as part of the output when a job aborts.

Executable Object Code

Machine language instructions that can be executed directly by the machine. A compiled program is composed of executable object code.

Extended Core Storage (ECS)

Refer to Extended Memory.
Extended Instruction Stack Purging

Extended instruction stack purging applies to models 825, 835, and 855 only. It causes the instruction lookahead registers to be purged under a wider range of conditions than normal. Under normal conditions, the lookahead registers for models 825, 835, and 855 are purged by the execution of a return jump instruction (010), UEM read instruction (011), exchange jump instruction (013), or unconditional branch instruction (02). Under extended instruction stack purging, these registers are also purged by the execution of any conditional jump instruction (03 through 07) or any central memory store instruction (50 through 57 with i = 6 or 7). The instructions that cause instruction stack purging vary from model to model for other computer systems (refer to the hardware reference manual for the individual computer system).

Extended Memory

Optional additional memory. Various called extended core storage (ECS), extended semiconductor memory (ESM), unified extended memory (UEM), large central memory (LCM), and large central memory extended (LCME), depending on the model of the computer system. Extended memory contains 60-bit words. It has a large amount of storage and fast transfer rates. Extended memory can be used only for program and data storage, not for program instructions. Special hardware instructions exist for transferring data between central memory and extended memory.

Family Device

Mass storage permanent file device associated with a specific system. A family may consist of 1 to 63 logical devices. Normally, a system runs with one family of permanent file devices available. However, additional families may be introduced during normal operation. This enables users associated with the additional families to access their permanent files via the alternate family.

Family Name

The name that is associated with a group of permanent file devices.

fci

Flux changes per inch. A measure of density used with magnetic tapes. Each flux change records two bits of information (per track); 3200 fci encodes 6400 bits of information. If you subtract 150 bits for error checking, 3200 fci is equal to 6250 cpi (assuming 1 bpi per track translates into 1 cpi per frame).

FET

Refer to File Environment Table.

Field Length (FL)

The central memory and extended memory assigned an executing job.

File

1. A set of information that begins at beginning-of-information (BOI), ends at end-of-information (EOI), and is referenced by a local file name.

2. That portion of a multifile file terminated by an end-of-file (EOF).

3. Data recorded on a magnetic tape beginning after an HDR1 label and ending before an EOF1 label.

NOS commands requiring a parameter that is a file name refer to definition 1. Commands requiring a parameter that specifies the number of files refer to definition 2. Definition 3 applies only to labeled magnetic tapes.

File Access Category

A property of a permanent file used by the creator of the file on a secured system to restrict access of the file to a particular group of users. A secured system supports up to 32 access categories, and you are authorized to use some, all, or none of those categories. Refer also to Job Access Category Set and System Access Category Set.
File Access Level

A property of each file on a secured system used to indicate the sensitivity of information contained on the file. A file is assigned the current job access level by default when it is created or stored; the file creator may specify any access level for that file that is within the set of access levels valid for the job, the system, the file creator, and (for interactive jobs) the communication line to the host mainframe. If you access a file on a secured system, you must be validated for the access level of the file. Refer also to Access Level, Job Access Level, and Job Access Level Limits.

File Environment Table (FET)

A table within a program's field length through which the program communicates with operating system input/output routines. One FET exists for each file in use by the program.

File Information Table (FIT)

A table through which a user program communicates with CYBER Record Manager. For direct processing through CRM, you must initiate establishment of this table. All file processing executes on the basis of information in this table. You can set FIT fields directly or use parameters in a file access call that sets the fields indirectly. Some product set members set the fields automatically.

File Set

One or more tape files referred to by the set identifier on a tape assignment command or macro. A file set may consist of:

1. One file recorded on a single volume.
2. More than one file recorded on a single volume.
3. One file recorded on more than one volume.
4. More than one file recorded on more than one volume.

All files within a file set have the same set identifier in their HDR1 labels.

FIT

Refer to File Information Table.

Flag

A character or bit that signals the occurrence or presence of a particular condition.

FNT

Refer to Local File Name Table.

FORTRAN

1. Formula Translation, a high-level language consisting of symbols and statements that can be used to create a program closely resembling mathematical notation.
2. The subsystem that uses the FORTRAN Version 5 compiler.

Frame

A tape recording unit made up of one bit from each tape track (7 bits for 7-track tape and 9 bits for 9-track tape). Each frame on a coded tape usually represents one character.

Generation

The position of a file within a series of files, each file developed from the preceding file. The generation number and generation version number of a tape file can be entered in its HDR1 label.

Global Library Set

A set of user libraries you specify on the LIBRARY command. The system conditionally searches these libraries when it attempts to process a command.

Graphic

A character that can be printed or displayed. Refer to Control Character.

Host

A computer that executes an application.
IAF

Refer to Interactive Facility.

Indirect Access File

A NOS permanent file that you access by making a temporary copy of the file (GET or OLD command). You create or alter it by saving or substituting the contents of an existing temporary file (REPLACE or SAVE command).

Input File Type

The file type the system assigns to file INPUT. Its first record is a command record which may be followed by records containing data, directives, or programs used by job steps.

Instruction Stack Purging

The process of clearing the instruction stack in the central processor. It affects the speed and accuracy of the central processor.

Interactive Facility (IAF)

An application that provides a terminal operator with interactive processing capability. The interactive facility makes terminal input/output and file input/output appear the same to an executing program.

Interrecord Gap

Space skipped between the writing of data blocks on magnetic tape.

Interruption Sequence

The character or sequence of characters that causes an executing program to be interrupted (also called the user break 1).

Job

A set of commands and the data and directives used by those commands. A batch job must begin with the Job and USER commands. An interactive job is all activity associated with a terminal session from login to logout unless you detach a job during the session. After a job detachment, the terminal session becomes a new job.

Job Access Category Set

On a secured system, a set of access categories is set when the job is initiated. This set is the intersection of your set of validated access categories and the system access category set. Refer also to File Access Category and System Access Category Set.

Job Access Level

On a secured system, each job has an access level. This is the default access level that is assigned to files that are created or stored in the job. A job's initial access level is the lower access level limit for the job. The job's access level is automatically raised to the access level of any file from which information is read. You can also change the job access level. Refer also to Job Access Level Limits.

Job Access Level Limits

An upper limit and a lower limit that determine the range of access levels that are valid for a particular job on a secured system. All files used in a given job must have an access level within the job's access level limits.

Job Sequence Name (JSN)

The unique, system-defined name assigned to every executing job or queued file. The JSN is a string of four alphabetic characters.

Job Step

An individual command, procedure or loader sequence. A group of job steps forms a job stream, command record, or procedure file.

Label

A block at the beginning or end of a magnetic tape volume or file, which serves to identify or delimit that volume or file.
Level Number

An octal number (0, 1, or 17) in the terminating marker of a PRU. A level number of 17 designates an EOF. A level number of 0 designates an EOR. A level number of 1 designates that the line of data is from a terminal and is not an empty line.

Library

1. A collection of programs or routines.
2. A file containing records that are accessed individually.
3. A file searched by CYBER Loader for entry points referenced by a program.
4. A file containing compressed records in Modify or Update format.

Library File

A read-only file that can be accessed by several users simultaneously or a file you specify on a LIBRARY command.

LID

Refer to Logical Identifier.

Line

A unit of data terminated by a zero-byte terminator. Unit used in interactive input/output, line printer output, and card reader input.

Line Mode

A mode of job interaction in which the basic unit of interaction is a line of data. Contrast with Screen Mode.

Load Point

Metallic strip marking the beginning of the recordable portion of a magnetic tape. Data, including labels, is written after the load point.

Local File

Any file that is currently associated with a job. Local files include all temporary files and attached direct access files.

Local File Name

The file name assigned to a file while it is local (assigned) to a job. The name is contained in the local file name table.

Local File Name Table (FNT)

A system-managed table that contains the local file name, the file type, and other job control information.

Locked File

A file on which you cannot write.

Logical Device

One or more physical disk units known to the system as a single device.

Logical Identifier (LID)

A three-character, alphanumeric string used to identify a particular mainframe in a loosely coupled network. LIDs are identified by your site.

Logical Record

A data grouping that consists of zero or more PRUs and ends with a short PRU or a zero-length PRU.

Login

The procedure used at an interactive terminal to gain access to the system.

Logout

The procedure used to end a terminal session.

Loosely Coupled Network (LCN)

A network of physically connected computer systems. The LCN environment allows jobs, data files, and messages to be transmitted from one computer system to another.

Macro

A sequence of source statements that are saved and then assembled whenever needed through a macro call.
Mass Storage

Magnetic disk or extended memory that can be accessed randomly as well as sequentially.

Master Device

Mass storage device that contains your permanent file catalog entries; all your indirect access files; and all, part, or none of your direct access files.

Multifile File

A file containing more than one logical file. It begins at BOI and ends at EOI. On a labeled tape, a multifile file is delimited by corresponding HDR1 and EOF1 labels.

Multifile Set

A tape file set having more than one tape file.

Network

A data and message switching and routing system used to provide communication between terminals, applications, and mainframes.

Network Operator (NOP)

The network operator manages the communications elements of the network. Network operator functions may be performed at the system console, or at a remote terminal.

Noise

Any tape block less than the minimum acceptable block size for its data format. Noise is discarded by the system.

Nonallocatable Device

A device (such as a magnetic tape unit, card reader, card punch, or line printer) which can be used only by one job at a time.

Object Code

Executable machine language instructions. An object code program need not be recompiled each time it is executed.

Order-Dependent

Used to describe items which must appear in a specific order.

Order-Independent

Used to describe items which need not appear in any specific order. Parameters, particularly those with keywords, may be order-independent.

Origin Type

A job attribute that indicates how a job entered the system. The four origin types are interactive origin, batch origin, remote batch origin, and system origin.

Packet-Switching Network (PSN)

A system that provides data communication service between different terminals and computer systems. The PSN is usually licensed as a common carrier. GTE Telenet is an example of a PSN.

Subscribers use a protocol defined by a standards body such as CCITT to interface with a PSN. The packet assembly/disassembly (PAD) access defines the terminal interface. The X.25 protocol defines the PSN interface with NOS.

Panel

A formatted screen defined using the panel definition utility. An application program uses a panel to display data or to request user input at the terminal.

Parameter

A value that follows a command name or function name and that alters the behavior of the command or function.
Parity

In writing data, an extra bit is either set or cleared in each byte so that every byte has either an odd number of set bits (odd parity) or an even number of set bits (even parity). Parity is checked on a read for error detection and possible recovery.

Passive Procedure

A procedure that does not have the parameter-prompting capability. If the call to the procedure contains errors, the job step terminates and the procedure is not executed.

Password

1. A system access word that must be used in addition to the user name at login.
2. A file access word that controls access to a particular file by alternate users.

Peripheral Processor (PP)

The hardware unit within the host computer that performs physical input and output through the computer's data channels.

Permanent File

A mass storage file that is cataloged by the system so that its location and identification are always known to the system. Permanent files cannot be destroyed accidentally during normal system operation. They are protected by the system from unauthorized access according to privacy controls specified when they are created.

Permanent File Device

Mass storage defined by your site to hold permanent files.

Permanent File Family

Permanent files which reside on the family devices of a specific system.

Physical Record Unit (PRU)

The amount of information transmitted by a single physical operation of a specified device. For mass storage files, a PRU is 64 central memory words (640 characters); for magnetic tape files, the size of the PRU depends upon the tape format. A PRU that is not full of user data is called a short PRU; a PRU that has a level terminator but no user data is called a zero-length PRU.

Post Radix

A letter following a numeral that indicates the base numbering system.

PP

Refer to Peripheral Processor.

Prefix Character

A character that has a special significance to a program or the operating system and is used in front of a string of characters.

Primary File

A temporary file created with the OLD, NEW, LIB (interactive jobs only), or PRIMARY command. The primary file is assumed to be the file on which most system operations are performed unless another file is specified. There can be only one primary file associated with your job.

Private Auxiliary Device

Auxiliary device associated with a specific user name. Only that user name may create files on the device, although other users may be permitted to access files which reside on the device.

Procedure

A user-defined set of instructions that can be referenced by name. The instructions consist of procedure directives and system commands.
Procedure File
A file containing one or more procedures.

Project Epilogue
An epilogue that executes any time you end an account block.

Project Prologue
A prologue that executes any time you initiate a new account block.

Prologue
A program the system executes any time you initiate a job (user prologue and system prologue) or initiate a new account block (project prologue).

PRU
Refer to Physical Record Unit.

PRU Device
A magnetic tape file or a mass storage device. Records on these devices are written in physical record units (PRUs).

PSN
Refer to Packet-Switching Network.

Public Auxiliary Device
Auxiliary device available for access by all validated users knowing the correct pack name. Additional validation is required to create or replace files on an auxiliary device.

Queue Priority
A number that controls the scheduling of a job to and from the rollout queue relative to other jobs of the same origin type.

Queued File
A file you have submitted for job entry or a file of job output waiting for processing. The queued file may have a print, punch, wait, or input disposition.

Random Access
Access method by which any record in a file can be accessed at any time. Applies only to mass storage files with an organization other than sequential. Compare with Sequential Access.

Random Access File
A file whose records are accessed through a directory containing the address of each record.

Read-Only Permission
If you have read-only permission on a file, you can read and execute the file. You cannot write, modify, append, or purge the file.

Record
A unit of information. In CYBER Record Manager and its language processors, a record is a unit of information produced by a single read or write request. Eight different record types exist within CRM. You define the structure and characteristics of records within a file by declaring a record format. A NOS record is a second-level subdivision of a file. It is the smallest subdivision that NOS recognizes. A NOS record can consist of a group of CRM records.

Recovery
The process by which you reattach a job to the terminal. You could have explicitly detached the job using the DETACH command or the job could have been detached because of a system failure or terminal disconnection before logout. You can initiate recovery processing with the RECOVER command.

Reference Address (RA and RAE)
RA is the absolute central memory address that is the starting or zero relative address assigned to a program. Addresses within the program are relative to RA.
RA+1 is used as the communication word between the user program and the system. RAE is the absolute extended memory starting address assigned to a program.

Remote Host
A computer connected to your local host so as to permit permanent file and queue file transfers between hosts.

Remote Host Facility (RHF)
An application program that allows you to transfer files to and from other mainframes connected to a loosely coupled network (LCN).

Rolled Out
The status of an executing job that has been temporarily removed from central memory.

Rubout Characters
Characters created by pressing the RUB OUT key on the terminal. These are considered null input by the system and are required in paper tape output.

Scheduling Priority
The variable associated with an executing job that controls the scheduling of the job for CPU time.

Screen Mode
A mode of job interaction in which the basic unit of interaction is a screen of data. Contrast with Line Mode.

Secured System
A system in which a mandatory security mechanism has been enabled during deadstart. A secured system protects information by enforcing restrictions based on access levels and access categories, and restricts many sensitive system functions to security administrators.

Security Administrator
A secured system prevents users and operators from performing certain functions that could result in the unauthorized disclosure of information. These functions can only be performed by a person who is designated a security administrator. A security administrator is always authorized to access the highest level of information stored on the system. This person performs functions in the areas of installation, user validation, system operation, and system maintenance.

Security Count
The number of security violations you have left before you are denied access to the system.

Security Unlock Status
This status of the system console applies only to a secured system and must be set by a security administrator. The console must be in security unlock status in order for the security administrator to perform certain functions that are restricted on a secured system.

Sequence Number
1. Number at the beginning of each line of a file.
2. For tape labels, number indicating position of a file within a file set.

Sequential Access
A method in which only the record located at the current file position can be accessed. Refer to Random Access.

Sequential (SQ) File
A file in which records are accessed in the order in which they occur. Any file can be accessed sequentially.
Service Class

A job classification based on a job's origin type or job's status. It determines how a job is serviced as it flows through the system.

Short PRU

A PRU that does not contain the maximum amount of character data allowed for a PRU. Refer to Zero Length PRU.

Source Code

Code input to the computer for later translation into executable machine language instructions (object code).

Special Editing Mode

A variation of normal input mode (other than transparent input mode) in which the cancel input character, backspace character, and line feed character are not treated as special characters but are passed to IAF as input data.

SRU

Refer to System Resource Unit.

Standard Labeled Tape

A tape with labels conforming to American National Standard Magnetic Tape Labels for Information Interchange X3.27-1969. Also called a system labeled tape.

String

A sequence of characters.

Subsystem Flag

A character or bit that tells the system that a particular subsystem is associated with a file.

System Access Category Set

On a secured system, a set of access categories is set during level 0 deadstart. This set may consist of some, all, or none of the 32 possible access categories. While the system is running, you may only use access categories that are within the set of system access categories. Refer also to File Access Category and Job Access Categories.

System Access Levels

On a secured system, a range of access levels is set during level 0 deadstart. This range may contain some or all of the eight possible access levels. While the system is running, you may only use access levels that are within the range of system access levels.

System File

A file that can be accessed only by a system program.

System Resource Unit (SRU)

A unit of measurement of system usage. The number of SRUs includes the central processor time, memory usage, and input/output resources used for a given job.

Tape Format

A parameter that specifies the internal recording format of a magnetic tape.

Tape Mark

A delimiter written on tapes under operating system control to separate label groups, files, and/or labels. Interpretation depends on the tape format.

Temporary File

A file that is assigned to your job and vanishes once you release it or at job termination. Local copies of indirect access permanent files are temporary files; direct access permanent files assigned to your job are not temporary files.

Terminal Name

A network-supplied name used to identify the terminal to the network operator.
Termination Sequence

The character or sequence of characters that causes an executing program to be terminated (also called the user break 2).

Time Slice

The amount of CPU or CM time a job is allowed to use before the system lowers its priority to allow other jobs to execute.

Timed/Event Rollout

A condition where an executing job that has been temporarily removed from central memory but will be rolled back into central memory only when a specified event (such as a file is no longer busy) or a specified time period has elapsed.

Transparent Input Mode

An input mode in which all characters entered at the terminal are sent to IAF as 7-bit codes (or as 8-bit codes, depending on the parity) without translation. Normally, characters entered at the terminal are translated and stored as 6-bit and/or 12-bit display codes. This mode is initiated either with the 0006 control byte or with the IN=X, IN=XX, or IN=XP terminal definition commands. In former interactive systems this mode was referred to as binary mode.

Transparent Submit Mode

The mode used in a submit file to transfer information that contains reformatting directives without processing the directives.

User Break 2

Refer to Termination Sequence.

User Index

A number the system assigns each user name and uses for internal record keeping.

User Index Hash

A string of four alphabetic characters derived from your user index that serves as the default user job name (UJN) for interactive jobs. It appears on the banner page/card of all line printer and card punch output. You can ascertain your user index hash with the ENQUIRE command.

User Job Name (UJN)

In general, the user-defined name for an executing job or queued file. If you fail to specify a UJN, the system uses your index hash. The UJN must be a string of seven or fewer alphanumeric characters. Unlike the job sequence name (JSN), the UJN for jobs is not always unique.

User Name

A one to seven-character name that identifies the user to the system and for which there is assigned a user index that allows access to permanent files.

User Number

Refer to User Name.

Validation File

File containing validation information for all users (user names, passwords, resources allowed, and so on).

Volume

A reel of magnetic tape. A given file can be comprised of more than one volume.

Unsecured System

A system in which the security mechanism has not been enabled during deadstart. The restrictions based on access levels and access categories are not enforced on an unsecured system.

User Break 1

Refer to Interruption Sequence.
Volume Serial Number (VSN)

A one- to six-character identifier that identifies the volume of magnetic tape to the system.

VSN

Refer to Volume Serial Number.

Word

A group of bits (or 6-bit characters) between boundaries imposed by the computer system. A word is 60 bits in length. The bits are numbered 59 through 0 starting from the left. It is also composed of five 12-bit bytes, numbered 0 through 4 from the left.

Write Interlock

Write interlock ensures that only one person at a time can attach a direct access file in write mode. A direct access file that is attached in write mode is in write interlock.

Write Ring

A circular device inserted into a tape reel indicating to the tape unit that it can write on that reel. NOS checks for the presence of a write ring if you request it.

XMODEM

XMODEM is the industry standard error checking communications protocol used to transfer files to and from microcomputers and mainframes. Also known as the Christensen protocol.

Files created interactively at a terminal and by commands that manipulate coded lines contain zero-byte terminated records. The image of cards input through a card reader also has such a terminator.

In 6-bit display code, two colons create 12 bits of zeros in the 64-character set. If two consecutive colons occur in a file that contains zero-byte terminated records, they might be stored in the lower order portion of a word and create a zero-byte terminator.

Zero Byte Terminator

The 12 bits of zero in the low order position of a central memory word that are used to terminate a line of coded information. A record with such a terminator in CYBER Record Manager is a zero-byte record (Z type record).

Zero Length PRU

A PRU that contains system information, but no user data. Under NOS, a zero-length PRU defines EOF.

6/7/8/9 Multipunch

A card with the characters 6, 7, 8, and 9 multipunched in column 1. Signifies a card deck EOI.

6/7/9 Multipunch

A card with the characters 6, 7, and 9 multipunched in column 1. Signifies a card deck EOF.

7/8/9 Multipunch

A card with the characters 7, 8, and 9 multipunched in column 1. Signifies a card deck EOR.
This appendix lists the output information printed for the sample job shown below. The job consists of the following commands.

OUTPUT.
USER,STARSKY,HUTCH.
GET,PFL.
ITEMIZE,PFL.

This job generates three pages of output. The first page is the banner page (shown on D-2), the second is the output generated by ITEMIZE (shown on D-3), and the third is the dayfile (shown on D-4).
The first line indicates the version of the operating system, the creation date of that version (crtndate), the printing date (yy/mm/dd), and the time of day the printing occurred.

The second line contains the user job name (UJN), as specified on the Job command; family name, and job origin.

The third line contains the job sequence name (JSN), the user name associated with the job, and the job's service class.

The first four block letters indicate the user index hash and the last four, the job's JSN.

</tbody>
</table>
The first line lists the job's JSN (ABNS); a site-selected, system or machine identifier; the time of job termination (16.58.59); and the current date. The dayfile includes a listing of the commands, system-supplied status messages, and program output, if any. Spaces precede status messages and program output. Each line includes the time the message was issued to the dayfile.

Six of the last nine lines specify the type and amount of system resources the job used. This job used 0.002 kilounit of application activity, 0.057 kilounit of permanent file activity, 0.770 kilounit of mass storage activity, 0.070 seconds of central processor time, and 2.186 system resource units. The first two numbers after UCLP give the machine identifier as 42 and the EST ordinal of the printer as 070. The job produced 0.256 kiloline (256 lines) of printable output.

The $OUT and $DAYFILE commands are system-supplied and ensure that the job's dayfile is printed.

Depending on the resources used, additional information may be included in the dayfile. Refer to Job Completion in section 3 for the formats of these messages.
Normal input mode from an ASCII code terminal uses a 63- or 64-character set where all lowercase alphabets are converted to uppercase characters. Under ASCII mode, the characters 74 and 76 represent the beginning of a 74xx or 76xx escape sequence. Under normal mode, the characters 74 and 76 are treated as data rather than escape codes. ASCII and normal modes apply to both input and output.

**DATA INPUT**

The manner in which the system interprets the characters entered from a terminal depends on whether you request ASCII or normal mode. For example, if you enter

```
aAbBcCdDeEfF
```
when in ASCII mode, the central memory equivalent is:

<table>
<thead>
<tr>
<th>Bit position</th>
<th>59</th>
<th>47</th>
<th>35</th>
<th>23</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>76</td>
<td>01</td>
<td>01</td>
<td>76</td>
<td>02</td>
<td>02</td>
</tr>
<tr>
<td>Character</td>
<td>a</td>
<td>A</td>
<td>b</td>
<td>B</td>
<td>c</td>
<td>C</td>
</tr>
<tr>
<td>Code</td>
<td>04</td>
<td>04</td>
<td>76</td>
<td>05</td>
<td>05</td>
<td>76</td>
</tr>
</tbody>
</table>
| Character    | d  | D  | e  | E  | f  | F
|              |    |    |    | end-of-line |

†Partial words are zero-filled; partial bytes are blank-filled.
However, if you enter the characters in normal mode, the characters are mapped into the 64-character subset of the ASCII character set that contains only uppercase letters; then the central memory equivalent is:

<table>
<thead>
<tr>
<th>Bit position</th>
<th>59</th>
<th>47</th>
<th>35</th>
<th>23</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>01</td>
<td>02</td>
<td>03</td>
<td>04</td>
<td>05</td>
<td>05</td>
</tr>
<tr>
<td>Character</td>
<td>A</td>
<td>B</td>
<td>C</td>
<td>D</td>
<td>D</td>
<td>E</td>
</tr>
<tr>
<td>Code</td>
<td>06</td>
<td>06</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>00</td>
</tr>
<tr>
<td>Character</td>
<td>F</td>
<td>F</td>
<td></td>
<td></td>
<td></td>
<td>end-of-line</td>
</tr>
</tbody>
</table>

Refer to appendix A for further description of the code sets for interactive jobs.

**DATA OUTPUT**

Data output is in either a 64/63- or 128-character set, depending on whether the terminal is in normal or ASCII mode. When the terminal is in normal mode, the codes 74 and 76 represent data rather than escape codes. In ASCII mode, 74 and 76 are treated as the beginning of an escape sequence.

Data can also be transmitted to or from a terminal through a paper tape reader. Refer to appendix N.
Data within the system is stored in binary or coded format. Binary data is variable length central memory images. Coded data consists of display-code characters. Each coded line is stored as an even number of characters. If an odd number of characters is entered, the system appends a space to make it even.

This appendix describes the formats for punch cards. It also describes the conversion performed by the system on data transferred between the system and card readers and punches.

When using the 64-character set, avoid using consecutive colons (00 characters). It is possible for these colons to be interpreted as an end-of-line. An end-of-line is defined as 12 to 66 zero bits, right-justified in one or two central memory words. If consecutive colons appear in the lower 12 bits of a central memory word, they are interpreted as an end-of-line rather than as colons.

Example:

The following characters are punched on a coded card beginning in column 1.

```
:::::::::A:::::::AA
```

This appears in memory as follows:

<table>
<thead>
<tr>
<th>Bit position</th>
<th>59</th>
<th>47</th>
<th>35</th>
<th>23</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>01</td>
</tr>
<tr>
<td>Character</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>A</td>
</tr>
</tbody>
</table>

| Code         | 00 | 00 | 00 | 00 | 00 | 01 | 01|
| Character    | :  | :  | :  | :  | :  | A | A |

| Code         | 00 | 00 | 00 | 00 | 00 | 00 | 00|
However, if the characters were copied with the COPYSBF utility, the following appears.

<table>
<thead>
<tr>
<th>Bit position</th>
<th>59</th>
<th>47</th>
<th>35</th>
<th>23</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>55</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>00</td>
</tr>
<tr>
<td>Character</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>end-of-line</td>
</tr>
<tr>
<td>Code</td>
<td>01</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>00</td>
</tr>
<tr>
<td>Character</td>
<td>A</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
<td>:</td>
</tr>
<tr>
<td>Code</td>
<td>01</td>
<td>55</td>
<td>00</td>
<td>00</td>
<td>00</td>
<td>00</td>
</tr>
<tr>
<td>Character</td>
<td>A</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>end-of-line</td>
</tr>
</tbody>
</table>

Because the COPYSBF utility shifts each line one 6-bit character to the right and adds a space, copying nine colons puts 12 zero bits in the last byte of the first word. This is interpreted as an end-of-line.

**NOTE**

If a colon is the last character of an input line, the system appends a space to preserve the colon and then appends an end-of-line. If needed, a second space is added to ensure an even number of 6-bit characters. Refer to figure F-1.

**INPUT CARD FILE FORMATS**

The system reads cards in coded and binary formats. The following conditions apply in both formats.

- A card with a 7/8/9 punched in column 1 is an EOR mark.
- A card with a 6/7/9 punched in column 1 is an EOF mark.
- A card with a 6/7/8/9 punched in column 1 is an EOI mark.

The remainder of each card is ignored except for columns 79 and 80 of the EOR and EOF cards. These columns can contain the keypunch conversion mode for the input records that follow. Conversion modes are discussed in Coded Cards.

---

†The 6/7/9 keypunch mark is not supported by RBF.
††HASP terminals can support other forms of separator cards such as /*EOR and /*EOI. (Refer to the Network Products Remote Batch Facility Reference Manual.)
CODED CARDS

Cards are read in Hollerith punch code. The 3447 card reader controller converts the Hollerith code to internal BCD code and passes the data to the card reader driver. The driver converts the data from internal BCD code to display code. Up to 80 characters can be transferred per card. Trailing blank characters are deleted. If a line has an odd number of characters, one trailing blank is added to make it even. In order to preserve the colon (00g) of the 64-character set, a trailing blank byte is either retained or appended as the last character in an even line. Examples of coded card conversion are shown in figure F-1.

Conversion Modes

Two conversion modes, 026 and 029,† exist for the Hollerith punch code. All data is converted in the system default keypunch mode unless a conversion mode change is specified. This change can be specified on any of the following cards.

The job card, 7/8/9 card (EOR mark), and 6/7/9 (EOF mark) can contain the keypunch conversion mode in columns 79 and 80. A 26 punched in columns 79 and 80 indicates that all subsequent cards are converted in 026 mode. A 29 indicates that subsequent cards are converted to 029 mode. Each conversion change remains in effect until another change card is encountered or the job ends. The user can switch between 026 and 029 mode as often as desired. If 26 or 29 does not appear in columns 79 and 80 of the job card, the initial keypunch mode of that job is the system default mode. If 26 or 29 does not appear on a 7/8/9 or 6/7/9 card, no conversion change is made, and the most recent keypunch mode remains in effect.

Keypunch mode can also be changed by a card containing a 5/7/9 punch in column 1. A blank (no punch) in column 2 indicates 026 conversion mode; a 9 punch in column 2 indicates 029 mode. The conversion change remains in effect until another change card is encountered or the job ends.

Literal Input

The 5/7/9 card also allows literal input when 4/5/6/7/8/9 is punched in column 2. Literal input allows 80-column binary data to be read while transmitting input in coded mode. Cards are read (16 central memory words per card) until a card identical to the previous 5/7/9 card (4/5/6/7/8/9 in column 2) is read. The next card can then specify the new conversion mode.

In order to maintain system integrity, an end-of-information card always terminates 80-column binary input (literal input). Either of the following is interpreted as an end-of-information card even though it appears in a literal input record.

- A card with 6/7/8/9 punched in column 1 and with columns 2 through 80 blank.
- A card with 6/7/8/9 punched in columns 1 and 80 and with columns 2 through 39 and columns 41 through 79 blank. Column 40 may be punched or left blank.

†These codes are ignored by a 200 User Terminal since conversion mode is selected by a hardware switch. (Refer to the Network Products Remote Batch Facility Reference Manual.)
Figure F-1. Examples of Coded Card Conversion
BINARY CARDS

Binary cards are denoted by a 7/9 punch in column 1 and can contain up to 15 central memory words. The 3447 card reader controller reads the binary data and passes it to the card reader driver in 12-bit codes. Each card column row corresponds to a bit position. The driver checks the checksum figure if this option is specified. The driver then passes the data to the central memory buffer.

The fields within a binary card are:

<table>
<thead>
<tr>
<th>Column(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>7/9 punch indicates a binary card.</td>
</tr>
<tr>
<td></td>
<td>4 punch ignores checksum punch in column 2.</td>
</tr>
<tr>
<td></td>
<td>Rows 0, 1, 2, and 3 contain the binary equivalent of the word count of the card.</td>
</tr>
<tr>
<td>2</td>
<td>Binary data checksum (modulo 4095).</td>
</tr>
<tr>
<td>3 through 77</td>
<td>Fifteen central memory words of binary data.</td>
</tr>
<tr>
<td>78</td>
<td>Blank.</td>
</tr>
<tr>
<td>79 and 80</td>
<td>24-bit binary card sequence number.</td>

<td>Conversion mode change/read 80-column binary.</td>
</tr>
<tr>
<td>7/9</td>
<td>Binary card.</td>
</tr>
<tr>
<td>Not 7 and 9</td>
<td>Coded card.</td>
</tr>
</tbody>
</table>

PUNCH FILE FORMATS

Punched cards can be in three formats.

- Coded (Hollerith punch).
- Binary.
- Absolute binary.
The following conditions apply to all three formats.

- When an EOR is encountered, a card is punched with a 7/8/9 in columns 1 and 80. This card is offset.
- When an EOF is encountered for a file, a card is punched with a 6/7/9 in columns 1 and 80; the remainder of the card is blank. This card is offset.
- When an EOI is encountered on a file, a card is punched with a 6/7/8/9 in columns 1 and 80; the remainder of the card is blank. This card is offset.
- If a compare error is encountered, the erroneous card and the following card are offset. These two cards are repunched until no error is detected. An EOI card with 6/7/8/9 punches in columns 1 and 80 contains a binary count in column 40 of the number of compare errors.
- During the punching of each file, the system maintains a count of the number of cards punched for the file. If the number exceeds the limit for which the user is validated, punching of the file is terminated. A special banner card with the word LIMIT is punched and offset as the last card of the deck.

The following methods are used by the system to punch each of the three forms of cards.

**CODED CARDS (PUNCH)**

With the exception of decks punched via the ROUTE command, the keypunch mode (026 or 029) of coded cards depends on the job origin type. If the job is of local batch origin, decks are punched in the initial keypunch mode (that is, the mode specified on the job card or set by system default). For all other job origin types, decks are punched in the system default keypunch mode.

**BINARY CARDS (PUNCH B)**

The card punch driver retrieves 15 words of binary data from central memory. The driver then generates a checksum for the data and issues a card number. The card punch controller receives the binary data and punches it on the card unchanged, that is, in 12-bit codes. Each row in a card column corresponds to a bit position. The driver formats the binary card in the following manner.

<table>
<thead>
<tr>
<th>Column(s)</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>7/9 punch denotes binary card. Rows 0, 1, 2, and 3 contain the binary equivalent of the word count of the card.</td>
</tr>
<tr>
<td>2</td>
<td>Binary data checksum (modulo 4095).</td>
</tr>
<tr>
<td>3 through 77</td>
<td>Fifteen central memory words of binary data.</td>
</tr>
<tr>
<td>78</td>
<td>Blank.</td>
</tr>
<tr>
<td>79 and 80</td>
<td>24-bit binary card sequence number.</td>
</tr>
</tbody>
</table>
ABSOLUTE BINARY CARDS (P8)

Absolute binary cards are central memory images in 12-bit codes. Each row in a card column corresponds to a bit position. Sixteen central memory words are punched per card with no special punches or fields added.
ANSI labels perform two functions. They provide information that uniquely identifies a file and the reel on which it resides, and they mark the BOI and EOI of a file and the beginning and end of a reel.

ANSI labels are designed to conform to the American National Standard Magnetic Tape Labels for Information Interchange X3.27-1969. All labels are 80 characters long and are recorded at the same density as the data on the tape. The first three characters of an ANSI label identify the label type. The fourth character indicates a number within a label type.

Labels padded to longer than 80 characters and which otherwise meet the ANSI X3.27-1969 standard are not processed by NOS as ANSI labels. Tapes with padded labels can be processed as unlabeled tapes by using the F, S, or L format (in this case, the label data is read or written by a user program).

The following is a summary of each label type, name, function, and whether or not it is required.

<table>
<thead>
<tr>
<th>Type</th>
<th>No</th>
<th>Name</th>
<th>Used As</th>
<th>Required/Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>VOL</td>
<td>1</td>
<td>Volume header label</td>

</tr>
<tr>
<td>EOV</td>
<td>2-9</td>
<td>End-of-volume label</td>
<td>End-of-volume</td>
<td>Optional</td>
</tr>
</tbody>
</table>

**REQUIRED LABELS**

The VOL1, HDR1, and EOF1 labels are required on all ANSI-labeled tapes. In addition, an EOF1 label is required if the physical end-of-tape reflector is encountered before an EOF1 label is written or if a multifile set is continued on another volume. In the descriptions of the contents of these labels, n is any numeric digit and a is any letter, digit, or any of the following special characters.

†Any member of the CDC 6-bit subset of the ASCII character set.
Some fields are optional. An optional field which does not contain the designated information must contain blanks. Fields which are not described as optional are required and written as specified. n-type fields are right-justified and zero-filled, and a-type fields are left-justified and blank-filled.

**VOL 1—VOLUME HEADER LABEL**

The volume header label must be the first label on a labeled tape. All reels begin with a VOL1 label. If two or more reels belong to a volume set, the file section field in the following HDR1 label gives the actual reel number.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
**HDR1—FIRST FILE HEADER LABEL**

The first file header label must appear before each file. When a file is continued on more than one volume, the file header label is repeated after the volume header label on each new volume for that file. If two or more files are grouped in a multifile set, each HDR1 label indicates the relative position of its associated file within the set.

</tbody>
</table>
EOF1—FIRST END-OF-FILE LABEL

The end-of-file label is the last block of every file. It is the system end-of-information for the file. A single tape mark precedes EOF1. A double tape mark written after the EOF1 label marks the end of a multifile set.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
EOVI—FIRST END-OF-VOLUME LABEL

The end-of-volume label is required only if the physical end-of-tape reflector is encountered before an EOFL label is written or if a multible set is continued on another volume. EOVI is preceded by a single tape mark and followed by a double tape mark.

<table>
<thead>

</tbody>
</table>
OPTIONAL LABELS

Six types of optional labels are allowed. They are additional file header (HDR2-9), end-of-file (EOF2-9), user volume (UVLa), header (UHLa), and trailer (UTLa) labels.

**HDR2 THROUGH HDR9—ADDITIONAL FILE HEADER LABELS †**

HDR2 through HDR9 labels may immediately follow HDR1. Their format is:

<table>
<thead>
<tr>
<th>Character Position</th>
<th>Field Name</th>
<th>Length (in Characters)</th>
<th>Contents</th>
<th>Default Written</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-3</td>
<td>Label identifier</td>
<td>3</td>
<td>HDR</td>
<td>HDR</td>
</tr>
<tr>
<td>4</td>
<td>Label number</td>
<td>1</td>
<td>2-9</td>
<td>2-9</td>
</tr>
<tr>
<td>5-80</td>
<td>76</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Only the label identifier and the label number are checked on read.

**EOF2 THROUGH EOF9—ADDITIONAL END-OF-FILE LABELS †**

EOF2 through EOF9 labels may immediately follow EOF1. Their format is:

<table>
<thead>
<tr>
<th>Character Position</th>
<th>Field Name</th>
<th>Length (in Characters)</th>
<th>Contents</th>
<th>Default Written</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-3</td>
<td>Label identifier</td>
<td>3</td>
<td>EOF</td>
<td>EOF</td>
</tr>
<tr>
<td>4</td>
<td>Label number</td>
<td>1</td>
<td>2-9</td>
<td>2-9</td>
</tr>
<tr>
<td>5-80</td>
<td>76</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Only the label identifier and the label number are checked on read.

**EOV2 THROUGH EOV9—ADDITIONAL END-OF-VOLUME LABELS †**

EOV2 through EOV9 labels may immediately follow EOV1. Their format is:

<table>
<thead>
<tr>
<th>Character Position</th>
<th>Field Name</th>
<th>Length (in Characters)</th>
<th>Contents</th>
<th>Default Written</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-3</td>
<td>Label identifier</td>
<td>3</td>
<td>EOV</td>
<td>EOV</td>
</tr>
<tr>
<td>4</td>
<td>Label number</td>
<td>1</td>
<td>2-9</td>
<td>2-9</td>
</tr>
<tr>
<td>5-80</td>
<td>76</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

†These are reserved for operating system use. Attempts by user programs to generate them will produce undefined results.
Refer to section 3 in Volume 4, Program Interface, for a description of the use of EOV2 labels in conjunction with CLOSER, REWIND, and UNLOAD macros.

**USER LABELS**

User labels may immediately follow their associated system labels. Thus, user volume labels (UVLa) may follow VOL1, user header labels (UHLa) may follow the last HDRn label, and user trailer labels (UTLa) may follow the last EOVn or EOFn label. Their format is:

<table>
<thead>
<tr>
<th>Character Position</th>
<th>Field Name</th>
<th>Length (in Characters)</th>
<th>Contents</th>
<th>Default Written</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-3</td>
<td>Label identifier</td>
<td>3</td>
<td>UVL, UHL, or UTL.</td>
<td>UVL, UHL, or UTL.</td>
</tr>
<tr>
<td>4</td>
<td>Label number</td>
<td>1</td>
<td>Must be 1, 2, 3, 4, and so on, consecutively for UVL labels. For other labels, any a character.</td>
<td></td>
</tr>
<tr>
<td>5-80</td>
<td>User option</td>
<td>76</td>
<td>Any a characters.</td>
<td></td>
</tr>
</tbody>
</table>

Only the label identifier and the label number are checked on read. The system checks the number of user labels of a label type; a maximum of 64 is allowed.
Appendix H provides information required to prepare files for printing. The information includes the following:

- NOS-supported paper lengths.
- Carriage control characters.
- Punched tape channel formats (non-PFC printers only).
- PFC, EVFU, and VFU arrays.

For the 5870 Non-Impact Printer, applicable information in this section is contained under Printed Data below and in table H-1. Note that the Q, R, S, T, and V carriage control characters are not supported by the 5870 printer. If encountered in a print file, these characters are ignored.

Default characteristics for the 5870 printer, such as the print font, page length, and print density are determined by the site. Check with your site administration for this information.

For further information on the functional characteristics of the 5870 printer, refer to the 5870 Site Reference Manual.

PRINTED DATA

All data to be printed is in coded format in a file within the print queue. The data consists of either 6-bit or 12-bit codes. Data recorded using the 6/12-bit display code set (refer to appendix A) should be converted to the 7-bit ASCII code set (refer to the FCOPY command in section 9) before being routed to a line printer.

The system extracts data until an end-of-line occurs or until 137 characters are retrieved. End-of-line is 12 or more zero bits in the rightmost byte of a central memory word.

PAPER LENGTH

580 LINE PRINTERS

NOS supports two paper lengths for 580 line printers, standard (14 inches x 11 inches) and short (14 inches x 8 1/2 inches). Files routed to a line printer must be properly formatted for the paper length used on the specified printer.

†The information in this appendix does not apply to remote batch line printers.
When printing on standard paper size, you have the option of specifying a print density of either 6 or 8 lines per inch. At 6 lines per inch, a maximum of 64 lines per page can be printed on standard paper. At 8 lines per inch, a maximum of 84 lines per page can be printed on standard paper.

All output printed on short paper is printed at a density of eight lines per inch. The carriage control characters used to specify print density (S and T) are ignored. A maximum of 66 lines can be printed on one page of short paper; overflow lines, if any, are printed on the following page.

A system default print density is used if you do not specify one for your print file. The system default is site selectable using the SPD IPRDECK entry; refer to NOS 2 Analysis Handbook for more information on SPD IPRDECK entry.

533/536, 537, AND 585 PRINTERS

The 533/536, 537, and 585 printers are supported by the Printer Support Utility (PSU). These printers can accommodate 8 1/2-, 11-, and 12-inch paper sizes. Modifying the EVFU load file (for 533/536 printers) or the VFU load procedure (for 585 printers) enables these printers to use other paper sizes. Refer to the NOS 2 Analysis Handbook for more information on PSU, and the EVFU load file. Refer to the CDCNET Network Configuration and Site Administration Guide for more information on the VFU load procedure. The 537 printers can use various paper sizes, as determined by settings on the printer. Refer to the NOS 2 Operations Handbook for more information on settings for 537 printers.

Unlike the 580 printers, the 533/536 and 585 printers support both six and eight lines per inch print densities for short paper output, as specified by the S and T carriage control characters. Vertical print density for 537 printers is determined by a switch setting on the printer. Refer to the NOS 2 Operations Handbook for more information on switch settings for 537 printers.

CARRIAGE CONTROL

You can control the format of printer output using the carriage control characters listed in table H-1 and table H-2. The system interprets the first character in a line as the carriage control character and that character is not printed. The remainder of the line is then printed, except when a Q, R, S, T, or V carriage control character is specified. The Q, R, S, T, and V format controls remain in effect until changed; all other carriage control characters must be supplied for each line they control.

Line spacing is normally done in auto eject mode; that is, creases in the paper are skipped by the line printer's automatic line spacing mechanism if the paper is loaded properly. Auto eject mode must be turned off if you want to select format channels to advance printing from a position above the bottom of form to a position beyond the next top of form.

---

†To print a file in which the first character of each line is not a carriage control character, refer to the COPYSBF command in section 9.
The 585 printers support all carriage control characters. The 533/536, 537 printers support all carriage control characters except V. Note that a page eject is issued to the 533/536, 537, and 585 printers whenever the print density is changed or when auto page eject is either set or cleared. Also, for 533/536 printers, auto page eject is set to ON whenever the print density is changed.

The 537 printers defined as printer class C537INT support carriage control characters 1, 0, -, +, /, and space. Lines with carriage control characters Q, R, S, and T are suppressed. Carriage control character 3 is treated the same as a 1; that is, a page feed is performed before printing. A V causes a page feed, but without printing. All other characters in the carriage control position are translated to a space.

The 537 printers defined as printer class C537BAT support carriage control characters 1, 0, -, +, /, A, and space. Period, comma, and characters in the range 0 through 2A (16) result in skipping one line before printing. All other characters cause the line not to be printed.

The system limits the number of lines you can print from a given file (refer to the LIMITS command). Your site can further limit the number of lines you can print by establishing a minimum number of lines per page for which you will be charged. During the printing of each file, the system maintains a count of the number of lines printed or skipped for the file. If the number exceeds the limit for which you are validated, printing of the file is terminated. The informative diagnostic LINE LIMIT EXCEEDED is printed. If a job's dayfile is part of the terminated file, the dayfile is subsequently printed.

FORMAT CHANNEL SELECTION ON NON-PFC PRINTERS

Non-PFC line printers, other than 533/536, 537, and 585 printers, use a punched tape loop to control carriage advancement. Figure H-1 shows the released tape format for printers using the standard paper size at 6 lines per inch. Figure H-2 shows the tape format for short paper printers.

The format tape shown in figure H-1 can be ordered as customer engineer's part number 44682683.

Each line, or frame, in the tape format represents one line of printer output. Notice, in figure H-1, that frames 132 through 134 are identical to frames 0 through 2. To form a continuous loop, the ends of the tape are fastened together with the first three frames (0 through 2) superimposed over the last three frames (132 through 134). This leaves a tape loop consisting of 131 frames. The tape format in figure H-1 represents two pages of 64-line printer output. The blank lines at frames 64 and 65, and at frames 130 and 131, represent spaces for the creases between pages.

Each channel controls a specific carriage control operation. Channel 1, for example, provides for top of page spacing, channel 3 controls triple spacing of lines, and channel 12 spaces to the bottom of the page.

For postprint operations, when the carriage control character in column 1 of a print line specifies a channel number, the printer checks that format channel, in the current frame, for a punch. If a punch is found, the printer prints the line. If no punch is found, the printer advances the punched tape loop (and, at the same time, the printer carriage) until a punch is found in that channel in a subsequent frame. At that point, the printer prints the line.

As an example of format channel usage, assume that the printer carriage is positioned at the second line of a page (frame 1 of the format tape). Also assume that the second output line contains a carriage control character of 2. The printer checks frame 1 and finds no punch in channel 12, so it advances to the next frame containing a punch in channel 12. The next punch occurs in frame 63 (line 64); therefore, the second output line is printed as the last line on the page.

FORMAT CHANNEL SELECTION ON 533/536, 537, AND 585 PRINTERS

Format channel selection for 533/536 and 585 printers is defined by the EVFU load file and the VFU load procedure respectively. Refer to the NOS 2 Analysis Handbook for a description of the EVFU load file. Refer to the CDCNET Network Configuration and Site Administration Guide for a description of the VFU load procedure. Format channel selection for 537 printers is not supported at level 688.

Figure H-2. Carriage Control Tape Format (Short Paper Length; 8 LPI)
CARRIAGE CONTROL ARRAYS

Line spacing on a printer is controlled by a carriage control array. This array has the following forms for the various printers:

- Programmable format control (PFC) array for 580 printers.
- Carriage control tape for non-PFC 580 printers.
- Electronic vertical format unit (EVFU) for 533/536 printers.
- Vertical format unit (VFU) for 585 printers.

The selection of an array for any printer is dependent on the print density and the paper length to be used. You can specify one of several arrays already defined by the system using the SC parameter on the ROUTE command. These arrays are described in the NOS 2 Analysis Handbook. You can also select a user-specified PFC or VFU array to control print spacing. You must have validation to use a user-specified PFC array (refer to the LIMITS command). A user-specified array remains in effect until another array is encountered or the end-of-file is reached. The print density for printers using standard sized paper is selected using the S or T carriage control characters. 580 printers using short paper always use a print density of 8 lines per inch and ignore S and T.

A user-specified array begins with the control character V. When a V is encountered, the printer ejects the page. For non-PFC 580 printers, the rest of the line is ignored. For PFC 580 printers, if your are not validated to use the V carriage control character, the print operation aborts and you receive an appropriate message in your output file.

ARRAY SYNTAX

An array consists of a string of alphanumeric characters that can be used to redefine some or all of the format channels of the previously specified array. An array for output at 6 lines per inch occupies one line of up to 132 characters plus the terminator for 580 printers, up to 127 characters for 585 printers. An array for 8 lines per inch may occupy one or two lines. For printing on standard length paper, an array for 8 lines per inch can consist of up to 176 characters on 580 printers, 127 characters on 585 printers (88 lines per page). For short paper printers, an array for 8 lines per inch must not exceed 136 characters plus the terminator for 580 printers, 127 characters for 585 printers (68 lines per page).

Column 1 of an array must contain the carriage control character V. The second character of the array determines which array is changed and may be one of the following values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>6 lines per inch; the entire array specification occupies one line.</td>
</tr>
<tr>
<td>8</td>
<td>8 lines per inch; the entire array specification occupies one line.</td>
</tr>
<tr>
<td>C</td>
<td>8 lines per inch; the array specification continues onto a second line. The second line begins in column 3; columns 1 and 2 of the second line are ignored.</td>
</tr>
</tbody>
</table>
The array must be terminated by the letter O. Starting in column 3 and continuing up to the column that precedes the array terminator (letter O), each column in the array represents one line of printer output. A format channel indicator placed in one of these columns in a user-specified array changes the format channel in effect for the corresponding output line. If an array column is left blank, the format channel for the corresponding line remains unchanged. The channel indicators that can be inserted in these columns are as follows.

<table>
<thead>
<tr>
<th>Character</th>
<th>Significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Specifies top of form code (channel 1); mandatory entry in column 3 of the array (representing output line 1). Delete previous channels.</td>
</tr>
<tr>
<td>B through L</td>
<td>Specify format channels 2 through 12, respectively. Delete previous channels.</td>
</tr>
<tr>
<td>M</td>
<td>Specifies auto page eject channel. Applies to 585 printers only.</td>
</tr>
<tr>
<td>N</td>
<td>Specifies bottom of form channel. Applies to 585 printers only.</td>
</tr>
<tr>
<td>O</td>
<td>Array terminator.</td>
</tr>
<tr>
<td>X</td>
<td>Remove the channel format previously in effect for the line. Applies to 585 printers only.</td>
</tr>
<tr>
<td>Blank</td>
<td>No channel is specified; the channel format previously in effect for the line remains unchanged.</td>
</tr>
</tbody>
</table>

In the 580, each channel number referenced in your PFC array must appear in the PFC array previously in effect. Channel specifications can be repeated within an array.

**NOTES**

If a PFC array contains an invalid character, the array line is printed, and the printing of the file is terminated. Other arrays with invalid characters are ignored, and the file is printed using the carriage control array previously loaded into the printer.

If a VFU array contains an invalid character, the line containing the V control character is processed according to the undefined format effector action.
Following are some examples of invalid array specifications:

<table>
<thead>
<tr>
<th>Invalid Array</th>
<th>Error</th>
</tr>
</thead>
<tbody>
<tr>
<td>V6BCD 0</td>
<td>Does not contain an A in column 3.</td>
</tr>
<tr>
<td>VBA C DEO</td>
<td>Second character is not 6, 8, or C.</td>
</tr>
<tr>
<td>V8ABWCO</td>
<td>Contains an invalid character (W).</td>
</tr>
<tr>
<td>V6A 0</td>
<td>Contains a zero for the terminator.</td>
</tr>
</tbody>
</table>

**RESERVED FORMAT CHANNELS FOR VFU PROCESSING**

For printers that support format channels, three channels are reserved for specific carriage control operations. Channel 1 is always used to position the paper to the top-of-form. Two additional site selected channels are also reserved: one for positioning the paper to the logical bottom-of-form, and one for skipping over the perforations between forms (auto page eject). Each of these channels may appear only once in a VFU array. By default, both the bottom-of-form and auto-page-eject channels will be placed two lines above the physical end of the form. If the operator or user changes form size or print density, the bottom-of-form and auto-page-eject channels are moved to accommodate the change in the number of lines on the form. If the auto-page-eject option is changed, then the auto-page-eject channel is removed and restored in the VFU array.

**EXAMPLE**

The following is an example of an array used to print a special 8-line form.

Suppose you want to print on the top, fifth, and bottom lines of an 8-line form (at 8 lines per inch print density). Load the following array:

```
Columns:  1 2 3 4 5 6 7 8 9 10 11 12
          V 8 A B N 0
```

Since columns 4, 5, 6, 8, 10, and 11 are blank, the format channels for these columns remain unchanged from the array previously in effect. You might want to put an X or a dummy channel indicator (that is, a valid channel indicator that is not otherwise referenced in the file), such as a K, into these columns to ensure that the B and N channel indicators appear only where intended.

After loading the example array above, output lines beginning with an 8 or H (format channel 1) are printed at the top of the form, lines beginning with a 7 or G (format channel 2) are printed at the fifth line, and lines beginning with a 2 (bottom-of-form channel) are printed at the bottom of the form.
The B, E, and X format coded tapes are no longer supported by NOS. The following description of the physical and logical characteristics of the obsolete tapes is included as a reference for you if you use the TCOPY command.

**B (BLOCKED) FORMAT**

<table>
<thead>
<tr>
<th>Characteristics</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Unlabeled.</td>
</tr>
<tr>
<td>Mode</td>
<td>Coded.</td>
</tr>
<tr>
<td>Block size (PRU size)</td>
<td>The block size cannot exceed 5120 frames. If the tape unit will not allow an odd number of frames to be written, the system will append a space. Unless you specify otherwise when you request a tape, the system will assume the maximum block size is 150 frames.</td>
</tr>
<tr>
<td>Logical end-of-record</td>
<td>For a write operation, there is no logical end-of-record. For a read operation, end-of-record status is returned when a tape mark is encountered. An additional read operation returns end-of-file status.</td>
</tr>
<tr>
<td>Logical end-of-file</td>
<td>Tape mark.</td>
</tr>
<tr>
<td>Logical end-of-information</td>
<td>None.</td>
</tr>
<tr>
<td>End-of-reel</td>
<td>Refer to option 2 under End-Of-Tape/End-Of-Reel Conditions.</td>
</tr>
<tr>
<td>Noise</td>
<td>Any block containing fewer than 18 frames is considered noise, and is, therefore, ignored.</td>
</tr>
</tbody>
</table>

**Special considerations**

- B-formatted tapes cannot be labeled.
- A write operation will stop either at a zero byte (end-of-line) in byte 4 of a CM word or at a multiple of CM words (rounded up) based on the frame or character count.
- For control word reads, byte count and unused bit count will be set appropriately. For regular reads, EOL is guaranteed.
- For a control word write operation, no end-of-line processing is done. Data is blocked on tape using the specified frame count. Likewise for a control word read operation, no end-of-line processing is done; data is transferred to you as it is read.
### E (LINE IMAGE) FORMAT

#### Characteristics

<table>
<thead>
<tr>
<th>Description</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logical end-of-record</td>
<td>For a write operation, there is no logical end-of-record. For a read operation, end-of-record status is returned when a tape mark is encountered. An additional read operation returns end-of-file status.</td>
</tr>
<tr>
<td>Logical end-of-file</td>
<td>Tape mark.</td>
</tr>
<tr>
<td>Logical end-of-information</td>
<td>None.</td>
</tr>
<tr>
<td>End-of-reel</td>
<td>Refer to option 2 under End-Of-Tape/End-Of-Reel Conditions.</td>
</tr>
<tr>
<td>Noise</td>
<td>Same as for B-formatted tapes.</td>
</tr>
</tbody>
</table>

#### Special considerations

- E-formatted tapes cannot be labeled.

- For a write operation, a block of data will stop either at a zero byte (end-of-line) in byte 4 of a CM word or at the multiple of CM words (rounded up) based on the frame or character count. The system will then space-fill the buffer to the number of frames specified. Thus, the amount of data written will exactly equal the amount specified.

- For a read operation, if there is an odd number of characters, the system will space-fill the last 6 bits of the last byte and delete all trailing spaces. For control word reads, byte count and unused bit count will be set appropriately. For regular reads, EOL is guaranteed.

- For a control word write operation, no end-of-line processing is done. Data is blocked on tape using the specified frame count. Likewise for a control word read operation, no end-of-line processing is done; data is transferred to you as it is read.
**X (EXTERNAL) FORMAT**

<table>
<thead>
<tr>
<th>Characteristics</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header</td>
<td>Unlabeled.</td>
</tr>
<tr>
<td>Mode</td>
<td>Binary.</td>
</tr>
<tr>
<td>Block size (FRU size)</td>
<td>Actual data block size can range from 0 to 512 (1000g) CM words in exact multiples of CM words.</td>
</tr>
<tr>
<td>Logical end-of-record</td>
<td>Any block containing fewer than 512 CM words represents a logical end-of-record. If a logical record consists of an exact multiple of 512 words, the block that denotes the logical end-of-record consists solely of a 48-bit block terminator.</td>
</tr>
<tr>
<td>Logical end-of-file</td>
<td>Tape mark.</td>
</tr>
<tr>
<td>Logical end-of-information</td>
<td>None.</td>
</tr>
<tr>
<td>End-of-reel</td>
<td>Refer to option 1 under End-Of-Tape/End-Of-Reel Conditions.</td>
</tr>
<tr>
<td>Noise</td>
<td>Any block containing fewer than eight frames for seven-track tapes or six frames for nine-track tapes is considered noise, and is, therefore, ignored.</td>
</tr>
</tbody>
</table>

**Special considerations**

- X-formatted tapes cannot be labeled.
- All nine-track tapes are written in an even multiple of bytes.

**END-OF-TAPE/END-OF-REEL CONDITIONS**

The following is a description of the processing options for end-of-tape conditions. You can select one of these options by default by specifying the data format or you can specify an option via the PO keyword on a LABEL, ASSIGN, or REQUEST command.

<table>
<thead>
<tr>
<th>Option</th>
<th>PO= Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>I</td>
<td>Rewrites the block on which the end-of-tape condition is sensed as the first block on the next volume, if the system senses the EOT during a write operation. During a read operation, the block on which the EOT occurred is ignored and reading continues on the next volume. If a tape mark and the EOT are sensed at the same time, the EOT is ignored.</td>
</tr>
<tr>
<td>Option</td>
<td>PO = Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>2</td>
<td>P</td>
<td>Writes a trailer sequence following the block on which the EOT is sensed, if the system senses the EOT during a write operation. Any data that occurs following the block on which EOT is sensed, yet before the tape mark, is ignored. During a read operation, the system transfers the block on which the EOT is sensed to your job. The read operation resumes on the next reel. If a tape mark and the EOT are sensed at the same time, the EOT is ignored. The system is concerned only with the block on which the EOT is sensed. If tapes written using these options are transferred to another system, any data that occurs on the reel after this block should be ignored.</td>
</tr>
</tbody>
</table>

The system is concerned only with the block on which the EOT is sensed. If tapes written using these options are transferred to another system, any data that occurs on the reel after this block should be ignored.
INTRODUCTION

The NAM/CCP network, through which terminals access a host and its applications (like IAF), can support many types of terminals. All supported terminals are grouped by the network into 18 standard terminal classes. Each terminal class has specific operating characteristics, also referred to as terminal characteristics. These terminal characteristics, taken together, make up a terminal definition and are predefined by the network to closely match the operating characteristics of actual terminals. The network accepts changes to any of these terminal definitions through terminal definition commands. These commands specify one or more parameters, each of which may give a new value to a terminal characteristic. Tables J-1 and J-2 list these terminal definitions, the default values, and possible values for each of the 18 classes.

The tables use the following abbreviations when identifying the terminal types for each terminal class:

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>HASP</td>
<td>Terminals using the Houston Automatic Spooling Program communication protocol.</td>
</tr>
<tr>
<td>HAZ</td>
<td>Hazeltine.</td>
</tr>
<tr>
<td>POST</td>
<td>HASP terminals that only support postprint format control.</td>
</tr>
<tr>
<td>PRE</td>
<td>HASP terminals that only support preprint format control.</td>
</tr>
<tr>
<td>Tek</td>
<td>Tektronix (teletypewriter emulation).</td>
</tr>
<tr>
<td>TTY</td>
<td>Teletype.</td>
</tr>
<tr>
<td>UT</td>
<td>User Terminal.</td>
</tr>
<tr>
<td>X.25</td>
<td>Terminals connected to a packet switching network (PSN) using the X.25 communication protocol.</td>
</tr>
<tr>
<td>X3.64</td>
<td>Terminals conforming to the ANSI X3.64 standard.</td>
</tr>
</tbody>
</table>

When a terminal logs in to the network, either the network assumes it to be of a certain terminal class or assigns it a terminal class that resembles the terminal's actual characteristics. If you do not know the terminal class in use, you can enter the CH command (described in this appendix) to ascertain the terminal class and some of the characteristics of your terminal. In either case, if the characteristics of your terminal do not match those of its assigned terminal class, you can change the values of the terminal characteristics or even change the terminal class by using the terminal definition commands described in this appendix. You can enter terminal definition commands any time the terminal is connected to the network (refer to login/logout procedures in Volume 1, Introduction to Interactive Usage).
When you use a terminal definition command to change a value, that change remains in effect until the terminal is disconnected from the network or another terminal definition command is used to change the value. Even application switching and logout do not change the values of the terminal characteristics if the terminal has not been disconnected from the network. Disconnecting your terminal from the network (that is, disconnecting the phone and redialing on dial-up terminals or turning a dedicated terminal off and then on again) causes all terminal characteristics to be reset to site-defined default values. The site defines these values using the Network Definition Language (NDL).

You can also reset your terminal's characteristics by entering the TC command. The TC command resets your terminal characteristics to the default values specified by the Communications Control Program (CCP). Note that CCP-defined values may differ from the site-defined NDL values.

It is also possible to change terminal definitions using the TRMDEF command or by using control byte 16 from an interactive job. Section 8 describes the TRMDEF command under Terminal Definition Commands. Refer to Volume 4, Program Interface, for information on control bytes.
TERMINAL DEFINITION COMMAND FORMAT

This section describes the general format of a terminal definition command. The specific format of each command appears later in this appendix.

General formats:

ct keyword=value
ct keyword1=value1 ct keyword2=value2...ct keywordn=value

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Represents a mnemonic associated with a terminal characteristic.</td>
</tr>
<tr>
<td>value</td>
<td>Specifies a particular value associated with the terminal definition mnemonic. Table J-2 gives the range of values for each terminal definition keyword. On some commands the =value portion of the command is optional and defaults to =Y.</td>
</tr>
<tr>
<td>keywordi</td>
<td>Same as keyword.</td>
</tr>
<tr>
<td>valuei</td>
<td>Same as value.</td>
</tr>
</tbody>
</table>

The second format allows you to make multiple terminal definitions in one line. If the line extends beyond character position 54, the results are unpredictable. Also, if you change the network control character ct in a concatenated group of commands, the CT command does not take effect until the remaining commands in the group have been processed.

As with all commands described in this manual, you must press the message transmission key in order for the system to process your command. Appendix K shows the default message transmission keys for the various terminal classes. This appendix describes how you can change the message transmission key (refer to the EB and EL commands).

Example:

To change the page width of a 200 User Terminal, enter these characters

% PW=50

and press the SEND key. The % character is the network control character, PW is the keyword associated with page width, 50 is the new page width for the terminal, and the SEND key is the message transmission key for a 200 User Terminal.

†The spaces shown are for clarity only. Do not include spaces when you enter a terminal definition command.

††You must press the ATTN key on a 2741-compatible terminal before entering this character.
RESTRICTIONS

You should not enter terminal definition commands while output is in progress. The network may not be able to perform such commands immediately.

The network presets all user-adjustable terminal characteristics any time you establish a connection to the network. The site administrators choose these preset values. Additionally, when a terminal is disconnected from the network and then reconnected, the network resets any terminal characteristics you have changed to their preset values.

To enter a terminal definition command at asynchronous terminals from which you can enter more than one line before transmitting (IN=BK is specified), the terminal definition command must be the last input line in the transmission. If the input is from paper tape (IN=PT is specified), the tape reader must stop. Unpredictable results can occur if more input follows the terminal definition command in the transmission block.

Characters or character codes you specify for the value portion of terminal definition commands are subject to the following restrictions:

- You cannot use the following ASCII characters (or their character codes) in the value portion of the AB, CN, BS, Bl, B2, CT, EB, or EL commands:
  - any lowercase or uppercase alphabetic character
  - any digit 0 through 9
  - NUL
  - SOH
  - STX
  - =
  - DEL
  - space

- The ASCII characters or character codes you specify for the AB, BS, Bl, B2, CN, CT, EB, and EL terminal definitions must all be different, except that AB and CN can have the same value and EB and EL may have the same value.

- If output flow control is used, do not use DClS and DC3s in the AB, CN, BS, Bl, B2, CT, EB, or EL commands.

TERMINAL DEFINITION COMMANDS

This subsection describes the function and format of each terminal definition command. The headings consist of the command name (a two-character mnemonic) followed by the terminal attribute it defines. Generally, the format descriptions do not show the default values or ranges of values since they vary with terminal class. Tables J-1 and J-2 show this information. If you are unable to find the key on your keyboard that corresponds to a particular character given in table J-1, consult the documentation for your terminal.

This section refers to categories of terminal classes to which commands apply. The categories are as follows:

<table>
<thead>
<tr>
<th>Category</th>
<th>Terminal Classes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asynchronous</td>
<td>1 through 8</td>
</tr>
<tr>
<td>Mode 4</td>
<td>10, 11, 12, 13, 15</td>
</tr>
<tr>
<td>HASP</td>
<td>9, 14</td>
</tr>
<tr>
<td>Bisynchronous</td>
<td>16, 17</td>
</tr>
<tr>
<td>X.25 PSN</td>
<td>1, 2, 3, 5, 6, 7, 8</td>
</tr>
<tr>
<td>3270</td>
<td>18</td>
</tr>
</tbody>
</table>

J-4
(AB) - ABORT OUTPUT BLOCK CHARACTER

The AB command specifies the character used to abort an output block. When you enter this character from the terminal as the only character in a line, the current transmission block of output to the terminal is discarded.

Format:

\[ ct \text{ AB} = \text{ab} \]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>ab</td>
<td>Specifies the new abort output block character. This character must differ from the characters defined for BS, Bl, B2, CT, EB, and EL.</td>
</tr>
</tbody>
</table>

This command only applies to asynchronous terminals and is not valid for X.25 PSN terminals.

(AR) - AUTOMATIC CHARACTER RECOGNITION

The AR command allows you to change the terminal's character set or its line speed, in many cases, by means of a switch on the terminal or a removable type ball. You can enter this command any time after the system prompts you for input, even before you enter your user name during login.

Format:

\[ ct \text{ AR} \]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
</tbody>
</table>

After entering the AR command, you must select the terminal speed and enter a carriage return. The system acknowledges the carriage return operation and indicates that the line speed recognition is complete by returning two line feeds. If your terminal cannot change its line speed, no line feed responses occur. At this point, enter a closing parenthesis followed by a carriage return so that the system can recognize the terminal's new character set. When the system recognizes the new character set, it issues a line feed and the message AR ACCEPTED.. to indicate you can continue. This is also the auto-recognition procedure used to connect the terminal to the system (refer to the login/logout procedures in Volume 1, Introduction to Interactive Usage).

This command only applies to asynchronous terminals and is not valid for X.25 PSN terminals. X.25 PSN terminals use the ASCII code and character set.
(BF) - BLOCKING FACTOR

The BF command sets the size of intermediate data blocks that will be delivered to the application.

Format:

ct BF=bf

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>bf</td>
<td>Specifies the blocking factor. You can specify the following values for bf:</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>2</td>
</tr>
</tbody>
</table>

Regardless of the blocking factor, an end-of-line character (usually a carriage return) forwards data to the application.

(BR) - BREAK KEY AS USER BREAK 1

The BR command determines if the BREAK key (interruption key for interactive output) also functions as the interruption sequence (user break 1 sequence) when entered during output and as the cancel character when entered during input.

Format:

ct BR=.option

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>option</td>
<td>Determines if this feature is enabled or disabled. A value of Y enables and a value of N disables this feature.</td>
</tr>
</tbody>
</table>

This command only applies to asynchronous terminals. For X.25 PSN terminals, the BREAK key can only function as the interruption sequence whether entered during input or output.
(BS) – BACKSPACE CHARACTER

The BS command specifies the character used to delete the previous input character.

Format:

```
ct BS=bs
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>bs</td>
<td>Specifies the new backspace character. This character must differ from the characters currently defined for AB, Bl, B2, CN, CT, EB, and EL.</td>
</tr>
</tbody>
</table>

It is possible to backspace only to the beginning of the current physical line; additional backspaces are disregarded. When a page width of 0 is selected, the network assumes a page width of 100 characters for backspacing. If the page width is in the range 20 through 56, backspacing into previous physical lines is sometimes permitted.

This command only applies to asynchronous terminals only.

(B1) – INTERRUPTION OR USER BREAK 1 CHARACTER

The B1 command specifies the character that, when entered as the only character in a logical line (interruption character followed by the message transmission key), causes program interruption.

Format:

```
ct B1=ubl
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>ubl</td>
<td>Specifies the new user break 1 character. This character must differ from the characters currently defined for AB, BS, B2, CN, CT, EB, and EL.</td>
</tr>
</tbody>
</table>

The interruption sequence is discussed in section 16. The BR command determines whether the BREAK key can also function as the B1 character.

This command does not apply to bisynchronous 2780 and 3780 terminals.
(B2) - TERMINATION OR USER BREAK 2 CHARACTER

The B2 command specifies the character that, when entered as the only character in a logical line (termination character followed by the message transmission key), causes program termination.

Format:

ct B2=ub2

Parameter | Description
---|---
ct | Represents the network control character for your terminal as defined by the CT terminal definition command.
ub2 | Specifies the new user break 2 character. This character must differ from the characters currently defined for AB, BS, Bl, CN, CT, EB, and EL.

The termination sequence is discussed in section 16.

This command does not apply to bisynchronous 2780 and 3780 terminals.

(CH) - DISPLAY TERMINAL CHARACTERISTICS

The CH command displays some of the terminal's current characteristics.

Format:

ct CH

Parameter | Description
---|---
ct | Represents the network control character for your terminal as defined by the CT terminal definition command.

The CH command produces a display in the following format:

TC=tc,BS=bs,CN=cn,AB=ab,B1=ub1,B2=ub2,EL=e1,EB=eb

where the variable portions appear as ASCII characters if printable, mnemonics (for example, STX) if nonprintable, or N/A if the attribute is not applicable.
(CI) - CARRIAGE RETURN IDLE COUNT

The CI command specifies the number of idle characters to be inserted into the output stream after a carriage return.

Format:

```
ct CI=ci
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>ci</td>
<td>Specifies the new carriage return idle count. This value can be from 0 to 127 or the string CA. A value of CA restores the carriage return idle count to the default value.</td>
</tr>
</tbody>
</table>

When the network produces a carriage return, the network outputs the specified number of idle characters before outputting the next line. This allows time for the carriage return function and ensures that characters are not lost because of printing attempts during the carriage return operation.

This command only applies to asynchronous terminals.

(CN) - CANCEL CHARACTER

The CN command specifies the character used to cancel the logical line currently being input.

Format:

```
ct CN=cn
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>cn</td>
<td>Specifies the new cancel character. This character must differ from the characters currently defined for BS, Bl, B2, CT, EB, and EL.</td>
</tr>
</tbody>
</table>

When you enter the cancel character as the last character in a line, the entire logical line in progress is cancelled. The system responds to a cancel line character by printing *DEL* on the next line and positioning the carriage to the beginning of a new line. The BR command determines whether the BREAK key can also function as the CN character.

This command does not apply to bisynchronous 2780 and 3780 terminals.
**CURSOR POSITIONING AFTER INPUT**

The CP command determines whether or not the system sends the terminal a response to the line feed key, the EL character, and the EB character.

Format:

```plaintext
ct CP=option
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>option</td>
<td>Indicates whether to send a response to the terminal or not. A value of Y indicates yes and N indicates no.</td>
</tr>
</tbody>
</table>

This command applies only to asynchronous terminals (except 2741s). If CP=Y and IN=KB are selected, the system responds to the line feed key by sending a carriage return and responds to an EL or EB character by sending the cursor positioning response specified by the EL or EB command. If IN=BK is selected or you are at an X.25 PAD terminal, the system responds only to the EB character by sending the cursor positioning response selected by the EB command.

**NETWORK CONTROL CHARACTER**

The CT command specifies a network control character for the terminal. When you enter this character as the first character of a logical line, it signals that what follows is a terminal definition command or a special command that the network forwards to your application with a preemptive status (refer to the interactive status commands in section 8).

Format:

```plaintext
ct CT=char
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the current network control character for your terminal.</td>
</tr>
<tr>
<td>char</td>
<td>Specifies the new network control character. This character must differ from the characters currently defined for AB, BS, BI, B2, CN, EB, and EL.</td>
</tr>
</tbody>
</table>

If you enter the CT command in a line with multiple terminal definitions, the new value char does not take effect until the complete line is processed.
(DL) - DELIMITERS FOR SINGLE-MESSAGE TRANSPARENT INPUT MODE

The DL command specifies the delimiters that terminate single-message transparent input mode. When you initiate transparent input mode (IN=X, IN=XX, or IN=XP), the network reads your input and sends it to the system without translation until it encounters a delimiter. If your terminal's parity is set to even, odd, or zero (PA=E, 0, or Z), the parity bit is stripped (set to zero) before the characters are sent to the host, although no translation occurs. If your terminal's parity is set to none or ignore (PA=N or I), the parity bit is not stripped. See the NAM/CCP Terminal Interfaces Reference Manual for more information on transparent input and parity. The first delimiter encountered terminates transparent input mode.

Format:

ct DL=Xxx,Ccount,TO

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>Xxx</td>
<td>Specifies the 2-digit hexadecimal code (xx) of the character you want as a delimiter. The network does not send the character as part of the input data. When you specify a hexadecimal code above 7F, you must have previously set your terminal's parity to none (PA=N) or ignore (PA=I); otherwise the network cannot detect the code when it occurs in a transparent mode message. If the terminal's parity is set to none, the 8-bit hexadecimal code input from the terminal is matched against the 8-bit hexadecimal code specified as the delimiter (xx). If the terminal's parity is set to ignore, the bottom 7 bits of the terminal input are matched against the bottom 7 bits of the specified delimiter (xx).</td>
</tr>
<tr>
<td>Ccount</td>
<td>Specifies a decimal value (count) from 1 to 4095 that functions as a character count delimiter. These values are valid within the network. However, unless changed during installation, the maximum logical input line length in IAF (2500 characters) limits you.</td>
</tr>
<tr>
<td>TO</td>
<td>Specifies that a timeout of between 200 and 400 milliseconds will be a transparent mode delimiter.</td>
</tr>
</tbody>
</table>

You can select any of the three types of delimiters: character delimiter (specify Xxx), character count delimiter (specify Ccount), and timeout delimiter (specify TO).

The parameter values for DL are order-independent and optional. However, you must specify at least one of the parameter values. You can omit trailing commas if you do not specify all three types of delimiters.

Entering this command with any number of new delimiters cancels all transparent mode input delimiters already in effect, including those specified with the XL command.

The DL command applies only to asynchronous and mode 4 terminals. Terminal class 4 is configured with the RETURN key as the only transparent mode terminator and mode 4 terminals are configured with the SEND or ETX key as their only transparent mode terminator. For X.25 devices, the PAD forwarding signal always acts as a transparent mode terminator in addition to any other options selected.
(EB) - END-OF-BLOCK CHARACTER

The EB command defines the end-of-block character and defines the cursor-positioning response to that character. The EB character acts as the message transmission key for terminals operating in block mode (refer to the IN command).

Format:

ct EB=eb,cpr

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>eb</td>
<td>Specifies the new end-of-block character. You can specify the following values for eb:</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>XXX</td>
</tr>
<tr>
<td></td>
<td>EB</td>
</tr>
<tr>
<td></td>
<td>EL</td>
</tr>
<tr>
<td>cpr</td>
<td>Specifies the cursor-positioning response to the EB character. You can specify the following values for cpr:</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>CR</td>
</tr>
<tr>
<td></td>
<td>LF</td>
</tr>
<tr>
<td></td>
<td>CL</td>
</tr>
<tr>
<td></td>
<td>NO</td>
</tr>
</tbody>
</table>

The two EB parameters (EB=eb and cpr) are optional and order-independent. If you omit one, the system retains its previous value.

This command is valid only for asynchronous terminals and mode 4 terminals, except for paper tape devices and 2741 terminals. The end-of-block character for mode 4 terminals is ETX and is not changeable. If you specify the char form of the eb parameter, it is only effective if it occurs as the last character in a line.

The CP command enables or disables the cursor-positioning response specified by the cpr parameter.
(EL) - END-OF-LINE CHARACTER

The EL command defines the logical end-of-line character (carriage return) and defines the cursor-positioning response to that character. It also defines the message transmission key for asynchronous terminals not operating in block mode (refer to the IN command).

Format:

```
ct EL=el, cpr
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>el</td>
<td>Specifies the new logical end-of-line character. You can specify the following values for el:</td>
</tr>
<tr>
<td></td>
<td>el</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>Xxx</td>
</tr>
<tr>
<td></td>
<td>EB</td>
</tr>
<tr>
<td></td>
<td>EL</td>
</tr>
<tr>
<td>cpr</td>
<td>Specifies the cursor-positioning response to the EL character. You can specify the following values for cpr:</td>
</tr>
<tr>
<td></td>
<td>cpr</td>
</tr>
<tr>
<td></td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>CR</td>
</tr>
<tr>
<td></td>
<td>LF</td>
</tr>
<tr>
<td></td>
<td>CL</td>
</tr>
<tr>
<td></td>
<td>NO</td>
</tr>
</tbody>
</table>

The two EL parameters (el and cpr) are optional and order-independent. If you omit one, the system retains its previous value.

This command does not apply to 2741, HASP, 3270, and bisynchronous 2780 and 3780 terminals; the cpr parameter does not apply to mode 4 or X.25 PSN terminals; and the char specification does not apply to mode 4 terminals.

The CP command enables or disables the cursor-positioning response specified by the cpr parameter.
**EP** - ECHOPLEX MODE

The EP command enables or disables the echoing of input characters back to the terminal.

**Format:**

```
ct EP=option
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>option</td>
<td>Specifies whether to enable (Y) or disable (N) input echoing.</td>
</tr>
</tbody>
</table>

Some terminals can perform their own character echoing, such as terminals with a HALF/FULL duplex switch. If the switch is in the HALF position, set the EP value to N, and the terminal echoes the input. If the switch is in the FULL position, set the EP value to Y and the network echoes the input.

You can use the EP command and full-duplex mode as a security measure. If you are in full-duplex mode and EP is Y during login, the system echoes all of your input except your password. This is not true, however, if you enter your user name and password on the same line.

This command only applies to asynchronous terminals (except 2741s).

**FA** - FULL ASCII INPUT MODE

The FA command enables or disables the full-ASCII input mode.

**Format:**

```
ct FA=option
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>option</td>
<td>Specifies whether to enable (Y) or disable (N) the full-ASCII input mode.</td>
</tr>
</tbody>
</table>

In full-ASCII input, all 128 ASCII characters, including NUL, DEL, STX, LF, and all BLK and message-forwarding signals (which are normally discarded), are sent to the host. Exceptions to this are the following characters:

- NULs, DELs and LFs when encountered as the first character of an input line or as the character following a message-forwarding signal
- CRs that follow LFs when inputting from paper tape
- DC3s that follow the EL character when inputting from paper tape
- DC1s and DC3s when output control (OC=Y) is selected
In full-ASCII mode, the network does not recognize the terminal functions associated with the mnemonics Bl, B2, CN, AB, and BS. The network does recognize terminal definition commands and other commands beginning with the CT character.

If SE is in effect when you select FA or if FA is in effect when you select SE, FA takes precedence and SE will not be effective until FA is turned off. If full-ASCII mode is enabled when you select transparent input mode, the network suspends the full-ASCII mode until the transparent input mode terminates.

This command only applies to asynchronous and mode 4 terminals.

**(HC) - HOST CONNECTION**

The HC command disconnects you from your current host and establishes a new host connection. The new host connection can be selected by an HN command or by the HC command (HC=hostname). The HC command is equivalent to HS or HN followed by TM.

Format:

\[
\text{ct HC=hostname}
\]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>hostname</td>
<td>Specifies the name of the host to which you want your terminal connected.</td>
</tr>
</tbody>
</table>

The host selected is used until you change it or until your terminal is disconnected from the host.

**(HD) - DISPLAY OF HOST NODES**

The HD command causes the host availability display (HAD) to be displayed at your terminal. The HAD lists all paths you can select to connect your terminal to a host.

Format:

\[
\text{ct HD}
\]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
</tbody>
</table>
The HAD has the following format:

```
message       CONTROL CHARACTER=ct
NPU NODE=npu TERMINAL NAME=terminal

<table>
<thead>
<tr>
<th>HOST</th>
<th>NODE</th>
<th>SELECTED/CONNECTED</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>host1</td>
<td>node1</td>
<td>condition1</td>
<td>status1</td>
</tr>
<tr>
<td>host2</td>
<td>node2</td>
<td>condition2</td>
<td>status2</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>hostn</td>
<td>node_n</td>
<td>condition_n</td>
<td>status_n</td>
</tr>
</tbody>
</table>
```

prompt response

The variable items in the display have the following descriptions.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>A message describing the status of your current host connection.</td>
</tr>
<tr>
<td>ct</td>
<td>Network control character currently defined for your terminal.</td>
</tr>
<tr>
<td>npu</td>
<td>The node number of the Network Processing Unit (NPU) your terminal is connected to.</td>
</tr>
<tr>
<td>terminal</td>
<td>The name of your terminal.</td>
</tr>
<tr>
<td>host&lt;sub&gt;i&lt;/sub&gt;</td>
<td>Represents the 1- to 7-character name of a host. The field may be blank.</td>
</tr>
<tr>
<td>node&lt;sub&gt;i&lt;/sub&gt;</td>
<td>Represents a node number (1-31).</td>
</tr>
<tr>
<td>condition&lt;sub&gt;i&lt;/sub&gt;</td>
<td>Indicates that you have selected node&lt;sub&gt;i&lt;/sub&gt; (S), that you are connected to the host using node&lt;sub&gt;i&lt;/sub&gt; (C), or that node&lt;sub&gt;i&lt;/sub&gt; has been automatically selected and the connection to the host is in progress (SA).</td>
</tr>
<tr>
<td>status&lt;sub&gt;i&lt;/sub&gt;</td>
<td>Represents AVAILABLE or NOT AVAILABLE.</td>
</tr>
<tr>
<td>prompt message</td>
<td>Action to take in response to a host status message.</td>
</tr>
<tr>
<td>message</td>
<td></td>
</tr>
</tbody>
</table>
(HN) - HOST NODE SELECTION

The HN command sets or changes the host or the path (node) to a host through which your terminal is connected. This command does not disconnect you from your current host connection. You must log out or disconnect with the Secure Login command or TM terminal definition command before you can connect to the new selection.

Format:

\texttt{ct HN=node}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{ct}</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>\texttt{node}</td>
<td>Specifies a node number. The default is the node the network processing unit is presently using to access its supervisor (CS).</td>
</tr>
</tbody>
</table>

The host availability display (HAD) lists all nodes your terminal can use. Refer to the HD command for a description of the HAD.

(HS) - HOST SELECTION

The HS command selects a host which is connected to your terminal. The host availability display (HAD) shows the available hosts (refer to the HD command).

Format:

\texttt{ct HS=hostname}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{ct}</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>\texttt{hostname}</td>
<td>Specifies the name of the host to which you want your terminal connected. The valid entries appear in the HAD.</td>
</tr>
</tbody>
</table>

Your terminal uses the path to host with the least traffic. The path selected is used until either you change it or until your terminal is disconnected from the host.
(IC) - FLOW CONTROL FOR INPUT DEVICES

The IC command specifies whether the terminal recognizes DC3s as a stop signal and DC1s as a resume signal for terminal input.

Format:

```
ct IC=option
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>option</td>
<td>Specifies whether to enable (Y) or disable (N) input control.</td>
</tr>
</tbody>
</table>

Input control applies to asynchronous terminals, including paper tape devices (except 2741s).

(IN) - INPUT DEVICE AND TRANSMISSION MODE

The IN command identifies the input device and the transmission mode of the device. As the input device, you can specify one of the following:

- A keyboard.
- A paper tape reader.

As the input transmission mode, you can specify either:

- Normalized line mode (one message or logical line per terminal transmission block).
- Normalized block mode (one or more logical lines or messages collected into a block before it is transmitted).
- Transparent mode (input is not edited or translated by the network).
Format:

ct IN=\textit{in}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{ct}</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>\textit{in}</td>
<td>Specifies the input device and transmission mode. You can specify the following values for \textit{in}:</td>
</tr>
<tr>
<td>\textit{BK}</td>
<td>Selects block mode as from a form terminal and normalized input mode.</td>
</tr>
<tr>
<td>\textit{KB}</td>
<td>Selects a keyboard in character or line mode and normalized input mode.</td>
</tr>
<tr>
<td>\textit{PT}</td>
<td>Selects paper tape and normalized input mode.</td>
</tr>
<tr>
<td>\textit{X}</td>
<td>Selects the current input device and transparent input mode.</td>
</tr>
<tr>
<td>\textit{XK}</td>
<td>Selects the keyboard and transparent input mode.</td>
</tr>
<tr>
<td>\textit{XP}</td>
<td>Selects paper tape and transparent input mode.</td>
</tr>
</tbody>
</table>

When the \textit{IN} value is XK, XP, or X, terminal input is sent to the host in transparent mode blocks. Transparent mode continues until the system encounters a previously defined transparent mode terminator.

When the \textit{IN} value is XK and transparent mode terminates, the \textit{IN} value automatically reverts to KB. When the \textit{IN} value is XP and transparent mode terminates, the \textit{IN} value automatically reverts to PT. When the \textit{IN} value is X and transparent mode terminates, the \textit{IN} value automatically reverts to the value that was previously in effect.

When the \textit{IN} value is PT or XP, the network sends the X-ON code to start the paper tape reader automatically after the end of a message is output to the terminal and the message empties the terminal's output queue.

The \textit{IN} command is not applicable to HASP, 3270, or bisynchronous 2780 and 3780 terminals. 2741 terminals can only select IN=KB, IN=X, and IN=XK. Mode 4 terminals, which are always in block mode, and X.25 PSN terminals cannot select PT or XP mode.
(LI) - LINE FEED IDLE COUNT

The LI command specifies the number of idle characters to be inserted into the output stream following a line feed.

Format:

```
ct LI=value
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>value</td>
<td>Specifies the new line feed idle count. This value can be from 0 to 127 or the string CA. A value of CA restores the line feed idle count to the default value.</td>
</tr>
</tbody>
</table>

The line feed idle count is similar to the carriage return idle count (CI), except that the idle characters are output after a line feed instead of after the carriage return.

This command only applies to asynchronous terminals.

(LK) - LOCKOUT OF UNSOLICITED MESSAGES

The LK command determines whether unsolicited messages from the network operator appear at your terminal.

Format:

```
ct LK=option
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>option</td>
<td>Specifies whether to lock out unsolicited messages. A value of Y locks out the messages and a value of N allows the messages to appear.</td>
</tr>
</tbody>
</table>
(MS) - MESSAGE TO NETWORK OPERATOR

The MS command sends a message to the network operator.

Format:

```
ct MS=message
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>message</td>
<td>Specifies your message to the operator. You can use any string of 50 characters or less.</td>
</tr>
</tbody>
</table>

If you are having problems with the network (such as difficulty connecting to IAF), you can communicate these problems to the network operator using the MS command.

(OC) - FLOW CONTROL FOR OUTPUT DEVICES

The OC command specifies whether the terminal generates DC3s as a stop signal to the network and DC1s as a resume signal for terminal output.

Format:

```
ct OC=option
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>option</td>
<td>Specifies whether to enable (Y) or disable (N) output control.</td>
</tr>
</tbody>
</table>

If the network receives a DC3 while output control is enabled, it suspends output until it receives a DC1.

Output control applies to asynchronous terminals, including paper tape devices (except 2741s).

(OP) - OUTPUT DEVICE SELECTION

The OP command specifies the type of output device.

Format:

```
ct OP=op
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
</tbody>
</table>
Parameter | Description
---|---
op | Specifies the output device. You can specify the following values for op:
  | OP | Description
  | DI | Specifies a display device.
  | PR | Specifies a printer.
  | PT | Specifies a paper tape punch.

You can punch a tape in any mode, but the network does not provide the proper X-OFF characters unless OP has a value of PT.

If you select OP=PR, the network does line folding and page bounding for asynchronous and X.25 PSN terminals. If OP=DI, the network assumes the terminal performs these functions itself.

This command only applies to asynchronous terminals (except 2741s). OP=PT does not apply to X.25 PSN terminals.

(PA) - PARITY PROCESSING

The PA command specifies the parity processing to be performed by the network.

Format:

ct PA=pa

Parameter | Description
---|---
ct | Represents the network control character for your terminal as defined by the CT terminal definition command.
pa | Specifies the type of parity processing. You can specify the following values for pa:
  | pa | Description
  | E | Set parity bit for even parity during output, and check for even parity (except for X.25 PSN terminals) and set parity bit to zero on input.
  | N | In transparent mode, do not set or check the parity bit because it is part of the input or output data. In normalized mode, set the parity bit to zero on input and output.
  | O | Set parity bit for odd parity during output, and check for odd parity (except for X.25 PSN terminals) and set parity bit to zero on input.
**Parameter** | **Description**
--- | ---
pa | 
Z | Set parity bit to zero on output and check parity bit against zero on input.
I | In transparent mode, do not set or check the parity bit because it is part of the input or output data. Ignore the parity bit when checking for transparent input mode delimiters. In normalized mode, set the parity bit to zero on input and output.

This command only applies to asynchronous terminals (except 2741s). For X.25 PSN terminals, the parity bit is set to 0 and not checked for input.

**(PG) - PAGE WAITING**

The PG command enables or disables page waiting at the terminal during output. If you enable page waiting, the terminal stops at the end of each output page for your acknowledgement (a null input line) before output continues. (In order for the PG command to be effective, page length (PL) must be non-zero.)

Format:

```
ct PG=option
```

**Parameter** | **Description**
--- | ---
ct | Represents the network control character for your terminal as defined by the CT terminal definition command.
option | Specifies whether to enable (Y) or disable (N) page waiting.

When you enter a null input line to get the next page of output, the null input line has no other meaning.

Page waiting does not apply to bisynchronous 2780 or 3780 terminals or to HASP terminals.

**(PL) - PAGE LENGTH**

The PL command establishes the maximum number of physical lines that can be printed as one page. If the output device type is PR, the network automatically positions the carriage to the top of the form after PL lines have been output.

Format:

```
ct PL=pl
```

**Parameter** | **Description**
--- | ---
ct | Represents the network control character for your terminal as defined by the CT terminal definition command.
pl | Specifies the page length. You can specify 0 or any value from 8 to 255. PL=0 selects an infinitely long page.

The PL value must be nonzero if you want to enable page waiting, since page waiting only occurs after the number of lines defined by pl-1 are output.
(PW) - PAGE WIDTH

The PW command establishes the maximum number of characters that the terminal prints on one output line. If the output device type is PR, the system automatically starts a new line after pw characters have been output.

Format:

```
ct PW=pw
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>pw</td>
<td>Specifies the page width. You can specify a value of 0 or any value from 20 to 255. PW=0 selects an infinitely long line.</td>
</tr>
</tbody>
</table>

(RC) - RESET TERMINAL CHARACTERISTICS

The RC command resets your terminal to the NDL-specified default values. Normally you would use this command after disconnecting from a host connection for which you had altered one or more terminal characteristics.

Format:

```
ct RC
```

Note that a terminal can also be automatically reconfigured each time the terminal is disconnected from a host if the terminal is on a line for which automatic reconfiguration has been specified by the network administrator.

(SE) - SPECIAL EDITING MODE

The SE command enables or disables the special editing variant of normalized input mode.

Format:

```
ct SE=option
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>option</td>
<td>Enables (Y) or disables (N) special editing operations.</td>
</tr>
</tbody>
</table>

When special editing is in effect, any backspace character entered is stored for transmission to the host. Similarly, a line feed entry produces a normal line feed operation at the terminal and the network stores the line feed character code for transmission to the host. A backspace followed by a line feed causes the system to output a bell.

This command is valid only for asynchronous terminals.
(TC) - TERMINAL CLASS COMMAND

The TC command specifies a terminal class for your terminal. The terminal class associates your terminal with a predefined set of terminal characteristics. To effectively use a terminal class, choose a terminal class whose default terminal definition corresponds to the characteristics of your terminal.

Format:

ct TC=tc

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>tc</td>
<td>Specifies the terminal class. The value tc can be from 1 to 18.</td>
</tr>
</tbody>
</table>

The following list associates terminal class values with terminal types:

<table>
<thead>
<tr>
<th>tc</th>
<th>Terminal Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>M33, M35, M37, M38 teletypes</td>
</tr>
<tr>
<td>2</td>
<td>CDC 713-10, 722, 751-1, 752, 756</td>
</tr>
<tr>
<td>3</td>
<td>CDC 721, 722-30</td>
</tr>
<tr>
<td>4</td>
<td>IBM 2741</td>
</tr>
<tr>
<td>5</td>
<td>M40 teletypes</td>
</tr>
<tr>
<td>6</td>
<td>Hazeltine 2000</td>
</tr>
<tr>
<td>7</td>
<td>Terminals conforming to the ANSI X3.64 standard (DEC VT100, TeleVideo 924, 950, 955)</td>
</tr>
<tr>
<td>8</td>
<td>Tektronix 4010, 4014</td>
</tr>
<tr>
<td>9</td>
<td>HASP protocol, postprint format control</td>
</tr>
<tr>
<td>10</td>
<td>200 User Terminal</td>
</tr>
<tr>
<td>11</td>
<td>CDC 714-30</td>
</tr>
<tr>
<td>12</td>
<td>CDC 711-10</td>
</tr>
<tr>
<td>13</td>
<td>CDC 714-10/20</td>
</tr>
<tr>
<td>14</td>
<td>HASP protocol, preprint format control</td>
</tr>
<tr>
<td>15</td>
<td>CDC 734, 731-12</td>
</tr>
<tr>
<td>16</td>
<td>IBM 2780</td>
</tr>
<tr>
<td>17</td>
<td>IBM 3780</td>
</tr>
<tr>
<td>18</td>
<td>IBM 3270</td>
</tr>
</tbody>
</table>

A terminal that is not shown as belonging to a terminal class may still be operational. The terminal can be assigned to a terminal class having similar characteristics and the terminal's definition can be modified as necessary to correctly define the operational characteristics of the terminal.

If your terminal is on an auto-recognition line and its terminal class is other than 4, 10, 13, or 18, you can use the TC command to change its terminal class to ensure proper operation.

If you include a TC command in a sequence of terminal definition commands, enter the TC command first as it resets all other terminal characteristics.
(TM) - TERMINATING A TERMINAL-HOST CONNECTION

The TM command terminates the connection between your terminal and a host.

Format:

    ct TM

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT command.</td>
</tr>
</tbody>
</table>

You can use the TM command if your application does not respond to your input. The system responds to the TM command in the following manner:

    HOST DISCONNECTED  CONTROL CHARACTER=ct
    ENTER INPUT TO CONNECT TO HOST
The network provides a transparent mode that allows you to remain in transparent input mode even after message blocks have been forwarded to the application. The XL command specifies the multimeasure-forwarding signal and the terminator for transparent input mode. If your terminal’s parity is set to even, odd, or zero (PA=E, O or Z), the parity bit is stripped (set to zero) before the characters are sent to the host, although no translation occurs. If your terminal’s parity is set to none or ignore (PA=N or I), the parity bit is not stripped. See the NAM/CCP Terminal Interfaces Reference manual for more information on transparent input and parity.

Format:

```
ct XL=Xxx,Ccount,TO,Yyy
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ct</td>
<td>Represents the network control character for your terminal as defined by the CT terminal definition command.</td>
</tr>
<tr>
<td>Xxx</td>
<td>Selects the character with the two-digit hexadecimal representation xx as the message-forwarding signal. If you do not specify a value yy, the occurrence of two successive characters defined by xx acts as a terminator for transparent input mode. When you specify a hexadecimal code above 7F, you must have previously set your terminal’s parity to none (PA=N) or ignore (PA=I); otherwise the network cannot detect the code when it occurs in a transparent mode message.</td>
</tr>
<tr>
<td>Ccount</td>
<td>Selects a decimal value from 1 to 4095 as a character count that functions as a message-forwarding signal. These values (1 to 4095) are valid with the network. However, unless changed during installation, the maximum logical input line length in IAF (2500 characters) limits you.</td>
</tr>
<tr>
<td>TO</td>
<td>Selects timeout as a transparent input mode terminator.</td>
</tr>
<tr>
<td>Yyy</td>
<td>Selects the character with the two-digit hexadecimal representation yy as a terminator for transparent input mode when it follows xx. When you specify a hexadecimal code above 7F, you must have previously set your terminal’s parity to none (PA=N) or ignore (PA=I); otherwise the network cannot detect the code when it occurs in a transparent mode message. Yyy, if specified, must follow the Xxx parameter; otherwise, it is ignored. The parameters are otherwise order-independent. You must specify at least one of Xxx or TO to select a transparent mode terminator. When it immediately follows the character defined by Xxx on input, the character defined by yy terminates transparent input mode. The characters defined by Xxx and Yyy can be identical or you can omit Yyy. In either case, two successive input characters defined by Xxx are required to terminate transparent mode.</td>
</tr>
</tbody>
</table>

The message-forwarding signals and mode terminators are not sent to the host.

The XL command applies only to asynchronous and mode 4 terminals. Terminal class 4 is configured with the RETURN key as the only transparent mode delimiter and terminator, and mode 4 terminals are configured with the SEND or ETX key as their only transparent mode delimiter and terminator. For devices connected through X.25, the PAD forwarding signal always acts as a transparent mode delimiter in addition to any other options selected.

This command does not apply to HASP and bisynchronous terminals.

60459680 G


You can transmit input to an application in normalized mode (also called character mode) or transparent mode (also called binary mode). Appendix J describes how you delimit and transmit input in transparent mode (refer to the DL and XL commands), however the default input mode for all supported terminal classes is normalized mode. The remainder of this appendix describes how to delimit and transmit terminal input in normalized mode under the default conditions of the various terminal classes. (Appendix J also describes how you can change these defaults).

**PHYSICAL END-OF-LINE (LINE FEED)**

In terminal classes 1 through 8, you can terminate a physical line of input (block) with a line feed key. The network also terminates a physical line of output whenever the page width of a terminal is reached and OP=PR (refer to the PW and OP command in appendix J). The network may respond to the line feed key by advancing the cursor or carriage to the beginning of the next line (refer to the CP command in appendix J).

**LOGICAL END-OF-LINE (CARRIAGE RETURN)**

You terminate a logical line of input with a carriage return key. A logical line can consist of one or more physical lines but not vice versa. The carriage return key advances the cursor or carriage to the beginning of the next line.

**MESSAGE TRANSMISSION**

You transmit your input to the network with the message transmission key. For terminal classes 1 through 8 operating in character or line mode (IN=KB), the message transmission key is the carriage return key. Hence, for these terminal classes, logical lines are transmitted separately. When the delimiter for the logical end-of-line and the transmission key are different (as with block mode devices, including PSN and mode 4 terminals), the terminal stores logical lines until you press the transmission key. The terminal then sends the single transmission consisting of multiple logical lines to the network. The network in turn sends each logical line to the application separately. The message transmission key always acts as a carriage return if not immediately preceded by one.

Table K-1 shows the keys used by the various terminal classes to perform the three functions just described.
Table K-1. Default Message Delimiters and Transmission Keys

†If in block mode, refer to terminal documentation for terminal key equivalences. Those listed are for character and line modes.

††Terminals operating under HASP protocol use different keys for this purpose.
Passive procedures are procedures that do not have the parameter-promoting capability. If the procedure call contains errors, the job step terminates and the procedure is not executed. In most respects, however, the structure and behavior of passive and parameter-promoting procedures are highly similar. This appendix shows only the areas in which passive procedures differ from the parameter-promoting varieties. Section 4 describes parameter-promoting procedures in detail.

**.PROC DIRECTIVE**

This format of the .PROC directive does not provide for parameter prompting nor will the system give parameter descriptions or other help.

Format:

```
.PROC, pname, P1, P2, ..., Pn
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Name of the procedure. One to seven alphanumeric characters. As with file names, the name of a procedure should begin with a letter.</td>
</tr>
<tr>
<td>Pi</td>
<td>Optional formal parameters whose keywords are used in the body of the procedure. Depending on the parameters specified in the procedure call, keywords in the procedure body can be removed, left as they are, replaced by a value specified in the procedure call, or replaced by first or second default values as specified on the procedure header parameter (refer to keyword substitution in this section).</td>
</tr>
</tbody>
</table>

The maximum number of procedure header keywords is defined by the installation. The default is 50.

The following are the acceptable formats for Pi.

<table>
<thead>
<tr>
<th>Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyword</td>
<td>FILE1</td>
</tr>
<tr>
<td>keyword=</td>
<td>FILE1=</td>
</tr>
<tr>
<td>keyword=default1</td>
<td>FILE1=LGO</td>
</tr>
<tr>
<td>keyword=default1/default2</td>
<td>FILE1=LGO/OLD</td>
</tr>
<tr>
<td>keyword=/default2</td>
<td>FILE1=/OLD</td>
</tr>
<tr>
<td>keyword=#DATA</td>
<td>FILE1=#DATA</td>
</tr>
<tr>
<td>keyword=#PRIMARY</td>
<td>FILE1=#PRIMARY</td>
</tr>
<tr>
<td>keyword=#FILE</td>
<td>FILE1=#FILE</td>
</tr>
</tbody>
</table>

| keyword | A 1- to 10-character keyword. |
| default1 | A 1- to 40-character first default value. If default1 contains special characters, it must be $-delimited. This default value replaces the keyword in the procedure body if this parameter is omitted from the procedure call. This option is similar to *K on interactive procedures. |
**Parameters**  
**Description**

- **default2**  
  A 1- to 40-character second default value. If default2 contains special characters, it must be $-delimited. This default value replaces the keyword if the procedure call specifies a parameter value identical to the keyword. This option is similar to *N or *D on interactive procedures.

default1 and default2 could be any of the following special values.

- **FILE**  
  Special default value used for keyword if an overriding value is not specified on the procedure call. If this default value is used, keyword within the procedure body references the record that immediately follows the procedure record on the file.

  If the procedure resides on a library and is called by a name call form of the BEGIN command, keyword is replaced by a null value.

- **DATA**  
  Special default value used for keyword if an overriding value is not specified on the procedure call. If this default value is used, keyword within the procedure body references a data file created within the procedure by the .DATA directive (refer to .DATA directive in section 4).

- **PRIMARY**  
  Special default value used for keyword if an overriding value is not specified on the procedure call. If this default value is used, keyword within the procedure body refers to the job's primary file (refer to File Types in section 2).

**PROCEDURE AND PARAMETER DESCRIPTIONS**

You cannot include the .HELP or .ENDHELP directive in your procedure body. Hence, you cannot provide the procedure caller with a description of the procedure or any of its parameters unless the caller has already entered an error-free procedure call.

**PARAMETER MATCHING**

When a procedure is called, the system must match each parameter on the call command to a parameter on the procedure header command. The system uses two methods of parameter matching: order-dependent and order-independent.

**ORDER-DEPENDENT PARAMETER MATCHING MODE**

Parameter matching always begins in order-dependent mode (refer to Order-Independent Parameter Matching Mode for information on changing parameter matching modes). The system compares, in order, each parameter on the BEGIN command with the parameter in that position on the procedure header directive. The system then substitutes the selected parameters into the procedure body.

All possible parameter substitutions in order-dependent mode are summarized in table L-1. The table shows each parameter format on the BEGIN command, each parameter format on the procedure header, and the substitution resulting from each combination. In the table the
word value indicates that the parameter in the BEGIN command (called value) is different than the corresponding keyword and/or defaults on the procedure header. Keyword in the BEGIN Command Parameter Format heading means the keyword in the BEGIN command is identical to the keyword in the procedure header parameter.

Assuming that all parameter matches between the BEGIN command and the procedure header are valid for order-dependent mode (table L-l), the system completes parameter matching in order-dependent mode.

In order-dependent mode, the system ignores excess parameters on the BEGIN command.

Use table L-l with the following examples to clarify the meaning of the table entries (keyword, default1, default2, value, and null).

Examples: Parameter Matching in Order-Dependent Mode.

<table>
<thead>
<tr>
<th>Procedure on File</th>
<th>Call and Substitution</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>.PROC, SAMPL1, L, M, N=XY</strong>.</td>
<td>BEGIN, SAMPL1, MYFILE. yields REWIND, L, A, M, N, XY.</td>
<td>When parameters are omitted on the BEGIN command, the system uses the defaults from the procedure header (L, M, and XY).</td>
</tr>
<tr>
<td><strong>REWIND, L, A, M, N</strong>.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>BEGIN, SAMPL1, MYFILE,, N.</strong></td>
<td>yields REWIND, L, A, M, N.</td>
<td>Omitted parameters indicate use of the procedure header defaults (L and M). N overrides the procedure header default (XY).</td>
</tr>
<tr>
<td><strong>BEGIN, SAMPL1, MYFILE, $*$, C.</strong></td>
<td>yields REWIND, $*, A, C, XY.</td>
<td>Special characters must be $-delimited. The asterisk (*) replaces M. The system uses the procedure header default (XY) for the omitted parameter.</td>
</tr>
<tr>
<td><strong>.PROC, SAMPL2, LFN1=, LFN2,</strong> SBF=SBF.</td>
<td>BEGIN, SAMPL2, MYFILE. yields COPY, LFN2.</td>
<td>Omitted parameters indicate use of procedure header defaults (LFN2 and null substitution for LFN1 and SBF).</td>
</tr>
<tr>
<td><strong>COPY_SBF, LFN1, LFN2.</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>BEGIN, SAMPL2, MYFILE,, SBF.</strong></td>
<td>yields COPYSBF, LFN2.</td>
<td>Omitted parameters indicate use of procedure header defaults (null and LFN2). The BEGIN command parameter, SBF, indicates use of the second default of the SBF procedure header parameter (SBF). The linking character (_) connects COPY and SBF to make COPYSBF.</td>
</tr>
<tr>
<td><strong>ATTACH, PFN/P1.</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

60459680 C
Table L-1. Parameter Substitution In Order-Dependent Mode

† Switches keyword substitution to order-independent mode for all subsequent parameters.

Example 1:

The following procedure is on file PROCFILE. It prepares a file for processing. If the file is local, it is rewound. If it is not local, the system searches for the file in your permanent file catalog. If the file is not found, the procedure reverts and aborts.

```
.PROC,PREPARE,FNAME=,M=R.
IF,FILE(FNAME,AS),PREP1.
REWIND,FNAME.
REVERT,FNAME PREPARED.
ENDIF,PREP1.
ATTACH,FNAME/#M=M,NA.
IF,FILE(FNAME,.NOT.AS),PREP2.
GET,FNAME/NA.
IF,FILE(FNAME,.NOT.AS),PREP3.
REVERT,ABORT,FNAME NOT FOUND.
ENDIF,PREP3.
ENDIF,PREP2.
REVERT,FNAME PREPARED.
EXIT.
REVERT,ABORT,PREPARE ERRORS.
```

Prepare file TEST with the following command.

```
BEGIN,PREPARE,,TEST.
```
Since `PROCFIL` is the default file, it does not have to be specified and is noted by successive commas.

The following is a segment of the dayfile that results when the `BEGIN` command is processed.

```
08.26.45. $BEGIN, PREPARE,, TEST.
08.26.46. IF, FILE (TEST, AS), PREP1.
08.26.46. ENDF, PREP1.
08.26.46. ATTACH, TEST/ M=R, NA.
08.26.46. TEST IS INDIRECT ACCESS, AT 00121.
08.26.46. IF, FILE (TEST, .NOT. AS), PREP2.
08.26.46. GET, TEST/NA.
08.26.47. IF, FILE (TEST, .NOT. AS), PREP3.
08.26.47. ENDF, PREP3.
08.26.47. ENDF, PREP2.
08.26.47. REVERT. TEST PREPARED.
```

Example 2: Parameter Matching in Nested Procedures (Order-Dependent Parameter Matching Mode)

The substitutions made in a procedure that calls a second procedure are shown in figure L-1. The resultant dayfile is shown on the right side of the figure.

```
GET, PROGRAM1.
BEGIN, EXECUTE, PFILE1, PROGRAM1, PRINT.

PFILE1

.PROC, EXECUTE, NAME, OUT.
FTN5, I=NAME, L=OUT.
LGO.
IF, EF=0, DROP.
BEGIN, LISTING, PFILE2, OUT.
ENDIF, DROP.

PFILE2

.PROC, LISTING, OUTFILE=OUT.
REWIND, OUTFILE.
COPYSBF, OUTFILE, OUTPUT.

RESULTANT DAYFILE
16.01.08. GET, PROGRAM1.
16.01.08. BEGIN, EXECUTE, PFILE1, PROGRAM1, PRINT.
16.01.09. FTN5, I=PROGRAM1, L=PRINT.
16.01.10. .043 CP SECONDS COMPILATION TIME
16.01.10. LGO.
16.01.11. STOP
16.01.11. .038 CP SECONDS EXECUTION TIME
16.01.12. IF, EF=0, DROP.
16.01.12. BEGIN, LISTING, PFILE2, PRINT.
16.01.12. REWIND, PRINT.
16.01.13. COPYSBF, PRINT, OUTPUT.
16.01.13. END OF INFORMATION ENCASED.
16.01.13. $REVERT, CCL
16.01.13. ENDF, DROP.
16.01.13. $REVERT, CCL
```

Figure L-1. Keyword Substitution in Two Procedures
ORDER-INDEPENDENT PARAMETER MATCHING MODE

The system switches to order-independent mode to match the remainder of the parameters if in comparison of a BEGIN command parameter and a procedure header parameter one of the following occurs.

- A BEGIN command parameter is in the format keyword= or keyword=value.
- A procedure header command parameter is in the format keyword=default/default2.

For each BEGIN command parameter, matching always begins in order-dependent mode. Once in order-independent mode, the system matches each keyword of the BEGIN command to the identical keyword in the procedure header command, regardless of order.

The following commands illustrate the parameter combinations that result in switching from order-dependent mode to order-independent mode.

<table>
<thead>
<tr>
<th>Procedure on Default</th>
<th>Call and Substitution</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>File PROCFL</td>
<td></td>
<td></td>
</tr>
<tr>
<td>.PROC, SALES, TAX, TOTAL=, FLAG=A.</td>
<td>BEGIN, SALES,, TAX, TOTAL=SUM, FLAG. yields</td>
<td>Parameter matching starts in order-dependent mode. The BEGIN parameter TOTAL=SUM switches the mode to order-independent mode. FLAG is then matched in order-independent mode, which yields A.</td>
</tr>
<tr>
<td>COPYL, TAX, TOTAL, HOLD,, FLAG. REPLACE, HOLD=TAX.</td>
<td>COPYL, TAX, SUM, HOLD,, A. REPLACE, HOLD=TAX.</td>
<td></td>
</tr>
<tr>
<td>.PROC, TAXES, TAX=FED/MN, DEDUCT, FLAG=A.</td>
<td>BEGIN, TAXES,, TAX, DEDUCT. yields</td>
<td>The TAX=FED/MN procedure parameter switches the mode to order-independent mode. All parameters will be matched in order-independent mode.</td>
</tr>
<tr>
<td>COPYL, TAX, DEDUCT, HOLD,, FLAG. REPLACE, HOLD=TAX.</td>
<td>COPYL, MN, DEDUCT, HOLD,, A. REPLACE, HOLD=MN.</td>
<td></td>
</tr>
</tbody>
</table>

All possible parameter substitutions in order-independent mode are summarized in table L-2. The table shows each parameter format on the BEGIN command, each parameter format on the procedure header command, and the substitution resulting from each combination.

In the table the word value indicates that the parameter in the BEGIN command (called value) is different than the keyword and/or defaults on the procedure header command. Use table L-2 with the following examples to clarify the meaning of the table entries (keyword, default1, default2, value, and null).
Examples of Parameter Matching:

<table>
<thead>
<tr>
<th>Procedure on Default File PROCFIL</th>
<th>Call and Substitution</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| .PROC, SAMPL1, L, M, N=XY. REWIND, L, A, M, N. | BEGIN, SAMPL1, L=SWITCH. 
REWIND, SWITCH, A, M, XY. | The L=SWITCH BEGIN parameter switches parameter matching mode to order-independent mode. |
| BEGIN, SAMPL1, L=CHANG, M, N. or BEGIN, SAMPL1, L=CHANG, N, M. 
REWIND, CHANG, A, M, XY. | | Order-independent mode uses the procedure header defaults for omitted BEGIN parameters. Order-dependent and order-independent modes work identically for omitted BEGIN parameters. |
| BEGIN, SAMPL1, L=FLIP, M=B, N=Z. 
REWIND, FLIP, A, B, Z. | | The L=CHANG parameter switches parameter matching to order-independent mode. In order-independent mode the order of the BEGIN parameters does not matter. M matches with M, and the N BEGIN keyword indicates substitution of the procedure header default (XY). |
| BEGIN, TRACE, IN=, OUT= HOLD, N=. 
COPY, HOLD, EOI. | | The IN= parameter switches parameter matching to order-independent mode. All BEGIN commands in the form keyword=value always override procedure header parameters. FLIP replaces L, B replaces M, and Z replaces XY. |
| .PROC, SAMPL4, FILE1, 
EC=B6/A6, DC=LP, REP=0. 
REWIND, FILE1. 
ROUTE, FILE1, #DC=DC, 
#EC=EC, #REP=REP. | BEGIN, SAMPL4, COIN. 
REWIND, COIN. 
ROUTE, COIN, DC=LP, EC=B6, REP=0. | COIN is substituted in order-dependent mode. EC=B6/A6 switches the mode to order-independent mode. The omitted parameters indicate use of the procedure header defaults (order-dependent and order-independent modes work alike for omitted BEGIN parameters). |
| BEGIN, SAMPL4, COIN, EC, DC, REP. 
REWIND, COIN. 
ROUTE, COIN, DC=LP, EC=A6, REP=0. | | EC=B6/A6 switches the mode to order-independent mode. Specifying the keyword on the BEGIN command produces the same result as omitting them (refer to previous example) except for the double default procedure parameter, EC=B6/A6. If EC is omitted, B6 is used. If EC is specified, A6 is used. |
Table L-2. Parameter Substitution In Order-Independent Mode

<table>
<thead>
<tr>
<th>Procedure Header Parameter Format</th>
<th>omitted</th>
<th>keyword</th>
<th>keyword=</th>
<th>keyword=value</th>
<th>value or $value$†</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyword</td>
<td>keyword</td>
<td>null</td>
<td>null</td>
<td>value</td>
<td>error</td>
</tr>
<tr>
<td>keyword=default1</td>
<td>null</td>
<td>default1</td>
<td>null</td>
<td>value</td>
<td>error</td>
</tr>
<tr>
<td>keyword=default1/default2</td>
<td>default1</td>
<td>default2</td>
<td>null</td>
<td>value</td>
<td>error</td>
</tr>
</tbody>
</table>

† Assumes the parameter is entered under order-independent mode.

Example 1:

The following procedure is the same procedure as Example 2 in Order-Dependent Parameter Matching Mode. It resides on file PROCFIL. It routes a specified file (FNAME) to the specified equipment (default is any CDC-graphics line printer).

```
.PROC,PRINTR,FNAME,REP=0,DC=LP,EC=B6.
REWIND,FNAME.
ROUTE,FNAME,#DC=DC,#REP=REP,#EC=EC.
REVERT. FNAME ROUTED.
EXIT.
REVERT,ABORT. PRINTR PARAMETER ERRORS.
```

The following command calls the procedure PRINTR. The system matches COLOR in order-dependent form. DC=SB switches the mode to order-independent mode. SB indicates the file is to be punched.

```
BEGIN,PRINTR,,COLOR,DC=SB,EC=SB.
```

The following is a segment of the dayfile that results when the BEGIN command is processed.

```
15.27.26.*BEGIN,PRINTR,,COLOR,DC=SB,EC=SB.
15.27.27.REWIND,COLOR.
15.27.27.ROUTE,COLOR,DC=SB,REP=0,EC=SB.
15.27.27.ROUTE COMPLETE.
15.27.28.REVERT. COLOR ROUTED.
```
Example 2: Parameter Matching in Nested Procedures (Order-Dependent and Order-Independent Parameter Matching Modes)

As shown in figure L-2, procedures ROUT and PREPARE reside on the default file PROCFIL. A BEGIN command within ROUT calls PREPARE. In procedure ROUT the substitution for the FNAME parameter (TEST) is passed to procedure PREPARE by the BEGIN command. The resulting dayfile is on the right side of figure L-2.

BEGIN calls procedure ROUT. The SBF=/SBF parameter switches parameter matching to order-independent mode. The first command of ROUT is a BEGIN command that calls procedure PREPARE. The parameters are matched in order-independent mode. PREPARE readies a file for processing. If the file is local, it is rewound. If it is not local, the system searches for the file in your permanent file catalog. If the file is not found, the procedure reverts and aborts. If the file is found, processing continues with the second command in procedure ROUT. The file is prepared for printing. Since the file is to be printed with the ASCII graphic 95-character set (EC=A9), the file must be changed to a 12-bit ASCII code file (FCOPY). The procedure then routes the file to the printer and reverts to the command following the BEGIN command.

Figure L-2. Keyword Substitution in Nested Procedures
PAPER TAPE OPERATIONS

GENERAL DESCRIPTION

Paper tape is used for preparing input off-line (when time is not charged) and entering it on-line (when time is charged). This ensures accuracy and speed when most needed. An input tape can include programs, data, and commands. Accordingly, it is possible for the entire terminal operation, after login, to be run from paper tape.

TELETYPEWRITER

This discussion assumes a typical teletypewriter (model 33) with a paper tape punch and a paper tape reader.

The paper tape punch has four buttons with the following labels and use.:

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>Turns the punch on.</td>
</tr>
<tr>
<td>OFF</td>
<td>Turns the punch off.</td>
</tr>
<tr>
<td>REL.</td>
<td>Releases the feedwheel so you can freely move the tape through the punch head.</td>
</tr>
<tr>
<td>B.SP.</td>
<td>Backspaces the tape one row of holes each time it is pressed. This is used to make corrections when preparing a tape off-line (refer to Corrections in this section).</td>
</tr>
</tbody>
</table>

The paper tape reader has one switch with four positions. Position labels and use are as follows:

<table>
<thead>
<tr>
<th>Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START</td>
<td>Starts the reader. After switch is momentarily held in this position, it snaps back to the AUTO position and reading continues.</td>
</tr>
<tr>
<td>STOP</td>
<td>Immediately stops reading.</td>
</tr>
<tr>
<td>AUTO</td>
<td>This position is used in conjunction with the input and processing of commands and data in tape mode (refer to Tape Mode in this section). It allows the tape reader to be turned off and on so that processing of each command or line of data can be completed before additional input is entered.</td>
</tr>
<tr>
<td>FREE</td>
<td>Releases the feedwheel so you can freely slide the tape in and out of the read head.</td>
</tr>
</tbody>
</table>

**NOTE**

On teletypewriters lacking an AUTO position, reading must be manually restarted each time it has been stopped.
CONTROL CHARACTERS

Each line of input from paper tape must end with a particular sequence of control characters. These are punched by functional keys on the teletypewriter keyboard. The control characters used with paper tape are as follows:

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LF</td>
<td>Message terminator. This is the RETURN key on the model 33. It moves the print head to the beginning of the line and informs IAF that this line of input is completed.</td>
</tr>
<tr>
<td>CTRL/X-OFF</td>
<td>Line feed. This is the LINE FEED key on the keyboard. It advances the paper roller one line. In normal mode, IAF sends a signal that initiates this feed; in tape mode, this signal is not sent and is therefore required on tape.</td>
</tr>
<tr>
<td>R0(n)</td>
<td>X-off. The appearance of this character on the tape during reading turns the tape reader off. This character is punched by holding down the CTRL key and pressing the X-OFF key.</td>
</tr>
<tr>
<td>NUL</td>
<td>Rubout. This is the RUB OUT key on the keyboard. It punches a full row of holes. This row is interpreted as null by the system, and hence this character is used for spacing and overpunching errors. The n parameter specifies the minimum number of times this character should be punched in sequence.</td>
</tr>
<tr>
<td></td>
<td>Null. This is the ASCII character represented by a feed hole only (blank tape). It may be used as a fill character.</td>
</tr>
</tbody>
</table>

INPUT LINES

The following line formats are used to enter programs, data, and commands. The left half of the page shows an example of the input; the right half of the page shows the control characters that immediately follow the last input character. Each line is terminated with three rubouts to provide separation from the next line and to allow time for the carriage to return to the left margin. While it is possible that adequate separation is provided with less than three rubouts, this is the recommended number.

PROGRAM LINE

100 PROGRAM TEST  ☐ LF R0(3)

DATA LINE

? 12.44, 18.31, 29.08  ☐ LF CTRL/X-OFF R0(3)

(The ? is supplied by IAF. The remainder of the line comes from the tape. X-OFF turns the reader off to allow this data to be processed before the next line is read.)

COMMAND LINE

CATLIST, LO=F  ☐ LF CTRL/X-OFF R0(3)

(X-OFF turns the reader off to allow processing of the command to be completed before the next line is read.)
Punching Tape Off-Line

The following procedure is used to punch a tape when the teletypewriter terminal is not logged in.

1. Place the teletypewriter in local mode.
2. Turn the paper tape punch on by pressing the ON button located on the punch.
3. Prepare a tape leader of about 30 rubouts (3 inches) either by simultaneously pressing the RUB OUT and REPT keys or, if the terminal has the capability, by punching blank tape.
4. With a pencil, trace the arrow above the punch output onto the tape. This identifies the start of the tape for reading. (It is possible to put the tape in the reader backwards.)
5. Type in the input lines with their appropriate control characters.
6. Add a 3-inch trailer of rubouts or blank tape and tear the tape off.
7. Turn the teletypewriter off.

Tape Mode

To read and process data and commands from tape, it is necessary that the tape reader be turned off, to allow time for processing, then be restarted. By entering tape mode, you enable IAF to synchronize tape input with its processing.†

You enter tape mode by using the TRMDEF command (section 8) or a terminal definition command (appendix K) to change the input device to a paper tape reader. To do this with the TRMDEF command, enter:

TRMDEF, IN=PT

To perform the same operation with a terminal definition command, press the ESC key†† (assuming a model 33 teletypewriter is being used) and enter

IN=PT

The TRMDEF command can specify the input device to be in character mode (PT or KB) only; to specify the input device is in transparent input mode (XP, XK, or X), a terminal definition command must be used. For all other paper tape operations, the TRMDEF command and terminal definition commands can be used interchangeably. The remainder of this section will use the TRMDEF command in examples.

The network acknowledges entry into tape mode with the response "IN ACCEPTED." If the reader switch is in the AUTO position, reading begins automatically; if the reader switch is in the OFF position, reading does not begin until it is manually initiated by momentarily moving the switch to START.

†You cannot use paper tape mode from terminals connected to a packet switching network (PSN).
††The ESC key is the default control character for terminal class 1. It must be pressed to signal the entry of a terminal definition command. Because the control character differs for some terminals, refer to appendix J for the default values for all terminal classes.
You can exit from tape mode by using the TRMDEF command or a terminal definition command to change the input device back to the keyboard. This can be done with TRMDEF by entering:

```
TRMDEF, IN=KB
```

The paper tape punch can also be defined as the output device using the TRMDEF command or a terminal definition command. This can be done by entering:

```
TRMDEF, OP=PT
```

You specify this command to enter tape mode for outputting information to paper tape. This mode provides the proper X-OFF characters when punching the tape. You can exit this mode by using the TRMDEF command or a terminal definition command to change the output device back to a printer. This can be done by entering:

```
TRMDEF, OP=PR
```

### PUNCHING A TAPE ON-LINE

To punch a tape with information already contained in a system file, the following procedure is used.

1. If not logged in, log in.
2. If not in tape mode, enter TRMDEF, OP=PT.
3. Type in LIST if the primary file is to be punched; type in LIST,F=lfn if a local file other than the primary file is to be punched. Do not press @.
4. Turn the punch on.
5. Run a leader of rubouts or blank tape.
6. Press @. The file is listed and punched simultaneously. The network adds the appropriate control characters at the end of each line.
7. Run a trailer of rubouts or blank tape.

### CORRECTIONS

When punching a tape off-line, corrections can be made by backspacing over the incorrect punch (use the B.SP. button on the punch) and punching a rubout over the error (use the RUB OUT key on the keyboard). Then punch in the correct character.

It is also possible to make corrections by using the backspace key as in normal, on-line operation. However, the error and/or any overtyping appear in the printout. When line numbers are being used, an erroneous line can be retyped (and repunched) with the same line number. Although the erroneous and correct versions appear in the printout, IAF retains only the last occurrence of the specific numbered line during processing.
Example:

In this example, the input tape contains only program lines. Commands and input are typed before and after the tape is read.

The following is the tape as punched. The left half of the page shows the printed copy produced as the tape is punched; the right half of the page shows the control characters entered at the end of each line but not printed.

```
100 LET FACTOR=1
110 INPUT N
120 FOR I=1 TO N
130 LET FACTOR=FACTOR*I
140 PRINT FACTOR
150 NEXT I
160 END
```

To demonstrate the use of this tape, you must be logged in under the null subsystem. You position the tape in the reader and set the reader switch to AUTO. The following is the printout that results. The right half of the page contains explanations of the action.

```

```
You initiate another run with the RUN command. IAF replies with ?.
You enter a 5 and receive the desired printout.

You want to punch a new tape containing this corrected program. You select paper tape as your output mode.

You type LIST but do not press the @. You turn on the paper tape punch and run off a leader of blank tape. You then press the @. This punches a CR on the tape and the network responds with LF and NUL punches. These three punches are not part of the file, and you must replace them with rubouts if you use the tape for subsequent input.

IAF begins the listing with a sequence of CR, NUL(n), LF, and NUL(m).† BRIEF mode suppresses this sequence.

IAF punches the tape as it lists the file. IAF terminates each line with CR, NUL(n), LF, NUL(m), DC3, and NUL(2).††

IAF punches READY. after it has punched the contents of the file. A CR-NUL(n)-LF-NUL(m) punch sequence precedes and follows this message.

†If you enter this tape as input, the CR and LF should be rubbed out, so that the system does not read them as an empty line. The system ignores all NULs.
††Refer to table K-1 in appendix K to find n, the carriage return idle count, and m, the line feed idle count, for your terminal class.
Example:

In this example, the input tape contains not only a program but also the commands to execute, modify, list, and save that program and the input data used by that program.

The following is the complete tape as punched. The left half of the page gives the printed copy produced as the tape is punched; the right half of the page shows the control characters entered at the end of each line but not printed.

```plaintext
FORTRAN
NEW, DEMO
100 PROGRAM DEMO
110 DIMENSION II(5)
120 READ 10, (II(J), J=1,5)
130 10 FORMAT (5I5)
140 PRINT 20, (II(J), J=1,5)
150 20 FORMAT (5I10)
160 END
RUN
111112222233334444455555
SAVE, DEMO=TAPE1
135 00 1 I=1,5
137 II(I)=II(I)+4444
139 1 CONTINUE
RESEQ, 100, 5
LIST
RUN
111112222233334444455555
REPLACE, DEMO=TAPE1
```

To execute this tape, you log in to IAF, position the tape in the reader, set the reader switch to AUTO, type the command TRMDEF, IN=PT and, upon pressing ©, start the reading of the tape. You then observe the remainder of the action without intervention.
The following is the printout of the execution of the tape. The right half of the page contains explanations of the action.

```
FORTRAN
NEW, DEMO
100 PROGRAM DEMO
110 DIMENSION II(5)
120 READ 10, (II(J), J=1,5)
130 10 FORMAT (S15)
140 PRINT 20, (II(J), J=1,5)
150 20 FORMAT(SI10)
160 END
RUN
? 11112222233334444455555
11111 22222 33333 44444 55555
SRU  0.130 UNTS.
RUN COMPLETE.
SAVE, DEMO=TAPE1
135 DO 1 I=1,5
137 II(I)=II(I)+4444
139 1 CONTINUE
RESEQ, 100, 5
SRU  0.576 UNTS.
```

When this line is read, the reader stops. As soon as FORTRAN is established as the current subsystem, IAF turns the reader back on.

When this line is read, the reader stops. After a new primary file called DEMO is established, IAF turns the reader back on.

The seven lines of the program are read without interruption.

After the command to run the program is read, the reader is turned off.

After processing reaches the READ statement (line 120) and after IAF prints ?, IAF turns the reader on, and the line of data is read. Then the reader is turned off to allow data processing.

Resulting printout:

```
11111 22222 33333 44444 55555
SRU  0.130 UNTS.
RUN COMPLETE.
```

After the SAVE command is read, the reader is turned off. A copy of the program DEMO is made an indirect access permanent file with the name TAPE1. Then the reader is turned back on.

These three lines of modification are read in from the tape without interruption.

After the RESEQ command is read, the reader is turned off. When resequencing is accomplished according to specifications, the reader is turned back on.
LIST

00100 PROGRAM DEMO
00105 DIMENSION II(5)
00110 READ 10, (II(J),J=1,5)
00115 10 FORMAT(5I5)
00120 DO 1 I=1,5
00125 II(I)=II(I)+4444
00130 1 CONTINUE
00135 PRINT 20, (II(J),J=1,5)
00140 20 FORMAT(5110)
00145 END

After the LIST command is read from tape, the tape reader is turned off. Then IAF lists the primary file which contains the previous modifications in resequenced format. When the listing is completed, the reader is turned on again.

RUN

? 111122222333344445555

After the RUN command is read in, the reader is turned off, and the modified program is executed. IAF prints the ? and then turns the reader on. The line of data is read in from the tape and the reader turned off. The data is processed and results printed.

15555 26666 37777 48888 59999

SRU 1.185 UNTS.
RUN COMPLETE.

REPLACE, DEMO=TAPE1

This last command is read in and the reader turned off. A copy of this revised version of DEMO replaces the old one that was made an indirect access permanent file under the name TAPE1. It is now the indirect access permanent file that is referenced by the name TAPE1.

The reader is turned back on. It runs through the trailer of rubouts and then turns itself off.

If, at this point, you have no more tapes to run, exit tape mode by entering the TRMDEF, IN=KB command.

</table>

In this table, n indicates the unit count for multiunit devices and x is 1 or 4.

If your validation permits (refer to LIMITS Command, section 7), the maximum size of an indirect access file is the device limit less the space allocated for catalog information and other files.

The size of a direct access file is limited by the device and by your validation. There are no other system limitations.
INTERACTIVE TRANSFER FACILITY (ITF)

ITF allows you to connect your interactive terminal to a remote CYBER 200 computer system linked to your host mainframe by a loosely coupled network (LCN). If you want to submit batch jobs or want to retrieve or otherwise manipulate permanent files, you can use the Interactive Facility (IAF) (refer to Submitting Jobs to Remote hosts in section 3).

SELECTING THE ITF APPLICATION

You select the ITF application in the same manner as you would any Network Access Method (NAM) application, such as IAF or RBF. You specify ITF for the application name during login to NOS. If you are logged into IAF, you can switch to ITF by specifying ITF on the BYE, GOODBYE, HELLO, LOGIN, or LOGOUT command.

SELECTING A REMOTE CYBER 200 SYSTEM

Once you select ITF, you receive an ITF banner at your terminal. The following is an example of the two-line ITF banner:

```
ITF 1.0 - psr level
TERMINAL T103, CONNECTION 12
```

Your site may automatically connect you to a remote host. If you are not automatically connected to a remote host, ITF prompts you for the logical identifier (LID) of the remote host you want to access.

The LID is a three-character name your site has associated with that remote host. The prompt has the following form:

```
ENTER LID (OR?):
```

In response to this prompt, enter one of the following:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lid</td>
<td>Specifies the three-character LID your site has associated with the remote host you are attempting to reach.</td>
</tr>
<tr>
<td>?</td>
<td>Requests a list of acceptable entries.</td>
</tr>
<tr>
<td>carriage return</td>
<td>Selects the default LID as defined by your site.</td>
</tr>
</tbody>
</table>

If the connection to the remote host cannot be established (for example, you enter an invalid LID), ITF so informs you. Unless otherwise directed by your site, ITF will then prompt you again for a LID. Your site may automatically switch you to another application, such as IAF, instead of prompting you for another LID.
If ITF establishes a connection to the remote host, it displays the following status message:

    ITF, CONNECTED TO HOST pid ON ACN n/TCN m

where pid is the physical identifier (PID) of the remote host and n and m are connection numbers used by the system. Sometimes the PID is identical to the LID you specify.

**PROCESSING YOUR JOB ON THE REMOTE CYBER 200**

Once your terminal is under the control of the remote host, it gives you the following login prompt:

    ENTER CYBER 200 LOGON

You can then log in and proceed with your interactive job. All of your terminal input is transmitted to the remote host and all data from the remote host is displayed at your terminal. You have the following limitations.

- You cannot use transparent input mode (that is, do not enter the IN=X, IN=XX, or IN=XP terminal definition command).
- Input lines longer than 999 characters are truncated without a comment.
- The termination sequence (user break 2) disconnects your terminal from the remote host.

To terminate your CYBER 200 job and disconnect from the remote host, enter the "$BYE" command.

**TERMINATING YOUR ITF SESSION**

Your site may automatically connect you to another application, such as IAF, any time you disconnect from the remote host. If not, your terminal returns to the control of ITF. ITF then prompts you for another LID. To end your ITF session, enter one of the following:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$BYE</td>
<td>Ends your ITF session and logs you out of NOS.</td>
</tr>
<tr>
<td>$BYE, application</td>
<td>Ends your ITF session and switches you to the specified application. The following are some valid applications:</td>
</tr>
</tbody>
</table>

FILE TRANSFERS USING XMODEM

XMODEM is an industry standard communications protocol used to transfer files between CYBER mainframes and microcomputers. With XMODEM you can upload and download binary files as well as ASCII text files. To use XMODEM, the microcomputer communication software must use the Christensen protocol.

**XMODEM COMMAND**

The XMODEM command initiates the file transfer between NOS and microcomputers. Certain parameters must be specified on the XMODEM command or XMODEM prompts for them. Other parameters, if not specified, are given default values.

You can define a configuration file (described later in this appendix) to change the default values for many of the command parameters as well as terminal characteristics. Some of the default values normally used by XMODEM can be superseded by values specified in your configuration file. If a value is specified in the command and in the configuration file, the command value supersedes the configuration file value.

**Format:**

\[
\text{XMODEM,FN=fn,TD=td,FT=ft,LF=lf,SP=sp,EC=ec,FM=fm,CF=cf.}
\]

or

\[
\text{XMODEM,fn,td,ft,lf,sp,ec,fm,cf.}
\]

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>FN=fn</td>
<td>Name of the file to be transferred. The file to be transferred from the CYBER to the micro may be local or permanent. If the file is not specified, XMODEM prompts for the file name.</td>
</tr>
<tr>
<td>TD=td</td>
<td>Transfer direction. If TD=S is specified, the file is sent from the CYBER to the micro. If TD=R is specified, the file is sent from the micro to the CYBER. If this parameter is not specified, XMODEM prompts for it.</td>
</tr>
<tr>
<td>FT=ft</td>
<td>File type. If this parameter is not specified, XMODEM prompts for it.</td>
</tr>
<tr>
<td></td>
<td>A Specifies a 6/12-bit display code text file on the CYBER to or from 8-bit ASCII on the micro.</td>
</tr>
<tr>
<td></td>
<td>C Specifies a 6-bit display code text file on the CYBER to or from 8-bit ASCII on the micro.</td>
</tr>
<tr>
<td></td>
<td>E Specifies a 7-bit ASCII code text file on the CYBER to or from 8-bit ASCII code on the micro.</td>
</tr>
<tr>
<td></td>
<td>T Specifies a text file. XMODEM uses the current character code set mode of your CYBER job.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>B</td>
<td>Specifies a CYBER binary file.</td>
</tr>
<tr>
<td>M</td>
<td>Specifies a micro binary file.</td>
</tr>
<tr>
<td>S</td>
<td>Specifies automatic selection (receive only). Special characters in the first block determines the file type.</td>
</tr>
<tr>
<td>LF=lf</td>
<td>This parameter determines whether an end-of-line on text files sent to the micro is transmitted as carriage return and line feed (LF=YES) or only as a carriage return (LF=NO). Default is LF=YES. The default value may be changed with the configuration file (refer to Configuration File in this appendix).</td>
</tr>
<tr>
<td>SP=sp</td>
<td>This parameter determines whether or not the first block transmitted is a special file type block. The default is SP=NO. If SP=YES is specified, the special block is transmitted. The default may be changed by the configuration file. For more information on the SP parameter, refer to Limitations and Considerations in this appendix.</td>
</tr>
<tr>
<td>EC=ec</td>
<td>Error checking (CRC or CHECKSM). The receiver determines the error checking mode. If TD=S is specified, the micro determines whether to use CRC or CHECKSM. Default is EC=CRC.</td>
</tr>
<tr>
<td>FM=fm</td>
<td>File markers. FM may be set to NOS, CPM, or MSDOS. FM determines which file markers are recognized or transmitted in text files by the CYBER. This parameter has no effect on the binary files. If FM=NOS is specified, #EOR, #EOF, and #EOI are recognized or transmitted to indicate end-of-record, end-of-file, and end-of-information, respectively. If used, a four-character file marker must appear as the first and only marker on the line. If FM=CPM or FM=MSDOS is specified, end-of-records and end-of-files are ignored on the text files transmitted from a CYBER to a micro. The end-of-information is transmitted as a CTRL/Z character. On files received from a micro, XMODEM recognizes a CTRL/Z character as the end-of-information. #EOR, #EOF, and #EOI are still recognized. FM=NOS is the default. The default may be changed with the configuration file (refer to Configuration File in this appendix).</td>
</tr>
<tr>
<td>CF=cf</td>
<td>Configuration file. This optional parameter specifies the name of a configuration file. The specified configuration file restores your terminal characteristics after an XMODEM file transfer. When the CF parameter is used, XMODEM accepts the values for certain command parameters and terminal characteristics from the specified configuration file. The format and contents of the file are discussed in the Configuration File section of this appendix. The configuration file may be local or permanent. Default is CF=PFTFCFG.</td>
</tr>
</tbody>
</table>
USING XMODEM IN PROMPTING MODE

Type in the command:

XMODEM

You will receive the prompt:

HOST TO SEND (S) OR RECEIVE (R) A FILE?

Enter S to send a file from the CYBER to a micro, or R to receive a file from a micro. You may enter the entire words SEND or RECEIVE.

SENDING A FILE FROM A CYBER

If you selected the transfer direction of SEND, the next prompt will be:

PLEASE ENTER THE FILE NAME.

The file you specify must be a local or a permanent disk file. If the file is empty or cannot be read, the file name prompt is repeated.

XMODEM will then ask:

Is the file -

B - Cyber binary
M - Micro binary
T - Text -- Display code (upper case only)
A - Text -- 6/12 Display code ASCII (upper/lower case)
E - Text -- 8/12 ASCII

After you select a valid option, XMODEM will print the approximate number of blocks to be transferred and indicate that it is ready to start the transfer. At this point, you should enter the appropriate commands on the micro to initiate the file transfer.

XMODEM on the CYBER will acknowledge an ASCII NAK, a capital C, or an ASCII CAN (CTRL/X). If a NAK is received by the CYBER, the file transfer takes place using the checksum method of error checking. If a capital C is received, the error checking is done using CRC method of error checking. If a CTRL/X is received, the transfer aborts, and you are back at the NOS command prompt.

If 10 characters are received and none are among the expected three, the transfer aborts with the error message:

NO INITIAL NAK RECEIVED.

If a CTRL/X is received at any time during the transfer, the transfer aborts.
RECEIVING A FILE FROM A MICRO

If you elected to receive a file from a micro, XMODEM prompts:

PLEASE ENTER THE FILE NAME.

Enter the local file name under which you wish to have the file stored on NOS. If the file name is invalid or you cannot write to it, XMODEM repeats the prompt.

Next, you are asked:

Is the file -

B - Cyber binary
M - Micro binary
T - Text -- Display code (upper case only)
A - Text -- 6/12 Display code ASCII (upper/lower case)
E - Text -- 8/12 ASCII
S - Auto-select file type

After you select a valid option, you should enter the micro commands necessary to start the transfer. XMODEM on the CYBER sends out an ASCII NAK or capital C (depending on the value set for the command parameter EC) until it either receives a block from the micro or has tried 10 times to initiate the transfer. After 10 tries, XMODEM aborts.

If a CTRL/X (ASCII CAN) is received as the first character in a block, XMODEM aborts, and you are back at the NOS command prompt.

CONFIGURATION FILE

XMODEM can accept the values of some parameters from a configuration file. With this file, you can change the default values for parameters LF, SP, EC, and FM. You can also reset certain terminal characteristics.

These are the rules for the configuration file entries:

- One parameter entry per line is allowed.
- Uppercase and lowercase characters may be used.
- Blanks are not significant.
- Lines beginning with an asterisk (*) are considered as comment lines.
- Each line may optionally be terminated by a period.
- Comments may follow the period on the same line.
The following are the parameters you can specify:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Possible values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LF</td>
<td>YES, NO, Y, N</td>
<td>Line feed issued after carriage return. Default is YES.</td>
</tr>
<tr>
<td>SP</td>
<td>YES, NO, Y, N</td>
<td>Special file type block issued. Default is NO.</td>
</tr>
<tr>
<td>EC</td>
<td>CRC, CHECKSM, CK, CM</td>
<td>Error checking. Maximum parameter length is 7 characters. Default is CRC.</td>
</tr>
<tr>
<td>FM</td>
<td>NOS, CPM, MSDOS, N, C, M</td>
<td>File marker type. Default is NOS.</td>
</tr>
<tr>
<td>PA</td>
<td>NONE, EVEN, ODD, ZERO, N, E, O, Z</td>
<td>Value to which parity will be reset upon termination of XMODEM file transfer. Default is NONE.</td>
</tr>
<tr>
<td>EP</td>
<td>YES, NO, Y, N</td>
<td>Echoplex value set at termination of file transfer. Default is NO.</td>
</tr>
<tr>
<td>IC</td>
<td>YES, NO, Y, N</td>
<td>Input flow control reset value. Default is YES.</td>
</tr>
<tr>
<td>OC</td>
<td>YES, NO, Y, N</td>
<td>Output flow control reset value. Default is YES.</td>
</tr>
<tr>
<td>AC</td>
<td>decimal number</td>
<td>Attention character (affects CDCNET terminals only). Refer to the CDCNET Terminal Interface Usage Manual.</td>
</tr>
</tbody>
</table>

Example:

- EC = CRC. Set error checking.
- SP = NO.
- LF = Y.
- EP = N.
- OC = Y.
FILE TRANSFER NOTES

There are three types of files that can be transferred: text files, CYBER binary files, and micro binary files. The processing of file markers and carriage control indicators (line feed, for example) depends on the type of file being transferred and the direction of transfer.

TEXT FILES

Text files have either an ASCII carriage return or a carriage return and a line feed appended to the end of each line when transferred from a CYBER to a micro.

When a file is transferred from a micro to a CYBER, carriage returns are translated into zero byte terminators, and an ASCII line feed is ignored if it immediately follows a carriage return. If the FM=CPM or FM=MSDOS parameter is specified, XMODEM recognizes a CTRL/Z character as the end-of-information and also recognizes #EOR, #EOF, and #EOI file markers. If FM=NOS is specified, XMODEM recognizes or transmits #EORs, #EOFs, and #EOIs. To be recognized, a 4-character file marker must appear as the first and only characters on a line.

If a file received by the CYBER is transferred as a display code text file (uppercase only), lowercase alphabetic characters are translated as uppercase. Untranslatable characters are set to asterisks (*), except for the ASCII NULL character, which is ignored.

CYBER BINARY

A CYBER binary file is transferred eight bits at a time. The file is blocked during transmission, with the first character being the length of the block or an EOR/EOF/EOI marker. If an EOR/EOF marker is found, the next character is again a block length or an EOR, EOF, or EOI. The maximum block size is 240 (decimal). A value of 253 indicates an EOR, 254 indicates an EOF, and 251 indicates an EOI. Only files that are transferred from a CYBER to a micro as CYBER binary files can be transferred from a micro to a CYBER as CYBER binary files, otherwise unpredictable results can occur.

Any data received by the CYBER after the EOI marker is received is acknowledged but discarded.

MICRO BINARY

A micro binary file received by the CYBER is stored as 8/12-bit ASCII. Each 8-bit ASCII character received is stored on the CYBER as a 12-bit ASCII character with the high order bit set. When the file is transmitted back to the micro, any zero character is ignored. Thus, a NULL character must be represented as 4000B. The high order bit is optional on all other characters. A file processed by FCOPY meets these requirements, except that end of lines (since they are zero) are ignored. This method is necessary to guarantee that the file is sent back to the micro exactly as it was received.
LIMITATIONS AND CONSIDERATIONS

The following are general tips on using XMODEM:

- Since the XMODEM protocol is an 8-bit protocol, parity must be set to NONE. XMODEM internally issues a TRMDEF,PA=N. However, data networks such as local area networks may force a specific parity. Such networks must be configured for transparent data transmission. If they are configured to force parity other than NONE, XMODEM will not work. The communications path must be capable of transmitting all 256 ASCII characters.

- Echoplex must be set to OFF (EP=N). If EP=Y is set, each character sent to the CYBER is echoed back, and the micro cannot distinguish between echoed data and real data transmitted by the CYBER. XMODEM internally turns echoplex off. As there is no way for XMODEM to determine the current setting of echoplex, it normally leaves it off after the transmission. This can be altered by using the configuration file (described earlier). Some data networks may echo data themselves, rather than having the CYBER front end echo the data. XMODEM cannot disable this echoing. You must disable the echoing.

- Some micros, such as the APPLE, require the high order bit in each character to be set for some files. This is also true of some word processors, such as WORDSTAR. If the file is transferred as a 6/12-bit display code text file to the CYBER, the high order bit is lost because these character sets do not support all 256 ASCII characters. To get around this problem, you can either write a program on the micro to restore the high order bit, or you can transfer the file to the CYBER as an 8/12-bit ASCII file, or as a micro binary file.

- If the SP parameter is set to YES, the first block transmitted from the CYBER to the micro is of this form:

  SOH+200B/filetype/255D-filetype/123D/zeros

Where SOH is an ASCII SOH, and file type is

  00 - Text
  04 - Micro binary
  08 - Cyber binary

The 123 is included to ensure that the checksum does not match so that micros which do not recognize this block will respond with a NAK (Negative Acknowledge). This block is recognized by ASCII Express for the Apple. If the special block is not supported by your micro's transfer program, it will be considered an invalid block and will be NAKed. If this block is NAKed three times, the transfer will proceed with the data.

If the first block received by the CYBER is of this form and the file type was set to auto-select, the file type in the block is used to determine the file type used for the transfer. If an invalid file type is detected, micro binary file is used. If the auto-select mode is set and no special file type block is received by the CYBER, a file type of TEXT with 6/12-bit display code is used.

†A registered trademark of Apple Computer, Inc.
††A registered trademark of United Software Industries, Inc.
Although the CYBER implementation supports most common extensions to the XMODEM protocol, it does not support batch mode. If you try to transfer files using batch mode, the transfer terminates.

As input timeout has not been implemented in NOS, XMODEM does not timeout after 10 seconds and does retransmit the last block. The protocol requires the receiver to timeout, but the sender may not always timeout. This causes problems only when the micro is the sender and the micro does not timeout. Most XMODEM packages available for micros timeout in both directions; so this limitation will not normally cause any problems.

PROFILE command 14-11
PROFILE directives 14-12
Program library 2-17; 14-5, 14
Programmable format control (PPC) 9-48.2; H-1
Programmable function keys 4-24.1
Project number 7-4
Project profile file 14-11
Prologue 7-4, 30, 31, 73; C-11
Prologue, project C-11
.PROMPT directive 4-32
PROTECT command 7-44
Protected command 3-13
PRU device C-11
PRU (See Physical record unit)
PSN (See Packet-switching network)
PSR level 6-16
PSU (See Printer Support Utility)
Public auxiliary device C-11
Public file 10-4
Punch disposition 2-11; 9-45
PUNCH file 2-11; 3-19; 9-45; F-5, 6
PUNCHH file 2-11; 3-19; 9-45; 11-9; F-6
PURGALL command 10-31
PURGE command 10-32.1
PW command J-24
P8 file 2-11; 3-19; 9-45; F-7
QGET command 7-45
QTF (See Queued File Transfer Facility)
Queue priority C-11
Queued file 2-11; 7-45; 9-31, 35, 44; C-11
Tape formats, obsolete 1-1
Tape management 12-1
Tape mark C-13
Tape marks 2-8; 12-2
Tape owner identification G-2
Tape (See also Magnetic tape)
Tape Verification Facility (TVF) 3-6
TAPEn file 11-10
TC command J-2,25
TCOPY command 2-7; 9-59
TDU command 8-8.1
TDUMP command 9-62
Tek terminal J-1
Tektronix 4010/4014 terminal 16-1; J-25
Teletypewriter (TTY) 16-1; J-1
Televideo terminals 8-6.2,8; 16-1
Temporary file C-13
Terminal
Categories J-4
Character conversion E-1
Characteristics 8-9; J-1
Classes 16-1; J-1,24,25
Control 16-9
Definition commands 16-2
Display of characteristics J-8
Input/output conventions 16-2
Name C-13
Output 16-5
Session 3-3
Terminal attributes 8-9
Terminal character set-mode 6-6
Terminal characteristics 3-5; J-1
Terminal characteristics, CCP default J-2
Terminal characteristics, NDL default J-2,24
Terminal classes J-1
Terminal control commands 8-2
Terminal definition commands 16-4; J-1
Terminal definition file 8-6.1,7.8.1
Terminal display model 6-8.1
Terminal identifier (TID) 2-12
Terminal messages 7-40
Terminal output
Asynchronous 16-5
Synchronous 16-5
Terminal Verification Facility (TVF) 7-32; 8-18
Terminating a host-terminal connection J-26
Terminating input lines 16-3
Termination character 16-6; J-8
Termination sequence 16-4,6; C-14; J-8
Terminator, command 5-2,3
TERMLIB 8-6.1,7.8.1
TEXT command 8-37
Text editor facility 14-1
Text editors 14-1,18
Text mode 8-37
TEXT record type 15-3
TID (See Terminal identifier)
Tieline Facility (TLF) 7-32; 8-18
Time of the week 6-7
Time slice C-14
Timed/Event rollout C-14
TIMEOUT command 8-9
Timeout period 3-5
Timeout status 8-9
TLF (See Tieline Facility)
TM command J-26
Tracks 2-7
Transaction Facility (TAF) 1-1; 3-6; 7-32; 8-18
Transferring files between mainframes 9-31,49,50; 10-22
Transmission key K-1
Transmitting input K-1
Transparent input mode C-14; J-11,18,27; K-1
Transparent submit mode 7-68,70; C-14
TRMDEF command 8-9; 16-2; J-2
TTY (See Teletypewriter)
TVF (See Tape verification facility)
TVF (See Terminal Verification Facility)
TYPE directive 15-30
Type of network 6-8.1

U-type record 15-1
UCF record type 15-4
UCLP (See Output, Lines printed)
UCLV (See Output, Lines printed)
UCPC (See Output, Cards punched)
UEAC (See Application, Job usage)
UEAD (See Adder activity)
USECP (See Accumulated central processor time)
UEMS (See Mass storage activity)
UERM (See Magnetic tape activity)
UEPF (See Permanent file activity)
UHLa G-11
UHLa label G-1
UJN (See User job name)
ULIB command 15-34
ULIB directory 15-32,33
ULIB record type 15-3,6
Unlabeled tape 12-7,13
UNLOAD command 7-54; 9-64
UNLOCK command 9-65
UPDATE command 14-14
UPDATE mode 10-8
UPL record type 15-15
UPLx record type 15-4
UPROC command 7-73
US code A-3
USECPU command 7-74
User break processing 16-4
User break 1 16-6; C-14; J-6,7
User break 2 16-6; C-14; J-8
USER command 7-69,74
User header label  G-1
User index 7-30; C-14
User index hash 3-8; 7-14; C-14; D-2
User job name (UJN) 3-8; 7-18,23,62; C-14; D-2
User label  G-11
User library 2-17; 15-1,32,33,34,43
User name 2-14; C-14
User name, alternate 10-5
User name LIBRARY 8-22,26
User number C-14
User permissions 7-31
User program 1-5
User prologue (See Prologue)
User trailer label  G-1
User validation 3-8; 7-28,74
User validation limits 7-5
User volume label  G-1
Using XMODEM  P-1
UT terminal  J-1
UTLa  G-11
UTLa label  G-1
UVLa  G-11
UVLa label  G-1

Validation file  C-14
Validation limits 7-28
VEIAF (See NOS/VE Interactive Facility)
VERIFY command 9-65
Verifying files  9-65; 15-35
VFU load procedure H-2,4,2
VFYLIB command 15-3,35
VFYLIB directive 15-31
Volume  C-14
Volume accessibility character, tape 12-10.1
Volume header label  G-1,2
Volume serial number (VSN) 12-1,6,11,25;
C-15; G-2
VOLI label 2-8,9; 12-1,9; G-1,2
VSN command 12-25
VSN (See Volume serial number)

Wait disposition 2-11,12; 9-45
Wait-if-busy option 10-6
WBR command 11-10
Weekday 6-7
WHATJSN command  8-37
WHILE command 6-31
Word  C-15
WRITE command 8-51
Write interlock 2-15; 9-26,65; C-15

WRITE mode 10-8.1
Write ring  C-15

WRITEF command  9-68
WRITEN command 8-52
WRITER command 9-68

X command 8-38
X format I-3
X format tapes 9-59,64
X.25 Public data network 7-36,38
X.25 terminals  J-4
XEDIT command 14-18
XL command  J-27
XMODEM command 8-38; P-1
X3.64 terminal  J-1

YANK status 15-6,15

Zero byte terminator  C-15
Zero length PRU  C-15
ZZZDUMP file 3-12; 11-5,6,7
ZZZZMB file 11-1,3
ZZZZTRM 8-6,1,7
ZZZZZLD file 13-1
ZZZZZxx files 13-1

026 punch code A-3; F-3
029 punch code  A-3; F-3

200 User Terminal 16-1; J-25
2741 terminal, ATTN key 16-8
5/7/9 multipunch  F-3,5
533/536 printer 9-48; A-4; H-1,2,4
580 line printer
Carriage control array  H-7
Format controls  H-1
PFC array  H-1
Spacing code 9-48.2
585 line printer 9-48; H-1,2
5870 Non Impact Printer 9-44; H-1
6-bit display code 8-2; 9-23
6/12-bit display code 8-2; 9-23
6/7/8/9 multipunch 2-6; C-15; F-2
6/7/9 multipunch 2-6; C-15; F-2
6PP record type 15-4
63-character set A-1
64-character set A-1
7-bit ASCII code 9-23; A-1
7/8/9 multipunch 2-6; 3-1; C-15; F-2
7/9 multipunch F-5
7PP record type 15-4
77 table (see Prefix table, record) 15-2
7700 table (see Prefix table, record) 15-2
9-54,55; 10-48,49
95-character set  A-1
# COMMENT SHEET
