PREFACE

The KRONOS® Time-Sharing System was developed by Control Data Corporation to provide remote interactive job processing for CONTROL DATA® CYBER 70 Series Model 72, 73, and 74 Computer Systems and for CONTROL DATA® 6000 Series Computer Systems. This interactive job processing capability is provided in addition to the local and remote batch processing capabilities available under KRONOS.

This manual describes communication between a remote time-sharing terminal user and the KRONOS Time-Sharing System. It contains a description of the subsystems available to the user and the procedures necessary to use the capabilities of these subsystems. However, this manual does not contain programming information for these subsystems. Sections 4 and 5 of this manual may be particularly useful to the inexperienced user as well as the more experienced user. These sections describe the command set available to all time-sharing users. Included are terminal control, subsystem selection, file creation, and file maintenance commands. The more experienced user may be interested in the ability to enter control card images, either one at a time, or as a batch job image, from the terminal. These features are described in sections 8 and 9.

The reader should note that this product is intended for use only as described in this document. Control Data cannot be responsible for the proper functioning of undescribed features or undefined parameters.

The following manuals contain additional information of interest to the user of the KRONOS Time-Sharing System.

INTRODUCTION

The KRONOS Time-Sharing System provides a user with general purpose or specialized time-sharing capabilities. It can be used from any location simply by dialing the computer's telephone number.

Since KRONOS is capable of serving a large number of users simultaneously, the cost of using the system is only a fraction of that of conventional data processing systems. This is combined with the speed and convenience of a conversational system.

Although a large number of users may be accessing KRONOS at the same time, the sophisticated software that controls the system assures the complete separation of each activity. Thus, each user may conceptually imagine that he is the only user of the system.

To further enhance the convenience of programming, the KRONOS system maintains control of all information (files) created by its users. Prior to creating a file, it is named and may subsequently be requested by that name at any time.

The KRONOS system is inherently secure. It assumes that any file created belongs exclusively to the person creating it and will deny any other user's request to access it. However, a user can also specify that a file be made available to other users.

In order to use the system, it is necessary to know its telephone number and be able to supply identification consisting of a user number and optionally, a password, charge number, and project number. After dialing the appropriate telephone number and making connection with the computer, the system requests the user identification. In some cases, the terminal being used may also require identification. If the identification is legitimate, access to the KRONOS system occurs immediately.

In summary, the KRONOS system is a powerful, sophisticated time-sharing system which can satisfy a wide spectrum of computational needs of its users. Its conversational capabilities permit its users to debug their programs much faster than with other data processing systems. Its peripheral mass storage and advanced file maintenance techniques permit vast amounts of information to be stored at high speeds. The fact that the system can be used from terminals in remote locations creates an environment in which many users can be performing work in the privacy of their own offices, without the inconvenience of traveling to the computer site.

TERMINALS

All communication with the computer can take place via a remote terminal. Programs or data are sent to the computer according to specific rules or commands. The computer responds by sending its answers on the terminal. If the user attempts to process an incorrect command, the computer rejects the command and prints the reason for its rejection.
Two types of terminals may be used to communicate with KRONOS.

- ASCII code compatible terminals (such as Teletype® models 33, 35, 37, and 38, Memorex 1240, CDC 713, etc.)
- Correspondence code terminals (such as Novar 5-41, Datel 30, IBM 2741, etc.)

If a correspondence code terminal is to be used, KRONOS requires that the communications system equipment be modified to accommodate this type of terminal. In addition, modification is also required if transmission speeds greater than ten characters per second are required.

Most time-sharing operations can be performed using either type of terminal. Differences in operation are described, when applicable, throughout this manual. A summary of these differences is described in Table B-1 of appendix B.

**SUBSYSTEMS**

After identifying himself to the system, the user can specify a subsystem to be used. The available subsystems are:

- **BASIC** An elementary programming language used for scientific applications. This easily learned language is quickly adaptable to the needs of engineers, businessmen, educators, and other fields. It requires neither computer background nor training in higher mathematics.

- **BATCH** Provides the user with a batch control card capability from the terminal. It enables a user to type control card images at his terminal that would normally have to be entered from a card reader at the central site or from a remote batch environment.

- **EXECUTE** Allows a user to execute a previously compiled program. Since a majority of the time spent on a job is for compilation, this subsystem provides an efficient means to run a frequently used program without having to recompile it each time.

- **FORTRAN** Translates mathematical language into machine language to solve mathematical and engineering problems. The time-sharing FORTRAN subsystem provides a convenient language for expressing mathematical and scientific problems and a convenient method for data input and output.

- **NULL** Allows the user to perform file manipulations and other time-sharing operations without subsystem association.

**CONVENTIONS**

Throughout this manual, the following conventions are used.

- **CR** denotes the RETURN key on the terminal keyboard. Each line of time-sharing terminal input must be followed by a **CR**. The system responds by performing a carriage return and line feed operation (positions carriage to first character position on the next line).

- The word system refers to the KRONOS Operating System which provides the interface between KRONOS and the user's program.

- The vertical spacing in examples does not necessarily coincide with the spacing that will appear on the user's terminal.
It is recommended that a new user refer to the glossary to become familiar with terms used in this manual and other KRONOS manuals.
INTRODUCTION TO KRONOS PROCESSING

This section is intended primarily for users unfamiliar with the KRONOS Time-Sharing System. It is designed as a guide to be used for the first session at a time-sharing terminal. Included are instructions necessary to gain access to the system (log-in), enter and run a simple program in the BASIC language, and finally, leave the system (log-off). Don't be nervous. You cannot harm the system by making incorrect entries or other mistakes at your terminal. The error will merely be detected by the system which in turn issues a routine error message (probably ILLEGAL COMMAND) back to your terminal. Generally, you are allowed as many chances to make a correct entry as are necessary. However, if you are unsuccessful at logging into the system four times in succession, your terminal is automatically disconnected. If this happens, merely recheck your assigned user number and password (if one is assigned), and start over.

LOG-IN PROCEDURE

1. Check to ensure that the following switches on the terminal are set to the correct position. Do not be alarmed if one or more of the switches listed do not exist on the terminal to be used. If the terminal has been determined to be acceptable for KRONOS time-sharing operations, its use should correspond to that described in this manual.
   - Full-duplex/half-duplex (FDX/HDX) switch - Although this switch can be set to either position, it is normally set to the half-duplex position. If set to full-duplex, characters entered from the terminal are not printed.
   - Even parity/odd parity switch - If an ASCII code terminal is being used, this switch must be set to even parity. Odd parity must be selected for correspondence code terminals.
   - Baud rate switch - This switch determines the speed at which the terminal transmits and receives information. There is only one correct position when the terminal is connected to KRONOS. However, this is a system option and is dependent upon the system equipment being used. If you do not know the correct setting, consult your service vendor.

2. Dial the KRONOS computer site. If the procedure is unfamiliar, refer to appendix B for complete instructions. When the connecting sequence is complete, KRONOS initiates the log-in sequence as follows:

```
yy/mm/dd, hh.mm.ss
KRONOS TIME-SHARING SYSTEM - VER. 2.1.
USER NUMBER:
```

Where:

- *yy/mm/dd.* Current date (year/month/day.)
- *hh.mm.ss.* Current time (hours.minutes.seconds.)

If this information does not appear at the terminal, identification of the terminal is required. Correspondence code terminals must always be identified. Specific ASCII code terminals may also require identification.
3. Identify your terminal to KRONOS as follows (if identification is not required, proceed to step 4):
   - Correspondence code terminals with standard print
     Press the ATTN key
   - Correspondence code terminals with APL print
     Type A and press the ATTN key
   - ASCII code terminals with standard print
     Type T
   - Memorex 1240 (ASCII code) terminals with APL print
     Type M

The log-in sequence should be initiated automatically (as described in step 2) after the terminal is identified.

4. Enter your assigned user number on the current line. For example:
   USER123
   The system responds by printing:
   PASSWORD
   *******

5. Enter your password in the blacked-out area. For example:
   ABCDEFG
   If no password has been established, type CR only.
   The system responds by printing either:
   TERMINAL: nnn, iii
   OR
   TERMINAL: nnn, iii
   RECOVER/CHARGE:
   OR
   RECOVER/SYSTEM:
   Where:
   nnn  Terminal number that the system uses as part of the unique identifier for each active user
   iii  Identifier that describes the type of terminal as follows:
   TTY  ASCII code terminal with standard print
   MEMAPL  Memorex 1240 (ASCII code) terminal with APL print
   CORAPL  Correspondence code terminal with APL print
   COR  Correspondence code terminal with standard print

6. Perform step a or b depending upon which system response was printed in step 5.
   a. If the RECOVER/SYSTEM: response was printed, enter the subsystem to be used on the same line (BASIC for this session).
      For example:
      BASIC
      The system responds by printing:
      OLD, NEW, OR LIB FILE:
b. If the RECOVER/CHARGE: response was printed, type CHARGE, followed by your assigned charge number and project number on the same line. For example:

    CHARGE chargeno, projectno

The system responds by printing:

    READY.

Then enter the subsystem to be used (BASIC for this session). For example:

    BASIC

The system responds by printing:

    OLD, NEW, OR LIB FILE:

7. Enter the appropriate file status on the same line (NEW for this session). For example:

    NEW

The system responds by printing:

    FILE NAME:

8. Enter the one to seven-character file name on the same line (PRIME for this session). For example:

    PRIME

The system responds by printing:

    READY.

To this point the output at the terminal has the following form.

    yy/mm/dd, hh.mm.ss.
    KRONOS TIME-SHARING SYSTEM - VER. 2.1.
    USER NUMBER: USER123
    PASSWORD
    ABCDEFG
    TERMINAL: mnn, iii
    RECOVER/SYSTEM: BASIC
    OLD, NEW, OR LIB FILE: NEW
    FILE NAME: PRIME
    READY.

The password cannot be seen and is shown in this manner solely for purposes of illustration.
PROGRAM ENTRY AND EXECUTION

1. Now enter the BASIC program PRIME. Each program statement is followed by a carriage return.

```
10 PRINT "THIS IS A LISTING OF TEN PRIME NUMBERS"
11 PRINT
20 PRINT "WHICH PRIME THE PRIME NUMBER"
30 LET N=0
40 LET V=0
45 FOR A=1 TO 10
50 LET V=V+1
60 LET Y=INT(V/2+.5)
70 FOR X=2 TO Y
80 LET Z=V/X
90 LET W=INT(Z)
100 IF Z=W THEN 50
110 NEXT X
120 LET N=N+1
140 PRINT ";N," ;V
160 NEXT A
170 END
```

2. The program is now ready to be executed. Type:

```
RUN CR
```

The system returns the following output:

```
yy/mm/dd. hh.mm.ss.
PROGRAM PRIME
THIS IS A LISTING OF TEN PRIME NUMBERS

<table>
<thead>
<tr>
<th>WHICH PRIME</th>
<th>THE PRIME NUMBER</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>4</td>
<td>5</td>
</tr>
<tr>
<td>5</td>
<td>7</td>
</tr>
<tr>
<td>6</td>
<td>11</td>
</tr>
<tr>
<td>7</td>
<td>13</td>
</tr>
<tr>
<td>8</td>
<td>17</td>
</tr>
<tr>
<td>9</td>
<td>19</td>
</tr>
<tr>
<td>10</td>
<td>23</td>
</tr>
</tbody>
</table>
```

3. This program prints the first ten prime numbers. After the program has completed execution, the system replies:

```
CP s.sss SECS.
RUN COMPLETE.
```

Where:

- `s.sss` Amount of central processor time required to execute the program
LOG-OFF PROCEDURE

To leave the system, type:

    BYE  CR

This command causes the following information to be printed, then logs you off the system by disconnecting the terminal.

    USER123 LOG OFF.  hh.mm.ss
    USER123 CP        s.sss  SEC.

Where:

    s.sss         Total central processor seconds used since log-in

TIME OUT

The system will log-off an inactive terminal if no entry is made within a 10-minute period.
With the exception of some central memory tables, all data in the KRONOS system is considered either a file or a part of a file. This section describes the mass storage file organization under KRONOS and explains the fundamentals of file processing. Refer to the KRONOS Reference Manual for detailed information concerning the KRONOS file structure.

FILE STRUCTURE

A file is the largest collection of information addressable by name (one to seven characters), and begins with the beginning-of-information (BOI), before which no data exists. A file consists of one or more logical records of information. A logical record is a group of related words or characters, of fixed or variable length, which is independent of its physical environment. Thus, a logical record on punched cards would contain the same information as its counterpart on mass storage.

The physical record unit (PRU) is the smallest division of data on a device. A PRU on all mass storage devices in the KRONOS system consists of 640 six-bit characters. The logical record is composed of one or more PRUs.

The end of a logical record is the end-of-record (EOR). The end of a file is the end-of-information (EOI). The system automatically writes an EOI as the last physical item of information on all files. However, the user may have the additional capability to write an end-of-file mark (EOF) to signify the end of a file. This capability exists in the FORTRAN subsystem and in other languages available under the BATCH subsystem (COMPASS, COBOL, etc.). Therefore, due to the EOI concept, a file may actually be a multifile file. For example:

(BOI)...data...(EOR)...data...(EOR)(EOF)...data...(EOR)(EOF)(EOI)

A typical file is illustrated by the following example.

One line of an invoice may form an item, a complete invoice may form a record, a set of such records may form a file, and the collection of invoice files may form a multifile file.

To have a file positioned at the BOI means that a subsequent read operation will read the first logical record. A write operation writes data on the first PRU and terminates with an EOR and EOI following the logical record. A file positioned at EOR has the following record, EOF, or EOI read on a subsequent read operation. A subsequent write operation on the file adds data to a new physical record following the current EOR or EOF. A file positioned at EOI is positioned at the last physical record of the file. Any subsequent read operation causes the EOI to be read. No data is transmitted. A write operation writes over the existing EOI and adds a new logical record to the file followed by an EOR and EOI.
The following examples illustrate possible positions within a file.

File 1  ...data...(EOR)(EOF)(EOI)
        1   2  3  4

File 2  ...data...(EOR)...data...(EOR)(EOF)...  
        1          2  3

File 3  ...data...(EOR)(EOI)
        1   2  4
        1  File positioned at BOI
        2  File positioned at EOR
        3  File positioned at EOF
        4  File positioned at EOI

WORKING FILES

Generally, a working file is either a new file, created by the user, or a copy of a file that already exists in the system (indirect access permanent file†). All working files are temporary in nature and can exist no longer than the user is logged into the system. Working files may be created, accessed, and released at the discretion of the user while he is logged into the system but they are automatically released when he logs off the system.

Working files may also be referred to as local files. The parameter LFN on most time-sharing job commands and permanent file commands (described in sections 4 and 5) signifies a local file name. Therefore, throughout this manual, the terms are synonymous.

One type of working file, the primary file, has special significance in certain time-sharing commands. A primary file is obtained with the OLD or LIBRARY command which retrieves a copy of an indirect access permanent file. In addition, a primary file is created with the NEW command. There is only one primary file active or available to the user at any given time. For example, the command

OLD, LFN1

retrieves a copy of indirect access permanent file LFN1 from permanent file storage for use as the primary file. If the command

OLD, LFN2

is entered, a copy of indirect access permanent file LFN2 is retrieved for use as the primary file, and the current primary file (LFN1) is released. To access LFN1 again, the user must enter the OLD command or enter:

GET, LFN1

If this command is used, a copy of permanent file LFN1 is retrieved for use as a working file and the current primary file (LFN2) remains the same.

†Refer to section 5 for complete information concerning permanent files.
Most operations performed on files by time-sharing terminal commands are performed using the primary file, unless another working file is specified in a command parameter. For example, the command

```
SAVE
```
is used to retain the primary file in the permanent file system. However, the command

```
SAVE,ABC
```
is used to retain file ABC in the permanent file system. File ABC could be either the primary file or another working file.

There is a close association between the primary file and the subsystem in use when the primary file is saved. Unless the NULL subsystem is active when the primary file is saved, an internal indicator called the subsystem flag is set to indicate which subsystem is being used. That subsystem becomes associated with the permanent file and is automatically selected each time the file is retrieved using the OLD command. For example, if a user currently operating under the BASIC subsystem issues the command

```
SAVE,ABC
```

where ABC is the current primary file name, the BASIC subsystem flag will be associated with the resulting permanent file ABC. If at a later date the user is operating under another subsystem and enters the command

```
OLD,ABC
```

the current primary file is released, the BASIC subsystem is selected automatically, and file ABC becomes the new primary file. To save the primary file without a subsystem association, the user must enter the NULL subsystem before issuing the SAVE command. Retrieving a file saved while under the NULL subsystem does not affect the subsystem currently being used. Furthermore, the subsystem flag is set only when saving the primary file. There is no subsystem association when working files other than the primary file. If the permanent file named in the command to select a new primary file (OLD or LIBRARY) does not have a subsystem associated with it, the subsystem currently being used remains in effect.

Following any operation on a primary file, the file is automatically rewound (positioned at BOI). However, the user is responsible for the position of all other working files because they are not automatically rewound following each operation. The REWIND command from a time-sharing terminal, the REWIND statement in FORTRAN, or the RESTORE statement in BASIC can be used to position a file to the BOI.

Source code (program statements, text, or data) entered from the terminal keyboard is normally stored in the primary file. However, the user can also enter source code into any working file, including the primary file, or create new working files using the Text Editor. Refer to the Text Editor (EDIT) Reference Manual for additional information.

**FILE SORTING**

Each line of source code entered by the user must begin with a one-to ten-digit line number unless the source code is entered in text mode. Leading zeros on line numbers are permissible but are not required (00120 and 120 are interchangeable). Line numbers with leading zeros can be intermixed with line numbers containing no leading zeros. Line numbers can be entered manually or may be generated automatically by the system. This is accomplished by entering the AUTO command (refer to description in section 4). Note that the line numbers generated by the AUTO command consist of only five digits.

†Refer to the TEXT command in section 4 for information concerning text mode.
When the user is not in text mode, entering numbered lines of source code sets an internal indicator called the sort flag. When the sort flag is set, the primary file is sorted automatically whenever the LIST, LNH, RUN, RNH, LENGTH, EDIT, or SUBMIT command is entered. Sorting of the file places the statements in order according to the first five digits of the line number. If it is desired to sort the file on more than the first five digits, the number of digits can be specified using the SORT,In command (NC parameter). Refer to description of this command in section 4.

When entering a program from the terminal, the user enters the line number and the statement. After the carriage return (CR) key is pressed, the text is entered into an area in core. Periodically, when this area (16 decimal central memory words) is filled, the text is written to the user's primary file on mass storage as a new logical record. When a sort is performed, these records are rewritten as one logical record. Thus, the entire program is stored as one logical record.

If the message

FILE TOO LONG TO SORT.

is returned to the user, the file is too long to be sorted automatically by the system. The user must then enter the SORT,In command before proceeding.

However, if the message

FILE NOT SORTED.

is returned to the user, the system has attempted to sort the file but discovered that one or more lines begin with nonnumeric line numbers. Thus, a sort was not performed. The user may enter the SORT,In command for more informative diagnostics.

If the user wishes to inhibit automatic sorting of the primary file, he may enter the NOSORT command. This command clears the sort flag and should be entered only when the user desires that the primary file not be sorted and packed into one logical record. The sort flag is reset when KRONOS receives the first numbered line of source code following the NOSORT command.

The following example illustrates the effect of the NOSORT command. The user selects the proper subsystem and obtains a copy of permanent file A with the command sequence:

FORTRAN, OLD, A

It should be noted that if file A had a subsystem flag other than FORTRAN or NULL associated with it, that subsystem would be selected automatically even though the user specified the FORTRAN subsystem. To ensure that the correct subsystem and file have been selected, the user enters the command:

STATUS

The system prints the following status report.

TERMINAL 42, TTY—Identifies the terminal being used
SYSTEM - FORTRAN—Proper subsystem was selected
FILE NAME: A—File A is the new primary file
STATUS - IDLE

The user then requests a listing of the file with the command:

LIST
The system prints the following copy of the file.

```
73/01/10.  16.07.14.
PROGRAM   A
00100 PROGRAM TEST (OUTPUT)
00110 DO 1 J=1, 10
00120 PRINT, J
00130 1 CONTINUE
00140 END
READY.
```

The user then enters the following changes:

```
00120 K=J*K
00130 PRINT, K
00140 1 CONTINUE
00150 END
```

and enters the command:

```
NOSORT
```

The system responds:

```
READY.
```

The user then calls for a listing with logical record indications by entering:

```
LIST,R
```

The system lists the unsorted file indicating the end of each logical record.

```
73/01/10.  16.12.23.
PROGRAM   A
00100 PROGRAM TEST (OUTPUT)
00110 DO 1 J=1, 10
00120 PRINT, J
00130 1 CONTINUE
00140 END
--EOR--
00120 K=J*K
00130 PRINT, K
00140 1 CONTINUE
00150 END
--EOR--
READY.
```

If the user had requested a listing without entering the NOSORT command, the following output would have been provided.

```
73/01/10.  16.12.23.
PROGRAM   A
00100 PROGRAM TEST (OUTPUT)
00110 DO 1 J=1, 10
00120 K=J*K
00130 PRINT, K
00140 1 CONTINUE
00150 END
--EOR--
```
If the user wishes to inhibit file sorting, but desires that the file be packed into one logical record, he may enter the following command.

PACK

If the user then wishes to perform text editing on the packed file, he can call the Text Editor with the EDIT command (refer to the description of the EDIT command in section 4).

WORKING FILE CONTROL

As mentioned previously, the OLD, NEW, and LIBRARY commands change the status of files by exchanging the current primary file for another. When the OLD command is entered, the primary file is exchanged for a copy of an indirect access permanent file from the permanent file system. When the NEW command is entered, the primary file is exchanged for a primary file which the user enters from the terminal. The LIBRARY command replaces the current primary file with a copy of an indirect access permanent file saved under the special user number LIBRARY.

It is important to note that normally, when the current primary file is released (by entry of the OLD, NEW, or LIBRARY command), all other working files are also released when the next command is entered, unless that command is NODROP. The current working files are retained if the next command entered is NODROP.

The following is a list of sample commands and their effect on files. The example assumes that there is no subsystem association with any file retrieved using the OLD command. Therefore, the subsystem to be used must be specified, if other than the current subsystem.

<table>
<thead>
<tr>
<th>Commands</th>
<th>Files Present at Completion of Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>BASIC, OLD, A</td>
<td>Primary: A</td>
</tr>
<tr>
<td>GET, B</td>
<td>Primary: A</td>
</tr>
<tr>
<td>GET, C</td>
<td>Primary: A</td>
</tr>
<tr>
<td>GET, D</td>
<td>Primary: A</td>
</tr>
<tr>
<td>FORTRAN, OLD, A1</td>
<td>Primary: A1</td>
</tr>
<tr>
<td>RUN (program A1 creates TAPE1)</td>
<td>Primary: A1</td>
</tr>
<tr>
<td>RUN COMPLETE. (system response)</td>
<td>Primary: A1</td>
</tr>
<tr>
<td>GET, B1</td>
<td>Primary: A1</td>
</tr>
<tr>
<td>GET, C1</td>
<td>Primary: A1</td>
</tr>
<tr>
<td>SAVE, TAPE1</td>
<td>Primary: A1</td>
</tr>
<tr>
<td>FORTRAN, OLD, A2</td>
<td>Primary: A2</td>
</tr>
<tr>
<td>NODROP</td>
<td>Primary: A2</td>
</tr>
<tr>
<td>RUN (program A2 creates TAPE2)</td>
<td>Primary: A2</td>
</tr>
<tr>
<td>RUN COMPLETE. (system response)</td>
<td>Primary: A2</td>
</tr>
</tbody>
</table>
Other commands that change the status of working files are:

CLEAR Releases all working files. Note that only the contents of the current primary file is released; the primary file name is retained. If no primary file is currently specified, a new primary file name is requested.

LOGIN Releases all working files
HELLO Releases all working files
GOODBYE Releases all working files
BYE Releases all working files

Refer to section 4 for a complete description of these commands.
After the user has successfully logged into the system, he can enter the commands necessary to process his job. There are four general categories of commands available to the user.

- Terminal control commands
- Subsystem selection commands
- Job processing commands
- Permanent file commands

With the exception of permanent file commands, each command category is described in this section. Permanent file commands are described in section 5.

COMMAND PROCESSING

The minimum number of characters required to specify a command depends upon the specific command and the subsystem currently being used. A minimum of three characters are checked when a command is entered in all subsystems except the BATCH subsystem. In the BATCH subsystem, commands cannot be abbreviated. If more than the minimum number of characters are entered, the system checks the number given, up to a maximum of seven characters.

For example, if a user is operating under the BASIC subsystem and wishes to change to FORTRAN, the following would be legal and illegal commands for entering FORTRAN.

<table>
<thead>
<tr>
<th>Legal Forms</th>
<th>Illegal Forms</th>
</tr>
</thead>
<tbody>
<tr>
<td>FOR</td>
<td>F</td>
</tr>
<tr>
<td>FORT</td>
<td>FO</td>
</tr>
<tr>
<td>FORTR</td>
<td>FORx</td>
</tr>
<tr>
<td>FORTRA</td>
<td>(where x is any alphanumeric character except T)</td>
</tr>
<tr>
<td>FORTRAN</td>
<td></td>
</tr>
</tbody>
</table>

However, if the user is in the BATCH subsystem and wishes to change to any other subsystem, the name of that subsystem must be entered without abbreviation.

In general, KRONOS processes each command by checking from one to seven of the characters entered. If the user does not enter a sufficient number of characters to make the command unique, the system responds

COMMAND NOT UNIQUE.

and the user must then reenter the command using a sufficient number of characters to make it unique. This only occurs with commands in which several characters are identical, such as HELP and HELLO. In this case, HEL would result in the command being declared not unique.
If the command entered is not a valid command or has been misspelled, the message
ILLEGAL COMMAND.
is returned. When the user discovers an error in the command or other input before
the carriage return (CR) key is pressed, he may either delete the entire line or
backspace to the point of the error, correct it, and continue on the same line.

To delete a line, simply press the ESC or ESCAPE key (ASCII code terminals) or ATTN
key (correspondence code terminals). The system responds

*DEL*

and then positions the carriage to the first character position of the next line.

To backspace and correct a line, count the number of characters (including spaces)
past the position of the error and press the backspace key an equal number of times.
Then correct the error and continue on the same line. The backspace key on ASCII
code terminals is the underline (_) key.† On correspondence code terminals, the
BACK SPACE key is used.

If the user attempts to perform an operation for which he is not validated or exceeds
his validation limits, the system responds:

ILLEGAL USER ACCESS.

The system maintains validation controls for every user number. Refer to the LIMITS
command at the end of this section for a complete description.

Alphabetic characters entered in lowercase are automatically translated to uppercase
unless the ASCII command is in effect. The ASCII command inhibits translation from
lowercase to uppercase (refer to the description of the ASCII command). Note that
all commands may be entered in uppercase or lowercase in either ASCII or non-ASCII
mode.

On all commands that require a numeric value, the number is treated as follows:

- If the number contains an eight or nine, decimal base is assumed.
- The base may be specified by a post radix of B or D, that is, 562D is
treated as 562 decimal and 562B is treated as 562 octal.
- Default conversion of numbers is normally to base octal although this is
a system option.

TERMINAL CONTROL COMMANDS

The terminal control commands allow the user to vary the source and format of
information given to and received from the system. These commands, which may be
entered at any time after the user has successfully logged in, are described as follows:

- **ASCII** Provides capability to use the full ASCII or correspondence
code set. This command specifies that subsequent characters
termed from the terminal will be translated into an extended
internal character set consisting of 128 characters. The
standard internal character set contains only the first 61 of
these characters. (Character sets are listed in appendix B.)

† The backspace character on Teletype model 33/35 terminals is the shift-Ø key.
The character may be either an underline (_) or a left arrow (→).
KRONOS recognizes all characters of the full ASCII code set except LINE FEED and the ASCII-DEL codes. Input control characters (return, delete, and backspace) are recognized but are not translated. Characters of the standard code set are processed internally as six-bit display code characters. The additional characters which make up the full ASCII code set are processed internally as 12-bit display code characters with an escape code convention. Refer to appendix B for an explanation of how the system interprets characters in both ASCII and non-ASCII modes.

The ASCII command must be entered if lowercase letters are to be interpreted as such by the system. Normally, all lowercase letters are translated to uppercase. Commands may be entered in uppercase or lowercase in either ASCII or non-ASCII mode.

**NOTE**

If a correspondence code terminal is being used, the ASCII command must be entered to enable use of the full correspondence code set.

**AUTO,nnnnn,iii**

Causes generation of five-digit line numbers automatically. The nnnnn parameter specifies the beginning line number; default value is 00100. The iii parameter specifies the increment value added for each succeeding line number; default value is 10. The user can exit from auto mode by using either of the following methods.

1. Delete the current line by pressing the ESC or ESCAPE key (ASCII code compatible terminals) or ATTN key (correspondence code terminals) and then enter a new command on the next line.

2. Backspace six character positions and then enter a new command on the same line (six backspaces are required to overwrite the five-digit line number and the blank that follows).

It is also possible to alter the line numbering sequence by deleting or backspacing (steps 1 or 2) and then entering a new beginning line number rather than a new command (leading zeros are permissible but not required). The user should exercise caution when doing this since the AUTO command is still in effect and continues generating line numbers using the original increment value. Thus, if a line number is generated that already exists in the file, the contents of that line are lost and must be entered again to be retained. Note that it is not possible to alter the increment value unless a new AUTO command is entered.

In the following example of the AUTO command, the user backspaces over the line number and enters an LNH command (refer to Time-Sharing Job Commands in this section for a description of the LNH command).
AUTO
00100 THIS IS A TEST
00110 FOR THE AUTO COMMAND
00120 END
00130 LNH

00100 THIS IS A TEST
00110 FOR THE AUTO COMMAND
00120 END
READY.

In the following example, the user backspaces to change the numbering sequence and later deletes a line to change the numbering sequence.

NEW, KL
READY.

AUTO,10,10
00010 THIS IS A TEST
00020 FOR THE AUTO COMMAND
00030 00100 TEST
00110 TEST
00120 *DEL*
00200 TEST
00210 END
00220 00100
L3NH

00100 THIS IS A TEST
00020 FOR THE AUTO COMMAND
00100 TEST
00110 TEST
00200 TEST
00210 END
READY.

FULL

Enters full-duplex mode. Under this mode, each character received by the system is echoed back to the terminal just as it was received. This mode is effective only for terminals which have a full-duplex capability. The system responds:

READY.

If the half/full duplex switch on the terminal is in the half-duplex position when this command is entered, each subsequent character entered is double printed (initially when it is typed, and again when it is echoed back by the system). Placing this switch in the full-duplex position allows only the character echoed back to the terminal to be printed.

HALF

Clears full-duplex mode (refer to FULL command). Characters received by the system after this command is issued are not echoed back to the terminal. The system responds:

READY.

If the terminal being used has a half/full duplex switch, characters entered at the terminal are not printed when the switch is in the full-duplex position. Only system-generated output appears at the terminal. Placing this switch in the half-duplex position enables keyboard entry to be printed.
NORMAL
Reverses the effect of the ASCII, AUTO, PARITY, and TAPE commands. KRONOS initially assumes that this command has been entered. Normal mode consists of a 61-character code set where all lowercase letters are converted to uppercase.

PARITY
Specifies that all subsequent output to an ASCII code terminal be transmitted in odd parity, and all output to a correspondence code terminal be transmitted in even parity. KRONOS initially assumes that all information is transmitted in even parity to ASCII code terminals and odd parity to correspondence code terminals.

ROUTE, nn
Sets the amount of time required to perform the return function (carriage return and line feed) for an ASCII code terminal. This command is not valid for correspondence code terminals. The nn parameter specifies a character count delay. This is the amount of time required by the system to send nn characters to the terminal, where the value of nn can range from 0 to 30. If zero is specified, a standard delay value is used. The system responds:

READY.

This command is necessary since the length of time required for the return operation varies depending upon the type of terminal being used. For example, if the system is transmitting output to a terminal, a fixed amount of time is allowed for the return function, after which the system sends the next line of output. If the amount of time is not sufficient, characters may be printed during the carriage return function.

The delay is accomplished by sending rubout characters for paper tape operations and null characters for all other input/output operations. The number of characters to be sent is initially set at log-in or recovery time by the system. If a ROUT command is entered, the number of characters specified for the delay remain in effect until termination of the session (log-off), recovery, or until another ROUT command is entered.

TAPE
Permits subsequent information to be read from the paper tape reader at an ASCII code terminal. The system sends an X-ON character to the terminal at the end of each program request for data and after execution of each command. The X-ON character is used to turn on the paper tape reader at the user's terminal. This mode also inhibits the output of header messages and the READY message when the LIST or LNH command is entered. The user should note that the system ignores carriage return characters entered on an empty input line while in tape mode. Refer to appendix C for complete information concerning paper tape operations.

TERM, t
Sets the terminal type to indicate standard or APL print.

\[
t \quad \text{Specifies terminal and print type}
\]

\[
\begin{align*}
\text{TTY} & \quad \text{ASCII code terminal with standard print} \\
\text{MEMAPL} & \quad \text{Memorex 1240 (ASCII code terminal with APL print} \\
\text{CORAPL} & \quad \text{Correspondence code terminal with APL print} \\
\text{COR} & \quad \text{Correspondence code terminal with standard print}
\end{align*}
\]
This command is useful only for terminals capable of having either standard or APL print. The user can change the print type and then indicate the change by means of the TERM command.

For example, a user operating a Memorex 1240 terminal changes the print type from standard to APL. To notify the system, he enters:

```
TERM, MEMAPL CR
```

**NOTE**

All ASCII code terminals with standard print are designated TTY. The Memorex 1240 is an ASCII code terminal and therefore is identified as TTY when using standard print.

**SUBSYSTEM SELECTION COMMANDS**

The following commands are used to select a specific subsystem. The user should always be aware of the subsystem that is currently active. For example, attempting to execute a FORTRAN program while operating under the BASIC subsystem causes meaningless diagnostic messages to be issued. To determine which subsystem is currently active, enter the STATUS command.

When a user enters the SAVE command to retain his primary file in the permanent file system, it is especially important that he is aware of which subsystem is currently active. An internal indicator called the subsystem flag associates the current subsystem with the primary file being saved. Thus, each subsequent request for that file using the OLD command causes the associated subsystem to be selected automatically. To save the primary file with no subsystem association, the user must enter the NULL subsystem before he issues the SAVE command. Note that the subsystem flag has meaning only when saving the primary file. When saving working files other than the primary file, no subsystem association is made.

```
BASIC, ccc
```

Selects the BASIC subsystem. The ccc parameter is optional and enables the user to specify an additional command. Although any valid command is permitted (as well as all valid parameters for that command), only one additional command may be specified. The following example illustrates the use of this option.

```
BASIC, OLD, PRIME
```

In this example, the user selects the BASIC subsystem and the OLD file PRIME in one command. Note that the file name (PRIME) is a valid parameter with the OLD command.

If ccc is omitted, and no primary file is currently defined, the system responds:

```
OLD, NEW, OR LIB FILE: ↑
```

The user may then specify the file type and the file name (separated by a comma) followed by a CR. If the file name is omitted in the reply, the system responds:

```
FILE NAME:
```

The user then specifies the file name followed by a CR.

↑LIB is an abbreviation of the command LIBRARY. Refer to the description of this command later in this section.
BATCH, nnnnn

Selects the BATCH subsystem. The nnnnn parameter specifies the field length in octal central memory words required for control card images to be entered. If nnnnn is not specified, a default value of 20000B is assumed. The system responds:

\$RFL, nnnnn.

(nnnnn is the specified field length.)

The user may then enter control card images, time-sharing commands, or both for the job. Refer to the KRONOS Reference Manual for information concerning control cards.

It is important to note that the time-sharing commands and control card images entered are not processed as a batch job, as the subsystem name implies. Instead, each control card or command is entered and processed individually. The subsystem is named BATCH because images of control cards, usually referred to as batch control cards, are able to be processed. Refer to section 9 for a complete description of the BATCH subsystem.

EXECUTE, ccc

Selects the EXECUTE subsystem. This subsystem is used only to execute a previously compiled (object code) program. The RUN (or RNH) command must be entered to initiate execution. The ccc parameter is optional and enables the user to specify an additional command. Although any valid command is permitted (as well as all valid parameters for that command), only one additional command may be specified. The following example illustrates the use of this option.

EXECUTE, OLD, OBJFILE

In this example, the user selects the EXECUTE subsystem and the OLD file OBJFILE in one command. Note that the file name (OBJFILE) is a valid parameter with the OLD command.

If ccc is omitted and no primary file is currently defined, the system responds:

OLD, NEW, OR LIB FILE: ♦

The user may then specify the file type and the file name (separated by a comma) followed by a CR. If the file name is omitted in the reply, the system responds:

FILE NAME:

The user then specifies the file name followed by a CR.

NOTE

Source language programs cannot be executed under the EXECUTE subsystem.

The EXECUTE subsystem should be used whenever possible to improve time-sharing efficiency. This can be achieved when certain programs are used frequently. For example, a source code program created under the FORTRAN subsystem must first be compiled before it can be executed. This process is automatic. The user needs only to enter the RUN command.

♦ LIB is an abbreviation of the command LIBRARY. Refer to the description of this command later in this section.
The program automatically goes through a compilation phase which produces an executable object code (binary) program. The object code program is then executed. From this, it can be seen that retaining the object code program in the permanent file system for later execution under the EXECUTE subsystem provides greater efficiency. This can be accomplished through use of the RUN,B=IFn command. This command causes the object code program to be placed on a working file (IFn) specified by the user. That file is then retained in the permanent file system by entering the command SAVE,IFn.

Note that since the file containing the object code is not the primary file, a subsystem flag is not associated with the file when it is saved. In this case, the EXECUTE subsystem will not be selected automatically when the file is requested using the OLD command. The user must ensure that the EXECUTE subsystem has been selected before attempting to execute the program.

To associate the EXECUTE subsystem with the file containing the object code program, enter the following commands.

EXECUTE,NEW,IFn Selects the EXECUTE subsystem and specifies a new primary file name (IFn)

NODROP Prevents the working file containing the object code program from being released

SAVE Retains the primary file in the permanent file system and sets the EXECUTE subsystem flag. The file contains no information at this point.

REPLACE,IFn=PFN Copies the contents of the working file containing the object code program (IFn) to the permanent file created with the SAVE command (PFN). This command can be entered regardless of the subsystem currently being used. It has no effect on the EXECUTE subsystem flag associated with file PFN.

If this is done, subsequent requests to the file using the OLD command cause the EXECUTE subsystem to be selected. Entering the RUN command initiates execution of the object code program.

FORTRAN,ccc Selects the FORTRAN subsystem. The ccc parameter is optional and enables the user to specify an additional command. Although any valid command is permitted (as well as all valid parameters for that command), only one additional command may be specified. The following example illustrates the use of this option.

FORTRAN,OLD,DATAGEN

In this example, the user selects the FORTRAN subsystem and the OLD file DATAGEN in one command. Note that the file name (DATAGEN) is a valid parameter with the OLD command.
If ccc is omitted and no primary file is currently defined, the system responds:

OLD, NEW, OR LIB FILE:†

The user may then specify the file type and file name (separated by a comma) followed by a CR. If the file name is omitted in the reply, the system responds:

FILE NAME:

The user then specifies the file name followed by a CR. Clears the subsystem currently in use. The system responds:

READY.

This command is entered before saving the primary file if the user does not want a specific subsystem flag to be associated with the file. Normally, when a user saves the primary file, an internal indicator called the subsystem flag is set to indicate the subsystem currently in use. That subsystem is automatically selected in each succeeding request for the file using the OLD command. Note that there is no subsystem association when saving working files other than the primary files.

If the user does not specify a subsystem at log-in time, the system assumes NULL by default.

TIME-SHARING JOB COMMANDS

The time-sharing job commands allow the user to perform a variety of job processing or job related operations. These commands may be entered at any time after the log-in procedure is complete.

APL,t

Selects the APL (A Programming Language) interactive interpreter. This command also specifies translation to the full 128-character code set. All characters are recognized although input control characters are not processed. Rather, they are passed to the program as data. The t parameter is optional and identifies the type of terminal being used. Refer to the KRONOS APL®CYBER Reference Manual for a list of terminal identifiers and information concerning the use of APL.

†LIB is an abbreviation of the command LIBRARY. Refer to the description of this command later in this section.
BINARY, nnnn, ccc Selects binary input mode. Under control of this command, eight-bit characters entered from the terminal are stored, without translation, in the primary file. Normally, characters entered from the terminal are translated and stored as 6-bit or 12-bit internal display codes (refer to Central Memory Character Equivalents in appendix B for complete information).

nnnn Number of characters (1 to 4095) to be entered

ccc Termination character; a three-digit octal code that corresponds to a character which the user selects to terminate binary input mode. Refer to appendix B for the correct character set and corresponding codes. (If a correspondence code terminal is being used, a value of 200 must be added to the octal code listed in appendix B.)

The termination character enables the user to return to the normal input mode before the number of characters specified by nnnn has been entered.

Example:

BINARY, 20, 207 CR

In this example, binary input mode is terminated when 20 characters have been entered or the ASCII character BELL (corresponds to octal code 207 entered in command) is typed.

NOTE

If the termination character (ccc) is omitted, the number of characters specified by nnnn must be entered to terminate binary input mode.

BYE

Logs the user off the system and disconnects the terminal. The system responds by printing:

usernum LOG OFF. hh.mm.ss.

usernum CP s.sss SEC.

Where:

usernum User number
hh.mm.ss. Time of day this command was entered
s.sss Total central processor time used since log-in

NOTE

The user should make certain that all working files to be retained are made permanent before issuing this command. All working files not saved are released when the BYE command is processed.
CHARGE, chargeno, projectno

This command allows the user to specify a valid charge number and project number to be billed for subsequent terminal operations. Although certain users are required to enter a charge and project number during the log-in sequence, all users may issue the CHARGE command as long as the charge and project numbers entered are valid. This command can be entered at any time during the time-sharing session. Both charge number (chargeno) and project number (projectno) parameters are required. The system responds:

READY.

CLEAR

Releases all working files. Only the name of the primary file is retained. If no primary file is currently specified, a new primary file name is requested. The system responds to entry of the CLEAR command with:

READY.

All files to be retained must be made permanent before entering this command.

DAYFILE

Prints the system's record of the user's time-sharing activity. Each line of output returned to the terminal is in the form

hh.mm.ss.  message

Where:

hh.mm.ss.  Time of day the message was placed in the dayfile

EDIT, lfn

Selects the KRONOS Text Editor. The lfn parameter specifies the name of an existing working file to be edited. The lfn parameter may also specify a new working file name. In this case, the new file is constructed using the Text Editor. If the lfn parameter is omitted, the primary file name is assumed. When necessary, the primary file is sorted prior to the initiation of text editing.

All working files consisting of several logical records should be compressed into one logical record before entering this command (refer to PACK command described in this section). If this is not done, the contents of all but the first logical record is lost. For additional information, refer to the Text Editor (EDIT) Reference Manual.

GOODBYE

Same as BYE command

HELLO

Logs the current user off the system, as in the BYE command, and reinitiates the log-in sequence. Any working files that are to be retained must be made permanent before the HELLO command is entered. This command allows a new user to log-in without first having to establish communications with the KRONOS system by dialing the computer site.
HELP

Allows the time-sharing user to obtain assistance in the use of KRONOS commands. If the user at a terminal is not sure of the format of a command or its use, the HELP command provides an easily accessible on-line description of the KRONOS command set. The system responds by printing:

IF MORE INFORMATION NEEDED, TYPE YES. OTHERWISE, TYPE THE COMMAND NEEDED.

? 

The user then types YES in reply to the request or else enters the command he wishes to have described. A minimum of three characters must be entered if a command is typed. The user must type END after a question mark (?) to terminate the HELP command.

I key

Interrupts a program that is currently transmitting output to the terminal. The system responds:

*INTERRUPTED*

The user must press the CR key or type P followed by CR to continue. However, if the TAPE command is in effect (tape mode), CR cannot be entered as the first character of a new line. In this case, P CR must be entered to continue. Refer to Job Suspension in section 7 for additional information.

Use of the I key to perform this function is effective only for ASCII code terminals. The ATTN key can be used to perform the same function on correspondence code terminals (refer to Table B-1 in appendix B for complete information concerning the use of special function keys for both ASCII and correspondence code terminals).

If pressing the I key accidentally disconnects the terminal from the system, the user can log-in again and enter the RECOVER command in response to the RECOVER/SYSTEM: or RECOVER/CHARGE: request. He can then continue from the point at which he was disconnected. Refer to Recovery in section 7 for additional information.

LENGTH, lfn

Prints the file name, file type, last status, and length of the working file specified by lfn. If the lfn parameter is omitted, the primary file is assumed. In this case, the primary file is sorted before the length is obtained, unless a NOSORT command precedes the LENGTH command (refer to description of NOSORT command in this section).

The system responds:

<table>
<thead>
<tr>
<th>FILENAM</th>
<th>TYPE</th>
<th>STAT</th>
<th>LENGTH</th>
<th>UNIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>lfn</td>
<td>.tt</td>
<td>xxxx</td>
<td>y.yyy</td>
<td>KPR.</td>
</tr>
</tbody>
</table>

Where:

- lfn: Local (working) file name
- .tt: File type
  - .PM: Direct access permanent file
  - .PT: Primary working file
  - .LO: Any working file that is not the current primary file or a direct access permanent file
The three following file types appear only if the user is in the BATCH subsystem.

. CM Common file
. LI Library file
. SY System file

An * preceding the file type indicates a locked file (user cannot write onto a locked file).

y,yyy Length of file in kilo physical record (KPR) units. A KPR is equal to 1000 physical record units (PRUs). A PRU contains 640 six-bit characters.

Example:

LENGTH,DIRFILE  CR  (user enters command)
FILENAME TYPE STAT LENGTH unit
DIRFILE *PM 0051 0.019 KPR.

LIBRARY

Allows a user to access a file that was previously saved in the permanent file system under special user number LIBRARY. The system responds:

FILE NAME:

The user then enters the selected file name. When the file is found, the system replies:

READY.

The file selected becomes the new primary file and all current working files (if any) are released unless the NODROP command immediately follows this command sequence. Special considerations in the use of this command are described at the end of section 5.

LIBRARY,ln= pfn/options

This is an optional form of the preceding command. It allows the user to specify the command LIBRARY, the selected file name, and special options on the same line. Refer to the command description in section 5 for information concerning this command format. Special considerations in the use of this command are described separately at the end of section 5.

LIMITS

Provides a listing of the user's current validation limits. Refer to Limits Command at the end of this section for a complete description of this command and a sample listing.
LIST,xxxxx,R,
F=lfn

Prints the contents of the primary file at the terminal unless the F option is specified. The primary file is automatically sorted before listing unless a NOSORT command precedes this command (refer to description of NOSORT command in this section).

xxxxx Line number of the line where listing is to begin. This parameter is optional and may be specified only if the primary file is being listed.

R End-of-record and end-of-file marks are to be indicated in the listing if present (optional). This lists the primary file from the beginning to the end-of-information unless the xxxxx parameter is specified.

F=lfn Lists working file lfn (optional). The file is not sorted before listing. When this parameter is specified, neither the xxxxx nor the R option can be supplied. The working file specified is listed from the current position to the end-of-information.

The system replies:

yy/mm/dd.  hh.mm.ss.  } header
PROGRAM nnnnnnn
.
.
(program lines)
.
.
READY.

The header information printed is:

yy/mm/dd.  Current date
hh.mm.ss.  Current time
nnnnnn    File name

This is an optional form of the preceding command which lists the file without a header.

LOGIN

Same as HELLO command

NEW

Allows the user to create a new primary file. The system responds:

FILE NAME:

The user enters a valid file name. When the system accepts the new file name, it replies:

READY.

The file name specified becomes the new primary file and all current working files are released unless NODROP is the next command entered.

NEW,lfn

This is an optional form of the preceding command which allows the user to specify NEW and the file name in one step.
NODROP

Prevents the system from releasing current working files when the user issues the OLD, NEW, or LIBRARY command to obtain a new primary file. This command must be entered immediately after the OLD, NEW, or LIBRARY command sequence is complete. The system responds:

READY.

Refer to Working File Control in section 3 for an example of this command.

NOSORT

Prevents the system from automatically sorting the primary file. This is done by clearing an internal indicator called the sort flag. Sorting of the primary file is initiated only if the sort flag is set when the LIST, RUN, EDIT, LENGTH, or SUBMIT command is entered. The system responds:

READY.

This command is generally used when making additions and/or modifications to the primary file. When followed by the NOSORT command, the additions and/or modifications create a new logical record in the primary file. Note that the NOSORT command remains in effect only until the next numbered line of source code is entered. This causes the sort flag to be turned on again. Refer to the description of file sorting in section 3 for an example which illustrates the effect of the NOSORT command.

OLD

Allows the user to access a file that was previously saved in the permanent file system. The system responds:

FILE NAME:

The user then enters the selected file name. When the file is found, the system replies:

READY.

The selected file becomes the new primary file. If a specific subsystem is associated with the file, it is selected automatically. This occurs only if the file was originally the primary file and was saved while a subsystem other than NULL was active. All working files are released following entry of this command unless the next command entered is NODROP.

OLD, lfn=pfn/options

This is a special form of the preceding command. It allows the user to specify the command OLD, the file name, and special options on the same line. Refer to the command description in section 5 for information concerning this command format.

PACK, lfn₁, lfn₂, NR

Compresses (that is, packs) a file consisting of several logical records into one logical record. When the operation is complete, the system responds:

READY.
The PACK command may be entered in one of the four following formats depending upon the options selected.

PACK

Packs the primary file into one logical record. When the primary file is packed, it is not sorted automatically by subsequent operations that normally cause the file to be sorted (that is, LIST, RUN, etc.). Automatic sorting resumes when the user enters the next line of source code or the SORT command.

PACK, lfn

Rewinds and packs working file lfn into one logical record. File lfn is rewound again after the pack.

PACK, lfn₁, lfn₂

Rewinds and packs working file lfn₁ into one logical record and then writes the file to lfn₂. If lfn₂ currently exists, lfn₁ is written at the current position of lfn₂. File lfn₂ is rewound after the pack; lfn₁ is not.

PACK, lfn₁, lfn₂, NR

Same as the preceding format, except that the no rewind (NR) parameter inhibits file lfn₁ from being rewound before the pack, unless it is the primary file. The primary file is rewound after all operations.

PASSWOR,
oldpswd,
newpswd

Allows validated users to change their password. The user must supply the correct current password (oldpswd) and a one-to seven-character, alphanumeric, new password (newpswd).

If any part of this command is in error, the system replies:

ERROR IN PASSWORD ARGUMENTS.

After the password has been changed, the system replies:

READY.

If the user is not validated to use this command, the system responds:

ILLEGAL CONTROL CARD.

RECOVER

Enables the time-sharing terminal user to resume processing after having been accidentally disconnected from the system or when a system malfunction requires that the log-in sequence be reinitiated. Refer to Recovery in section 7 for a complete description and examples of the use of this command.

RENAME, lfn₁, lfn₂

Changes the name of working file lfn₂ to file name lfn₁. If file lfn₁ currently exists, it is released. This command cannot be used to change the name of a permanent file. However, a working file can be renamed and then saved in the permanent file system under the new name.

RESEQ

This command enables the user to resequence the line numbers of the primary file. If the current primary file is a text file, line numbers can be added. Statements that reference line numbers are updated when BASIC programs are resequenced. Refer to Resequencing Line Numbers in section 7 for a complete description and examples of the use of this command.
RETURN, lfn

Releases working file lfn

REWIND, lfn

Positions working file lfn at the beginning-of-information (BOI). Refer to File Structure in section 3 for additional information.

RUN

Compiles and/or initiates execution of the primary file or another working file. The primary file is sorted before being compiled unless a NOSORT command precedes this command (refer to description of NOSORT command in this section). The system responds:

\[ \begin{array}{ll}
\text{yy/mm/dd.} & \text{hh.mm.ss.} \\
\text{PROGRAM} & \text{nnnnnn} \\
\end{array} \]

header

(data or error messages)

CP

s.sss SECS.

RUN COMPLETE.

One or more of the following options may be supplied with the RUN command.

RUN,B=lfn

or

RUN,C=lfn

Compiles the source program and generates a binary file containing the resultant object code on file lfn. The source program is not executed. File lfn can later be executed under the EXECUTE subsystem by entering the RUN command. File lfn can be retained as a permanent file using the SAVE (or REPLACE command).

RUN,I=lfn

Compiles and/or initiates execution of the working file lfn (lfn is assumed to be sorted). In the EXECUTE subsystem, no compilation occurs.

RUN,MA=nnnn

Uses nnnn as the octal field length for the current job †

RUN,MI=nnnn

Increments the job's current field length by nnnn octal. Refer to example 1. †

RUN,T,q_1,q_2,...,q_n

This command applies only when running a previously compiled (object code) FORTRAN program in the EXECUTE subsystem. It allows the user to rename working files specified in the PROGRAM statement without recompiling the program. The parameters q_1 through q_n are used to specify new working file names to be used in place of those that currently exist in the PROGRAM statement (the parameters are order-dependent and must correspond to those they replace). Refer to example 2.

† If the user exceeds the maximum field length for which he is validated, the message ILLEGAL USER ACCESS is returned to the terminal.
Example 1:

The following example illustrates the use of the RUN, MI=nnnnn command.

```
00100 PROGRAM M (INPUT, OUTPUT)
00110 DIMENSION J(17000)  Causes program to exceed
00120 PRINT 4    field length (included solely
00130 4 FORMAT (*ENTER TWO NUMBERS*)    for purposes of illustration)
00140 READ, A, B
00150 C=A*B
00160 PRINT 5
00170 5 FORMAT (*A X B*)
00180 PRINT, C
00190 END
00190 READY.
```

RUN

```
72/03/01.  16.07.31.
PROGRAM M

AT LINE NUMBER 00190 MORE STORAGE NEEDED FOR COMPILATION
000001 FORTRAN ERRORS IN M   Diagnostic indicates that job's
                          current field length was ins-
CP   0.164 SECS.       ufficient.

RUN COMPLETE.

RUN, MI=3000   Additional field length is
              requested.
```

```
72/03/01.  16.08.41.
PROGRAM M

ENTER TWO NUMBERS
? 16, 23
A X B
  368.00
END.

CP   0.396 SECS.

RUN COMPLETE.
```

Example 2:

The following example illustrates the use of the RUN, T command. Assume a
FORTRAN program contains the following PROGRAM statement.

```
PROGRAM TEST (INPUT, OUTPUT, AAA, BBB, TAPE1=AAA, TAPE2=BBB)
```

Normally, to execute a program containing this statement, the user would have to
deﬁne working ﬁle AAA. Working ﬁle BBB would result from the execution of the
program. However, the user could change the names of working ﬁles AAA and
BBB without recompiling the program (if the object program exists) by using the
RUN, T command under the EXECUTE subsystem. For example:

```
RUN, T, INPUT, OUTPUT, CCC, DDD
```
RHN

This is an optional form of the RUN command which allows the user to run the job without a header being printed. The commands are identical in all other respects.

S key

The user presses this key to terminate a job that is currently transmitting output to the terminal. The use of this key is effective only for ASCII code compatible terminals. The system responds:

*TERMINATED.*

If pressing this key accidentally disconnects the terminal from the system, dial the KRONOS site and enter the RECOVER command in response to the RECOVER/SYSTEM: or RECOVER/CHARGE: request during the log-in sequence.

To terminate a job currently transmitting output to a correspondence code terminal, press the ATTN key. The system responds:

*INTERRUPTED.*

The user must then enter the STOP command which terminates the job and prints the message:

*TERMINATED.*

Refer to Table B-1 in appendix B for complete information concerning the use of special function keys for both ASCII and correspondence code terminals.

SETTL,nnnn

Sets time limit. This command allows the user to specify a time limit (nnnnn octal seconds) for all subsequent operations requiring the central processor. If nnnnn is omitted, the system assumes nnnnn=100B seconds which is the normal default value at log-in time. The minimum time limit that can be entered is 10B seconds. The maximum time limit is dependent upon the user's validation limits (refer to Limits Command at the end of this section).

This command is useful when debugging a program that is cycling in a loop. It prevents the user from accumulating a large bill for computer usage.

SORT

Sets an internal indicator called the sort flag. Sorting of the primary file takes place when the next LIST, LENGTH, EDIT, SUBMIT, or RUN command is entered. The lines of the primary file are then arranged in order according to the first five digits of the line number, and the file is packed into one logical record.

SORT, lfn, NC=n

Sorts working file lfn by arranging the statements in order according to the first n digits of the line number (where 1≤n≤10). If the NC option is omitted, the sort is performed using the first five digits of the line number. File lfn is also packed into one logical record when the sort is performed.

When the sort is complete, file lfn is positioned at end-of-information (EOI) unless it is the primary file which is automatically rewound. This command forces immediate sorting of the specified file and is commonly used to sort the primary file when it is too long to be sorted automatically by the system. Refer to description of File Sorting in section 3 for additional information.
The STATUS command performs one of four functions depending upon the options selected when entering the command. The possible forms of the STATUS command are:

**STATUS** Requests the current job status. An important feature of this command is that it may be entered during job execution. The system responds by printing:

- **TERMINAL** nnn, iii (subsystem currently active)
- **SYSTEM -** (primary file name)
- **FILE NAME:** (primary file name)
- **STATUS -** IDLE No job being processed
- **EXECUTE** User job being processed
- **WAIT** User job waiting for computer

Where:

- **nnn** Terminal number
- **iii** Identifier that describes type of terminal

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTY</td>
<td>ASCII code terminal</td>
</tr>
<tr>
<td>COR</td>
<td>Correspondence code terminal</td>
</tr>
<tr>
<td>CORAPL</td>
<td>Correspondence code terminal with APL print</td>
</tr>
<tr>
<td>MEMAPL</td>
<td>Memorex 1240 (ASCII code) terminal with APL print</td>
</tr>
</tbody>
</table>

**STATUS,F** Requests the current job status. The system supplies the information described in the preceding format plus the file information supplied with the LENGTH command. Note that this command cannot be entered when the job is in EXECUTE status. An example of the STATUS,F command follows.

```
TERMINAL 14, TTY
SYSTEM - FORTRAN
FILE NAME: SECTEST
STATUS - IDLE
```

<table>
<thead>
<tr>
<th>FILENAM</th>
<th>TYPE</th>
<th>STAT</th>
<th>LENGTH</th>
<th>UNIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECTEST</td>
<td>PT</td>
<td>0051</td>
<td>0.002</td>
<td>KPR.</td>
</tr>
<tr>
<td>TAPE2</td>
<td>LO</td>
<td>0051</td>
<td>0.002</td>
<td>KPR.</td>
</tr>
<tr>
<td>SECB</td>
<td>LO</td>
<td>0051</td>
<td>0.046</td>
<td>KPR.</td>
</tr>
<tr>
<td>DATA</td>
<td>LO</td>
<td>0051</td>
<td>0.002</td>
<td>KPR.</td>
</tr>
</tbody>
</table>

**STATUS,T** Requests the accumulated CPU time for this session. For example:

```
CP. 0.046 SECS.
```
STATUS, J = jobname

Requests the status of a remote batch job that was initiated with the SUBMIT command. Remote entry jobs can be submitted from either the time-sharing terminal or from EXPORT/IMPORT. The jobname parameter is the name assigned to the job, by the system, when it is submitted. The possible replies are:

- JOB NOT FOUND.
- JOB IN INPUT QUEUE.
- JOB IN OUTPUT QUEUE.
- JOB IN PUNCH QUEUE.
- JOB EXECUTING.

The JOB NOT FOUND message normally indicates that the job has been processed and no longer exists in the system. However, if the jobname is entered incorrectly (misspelled), this message may also be issued.

The JOB EXECUTING message indicates that the job is either executing or has been rolled out for a higher priority job.

It is only possible to obtain the status of jobs submitted under the current user number. Refer to section 8 for a complete description of remote job entry.

STOP

Terminates any program that is currently in execution or waiting for input from the terminal. The system responds:

*TERMINATED.*

SUBMIT

Allows a validated user to create a batch job deck image and submit it to the local batch queue as a deferred batch job. The user cannot interact with a job submitted for processing using this command. Rather, the job is treated in the same manner as a job submitted from the card reader at the local computer site or from EXPORT/IMPORT. This process is commonly referred to as remote job entry. Refer to section 8 for a complete description and examples of the use of this command. It is recommended that the user become familiar with all information in section 8 before attempting remote job entry.

TEXT

Enter text mode. This command allows keyboard entry of source code (program statements, data, or text) into the primary file without specifying line numbers. Commands entered in text mode are interpreted as text and are not processed by the system. The system responds:

ENTER TEXT MODE.
To terminate text mode from an ASCII code terminal, press the interrupt key (generally labeled INT, INTRPT, or BREAK). If a correspondence code terminal is being used, press the ATTN key. Note that in either case, the carriage must be positioned at the beginning of a new line (empty input line) to be effective. The system responds:

EXIT TEXT MODE.

Since a text file does not normally contain line numbers, and therefore, cannot be sorted (and packed) automatically by the system, a PACK command should be issued after exit from text mode to ensure that the data is in one logical record.

 Initiates processing of procedure file lfn. This allows the user to process a procedure file and remain interactive with his job.

A procedure file is a source file which contains control card images and/or KRONOS control language (KCL) statements. It has the same structure as the control card record in a normal batch job although the JOB and ACCOUNT control cards required in batch jobs cannot be included.

Optional parameters may also be included in this command. The command format with options is:

\[-lfn,S=ccc(\text{oldnam}_1=\text{newnam}_1, \text{oldnam}_2=\text{newnam}_2, \ldots, \text{oldnam}_n=\text{newnam}_n)\]

Where:

\( lfn \) Name of the procedure file to be processed. KRONOS searches for lfn according to the following hierarchy.

1. Check current working files (including primary file).
2. Check system-defined procedure files. This can be a procedure file created by the installation and included as part of the KRONOS system.
3. Check user's permanent file catalog for indirect access permanent file. File must not have an associated password.

If the specified file cannot be found, the system responds:

\( lfn \) NOT FOUND.

\( S=ccc \) Specifies control statement ccc as the first statement in the procedure file to be executed.

\( \text{oldnam} = \text{newnam} \) For each occurrence of oldnam in the procedure file, substitute newnam. This allows use of the same procedure file to perform several tasks depending upon the parameters specified.

To create a procedure file from the terminal, the user should enter text mode (refer to TEXT command). After leaving text mode, issue the PACK command to ensure that the file is packed into one logical record. The file can then be SAVED for future reference as an indirect access permanent file. If changes have to be made to the procedure file, it is necessary to use the KRONOS Text Editor (refer to EDIT command).

Refer to the KRONOS Reference Manual for information concerning the KRONOS control cards and KCL statements available.
LIMITS COMMAND

Entry of the LIMITS command provides a listing of the user's validation limits. Generally, validation limits are the internal system controls associated with each user number which govern his use of certain system resources. The listing provided describes both the resources available to the user and the extent to which they may be used. All numeric values listed are decimal unless the post radix B appears, signifying an octal value. The following information is listed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AB</td>
<td>Answerback identifier (1 to 10 alphanumeric characters). Terminals with answerback capability automatically send this identifier to the system during log-in. The system uses the information to determine if it is a legal terminal. Each user number can have up to four terminal answerback identifiers associated with it.</td>
</tr>
<tr>
<td>MT†</td>
<td>Maximum number of magnetic tapes the user is allowed to have assigned to his job concurrently</td>
</tr>
<tr>
<td>RP†</td>
<td>Maximum number of auxiliary devices the user is allowed to have assigned to his job concurrently</td>
</tr>
<tr>
<td>TL</td>
<td>Maximum amount of central processor time in seconds allowed for the user's job (refer to SETTL command)</td>
</tr>
<tr>
<td>PR†</td>
<td>Maximum central processor priority allowed for the user's job</td>
</tr>
<tr>
<td>CM†</td>
<td>Maximum number of central memory words that the user is allowed to request. This is the job's maximum field length.</td>
</tr>
<tr>
<td>NF††</td>
<td>Maximum number of files that the user is allowed to have associated with his job concurrently</td>
</tr>
<tr>
<td>MS††</td>
<td>Maximum number of mass storage tracks the user is allowed to use</td>
</tr>
<tr>
<td>PN††</td>
<td>Project number to which the user is assigned (not the project number associated with the charge number entered at log-in with the CHARGE command)</td>
</tr>
<tr>
<td>DB††</td>
<td>Maximum number of deferred batch jobs that the user can have in the system concurrently (refer to description of SUBMIT command in section 8).</td>
</tr>
</tbody>
</table>

† For further information about this field, refer to the KRONOS Reference Manual.
†† Not currently used by the system but provided for future expansion.
The following three specifications control permanent file access for the individual user (ordinarily this is specified by origin type).

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FC = n</td>
<td>File count indicating the maximum number of indirect access permanent files allowed the user. n may assume values in the ranges shown. The user is validated for the corresponding upper limit.†</td>
</tr>
<tr>
<td></td>
<td>n</td>
</tr>
<tr>
<td>0</td>
<td>Use job origin control</td>
</tr>
<tr>
<td>1 to 10</td>
<td>10</td>
</tr>
<tr>
<td>11 to 20</td>
<td>20</td>
</tr>
<tr>
<td>21 to 30</td>
<td>30</td>
</tr>
<tr>
<td>31 to 40</td>
<td>40</td>
</tr>
<tr>
<td>41 to 50</td>
<td>50</td>
</tr>
<tr>
<td>51 to 100</td>
<td>100</td>
</tr>
<tr>
<td>101 and above</td>
<td>Not checked</td>
</tr>
</tbody>
</table>

If FC is not specified, n=0 will be assumed.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS = n</td>
<td>Cumulative size of all indirect access files for this user. n may assume any value. The user is validated for the corresponding upper limit.†</td>
</tr>
<tr>
<td></td>
<td>n</td>
</tr>
<tr>
<td>0</td>
<td>Use job origin control</td>
</tr>
<tr>
<td>1 to 1000</td>
<td>1000</td>
</tr>
<tr>
<td>1001 to 2000</td>
<td>2000</td>
</tr>
<tr>
<td>2001 to 5000</td>
<td>5000</td>
</tr>
<tr>
<td>5001 to 10000</td>
<td>10000</td>
</tr>
<tr>
<td>10001 to 50000</td>
<td>50000</td>
</tr>
<tr>
<td>50001 to 100000</td>
<td>100000</td>
</tr>
<tr>
<td>1000001 and above</td>
<td>Not checked</td>
</tr>
</tbody>
</table>

If CS is not specified, n=0 is assumed.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FS = n</td>
<td>Maximum file size allowed for an individual indirect access permanent file. n may assume the values listed. The user is validated for the corresponding upper limit.†</td>
</tr>
<tr>
<td></td>
<td>n</td>
</tr>
<tr>
<td>0</td>
<td>Use job origin control. No controls are enacted</td>
</tr>
<tr>
<td>1 to 10</td>
<td>10</td>
</tr>
<tr>
<td>11 to 20</td>
<td>20</td>
</tr>
<tr>
<td>21 to 30</td>
<td>30</td>
</tr>
<tr>
<td>31 to 40</td>
<td>40</td>
</tr>
<tr>

<td>50</td>
</tr>
<tr>
<td>51 to 60</td>
<td>60</td>
</tr>
<tr>
<td>61 and above</td>
<td>Not checked</td>
</tr>
</tbody>
</table>

If FS is not specified, n=0 will be assumed.

†If the value listed for this field is SYSTEM, the actual value used is a system option.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PA</td>
<td>Specifies that ODD or EVEN parity is associated with the terminal (refer to PARITY command under Terminal Control Commands in this section).</td>
</tr>
<tr>
<td>RO†</td>
<td>Number of rubout characters required for carriage return delay (refer to ROUT command under Terminal Control Commands in this section).</td>
</tr>
<tr>
<td>PX</td>
<td>Specifies full- or half-duplex transmission mode is associated with terminal (refer to FULL and HALF commands under Terminal Control Commands in this section).</td>
</tr>
<tr>
<td>TT</td>
<td>Specifies type of terminal; value listed may be:</td>
</tr>
<tr>
<td></td>
<td>TTY</td>
</tr>
<tr>
<td></td>
<td>MEMAPL</td>
</tr>
<tr>
<td></td>
<td>COR</td>
</tr>
<tr>
<td></td>
<td>CORAPL</td>
</tr>
<tr>
<td></td>
<td>Refer to TERM command under Terminal Control Commands in this section.</td>
</tr>
<tr>
<td>AW</td>
<td>Access word; the octal value listed corresponds to the following access options (bit 0 is option 1, bit 1 is option 2, etc.).</td>
</tr>
<tr>
<td>Option</td>
<td>Signifies</td>
</tr>
<tr>
<td>1</td>
<td>User can change his password (refer to PASSWOR command).</td>
</tr>
<tr>
<td>2</td>
<td>User can use privileged time-sharing commands (refer to appendix E in the KRONOS Operator's Guide).</td>
</tr>
<tr>
<td>3</td>
<td>User is allowed to create direct access permanent files.</td>
</tr>
</tbody>
</table>
Option     Signifies
4          User is allowed to create in direct access permanent files.
5          User can have system origin status from any job origin if the system console is in DEBUG mode (refer to KRONOS Reference Manual).
6          User can access common files (refer to KRONOS Reference Manual).
7          User can assign nonallocatable devices (refer to KRONOS Reference Manual).
8          User is allowed to access system without supplying his assigned charge and project numbers.
9          User can create and/or replace files on auxiliary devices.
10         User can access special transaction functions (refer to KRONOS Transaction Subsystem Reference Manual).

For example, if the access word listed were

\[ \text{AW} = 00000000000000000215 \]

the user would be validated for options 1, 3, 4, and 8.

If any parameters are included with the LIMITS command, the system responds:

ERROR IN LIMITS ARGUMENTS.

The following is an example output listing produced by LIMITS.

```
LIMITS.  73/04/10, 13,5P,35.  PAGE 1
USER123  73/02/16, 73/02/16.

AB =
AB =
AB =
AB =
MT =  0
RP =  0
TL =  7777B
PR =  12B
CM =  1000B
NF =  20
MS =  100
PN =
DB =  1
FC = SYSTEM
CS = SYSTEM
FS = SYSTEM
PA = EVEN
RO = SYSTEM
PX = HALF
TT = TTY
AW = 00000000000000000215
```
All time-sharing users may access permanent files after the log-in procedure is complete. Validated users may also create permanent files (refer to LIMITS Command at the end of section 4 for information concerning user validation limits).

The user number supplied during log-in represents a specific catalog in the permanent file system. The catalog contains a list of files saved under that user number as well as pertinent information about each file. All permanent file requests are made to this catalog unless an alternate user number or an auxiliary device is specified in the file request.† If an alternate user number is specified, the request is made to that user's catalog. If a validated user specifies that the file resides on an auxiliary device, the request is made to a separate catalog on that device. A separate catalog exists on the auxiliary device for each user with files on that device.

User numbers that contain asterisks (*) represent users with automatic read-only permission to files in catalogs of other users. The user number must match the alternate user number in all characters that are not asterisks. For example, a user with the user number *ABDE* can access all files in the catalogs of the following users:

UABCD
UABDDE
MABCD
MAB1DE

All permanent files are classified according to the manner in which they are accessed. There are indirect access and direct access permanent files. The mode of access is determined by the command used to create the file. Indirect access permanent files are created with the SAVE command while the DEFINE command must be used to create a direct access permanent file. The command used to create a permanent file also determines the command that must be used to access the file. The user must enter the OLD, LIBRARY, or GET command in requests for indirect access files. The ATTACH command must be entered to request use of a direct access file. The following are characteristics of each type of file.

- Indirect access

An indirect access file is, as the name implies, a permanent file that cannot be accessed directly by the user. Instead, when access is requested through entry of the OLD, LIBRARY, or GET command, a copy of the permanent file is created. The copy, considered a working file, is referenced instead of the permanent file in all subsequent I/O operations. This feature offers protection from endangering the integrity of the permanent file. Several copies of an indirect access file may exist in the system at the same time. Note that if the working file is altered, the user must enter the REPLACE command in order to update the permanent file. If the user is not allowed to update the permanent file, he can create a new indirect access file (to reflect his modifications) by entering the SAVE command and specifying a new file name.

†An auxiliary device is a mass storage permanent file device used to supplement the normal permanent file devices associated with the system (family devices).
Indirect access permanent files are allocated in blocks of 64 central memory words (one physical record unit). When compared to the size of blocks allocated for direct access files (refer to appendix D), this block size is relatively small. Thus, permanent files that are small in size are typically indirect access files. This is done to avoid allocation of more mass storage area than is actually required for the file.

- **Direct access**

A direct access file is a permanent file which, upon request, becomes linked directly to the user's job. Unlike requests for indirect access files, a copy of the permanent file is not created for user access. Use of a direct access file is requested by entering the ATTACH command, and all subsequent I/O operations are performed on the permanent file itself. Note that although a copy of the permanent file is not created, a working file name may be specified in the request for a direct access file. This allows the user to reference the file by a name other than its permanent file name. Because data is written directly on the permanent file rather than on a working copy, care must be taken when modifying a direct access file.

Direct access files have a write interlock feature. This means that if one user has attached the file in write mode, it cannot be attached by another user. Likewise, if a user wishes to attach the file in write mode, he must wait until all users currently accessing the file in alternate modes have released it.

Direct access permanent files are allocated in large blocks (refer to appendix D) and are generally used as large data base files. When a user creates a direct access file, it is placed on the device with the most space available, unless a specific device type is specified in the request. If more than one device of the type specified exists, the file is placed on the device with the most space available.

In summary, the file access mode depends upon the command that was used to create the file. Direct access files are created with the DEFINE command. Indirect access files are created with the SAVE command. A permanent file cannot be requested as a direct access file one time using the ATTACH command, and as an indirect access file later using the OLD, LIBRARY, or GET command. The command that must be used to access the file depends upon the command that was originally used to create the permanent file.

**PERMANENT FILE COMMAND FORMAT**

The following describes the general format of a permanent file request. If special options are desired, they must follow the specified file name. The options must follow the / symbol, are order-independent, and are indicated by the specified keyword (kw).

```
pfcmd,lfn=pfn/kw_1=option_1,...,kw_n=option_n

 pfcmd Permanent file command name
 lfn Working file name used while accessing permanent file pfn. Allows user to reference a permanent file by a name other than its permanent file name.
 pfn Name under which the file is cataloged in the permanent file directory. If the pfn parameter is omitted, lfn is assumed to be the permanent file name.
```
The following are the keywords and corresponding option parameters which may be included.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UN=</td>
<td>usernum</td>
<td>Alternate user number. This parameter is necessary only if the permanent file involved resides in another user's catalog. To access a file in another user's catalog, the requesting user must be granted explicit permission (refer to PERMIT command), must have automatic read-only permission (user number contains asterisks for all characters that do not match in the alternate user number), or the file must be a semiprivate or public file.</td>
</tr>
<tr>
<td>PW=</td>
<td>passwd</td>
<td>The user has the option of specifying a one-to-seven character password for a file. This password must be specified whenever alternate users access the file.</td>
</tr>
<tr>
<td>CT=</td>
<td>n</td>
<td>Permanent file category. The file category determines which users may access a file. There are three categories of permanent files. P or PRIVATE Files available for access only by the originating user or by those explicitly granted permission (refer to PERMIT command). S or SPRIV Files available for access by all users knowing the file name, password, and user number. Accesses by alternate users for files of this category are recorded for the originator of the file. This includes the user number of the alternate user, the number of accesses made, and the date and time of the last access (refer to CATLIST command). PU or PUBLIC † Files available for access by all users knowing the file name, password, and user number. Only the total number of accesses to files of this category are recorded for the originator of the file.</td>
</tr>
</tbody>
</table>
| M=      | m        | File or user permission mode. W or WRITE Allows the user to write, modify, append, read, execute, or purge the file (modify permission applies only to direct access files). M or MODIFY Allows user to modify information within a direct access file and/or append information at the end of the file. The user may also read or execute the file. This mode applies only to direct access files. A or APPEND Allows user to append information at the end (EOI) of the file. R or READ Allows user to read and/or execute the file. † The parameter name L or LIBRARY which existed in previous versions of KRONOS remains valid for upward compatibility. The parameter name was changed to PU or PUBLIC to avoid confusion with the permanent file command LIBRARY.
<table>
<thead>
<tr>
<th>Keyword</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RM or READMD</td>
<td></td>
<td>Allows user to read a direct access file with the implication that another user may currently be accessing the file in MODIFY mode. The file may also be executed in this mode. This mode applies only to direct access files.</td>
</tr>
<tr>
<td>RA or READAP</td>
<td></td>
<td>Allows user to read a direct access file with the implication that another user may currently be accessing the file in APPEND mode. The file may also be executed in this mode. This mode applies only to direct access files.</td>
</tr>
<tr>
<td>E or EXECUTE</td>
<td></td>
<td>Allows the user to execute the file</td>
</tr>
<tr>
<td>N or NULL</td>
<td></td>
<td>None; removes previously granted permission</td>
</tr>
<tr>
<td>R=r</td>
<td></td>
<td>Specifies the type of device on which the permanent file resides or is to reside; r can be any of the following.</td>
</tr>

</tbody>
</table>

\( n = \text{Number of units} \ (1 \leq n \leq 8) \)

The R keyword can be used in two ways.

1. It can be specified on the DEFINE command to indicate the type of family device on which the direct access file is to reside. The user should consult the service vendor to determine which devices are available. Appendix D contains a list of the block sizes allocated for each device type. If the file already exists on another device, R is ignored. If an illegal device is specified, the system responds

   DIRECT ACCESS DEVICE ERROR.

If the number of units specified does not agree with the actual number for device types DD, DI, and MD, the system issues the message

   ILLEGAL DEVICE REQUEST.
Keyword | Option | Description
--- | --- | ---

2. It can be used in conjunction with the PN and NA keywords on any permanent file command (including DEFINE) to identify an auxiliary device on which the file resides or is to reside. If PN and NA are specified but R is not, the system default device type is assumed. If the device type of the auxiliary device PN conflicts with the device specified by the R parameter, the system issues the message

```
ILLEGAL DEVICE REQUEST.
```

For example: if auxiliary device PN has device type DI and the device type specified by R is MD, a conflict exists and the error message is issued.

| S= | space | Specifies the amount of space in decimal PRUs desired when creating a new direct access permanent file (refer to DEFINE command). There are 640 decimal 6-bit characters in a PRU. KRONOS then creates the file on a device with the specified amount of space available. Unused space is not guaranteed to be available if the user attempts to expand the file at a later date. If no device currently has the specified amount of space available, the system responds

```
REQUESTED SPACE UNAVAILABLE.
```

If S is used in conjunction with the R keyword, only devices of the type specified are checked for adequate space.

| PN= | packname | A one-to-seven character packname used in conjunction with the R keyword to identify an auxiliary device to be accessed in the permanent file request. This parameter is specified only when the file to be accessed resides on an auxiliary device. If the device is currently not available and the NA keyword is not specified in the request, the system responds

```
DEVICE UNAVAILABLE.
```

An auxiliary device is not necessarily a disk pack that can be physically removed as the parameter name implies. Rather, an auxiliary device can be any mass storage device supported by KRONOS and defined as such by the service vendor. Auxiliary devices are used to supplement the normal mass storage permanent file device associated with the system (family devices). If two or more auxiliary devices are to be in use concurrently, the user must enter the BATCH subsystem and issue the RESOURC control card image (refer to the KRONOS Reference Manual for information concerning the RESOURC control card). Note that the user must be validated to create or replace files on an auxiliary device.†

† Refer to LIMITS Command at the end of section 4 for information concerning validation limits.
Keyword | Option | Description
--- | --- | ---
NA |  | The NA keyword specifies that if a requested resource is not available, the command will not be terminated and KRONOS will automatically suspend the user's job until the resource becomes available. NA can be used in two ways.

1. It can be specified on the ATTACH command to indicate that the user wishes to wait for the direct access file to become available. If the file is currently being accessed in a mode that conflicts with that specified in the command (interlocked), the user's job is suspended and subsequent terminal entry is not accepted. To terminate the request, enter the STOP command.

2. It can be used in conjunction with the PN and R keywords on any permanent file request (including ATTACH) for a file that resides on an auxiliary device. If the device is not currently available, the NA keyword directs the system to make the desired auxiliary device available. Note that the system will not make the device available unless the user is validated to have at least one auxiliary device assigned to his job. ↑

PERMANENT FILE PROCESSING COMMANDS

The following list of permanent file commands is available to the user. The parameters specified have been described on the preceding pages.

APPEND, pfn, Ifn₁, ..., Ifnᵣ/
UN=usernum, PW=password, PN=packname, R=r, NA

ATTACH, Ifn=pfn/UN=usernum,
PW=password, M=m, PN=packname,
R=r, NA

Append working files Ifn₁, ..., Ifnᵣ at the end of the specified indirect access permanent file pfn. The logical structure of the files is retained, that is, EORs and EOFs are appended as well as data. Each working file is appended in the order specified in the command. This command can only be used for indirect access permanent files. Establishes a link to permanent file pfn for direct access usage. If pfn is omitted, the system assumes Ifn=pfn.

↑Refer to LIMITS Command at the end of section 4 for information concerning validation limits.
Note that a working file is not created since user access is made directly to the permanent file. Thus, the fn parameter is used when it is desirable to reference the attached file by a name other than its permanent file name (pfn). If fn specifies the name of a current working file, the contents of that file is lost when the permanent file is attached. In addition, fn cannot specify the primary file name. A direct access file cannot become the primary file.

If the M keyword (permission mode) is omitted, the system assumes read permission for the attached file. The M keyword must be specified by all users, including the originator, if the file is to be modified or new information is to be added to the file.

If the NA keyword is not specified and another user is currently accessing the file in a mode that conflicts with that specified in the command (M keyword), the system responds

```
fn BUSY.
```

If a direct access permanent file has been attached in the WRITE mode, it should be released after use in order to be attached by other users. In general, it is best to access the file in a mode that allows other users to access the file at the same time.

A direct access permanent file can be released with any of the following commands (refer to section 4 for a description of these commands).

- OLD, NEW, or LIBRARY (all working files also released)
- GOODBYE, BYE, HELLO, or LOGIN (all working files also released)
- CLEAR (all working files also released)
- RETURN, fn (file specified is released)

A direct access file will also be released if the fn parameter on subsequent GET or ATTACH commands specifies the name of the attached file.

```
CHANGE, fn=ofn/PW=password, CT=n, M=m, PN=packname, R=r, NA
```

Allows the originator of a direct or indirect access permanent file to alter any of several parameters without having to attach and redefine the file or retrieve and save it. Note that this command is valid only for the originator of the file (UN keyword is illegal).

†When a direct access permanent file is attached in the WRITE mode, the last modification date is incremented even if the file is not altered.
The nfn parameter specifies the new permanent file name to be assigned; ofn is the current file name. If no name change is desired, only ofn is specified. To clear the password currently assigned to a file, set the new password equal to zero (PW=0). The CT, M, and PW keywords should be specified only if a change in the value associated with that keyword is desired. The PN and R keywords cannot be used to specify a new auxiliary device. They are used only to specify the device on which ofn resides.

If the specified permanent file, ofn, is not in the user's catalog, the system responds

ofn NOT FOUND.

If a new permanent file name, specified by nfn, already exists in the user's catalog, the system responds

nfn ALREADY PERMANENT.

The CHANGE command also updates the last modification date and last access date for the file.

DEFINE, Ifn=pfn/PW=passwd, CT=n,M=m,R=r,S=space, PN=packname,NA

Allows a validated user to create a direct access permanent file (pfn) and attach it in WRITE mode. If pfn is omitted, the system assumes Ifn=pfn.

If pfn is specified, the Ifn parameter can be used in two ways.

- To reference the direct access file by a name other than its permanent file name (pfn). In this case, the direct access file created contains no information initially. Data is placed on the file in succeeding write operations.

- To define a current working file as a direct access permanent file. It is important to note that the working file specified must reside on a mass storage device that also supports the residence of direct access permanent files. If the file specified by Ifn does not reside on such a device, the system responds

DIRECT ACCESS DEVICE ERROR.

NOTE

Since time-sharing users are generally unaware of the device that contains their working files, this use of the Ifn parameter is not recommended.
If the optional keywords are omitted, the system assumes the following values:

<table>
<thead>
<tr>
<th>KW</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PW</td>
<td>None</td>
</tr>
<tr>
<td>CT</td>
<td>PRIVATE</td>
</tr>
<tr>
<td>M</td>
<td>WRITE</td>
</tr>
<tr>
<td>R</td>
<td>File is placed on device with most space available</td>
</tr>
<tr>
<td>S</td>
<td>None</td>
</tr>
<tr>
<td>PN</td>
<td>Not applicable unless PN specified</td>
</tr>
</tbody>
</table>

If the user releases the file and then wishes to access it at some time in the future, the ATTACH command must be entered (refer to the ATTACH command).

For information regarding creation of indirect access permanent files, refer to the SAVE command later in this section.

Retrieves a copy of the specified indirect access permanent file (pfn) for use as a working file. This command can only be used for indirect access permanent files. If pfn is omitted, the system assumes lfn=pfn.

If the user wishes to reference the working file by a name other than its permanent file name (pfn), the lfn parameter is specified. However, if lfn specifies the name of a current working file, the contents of that file will be replaced by the copy of pfn. The current primary file and subsystem in use remain the same unless the file name specified for lfn is that of the current primary file. In this case, the contents of the primary file is replaced by the copy of pfn which becomes the new primary file. Furthermore, if pfn has a subsystem flag associated with it (refer to SAVE command), that subsystem is selected automatically. For example, if file A is the current primary file and the user enters

```
GET, A=B
```

the copy of permanent file B will become the new primary file. If a subsystem other than the one currently active is associated with file B, it is also selected.

If the request is for a file in another user's catalog (UN keyword specified), the permission mode (READ, WRITE, EXECUTE, etc.) is that which the user has been permitted for private files or that specified in the catalog for semi-private and public files.
LIBRARY, ln=pfn/PW=password, PN=packname

Retrieves a copy of the specified permanent file from the catalog of special user number LIBRARY. This command can only be used for indirect access permanent files.

The permission mode is that which has been granted for private files or specified in the catalog for semiprivate and public files. The copy of the permanent file retrieved becomes the new primary file and all other working files are released unless the next command entered is NODROP.

ATTACH, GET, or OLD command can also be used to access permanent files in the catalog of user number LIBRARY. For additional information, refer to LIBRARY Command at the end of this section.

OLD, ln=pfn/UN=usernum, PW=password, PN=packname

Retrieves a copy of the specified permanent file (indirect access only) for use as the primary file. If a specific subsystem is associated with the file, it is selected automatically. This occurs only if the file was originally the primary file and was saved while a subsystem other than NULL was active. Refer to the description of the SAVE command in this section for additional information. All working files are released unless the next command entered is NODROP.

PACKNAM, PN=packname

Enables validated users to direct subsequent permanent file requests to the auxiliary device specified by the packname parameter. This command allows the user to omit the PN keyword in requests for files that reside on that auxiliary device. However, if permanent files on another auxiliary device are to be accessed, the PN keyword can be included in the request or a new PACKNAM command can be entered.

The user cannot access permanent files residing on the normal system devices (family devices) while the PACKNAM command is in effect. To access these files again, he must enter the PACKNAM command and set the packname parameter to zero, as follows:

PACKNAM, PN=0 or PACKNAM

An auxiliary device is not necessarily a disk pack that can be physically removed as the command name implies. Rather, an auxiliary device can be any mass storage device supported by KRONOS and defined as such by the service vendor. Auxiliary devices are used to supplement the normal mass storage permanent file devices associated with the system (family devices).
Examples:

OLD, FILEA ← Request to normal family device for file FILEA

PACKNAM, → Permanent file requests that follow are made to auxiliary device ABC, unless PN option is specified in the request or a new PACKNAM command is entered

GET, DATA ← Request to auxiliary device ABC for file DATA

PACKNAM, → Permanent file requests that follow are made to auxiliary device XYZ

GET, TAPE1 ← Request to auxiliary device XYZ for files TAPE1 and TAPE2

PACKNAM, → Clear PACKNAM command. Permanent file requests that follow are made to the normal family devices

PERMIT, pf, I/usernum1=m1, usernum2=m2,...,usernumn=m_n/ PN=packname, R=r, NA

Grants user usernum1 permission to access private file pf. If the permission mode, m1, is omitted, the system assumes read permission.

PURGE, pf/UN=usernum, PW=passwd, PN=packname, R=r, NA

 Removes the specified permanent file from permanent file storage. If the permanent file does not exist, the system responds

 pf NOT FOUND.

WRITE permission is required to purge a permanent file in an alternate user's catalog (UN keyword specified). The PW keyword must also be specified if the file has a password. It is important to note that direct access files are not actually purged until the last user accessing the file has released it. However, subsequent attempts to access the file will be rejected.

REPLACE, lfn=pf, I/UN=usernum, PW=passwd, PN=packname, R=r, NA

Allows validated users to replace the contents of a permanent file (pf) with the contents of a working file (lfn). If the file name specified for pf does not exist, a new permanent file is created. This command can only be used for indirect access permanent files. Note that the REPLACE command does not affect the subsystem associated with the permanent file (if any).
SAVE, Ifn=pfn/PW=passwd,
CT=n, M=m, PN=packname, R=r, NA

Creates an indirect access permanent file. This command allows a validated user to retain a copy of the specified working file in the permanent file system. If the optional keywords are omitted, the system assumes the following values.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PW</td>
<td>None</td>
</tr>
<tr>
<td>CT</td>
<td>PRIVATE</td>
</tr>
<tr>
<td>M</td>
<td>WRITE</td>
</tr>
<tr>
<td>PN</td>
<td>None</td>
</tr>
<tr>
<td>R</td>
<td>Not applicable unless NA is specified</td>
</tr>
</tbody>
</table>

Unless the NULL subsystem is active when the primary file is saved, an internal indicator called the subsystem flag is set to indicate which subsystem is being used. That subsystem becomes associated with the permanent file and is selected automatically each time the file is retrieved in subsequent requests using the OLD command. To save the primary file without a subsystem association, the user must enter the NULL subsystem before issuing the SAVE command. Note that the subsystem flag is set only when saving the primary file. There is no subsystem association when working files other than the primary file are saved.

**CATLIST COMMAND**

The user may wish to obtain specific information about his permanent files. This can be done with the CATLIST command. In addition, this command may be entered if the user wishes to obtain specific information about permanent files that he can access in catalogs of alternate users. The following is the format of the CATLIST command; the optional keywords (and corresponding parameters) to be included must follow the / symbol and are order-independent.

CATLIST/LO=options, FN=pfn, UN=usernum, L=Ifn, PN=packname, R=r, NA

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LO</td>
<td>F</td>
<td>Selects a listing of pertinent information about each file in the user's catalog (refer to example 1). If an alternate user number is specified (UN keyword), the user obtains a listing of all files that he can access in the alternate user's catalog. Note that the password for files in an alternate user's catalog is not included in the listing. The password to files in an alternate user's catalog must be obtained directly from that user (refer to example 2).</td>
</tr>
<tr>
<td>Keyword</td>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| FP      |        | Selects a listing of permission information recorded for each alternate user that has accessed a specified file in the user's catalog (refer to example 3). This option requires that a file name be specified (FN keyword). If an alternate user number is also specified (UN keyword), only the permission information recorded for that user of the specified file is listed. The user numbers listed include:  
  - Those that have been granted explicit permission to the file (private file only).  
  - Those that have accessed the file because of implicit permission (semi-private files only). Permission information for alternate users that have accessed public files is not recorded. |
<p>| 0 (zero) |        | Selects a short list that indicates only the names of the files in the user's catalog (refer to example 4). If an alternate user number is specified (UN keyword), the user obtains only the names of the files that he can access in the alternate user's catalog. If no LO keyword is specified, the system assumes this value. Selects a short list that indicates only the user numbers of alternate users who have accessed the specified private or semi-private file (refer to example 5). This option requires that a file name be specified (FN keyword). |
| P       |        | Selects a short list that indicates only the user numbers of alternate users who have accessed the specified private or semi-private file (refer to example 5). This option requires that a file name be specified (FN keyword). |
| FN=     | pfnn   | Permanent file name. This option specifies that catalog information is desired only for this permanent file. This parameter is required when listing permit information (LO=FP, LO=P). If the short list options are selected (LO=0, LO=P), the message pvn FOUND, is returned if the file (or user number) is located. The message pvn NOT FOUND, is returned if specified file (or user number) is not located. |
| UN=     | usernum| User number. This parameter has two purposes. For LO=F and LO=0, Indicates the alternate catalog for which the user desires catalog information (refer to example 2). For LO=FP and LO=P, Indicates the permission information recorded for the specified alternate user. |</p>
<table>
<thead>
<tr>
<th>Keyword</th>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>L=</td>
<td>lfn</td>
</tr>
<tr>
<td>R=</td>
<td>r</td>
</tr>
</tbody>
</table>

**Description**

Output file name. This is the name of a working file to which the CATLIST information is written. If this parameter is omitted, the system assumes L=OUTPUT and the data is returned to the terminal. If lfn is a current working file, the CATLIST information is written at the current position in the file. For example, if lfn is positioned at the beginning-of-information (BOI), the contents of that file is replaced with the CATLIST information. If lfn is positioned at end-of-information (EOI), the CATLIST information is appended to the file as a new logical record.

This keyword is used in conjunction with the PN and NA keywords to specify the type of auxiliary device that contains the desired catalog information. If PN and NA are specified but R is not, the system default device type is assumed. If the device type of the auxiliary device PN conflicts with the device specified by the R parameter, the system issues the message **ILLEGAL DEVICE REQUEST**.

For example: if auxiliary device PN has device type DI and the device type specified by R is MD, a conflict exists and the error message is issued.

The device types are:

<table>
<thead>
<tr>
<th>Device</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DA</td>
<td>6603 disk system</td>
</tr>
<tr>
<td>DB</td>
<td>6638 disk system</td>
</tr>
<tr>
<td>DC</td>
<td>863 drum storage</td>
</tr>
<tr>
<td>DDn</td>
<td>854 disk storage drive</td>
</tr>
<tr>
<td>DE</td>
<td>Extended core storage</td>
</tr>
<tr>
<td>DF</td>
<td>814 disk file</td>
</tr>
<tr>
<td>DH</td>
<td>821 disk file</td>
</tr>
<tr>
<td>DIn</td>
<td>844 disk storage subsystem</td>
</tr>
<tr>
<td>DP</td>
<td>Distributive data path</td>
</tr>
<tr>
<td>MDn</td>
<td>841 multiple disk drive</td>
</tr>
</tbody>
</table>

n = number of units (1 ≤ n ≤ 8)

If the number of units specified does not agree with the actual number for device types DD, DI, and MD, the system issues the message **ILLEGAL DEVICE REQUEST**.
The packname option identifies an auxiliary device that contains catalog information for all users with files on that device. Unless the PACKNAM command is in effect, the PN keyword must be specified if a user wishes to obtain the following information from his catalog on an auxiliary device.

- Pertinent information about each file that resides on the device (LO=F)
- Only the name of each file (LO=0)
- Permission information for each alternate user that has accessed a specific file (LO=FP)
- Only the user number of each alternate user that has accessed a specific file (LO=P)

If two or more auxiliary devices are to be in use concurrently, the user must enter the BATCH subsystem and issue the RESOURC control card image (refer to the KRONOS Reference Manual for information concerning the RESOURC control card). If an auxiliary device is available in the system, the PN keyword can also be specified by alternate users to obtain a list of files and pertinent information about each file they can access on the device.

This keyword is used in conjunction with the PN keyword in requests for catalog information on auxiliary devices. If the device is currently not available, NA directs the system to make the desired device available. If the NA keyword is omitted and the auxiliary device is not currently available, the system responds

DEVICE UNAVAILABLE.

Note that the system does not make the desired device available unless the user is validated to have at least one auxiliary device assigned to his job (refer to LIMITS command in section 4).
CATLIST EXAMPLES

The following examples illustrate some of the options available to the user when entering the CATLIST command (the user entering the command in the examples is USER123).

Example 1. Listing of pertinent information about each file in the catalog of USER123. The command is entered in the form ... CATLIST/LO=F

```
CATALOG OF USER123 73/04/10, 13.41.59.

FILE NAME  ACCESS  FILE-TYPE  LENGTH  DN  CREATION  LAST ACCESS  LAST MOD  PASSWORD  MD/CNT  PERM.  SUBSYS  DATE/TIME  DATE/TIME  DATE/TIME

1 DIRFILE  DIR,  PUBLIC  25600  40  73/01/13, 73/03/23, 73/03/73.  CDC  13  READAP  19,02,50, 07,33,05, 07,33,05.

† The file category LIBRARY which existed in previous versions of KRONOS remains valid for upward compatibility. This category was renamed PUBLIC to avoid confusion with the permanent file command LIBRARY.
**LIBRARY COMMAND**

The LIBRARY command allows access to indirect access permanent files in the catalog of special user number LIBRARY. Direct access files may also reside in the catalog of user number LIBRARY although an alternate method must be employed to access these files (described later in this section). The file category may be private, semiprivate, or public. The permission mode is that which has been granted for private files or specified in the catalog for semiprivate and public files.

When the LIBRARY command is entered, a copy of the specified indirect access permanent file is retrieved. This copy becomes the new primary file and all other working files are released unless the next command entered is NODROP. For example:

`LIBRARY, ABC75/PW=13479`

In this example, a copy of the indirect access permanent file ABC75 is retrieved and becomes the new primary file. Note that only indirect access permanent files may be accessed with the LIBRARY command. The following commands may also be entered to access permanent files in the catalog of user number LIBRARY (differences in command function are described).

- **ATTACH**, `ln=pfn/UN=LIBRARY,PW=password,M=m`
  
  This command must be entered in order to use any direct access permanent files in the catalog of user number LIBRARY. Note that a working file is not created since all I/O operations are performed directly on the permanent file itself. However, if the user wishes to reference the file by a name other than its permanent file name, he may assign a working file name (ln) in the command. The primary file name remains unchanged.

- **GET**, `ln=pfn/UN=LIBRARY,PW=password`
  
  This command retrieves a copy of the specified indirect access permanent file (from catalog of LIBRARY) for use as a working file. The primary file remains unchanged unless ln specifies the name of the current primary file (refer to description of GET command for additional information).

- **OLD**, `ln=pfn/UN=LIBRARY,PW=password`
  
  The function of this command is identical in all respects to that of the LIBRARY command.

The only files that can be accessed from the catalog of LIBRARY are those that allow alternate user access. Note that all users, except user number LIBRARY, are considered to be alternate users. The rules for alternate user access are summarized as follows:

- Only those users permitted to private files may access them.

- All users can access semiprivate and public files providing they know the file name, password (if one exists for the file), type of access (direct or indirect), and user number (LIBRARY).

The following forms of the CATLIST command may be entered to obtain a listing of files that can be accessed in the catalog of user number LIBRARY.

```
CATLIST/LO=F,UN=LIBRARY (full listing)
CATLIST/UN=LIBRARY (file names only)
```
This section describes various conventions used in time-sharing job processing, as well as facets of system operation.

**INPUT/OUTPUT CONVENTIONS**

The following conventions and standards are used for I/O operations at a time-sharing terminal.

- **Standard input lines**
  The standard input line entered from the terminal keyboard consists of commands or source code (program statements, data, or text). Each input line containing source code is placed in the primary file and must be numbered. The line numbers range from one to ten digits in length. Note that the line numbers in FORTRAN or BASIC programs cannot be more than five digits in length. Refer to the description of File Sorting in section 3 for additional information.

- **Text mode input**
  Text mode allows keyboard entry of source code, into the primary file, without specifying line numbers. Commands entered in text mode are interpreted as text and are not processed by the system. For complete information concerning text mode, refer to the TEXT command described in section 4.

- **Text Editor input**
  Normally, keyboard entry of source code is possible only to the primary file. However, the Text Editor allows the user to enter or modify source code in all working files (including the primary file) from the terminal keyboard.

An important feature of the Text Editor is its ability to reference direct access permanent files. Since a direct access file cannot be referenced with the OLD command, it cannot become the primary file, and normal keyboard entry to the file is therefore impossible. The Text Editor is one method that is commonly used to accomplish keyboard entry of source code into a direct access file. The following example illustrates the use of the Text Editor to enter source code into an empty direct access permanent file from the terminal keyboard (note that a direct access file is empty when it is created).

```

CP 0.007 SECS.
READY.

RETURN, DIRFILE
READY.

.
.
.

For complete information concerning the use of the Text Editor, refer to the
Text Editor Reference Manual. A list of the commands available under the
Text Editor is included as appendix E of this manual.

Although data can be entered into a direct access file from the terminal
keyboard, through use of the Text Editor, a program can also be used. Since
direct access files are normally large in size, a program is generally used
to manipulate or maintain data on direct access files.

- Length of input/output lines

The input line may consist of 150 characters maximum. The output line may
be any length in accordance with the line width of the terminal being used.
If the user attempts to input or output more characters per line than are
allowed, the additional characters overprint at the end of the line, unless
the terminal being used has an automatic carriage return feature.

- Terminate the input line

The user must terminate each line of input information by pressing the RETURN
key. This tells the system that the current input line is complete. KRONOS
responds by positioning the carriage to the beginning of the next line. The
user can then enter additional input information on the new line.

- Correct the input line

Entry errors in the input line can be corrected, before the RETURN key is
pressed, through use of the backspace character. The backspace character,
on ASCII code terminals, is the underline (_) key.† On correspondence code

† The backspace character on Teletype model 33/35 terminals is the shift-Ø key. The
character may be either an underline (_) or a left arrow (←).
terminals, the BACK SPACE key is used. One character (including spaces) is
deleted for each backspace character entered. If the beginning of the line
is reached, further backspace characters are ignored. For example, if the
input line contained ...

   BAX_SJK__IC

it would be interpreted by KRONOS as the subsystem selection command BASIC.

* Delete the input line

If the user discovers an error in the command or other input just typed,
he can delete the current input line by pressing the ESC or ESCAPE key
(ASCII code terminals) or the ATTN key (correspondence code terminals).
This must be done before the RETURN key is pressed. KRONOS ignores the
entire input line and responds by printing *DEL* and positioning the carriage
to the beginning of the next line. The following example illustrates the use
of the ESC key.

    NEW, TEST
    READY.

    10 PROGRAM T(OUTPUT)
    20 PRINT 6
    30 6 FORMAT (*THIS IS A TEST*9 _ ) *DEL* ---- ESC key pressed
    40 6 FORMAT (*THIS IS IT*)
    50 END
    LNH

    10 PROGRAM T(OUTPUT)
    20 PRINT 6
    40 6 FORMAT (*THIS IS IT*)
    50 END
    READY.

* Input to executing program

A ? output to the terminal normally indicates that the executing program has
requested input. However, it should be noted that the program may include
question marks in its normal output.

* Interrupt executing program

To interrupt an executing program that is currently transmitting output to
an ASCII code terminal, press the I key† or the interrupt key (generally
labeled INT, INTRPT, or BREAK on most ASCII code terminals). If a corre-
spondence code terminal is being used, press the ATTN key.

This process is commonly referred to as job suspension and is described in
more detail in section 7.

* Terminate executing program

To terminate an executing program that is currently transmitting output to
an ASCII code terminal, press the S key. If a correspondence code terminal
is being used, press the ATTN key. If the program is in execution, but is
not actively transmitting output, enter the STOP command to terminate the
program.

†If the program in execution is not currently transmitting output to the terminal, the
I key cannot be used to interrupt the program. However, the other keys described
can still be used.
• System messages during input
The following diagnostic messages can appear at anytime during input from the terminal.

*OVL* Line overflow. This message is issued when more than 150 characters have been entered since the last carriage return (the entire line is lost when the 151st character is entered).

*RE-ENTER LAST LINE* Data was lost during the last line of input. The user should reenter the last line.

TERMINAL JOB PROCESSING

This section explains the basic steps in processing a time-sharing job. These steps include:

• Terminal log-in
• Subsystem selection
• Program entry and execution
• Terminal log-off

To use the KRONOS system from a time-sharing terminal, the user must:

1. Check to ensure that the following switches on the terminal are set to the correct position. Note that one or more of the switches listed may not exist on the terminal to be used. However, if that terminal has been determined to be acceptable for KRONOS time-sharing operations, its use should correspond to that described in this manual.
   • Full-duplex/half-duplex (FDX/HDX) switch. Although this switch can be set to either position, it is normally set to the half-duplex position. If set to full-duplex, user-generated information will not appear at the terminal. Refer to the descriptions of FULL and HALF commands in section 4 for additional information.
   • Even parity/odd parity switch. If an ASCII code terminal is being used, this switch must be set to even parity. Odd parity must be selected for correspondence code terminals.
   • Baud rate switch. This switch determines the speed at which the terminal transmits and receives information. There is only one correct position when the terminal is connected to KRONOS. However, this is a system option and is dependent upon the system equipment being used. If the correct setting is not known, consult the service vendor.

2. Connect to the central site using one of the procedures described in appendix B.
When the connecting sequence is complete, certain terminals must be identified to the system before the log-in procedure can proceed. These terminals include:

• All correspondence code terminals (such as IBM 2741, NOVAR 541, DATEL 30, etc.)
3. Identify the terminal to KRONOS as follows:

- Correspondence code terminals with standard print
  
  Press the ATTN key

- Correspondence code terminals with APL print
  
  Type A and press the ATTN key

- ASCII code terminals with standard print
  
  Type T

- Memorex 1240 (ASCII code) terminal with APL print
  
  Type M

4. When communication with KRONOS has been established, the system responds

   yy/mm/dd.  hh.mm.ss.

   KRONOS TIME SHARING SYSTEM - VER. 2.1.

   and requests

   USER NUMBER:

5. Submit the user number on the same line.

   usernum  CR

   The system then requests

   PASSWORD

   ************

6. Enter the password

   passwd  CR

   If the password is required, it may consist of one to seven alphanumeric characters. To provide a greater measure of security, the password is typed in the area the system has blacked out.

   If no password is required, type:

   CR

   If the terminal was connected to an alternate or backup system in step 2, the alternate system requests:

   FAMILY:

   NOTE

   The installation must notify users if they are to connect to a system other than the one normally used.
7. Enter the family name on the same line.

   familyname  \(CR\)

The family name identifies the mass storage device(s) which contains the permanent files for a specific KRONOS system. Each system has its own family of permanent file devices. Thus, the family name entered describes the device(s) which makes up the user's normal permanent file family.

The device containing the validation file for the family must be present in the alternate system in order for the user to log-in. The validation (VALIDUX) file is used to determine if the user number and password entered are valid, etc. However, the user's permanent files may reside on another device, in the same family, that is not present in the alternate system. Any attempt to access permanent files on a device not present in the alternate system causes either of the following messages to be printed.

- **DEVICE UNAVAILABLE.**
  
  This message appears if the user's master device is not present in the alternate system. The user's master device contains his permanent file catalog, all indirect access files, and all, part, or none of his direct access files.

- **DIRECT ACCESS DEVICE ERROR.**
  
  This message appears if the user attempts to reference direct access files on a device (other than his master device) not present in the alternate system.

If the system to which a user normally connects at log-in is providing backup support for another KRONOS system, the FAMILY: request is also issued. In this event, the user need only type carriage return in response. The normal system family name is assumed by default.

**NOTE**

Steps 5, 6, and 7 can be combined into one step in order to speed log-in. This allows the user to enter his user number, password, and family name together on the same line (in response to USER NUMBER: request). Each item entered is order-dependent and must be separated by commas. That is, if no password or family name is required and this method of log-in is desired, the user number must be followed by a single comma and \(CR\). If the family name is required and the password is not, the user number must be followed by two commas, the family name, and \(CR\).

If the user number, password, or family name are not acceptable, the system responds:

**IMPROPER LOG IN, TRY AGAIN**

**USER NUMBER:**
If the user is unsuccessful at logging-in four times in succession, the system issues the message

ILLEGAL TERMINAL.

and then disconnects the terminal from the system.

If the user number, password, and family name are acceptable, the system responds:

TERMINAL: nnn, iii
RECOVER/CHARGE: or TERMINAL: nnn, iii
RECOVER/SYSTEM:

Where:

nnn  Terminal number that the system uses as part of the unique identifier for each active user. This number is required in certain recovery cases (refer to section 7 for a description of terminal recovery).

iii  Terminal type identifier. Can be one of the following:

TTY   ASCII code terminal with standard print
MEMAPL Memorex 1240 terminal (ASCII code) with APL print
CORAPL Correspondence code terminal with APL print
COR   Correspondence code terminal with standard print

8. Perform part a or part b of this step depending upon which system response was issued in step 7.

a. If the RECOVER/SYSTEM: response was issued, enter the subsystem to be used or any valid command (refer to sections 4 and 5).

BASIC  To use the BASIC language
BATCH, nnnnn  To enter control card images interactively from the terminal; nnnnn is the field length to be used
EXECUTE  To execute a previously compiled program
FORTRAN  To use the time-sharing FORTRAN language

To BASIC, FORTRAN, or EXECUTE, the system responds:

OLD, NEW, OR LIB FILE:

To BATCH, nnnnn the system responds:

$RFL, nnnnn.  (nnnnn is the specified field length)
b. If the RECOVER/CHARGE: response was issued, type CHARGE, followed by a valid charge number and project number.

    CHARGE, chargeno, projectno CR

The system responds:

    READY.

The user then enters the name of the subsystem to be used or any valid command (refer to sections 4 and 5).

    BASIC CR To use the BASIC language
    BATCH, mmmmm CR To enter control card images interactively from the terminal; mmmmm is the field length to be used
    EXECUTE CR To execute a previously compiled program
    FORTRAN CR To use the time-sharing FORTRAN language

To BASIC, FORTRAN, or EXECUTE, the system responds:

    OLD, NEW, OR LIB FILE:

To BATCH, mmmmm the system responds:

    $RFL, mmmmm. (mmmm is the specified field length)

9. Enter the appropriate file type.

    OLD CR For a file that was previously saved as a permanent file (the file cannot be a direct access file)
    NEW CR For a new working file
    LIBRARY CR For an indirect access permanent file that resides in the catalog of user number LIBRARY

The system responds:

    FILE NAME:

For responses to BATCH requests, refer to section 9.
10. Enter the file name (one to seven characters).

If an OLD or LIBRARY file is specified, but does not exist, the system responds:

PFN NOT FOUND. (PFN is the name of the file requested)

The user must then return to step 8 and attempt to enter the file type and file name again.

If no errors are detected, the system responds:

READY.

The following example illustrates a sample log-in.

72/10/02, 11.00.00.
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123
PASSWORD
ABCDEF

TERMINAL: 40, TTY
RECOVER/SYSTEM: BASIC
OLD, NEW, OR LIB FILE: OLD
FILE NAME: DEMO

READY.

The password cannot be seen and is shown in this manner solely for purposes of illustration.

To hasten the preceding log-in sequence, the user may select the short form as follows:

72/10/02, 11.00.00.
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123, ABCDEFG
TERMINAL: 40, TTY
RECOVER/SYSTEM: BASIC, OLD, DEMO

READY.

User number and password entered on same line
Subsystem, file type, and file name entered on same line

Note that any time the OLD command is used in requests for indirect access permanent files (refer to preceding examples), the subsystem need not be specified unless the file requested has a NULL subsystem flag associated with it. If the file has a subsystem flag other than NULL associated with it (that is, BASIC, FORTRAN, EXECUTE, or BATCH), that subsystem is selected automatically. A subsystem flag becomes associated with a file when it is saved (refer to the SAVE command in section 5).

In the following example, the user logs into the system and requests file DEMO with the OLD command. He does not specify a subsystem since he knows that the subsystem flag associated with the file causes BASIC to be selected automatically.
72/10/02.  11.00.00.
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123, ABCDEFG
TERMINAL: 40, TTY
RECOVER/SYSTEM: OLD, DEMO → The BASIC subsystem flag
                         associated with file DEMO causes
                         BASIC to be selected automatically.
READY.

To ensure that the BASIC subsystem has indeed been selected, the user can
enter the STATUS command. The system responds:

TERMINAL: 40, TTY
SYSTEM - BASIC
FILE NAME: DEMO
STATUS - IDLE

11. Perform all necessary file creation and/or file retrieval activity. If new
BASIC or FORTRAN programs are entered, each line must be entered in the
proper format and must begin with a one- to five-digit line number. Refer to
the Time-Sharing FORTRAN and/or BASIC Reference Manuals for complete
information concerning each language.

Enter the following command to compile and/or execute a BASIC or FORTRAN
program.

RUN   CR

This command causes the FORTRAN or BASIC program to be compiled and
executed. The RUN command is also used to execute a program under the
EXECUTE subsystem.

The output of a BASIC or FORTRAN program is in the form:

yy/mm/dd.  hh.mm.ss.
PROGRAM     nnnnnnn

(data requested or generated by the program;
error messages if program errors occurred)

CP 0.032 SECS.†
RUN COMPLETE.

† The output of CPU time (for the preceding activity) after completion of job execution occurs
only in the BASIC, FORTRAN, and EXECUTE subsystems. The total accumulated CPU
time since log-in may be determined in all subsystems by entering the STATUS, T command.
If the user wishes merely to compile object code which can be saved and used
at a later time, he enters the command

RUN, B=ln

where ln is the name of the file on which the object code is written.

If the user wishes to retain the compiled program for later execution under
the EXECUTE subsystem, the SAVE command must be entered (no subsystem
name is retained when a working file, other than the primary file, is saved).

Refer to sections 4 and 5 in this manual for complete information concerning
the time-sharing commands available to the user. These commands include:

- Terminal control commands
- Subsystem selection commands
- Time-sharing job commands
- Permanent file commands

Appendix G of this manual illustrates a sample session at the terminal.

LOG-OFF PROCEDURE

When the user completes job processing, he logs off the system by typing:

BYE

or

GOODBYE

These commands log the user off the system, release all current working files, and
cause the following information to be printed at the terminal.

usernum LOG OFF. hh.mm.ss.
usernum CP s.sss.SEC.

Where:

usernum User number
hh.mm.ss. Current time in hours, minutes, and seconds
s.sss Number of seconds of central processor time used

The terminal is then disconnected from the system.
ALTERNATE LOG-OFF/LOG-IN

When the terminal is connected, another user may wish to use the terminal. To log the present user off the system and reinitialize the log-in sequence, type:

HELLO  CR
or
LOGIN  CR

The system logs the current user off the system, issues the normal log-off messages, and then automatically initiates a new log-in sequence. The new user proceeds as described earlier in this section.
This section contains a description of the program editing, job suspension, and recovery features provided for the KRONOS terminal user.

PROGRAM EDITING

To allow ease of editing the primary file when working with source programs, KRONOS provides a simplified editing capability that can be used under any subsystem.† This capability allows the user to:

- Insert statements into a program
- Delete statements from a program
- Correct statements in a program

The following example illustrates this program editing capability. The user types:

```
10 LET A=1
20 LET B=50
30 FOR I=1 TO B
40 A=A*I
50 PRINT "FACTORIAL" ; I,A
60 NEXT I
70 END
```

If the user wishes to insert a statement between line numbers 10 and 20, he types:

```
15 LET Z=20
```

If the user wishes to delete the statement at line 20, he types:

```
20
```

Finally, to change the statement at line number 30, the user types:

```
30 FOR I=1 TO Z
```

Leading zeros are not required even if the statement being deleted or corrected contains line numbers with leading zeros. For example, a line numbered 30 would replace and be interchangeable with a line numbered 00030.

†For more detailed editing, the Text Editor should be used. Refer to the Text Editor (EDIT) Reference Manual for complete information concerning its use.
When the file is listed, it has the following form.

10 LET A=1
15 LET Z=20
30 FOR I=1 TO Z
40 A=A*I
50 PRINT "FACTORIAL" ; I,A
60 NEXT I
70 END

To replace the new version of the file in the permanent file system, use:

REPLACE

If the user wishes to save the file under a new name, he may enter:

REPLACE, lfn=pfnn

lfn Primary working file name
pfn Permanent file name

RESEQUENCING LINE NUMBERS

It is often convenient to resequence the line numbers of the primary file. This is done using the following command.

RESEQ,nnnnn,iIII,t  

Where:

| nnnnn  | New line number of the first statement (five digits maximum); if omitted, the system assumes nnnnn=00100 |
| iii   | Increment to be added to nnnnn; if omitted, the system assumes iii=0010 |
| t    | Type of file to be resequenced |

B  For files that contain BASIC source code. BASIC statements that contain references to line numbers are updated when the line numbers are resequenced.

T  For files that contain text source information. A five-digit line number, plus a blank, is added at the beginning of each line. No inspection is made for existing line numbers. Thus, if line numbers currently exist, they are not resequenced or deleted and two sets of line numbers result.

other  Any number at the beginning of a line is considered a line number and is resequenced according to the nn and ii parameters; line numbers are added to the beginning of lines where none appear.

default  The user must change to the correct subsystem before entering the RESEQ command.

BASIC programs are resequenced under the BASIC subsystem; statements with line number references are updated. Note that language errors in the BASIC program may cause faulty resequencing.

FORTRAN programs are resequenced under the FORTRAN subsystem; statement numbers and references to statement numbers are not changed.
All parameters supplied in the RESEQ command are order-dependent (must be entered in the order they appear in the command). Omitted parameters must be indicated by a comma if other parameters are to follow. For example, the command

```
RESEQ, 50, T
```

adds line numbers to the primary (text) file without checking for existing line numbers. Thus, the first line is numbered 00050 and each succeeding number is incremented by 10 (default value). If the T parameter was not specified in the command, the two preceding commas would not have been necessary.

If the starting line number (nn parameter) is greater than five digits in length or the increment value (ii parameter) causes the line numbers generated to exceed five digits in length, the message

```
LINE NUMBER LIMIT EXCEEDED.
```

is returned to the terminal. In addition, the message

```
RESEQ NUMERIC PARAM ERROR.
```

is returned if the user enters a nonnumeric value for either the nn or the ii parameters.

**JOB SUSPENSION**

A user may suspend his job at any time during program execution (RUN command issued). If an ASCII code terminal is being used, this is done by pressing the interrupt key (generally labeled INT, INTRPT, or BREAK). If the program is actively transmitting output to the terminal, the I key may also be used to suspend the job. If a correspondence code terminal is being used, only the ATTN key may be used to suspend the job. The system responds:

```
*INTERRUPTED*
```

A job can also be suspended automatically by the system when:

- The job has exceeded its time limit (the message TIME LIMIT is provided). The time limit is initially set to 100 octal seconds at log-in although the user may change this value through use of the SETTL command (refer to description in section 4).

- A successful recovery has been performed (refer to Recovery later in this section).

If the job was suspended by the user (interrupted) or by the system after a successful recovery, the user may perform one of the following.

- **CR** Continue (transmit current output).† If the program was transmitting output to the terminal when it was suspended, the remaining output is transmitted when this response is made. Note that a portion of the output may be lost. When output is complete, program execution continues.

- **P CR** Proceed (discard current output). If the program was transmitting output to the terminal when it was suspended, the remaining output is discarded and program execution continues when this response is made.

†If the TAPE command is in effect (tape mode), carriage return is ignored when entered on an empty input line. **P CR** must be issued to resume execution.
STOP CR Terminate the job.

other Terminates the job.

If the job was suspended because it exceeded its time limit (TIME LIMIT message issued), the user may respond as follows:

T,nnnn CR Increment central processor time limit by nnnn (number of octal seconds). When a job exceeds its time limit, this response is required to continue job execution. Any other input will terminate the job.

The following example illustrates the use of the I key to interrupt a program (note that the I key is effective only for ASCII code terminals).

LNH

00100 REM TEST FOR I KEY
00110 FOR I=1 to 100
00120 PRINT I
00130 NEXT I
00140 INPUT A,B
00150 PRINT A,B
00160 END

READY.

RNH

1
2
3
4
5

*INTERRUPTED.*

The job is interrupted by the I key.

The user continues by pressing the carriage return key (some output was lost).

25
26
27
28
29
30
31

*INTERRUPTED.*

The job is again interrupted by the I key.

The user continues execution of the job by entering P CR (all output generated but not yet transmitted to the terminal when the interrupt occurred is discarded).

? 2,7
2

CP 0.105 SECS.
In the following example, a program exceeds its allocated time limit. The program then runs to completion when a new time limit is entered.

```
RECOVER/SYSTEM: FORTRAN, OLD, NM
READY.

00100 PROGRAM T(OUTPUT)
00110 DO 6 I=1,1000
00120 DO 6 J=1,1000
00130 A=1
00140 6 CONTINUE
00150 END
READY.

SETTL, 10

CP 0.001 SECS.
READY.

RNH

TIME LIMIT.
T, 1000
END.

CP 15.421 SECS.

RUN COMPLETE.
```

**RECOVERY**

During job processing, recovery may be necessary when:

- The terminal has been accidentally disconnected from the system.
- A system malfunction has occurred which requires a restart.

The user is placed in recovery state whenever he is disconnected from the system without logging off, providing that he is not already in recovery state. The user is given 10 minutes to initiate recovery.

In order to recover, a user completes the log-in sequence to the point where the system requests RECOVER/SYSTEM: (or RECOVER/CHARGE:). For example:

```
72/10/02. 16.07.24.
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123, ABCDEFG User number and password entered
TERMINAL: 15, TTY Terminal number/type identifier
RECOVER/SYSTEM:
```

In response, the user enters:

```
RECOVER, nnn CR
```
Where:

nnn  Terminal number being used when the failure occurred. This number was indicated when the user initially logged-in (refer to preceding example). If the same terminal number is indicated when the user logs-in to recover, this parameter is not required.

The RECOVER command is valid only when entered in response to the RECOVER/SYSTEM: or RECOVER/CHARGE: request during the log-in sequence. If the user's terminal number is not the same as before the failure, the previous terminal number must be entered with the RECOVER command (nnn parameter). This may occur when the failure is due to a dropped line connection. In this case, a different terminal number may be assigned at log-in because of telephone switching rotaries. If the RECOVER command is not entered where indicated, the user may log-off, log-in again, and then enter the RECOVER command correctly.

If the system responds RECOVERY IMPOSSIBLE, one of the following conditions has occurred.

- No record was found of the specified user being logged-in on the given terminal number within the past 10 minutes.
- The user's system information was incorrect due to system malfunction.

If the user receives this message, he should check the terminal number he has entered. If he finds he has not given the correct number, he may reenter RECOVER with the correct terminal number.

If recovery is successful, the system responds:

RECOVERED - ENTER (CR) TO CONTINUE
LAST COMMAND  nnnn
NEXT OPERATION -
 yyyyy

nnnn  Name of last command processed. If source code was being entered, the word SOURCE is output.

yyyy  One of the following messages:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDLE.</td>
<td>No activity.</td>
</tr>
<tr>
<td>INPUT REQUEST.</td>
<td>Job is awaiting input data.</td>
</tr>
<tr>
<td>OUTPUT AVAILABLE.</td>
<td>Output data is available.</td>
</tr>
<tr>
<td>EXECUTING.</td>
<td>Job is active with no output.</td>
</tr>
<tr>
<td>REENTER COMMAND.</td>
<td>Last command was not processed. The user should reenter the command.</td>
</tr>
<tr>
<td>REENTER INPUT.</td>
<td>The last line of input data was lost.</td>
</tr>
<tr>
<td>SORT.</td>
<td>The primary file is waiting to be sorted.</td>
</tr>
</tbody>
</table>

If the message FILES LOST is also issued, one or more working files was lost. This would occur only on system malfunction.

The user must then issue a carriage return to restart his job. If the job was previously transmitting output, the output data normally resumes a few lines prior to where the interruption in service occurred.
In general, recovery in the KRONOS system has been designed to provide minimum inconvenience to the user with a maximum of security. It should be realized, however, that under certain conditions recovery of user information cannot be perfect. The following are two examples of these circumstances.

- In some cases, a few lines of output may be lost when a phone line is disconnected just as a job is being restarted to generate more output. This actually occurs before current output is exhausted.
- If a phone line is disconnected when a user is entering source code, he can normally expect to lose the last few lines of text he has entered.

Whenever the user and terminal numbers of a user who must be placed in the recovery state match the user and terminal numbers of a user already in the recovery state, the user who was originally in the recovery state remains there and the other user is logged off.

An example of a normal recovery is:

```
72/10/02, 16.10.02
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123
PASSWORD
*********
TERMINAL: 16, TTY
RECOVER/SYSTEM: RECOVER,12
RECOVERED - ENTER (CR) TO CONTINUE
LAST COMMAND - RUN
NEXT OPERATION - IDLE.
```

The user types \texttt{CR} to continue job processing.

The following example illustrates a sample recovery.

```
72/10/02, 16.12.08,
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123, ABCDEFG
TERMINAL: 15, TTY
RECOVER/SYSTEM: FORTRAN, OLD, AA READY.

LNH

10 PROGRAM AA(INPUT,OUTPUT)
20 PRINT 4
30 4 FORMAT(*ENTER 2 NUMBERS*)
40 READ, A, B
50 C=A*B
60 PRINT 5
70 5 FORMAT(*A X B=*)
80 PRINT, C
90 END
READY.
```
ENTER 2 NUMBERS

The user is disconnected and logs in again.

72/10/02. 16.13.14
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123, ABCDEFG
TERMINAL: 15, TTY
RECOVER/SYSTEM: RECOVER
RECOVERED - ENTER (CR) TO CONTINUE.
LAST COMMAND-RNH
NEXT OPERATION -
INPUT REQUEST.

The user enters CR to continue.

? 4,5
A X B= 20.00
END.
CP 0.004 SECS.
RUN COMPLETE.

This example illustrates another recovery situation.

STATUS
TERMINAL: 32, TTY
SYSTEM - BASIC
FILE NAME: BB
STATUS - IDLE

LNH

10 REM THIS IS A TEST
20 REM PRINT B
30 PRINT "PRINT B"
40 LET B=1+3
50 PRINT B
60 END
READY.

The user is disconnected.

72/10/04. 15.16.23.
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123, ABCDEFG
TERMINAL: 32, TTY
RECOVER/SYSTEM:

The user is disconnected before recovering.
This is processed as a normal log-off.
RECOVER/SYSTEM: RECOVER, 32 The user enters the RECOVER command.
RECOVERED - ENTER (CR) TO CONTINUE.

The user enters CR to continue.

10 REM THIS IS A TEST
20 REM PRINT B
30 PRINT "PRINT B"
40 LET B=1+3
50 PRINT B
60 END

READY.
REMOTE JOB ENTRY

Remote job entry is a feature of KRONOS that enables a validated, time-sharing user to submit batch job deck images to the system for processing. The batch job image can be created interactively at the time-sharing terminal and then submitted to the local batch queue by entering the SUBMIT command. The user is no longer interactive with the job once it has been submitted. Instead, the job is treated in the same manner as a job submitted from the card reader at the local computer site or from a remote batch terminal (EXPORT/IMPORT). The batch job image can consist of control card images, KRONOS control language (KCL) statements, program statements, and data. The structure of the batch job image must also be the same as its counterpart on cards (job deck). The user can specify how the job is to be structured through use of the reformattting directives described in this section. Refer to the KRONOS Reference Manual for information concerning job structure and a description of the batch control cards and KCL statements available.

The format of the SUBMIT command is:

SUBMIT(lfn, q, NR)c

Where:

lfn Name of file to be submitted to KRONOS for processing as a deferred batch job. If lfn is omitted, the primary file name is assumed. In this case, the primary file is sorted before being submitted. Permanent files may also be submitted but first must be associated with the job via the OLD, GET, or ATTACH command.

q Specifies disposition of job output as follows:

B Job output is disposed to local batch queue to be printed, punched, etc., at the central site.

N Job output is disposed to local batch queue, but output is dropped at job termination (default value).

E Job output is disposed to EXPORT/IMPORT queue for printing at a remote batch terminal.

NR No rewind option; inhibits rewind of file specified by reformattting directive cREAD (refer to Reformatting the Submit File later in this section). If omitted, file specified by cREAD directive is automatically rewound.

c Escape character used to identify reformattting directives in the file to be submitted (lfn). If omitted, the system assumes c=/. 
After the job has entered the local batch queue, the system responds:

```
hh.mm.ss.jobname
READY.
```

Where:

```
hh.mm.ss. Time that the job entered the batch queue
             (hours.minutes.seconds.)
```
```
jobname   Job identification
```

The job identification is entered with the STATUS, J=jobname command to obtain the status of a job once it has entered the system. Refer to the description of the STATUS, J command in section 4 for additional information.

**REFORMATTING THE SUBMIT FILE**

The submit file (lfn in the SUBMIT command) is a file which contains the batch job image submitted to KRONOS for processing. The reformatting directives described in this section are provided to aid the user in preparing the submit file. When the SUBMIT command is entered, the submit file is reformatted according to the directives that appear in the file and is then placed in the batch input queue awaiting execution. Thus, several of the directives are provided to format the submit file to meet the structural requirements of a batch job (refer to section 3 in the KRONOS Reference Manual).

Each line in the submit file preceded by an escape character is recognized by KRONOS as a reformatting directive. The escape character to be used must be defined in the SUBMIT command (/ by default). Throughout this description, the letter c, preceding a directive, denotes the escape character. Reformatting directives may be interspersed throughout the submit file as long as transparent mode is not in effect. Transparent mode is selected by the cTRANS directive and requires that the user observe special rules when inserting subsequent directives into the file (refer to the description of cTRANS and cNOTRANS directives).

It is important to note that reformatting directives will not be processed unless the first line of the submit file contains the cJOB directive. In addition, the first two card images following the cJOB directive (second and third lines of the submit file) must be a JOB and ACCOUNT card, respectively. All following information is determined by the user. Thus, the first three lines of a submit file that is to be reformatted before processing should be:

```
00100 cJOB
00110 JOBNAME,... JOB card image
00120 ACCOUNT,... ACCOUNT card image
```
NOTE

The JOB and ACCOUNT cards are required in all batch jobs and must be present even though the cJOB card is omitted.

Although text mode may be used to create a submit file, it is not necessary since each line may or may not have a leading line number. The cSEQ and cNOSEQ directives are used to determine, during reformatting, if line numbers in the submit file will be retained. Therefore, it is a simple matter to include line numbers on the entire submit file and specify which line numbers are to be removed during reformatting. This is especially useful if the submit file contains a BASIC program where line numbers are a requirement of the language.

The reformatting directives available are described as follows:

- **cJOB**
  Indicates that the submit file is to be reformatted and selects the following default reformatting directives. The default directives remain in effect until specified otherwise.
  
  - **cNTRANS (disabled by cTRANS)**
  - **cSEQ (disabled by cNOSEQ)**
  - **cPACK (disabled by cNOPACK)**

  The cJOB directive must be the first line of the submit file. If omitted, the file is not reformatted.

- **cEOR**
  Indicates that an end-of-record mark is to be placed at this point in the submit file during reformatting.

- **cEOF**
  Indicates that an end-of-file mark is to be placed at this point in the submit file during reformatting.

- **cSEQ**
  Indicates that line numbers will be removed from all subsequent lines during reformatting (default value).

- **cNOSEQ**
  Reverses the effect of the cSEQ directive. No attempt is made to remove leading line numbers from subsequent lines.

- **cPACK**
  Indicates that all succeeding internal EOR and EOF marks be removed during reformatting (default value). This directive applies only to internal EOR and EOF marks that currently exist. The cEOR and cEOF reformatting directives are not affected.

- **cNOPACK**
  Reverses the effect of the cPACK directive. Requests the system not to discard succeeding internal EOR and EOF marks that currently exist.

- **cTRANS**
  Indicates transparent mode. When encountering this directive during reformatting, KRONOS checks the next line of the submit file for an additional reformatting directive. If one exists, it is processed and the following line is checked. This continues until a line that does not contain a reformatting directive is encountered. Transparent mode is then selected and all directives that exist on subsequent lines are ignored until an internal EOR or EOF is encountered (not cEOR or cEOF). The cPACK and cNOPACK directives determine if the internal EOR or EOF
will be retained. The line following the internal EOR or EOF mark is then checked for a reformatting directive. If one exists, it is processed and the following line is checked. All directives are processed until a line that does not contain a reformatting directive is encountered. This causes transparent mode to be reset unless a cNOTRANS directive was encountered. This process continues until either the end of the submit file is reached or until a cNOTRANS directive following an internal EOR or EOF is encountered.

The cTRANS directive is typically used in conjunction with the cREAD directive. This allows the user to copy the contents of an existing file into the submit file at the location of the cREAD directive. Because the file is read in transparent mode, no check for reformatting directives is attempted until an internal EOR or EOF is encountered. Note that the cREAD directive must follow the cTRANS directive and must be located before the first succeeding line that is not a reformatting directive. If not, transparent mode is selected before the cREAD directive is encountered, and the cREAD will be ignored.

The cSEQ or cNOSEQ directive in effect before transparent mode was selected has no effect upon the submit file or the file being read (cREAD) while transparent mode is in effect. Note, however, that the cPACK or cNOPACK directive in effect before transparent mode was selected remains in effect after it is selected.

cNOTRANS

Reverses the effect of the cTRANS directive and informs the system that the submit file is to be examined on a line-by-line basis. All directives encountered in the submit file while the cNOTRANS directive is in effect are processed. This directive is initially selected by default and remains in effect until a cTRANS directive is encountered in the submit file.

Caution should be observed in the placement of this directive in the submit file. If transparent mode is selected, this directive can possibly be ignored unless it immediately follows either a cREAD directive in the submit file or an internal EOR or EOF mark.

cREAD, lfn

Requests that the system read the entire contents of the specified file (lfn) and insert that file in place of the cREAD directive in the submit file, during reformatting. If the file to be read is not currently attached to the user, KRONOS automatically attempts a GET and then an ATTACH on the file. If lfn is not specified in the directive, TAPE1 is assumed. If the file specified cannot be found, the message

NO READ FILE - lfn

is issued to the job dayfile, and the job is terminated. If the read file is found to be busy (direct access files only), the message

READ FILE BUSY - lfn

is issued to the job dayfile and the job is terminated. The file specified by lfn in the cREAD directive is automatically rewound before the read operation unless the NR parameter is specified in the SUBMIT command. In this case, the cREWIND directive must precede the cREAD directive in the submit file if it is desired to rewind file lfn before the read operation begins. KRONOS returns all files specified in cREAD directives before completion of the job.
If the cPACK directive is in effect at the time of the read, all internal EOR and EOF marks will be removed. If the cNOPACK directive is in effect, all internal EOR and EOF marks are read into the submit file in the proper position during reformattting.

Unless transparent mode is in effect when file lfn is read, each line of that file is also checked for a reformattting directive. Any directives contained in the file, except another cREAD, are processed. The cREAD directive cannot be nested. In addition, any directives in effect before the cREAD directive is processed remain in effect for the file being read, unless transparent mode is selected. Then, only the cPACK or cNOPACK directives remain in effect for the file being read. Moreover, only those directives that immediately follow an internal EOR or EOF in the file being read are processed. If the file to be read is a binary file, it is recommended that the cTRANS directive be used. This is to ensure that binary data will not be mistaken for a reformattting directive. If used, the cTRANS directive should immediately precede the cREAD directive in the submit file.

cREWIND, lfn
Requests that the system rewind file lfn to the beginning-of-information (BOI). If lfn is not supplied, TAPE1 is assumed. This directive is required only if the NR parameter is included in the SUBMIT command. Otherwise, file lfn is automatically rewound.

This directive is used in conjunction with the cREAD directive. Thus, if it is desired to rewind a file before the read operation begins, this directive must precede the cREAD directive in the submit file.

c1EC=c2
Indicates that the escape code character is to be changed from c1 (current escape code) to c2 (new escape code). The new escape code is used to recognize all subsequent reformattting directives until further change.

ERROR PROCESSING

If the user determines that an error occurred during processing of his job, he may reference a listing of the job dayfile as an aid in identifying the cause of the error. The job dayfile contains a record of the job processing activity and is disposed to the local batch queue or the EXPORT/IMPORT queue for printing when the job is terminated. However, all output is normally dropped at job termination when a batch job image is submitted from a time-sharing terminal. This includes the dayfile output as well as the job's output. In this event, the user can make provisions within his job to save the contents of the dayfile if an error in processing occurs. This is done by including the following control card images at the end of the job's control record (first record of the submit file).

00562 EXIT.
00563 DAYFILE, lfn.
00564 REPLACE(lfn)

60407600 A
When an error condition occurs during job processing, the system searches the job's control record for an EXIT card. If an EXIT card is found, the error condition is cleared and the control card images that follow are processed. In this case, the contents of the job dayfile is copied to the working file specified by IFn. That file is then saved for future reference.

If an error does not occur during job processing, the EXIT card indicates where to terminate normal control card processing.
The BATCH subsystem provides the time-sharing terminal user with a capability to enter KRONOS batch control card images as well as the standard time-sharing commands described in this manual. The control card images are entered and processed one at a time, and all output is returned to the terminal unless otherwise specified. Refer to the KRONOS Reference Manual for a description of the batch control cards available and information concerning their use.

To enter the BATCH subsystem, the user types:

    BATCH, nnnnn

Where:

    nnnnn  Amount of field length required for the control card images to be entered. If nnnnn is not specified, a default value of 20000B is assumed. Note that an RFL control card image can be entered at any time to specify a new field length.

Many of the system utilities and file manipulation control cards (for example, COPYBF and SKIPF) run at a predefined field length rather than the field length specified in the BATCH command. However, all other control cards use the field length specified in the BATCH command or by a subsequent RFL control card. The field length required for the product set control cards (for example, COMPASS) is listed in the KRONOS Reference Manual.

The system responds:

    $RFL, nnnnn.  (nnnn is the specified field length)

The user may then enter any valid batch control card image or time-sharing command. Time-sharing commands cannot be abbreviated under the BATCH subsystem; the entire command or control card must be entered to be valid. The user may also end each control card with a period, but this is not required since the system automatically terminates each line of batch input with a period. If the command or control card is not valid or is entered incorrectly, the system responds:

    ILLEGAL CONTROL CARD.

CATLIST and DEFINE permanent file commands are always processed as batch commands.

The remaining permanent file commands are processed as time-sharing commands unless preceded by an X (refer to the following paragraphs), in which case they are also processed as batch commands. When a command is treated as a batch command, its operation will depend on a previously entered ACCOUNT card.
Initially, when a control card image is entered at the terminal, the time-sharing executive routine attempts to process it as a time-sharing command. Under the BATCH subsystem, if a command cannot be interpreted by the executive routine, it is passed to the system as a control card. A command that cannot be interpreted is either not in the time-sharing command set or is too complex to be processed by the executive routine. For example, the command

\texttt{GET,A}

is a valid time-sharing command and can be processed as such. However, the command

\texttt{GET,A,B,C,D}

cannot be interpreted by the time-sharing executive routine and is thereby passed to the system for processing as a control card. If the user desires that a valid time-sharing command be processed as a control card, he may enter the following command (available only under the BATCH subsystem):

\texttt{X,ccccccc}

This command allows the user to force a valid time-sharing command (ccccccc), normally interpreted by the executive routine, to be processed by the system as a control card. For example, to call the BASIC compiler, the user enters

\texttt{X,BASIC}

rather than the command

\texttt{BASIC}

which would change the subsystem from BATCH to BASIC.

To exit from the BATCH subsystem, the user must type the entire name of one of the other subsystems (FORTRAN, BASIC, EXECUTE, or NULL). It is important to note that the user may also change the subsystem unintentionally by entering the OLD command. The OLD command is used to obtain a different primary file, but may also select the subsystem that was active when the specified file was originally saved. Refer to the description of the SAVE command in section 5 for additional information.

\textbf{NOTE}

Although a user can enter any batch control card from a time-sharing terminal, the output produced by several of these cards is formatted for transmission to a line printer (136 characters per line). Through use of the L072 control card, the user can format the output for transmission to a time-sharing terminal (72 to 150 characters per line). Refer to the description of the L072 control card in section 5 of the KRONOS Reference Manual.
The following error messages may appear at the terminal.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPEND ERROR.</td>
<td>An error was encountered when appending a file.</td>
</tr>

<tr>
<td>ERROR IN PFILE ARGUMENTS.</td>
<td>An argument for permanent file request was illegal.</td>
</tr>
<tr>
<td>EXECUTE ONLY FILE.</td>
<td>The user has only an E permission level on the file.</td>
</tr>
<tr>
<td>FILE NAME ERROR.</td>
<td>The file name must contain only alphanumeric characters.</td>
</tr>
<tr>
<td>FILE NAME MISSING.</td>
<td>A file name must be specified before a listing containing the permit information can be obtained with a CATLIST command.</td>
</tr>
<tr>
<td>FILE NOT SORTED.</td>
<td>Primary file has one or more lines with nonnumeric line numbers. (Use SORT,1fn command to obtain more detailed diagnostics.)</td>
</tr>
<tr>
<td>FILE TOO LONG.</td>
<td>Limit for length of indirect access permanent file has been exceeded.</td>
</tr>
</tbody>
</table>
FILE TOO LONG TO SORT.  Primary file is too long to be sorted automatically by the system. (Enter SORT, Ln command to obtain more detailed diagnostics.)

FL TOO SHORT FOR PROGRAM.  Self explanatory; increase field length with RUN command (or RFL card in BATCH subsystem).

ILLEGAL CHARGE.  Either charge or project number does not exist or the project number entered is not available to this user number.

ILLEGAL COMMAND.  The command name entered is not a valid command.

ILLEGAL LIST OPTION.  The list option specified in a CATLIST command is illegal.

ILLEGAL LOGIN.  The validation (VALIDUX) file for the permanent file family specified is not present in this system.

ILLEGAL PARAMETER.  May indicate:

- Parameter is outside legal bounds.
- Parameter is not one of the acceptable sets for the command.
- Parameter referenced does not exist.

ILLEGAL USER ACCESS.  User has either attempted an operation that he has not been validated to perform or has exceeded his validation limits (refer to the LIMITS command in section 4).

ILLEGAL WRITE ON APPEND ONLY FILE.  User has attempted to write on a permanent file with append-only permission to the file.

ILLEGAL WRITE ON MODIFY ONLY FILE.  User has attempted to write on a direct access file with modify-only permission to the file.

ILLEGAL WRITE ON READ ONLY FILE.  User has attempted to write on a permanent file with read-only permission to the file.

In EMPTY.  File contains no data.

In NOT ON MASS STORAGE.  The user has attempted to save a file that does not reside on mass storage.

NO CONNECT TIME AVAILABLE.  Terminal connect time allowed under this project number has been expended.

NO CPU TIME AVAILABLE.  Central processor time allowed under this project number has been expended.

NO PRIMARY FILE.  The user has attempted an operation which requires a primary file when there was none defined.

pfn ALREADY PERMANENT.  The specified file already exists (use REPLACE).

pfn BUSY.  The file to be attached is currently assigned to another user in conflicting mode.

pfn NOT FOUND.  The permanent file specified does not exist. If this message occurs in response to the CATLIST command, pfn may specify a user number.

PERMISSION NOT GRANTED.  The user does not have WRITE or APPEND permission on the specified permanent file.
**PF UTILITY ACTIVE.**
Permanent file utility operation is currently taking place. Permanent file commands (OLD, LIB, GET, etc.) are aborted. Control card images entered in the BATCH subsystem are placed on recall until the utility operation is complete.

**PFM ILLEGAL REQUEST.**
An illegal request was issued to the permanent file manager.

**RESERVED FILE NAME.**
File name is reserved by the system (for the user's protection).

**TOO MANY PARAMETERS.**
The user has submitted more parameters than the command allows.

---

**ERROR MESSAGE FOR SYSTEM MALFUNCTIONS**

The following messages indicate system error conditions:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA BASE ERROR.</td>
<td>An error in the structure of the validation file has been detected. Report this error to the computer center immediately.</td>
</tr>
<tr>
<td>ROLLIN FILE BAD.</td>
<td>If this message is received, the user should log-off immediately. If he desires to continue, he may log-in again. The user should report this malfunction to the computer center and supply all terminal output since log-in, if possible.</td>
</tr>
<tr>
<td>SYSTEM ERROR.</td>
<td>This error message should never appear. If it does, the user should report the malfunction to the computer center and supply all terminal output since log-in, if possible.</td>
</tr>
</tbody>
</table>
DIAL-IN PROCEDURE AND CHARACTER SET

This appendix presents an explanation of how to connect an interactive terminal to the KRONOS Time-Sharing System. Also included are illustrations of typical keyboard configurations for terminals using either standard or APL print, the function of certain control keys when connected to KRONOS, and finally, a list of the KRONOS character set.

The procedure to connect the terminal to the system depends upon whether a data set or an acoustic coupler is being used to establish the connection. Both procedures are included in this appendix. Note that some terminals (most teletypewriter models) can include a data set or an acoustic coupler as an integral part of the terminal.

It is recommended that the user read the instruction manual, generally supplied with the terminal, to become familiar with the operation of the terminal before connecting to KRONOS (that is, how to apply power, load paper, etc.).

CONNECTING TERMINAL USING A DATA SET

If the data set is included as part of the terminal, proceed as follows:

1. Apply power to the terminal (refer to appropriate instruction manual). A dial tone should be audible when power is applied.
2. Dial the correct phone number. A short high pitched signal indicates that the call has been answered.

If the data set is a stand-alone unit, proceed as follows:

1. Apply power to the terminal (refer to appropriate instruction manual).
2. Remove the data phone receiver from its cradle.
3. Press the TALK key on the data set to obtain a dial tone.
4. Dial the correct phone number. A constant high pitched signal indicates that the call has been answered.
5. Press the DATA key on the data set (indicator in key should light), and replace the receiver in its cradle.

CONNECTING TERMINAL USING AN ACOUSTIC COUPLER

1. Apply power to the terminal (refer to appropriate instruction manual).
2. Turn on the acoustic coupler (not required if the coupler is included as part of the terminal).
3. Using a standard telephone, obtain a dial tone and dial the correct phone number. A constant high pitched signal indicates that the call has been answered.
4. Place the receiver in the acoustic coupler.
Figure B-1 illustrates a typical terminal keyboard with standard print.

† Effective only when entered in first character position of line (empty input line)
CENTRAL MEMORY CHARACTER EQUIVALENTS

The manner in which characters entered from the terminal are interpreted by the system depends upon whether the user has specified that the characters belong to the full ASCII set (refer to the description of the ASCII command in section 4). For example, if the user enters the following characters to be mapped into the full ASCII set (128 characters recognized):

aAbBcCdDeE

the central memory equivalent (in display code) is as follows:

<table>
<thead>
<tr>
<th>59</th>
<th>47</th>
<th>35</th>
<th>23</th>
<th>11</th>
<th>0 ← Bit position (60-bit central memory word)</th>
</tr>
</thead>
<tbody>
<tr>
<td>76</td>
<td>01</td>
<td>01</td>
<td>76</td>
<td>02</td>
<td>02</td>
</tr>
<tr>
<td>04</td>
<td>04</td>
<td>76</td>
<td>05</td>
<td>05</td>
<td>55</td>
</tr>
</tbody>
</table>

However, if the characters are mapped into the subset of the ASCII character set used during NORMAL operation (61 characters recognized), the central memory equivalent (in display code) is as follows:

<table>
<thead>
<tr>
<th>59</th>
<th>47</th>
<th>35</th>
<th>23</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>01</td>
<td>02</td>
<td>02</td>
<td>03</td>
<td>03</td>
</tr>
</tbody>
</table>

Characters entered under control of the BINARY command are not translated into display code. It makes no difference if the ASCII command is in effect (128 characters recognized) or the characters are entered during NORMAL operation (61 characters recognized). However, each 8-bit character is weighted by a value of 4000B. For example, if the user enters the following characters and the BINARY command is in effect:

aAbBcCdDeE

the central memory equivalent is as follows:

<table>
<thead>
<tr>
<th>59</th>
<th>47</th>
<th>35</th>
<th>23</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 3 4 1</td>
<td>4 1 0 1</td>
<td>4 3 4 2</td>
<td>4 1 0 2</td>
<td>4 1 4 3</td>
<td></td>
</tr>
<tr>
<td>4 3 0 3</td>
<td>4 3 4 4</td>
<td>4 1 0 4</td>
<td>4 1 4 5</td>
<td>4 3 0 5</td>
<td></td>
</tr>
</tbody>
</table>

The characters illustrated are entered from an ASCII code terminal although a correspondence code terminal may also be used.

Table B-2 lists the KRONOS characters sets, indexed by 6000 internal display code.

*ON TTY MODELS HAVING NO UNDERLINE, THE BACKARROW ( — ) TAKES ITS PLACE.*
PAPER TAPE OPERATIONS

Paper tape is used for preparing input off-line (when time is not charged) and entering it on-line (when time is charged). This ensures accuracy and speed when most needed. An input tape can include programs, data, and commands. Accordingly, it is possible for the entire terminal operation, after log-in, to be run from paper tape.

This exposition assumes a typical teletypewriter (model 33) with a paper tape punch and a paper tape reader.

The paper tape punch has four buttons with the following labels and use:

- **ON**  
  Turns the punch on

- **OFF**  
  Turns the punch off

- **REL.**  
  Releases the feedwheel so one can freely move the tape through the punch head

- **B.SP.**  
  Backspaces the tape one row of holes each time it is pressed. This is used to make corrections when preparing a tape off-line (refer to detailed description later in this appendix).

The paper tape reader has one switch with four positions. Their labels and use are as follows:

- **START**  
  Momentarily pressing the switch to this uppermost position starts the reader. The switch snaps back to the AUTO position and reading continues.

- **STOP**  
  Reading stops immediately whenever the switch is moved to this position.

- **AUTO**  
  This position is used in conjunction with the input and processing of commands and data in tape mode (tape mode is explained later in this appendix). It allows the tape reader to be turned off and on so that processing of each command or line of data can be completed before additional input is entered.

- **FREE**  
  Releases the feedwheel so one can freely slide the tape in and out of the read head.

**NOTE**

On teletypewriters lacking an AUTO position, reading must be manually restarted each time it has been stopped.

**CONTROL CHARACTERS**

Each line of input from paper tape must end with a particular sequence of control characters. These are punched by functional keys on the teletypewriter keyboard. The control characters used with paper tape are as follows.

- **CR**  
  Carriage return. This is the RETURN key on the keyboard. It moves the print head back to the beginning of the line and informs the system that this line of input is completed.
LF Line feed. This is the LINE FEED key on the keyboard. It advances the paper roller one line. In normal mode, the system sends back a signal that initiates this feed; in tape mode, this signal is not sent and is therefore required on tape.

CTRL/ X-OFF X-OFF The appearance of this character on the tape during reading turns the tape reader off. This character is punched by holding down the CTRL key and pressing the X-OFF key.

RO(n) Rubout. This is the RUB OUT key on the keyboard. It punches a full row of holes. This row is interpreted as null by the system and hence this character is used for spacing and overpunching errors. The n parameter specifies the minimum number of times this character should be punched in sequence.

INPUT LINES

The following line formats are used to enter programs, data, and commands. The left half of the page shows an example of the input and the right half shows the control characters that immediately follow the last input character. It should be noted that each line is terminated with three rubouts to provide separation from the next line. While it is possible that adequate separation may be provided with less than three rubouts, this is the recommended number. (The system punches three rubouts at the end of each line when a tape is produced on-line.)

PROGRAM LINE

100 PROGRAM TEST (INPUT,OUTPUT) - - CR LF RO(3)

DATA LINE

? 12.44,18.31,29.08 - - CR LF CTRL/X-OFF RO(3)

The ? is supplied by the system. The remainder of the line comes from the tape. The X-OFF turns the reader off to allow this data to be processed before the next line is read.

COMMAND LINE

CATLIST/LO=F - - CR LF CTRL/X-OFF RO(3)

The X-OFF turns the reader off to allow processing of the command to be completed before the next line is read.

PUNCHING A PAPER TAPE OFF-LINE

The following procedure is used to punch a tape when the teletypewriter terminal is not logged-in.

1. Turn the teletypewriter on in local mode by pressing the LCL button below the phone dial.
2. Turn the paper tape punch on by pressing the ON button located on the punch.
3. Prepare a tape leader of about 30 rubouts (3 inches) by pressing the RUB OUT and repeat (REPT) keys together.

4. With a pencil, trace the arrow above the punch output onto the tape. This will identify the start of the tape for reading. (It is possible to put the tape in the reader backwards.)

5. Type in the input lines with their appropriate control characters.

6. Add a 3-inch trailer of rubouts and tear the tape off.

7. Press the CLR button below the phone dial to turn the teletypewriter off.

**TAPE MODE**

To read and process data and commands from tape, it is necessary that the tape reader be turned off and on to allow time for processing. By entering tape mode, the user enables the system to synchronize tape input with its processing. This mode also inhibits the output of header messages and the READY message when LIST (or LNH) is used to punch a tape on-line (refer to Punching a Tape On-line). It should be noted that carriage return (CR) entered on an empty input line will be ignored by the system while in tape mode.

The user enters tape mode by typing the TAPE command and pressing the carriage return key. The system acknowledges entry into this mode by advancing the printout paper one line. It will not print READY. If the reader switch has been in the AUTO position, reading begins automatically; if the reader switch was in the OFF position, reading does not begin until manually initiated by momentarily moving the switch to START. All subsequent commands and data entries are acknowledged by the one-line advancement without the printout of READY.

The user exits from tape mode by typing the NORMAL command and pressing the carriage return key.

**PUNCHING A TAPE ON-LINE**

To punch a tape with information already contained in a system file, the following procedure is followed.

1. If not logged-in, log-in.
2. If not in tape mode, type TAPE and press the carriage return key.
3. Turn the punch on.
4. Run a leader of rubouts.
5. Type in LIST if the primary file is to be punched; type in LIST,F=ifn if a working file other than the primary file is to be punched. (The short form LNH is permissible.)
6. Press the carriage return key. The file will be listed and punched simultaneously. The system will add the appropriate control characters at the end of each line.
7. Run a trailer of rubouts.
CORRECTIONS

While punching a tape off-line, corrections can be made by backspacing over the incorrect punch (use the B.SP. button on the punch) and punching a rubout over the error (use the RUB OUT key on the keyboard). Then punch in the correct character.

It is also possible to make corrections by using the back arrow as in normal, on-line operation. However, the error and arrow will appear in the printout. Likewise, when line numbers are being used, an erroneous line can be retyped (and repunched) with the same line number. Again, the erroneous and correct version will appear in printout although the system will recognize only the correct version during processing.

Example:

In this example, the input tape contains only program lines. Commands and input are typed in by the user before and after the tape is read in.

The tape as punched is shown below. The left half of the page gives the printed copy which was produced as tape was punched; the right half of the page shows the control characters which were entered at the end of each line but were not printed.

<table>
<thead>
<tr>
<th>RO(30)</th>
<th>CR</th>
<th>LF</th>
<th>RO(30)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<td>CR</td>
<td>LF</td>
<td>RO(30)</td>
</tr>
<tr>
<td>160 END</td>
<td>CR</td>
<td>LF</td>
<td>RO(30)</td>
</tr>
</tbody>
</table>

To demonstrate the use of this tape, it is assumed the user is logged-in under the NULL subsystem. He positions this tape in the reader and sets the reader switch to AUTO. The following is the printout that results from the interaction of user and tape with the terminal. The right half of the page contains explanations of the action.

**BASIC**  
**READY.**

**NEW, FACT1**  
**READY.**

**TAPE**  

| 100 LET FACTOR=1 | CR    | LF | RO(30) |
| 110 INPUT N      | CR    | LF | RO(30) |
| 120 FOR I=1 TO N | CR    | LF | RO(30) |
| 130 LET FACTOR=FACT*1 | CR | LF | RO(30) |
| 140 PRINT FACTOR | CR    | LF | RO(30) |
| 150 NEXT I       | CR    | LF | RO(30) |
| 160 END          | CR    | LF | RO(30) |

By typing in this command, the user enters the BASIC subsystem.

This line is typed in to establish a new primary file with the name FACT1

The command TAPE is typed in, and as soon as the carriage return takes effect, the tape reader goes on and the entire tape (seven lines) is read in. The reader runs through the trailer of rubouts and then turns itself off.

Types in RNH and receives the diagnostics shown. BASIC variables cannot be more than two characters.

To execute this tape, the user logs in, positions the tape in the reader, sets the reader
switch to AUTO, types in TAPE, and upon pressing the carriage return key, starts the
reading of tape. He then observes the remainder of the action without intervention.

The following is the printout of the execution of the tape. The right half of the page
contains explanations of the action.

```
FORTRAN                       When this line is read, the reader
NEW, DEMO                      stops. As soon as FORTRAN is
                               established as the current subsystem,
100 PROGRAM DEMO(INPUT, OUTPUT) the system turns the reader back on.
110 DIMENSION II(5)           When this line is read, the reader stops.
120 READ 10, (II(J), J=1,5)   After a new primary file called DEMO
130 10 FORMAT(5I5)             is established, the system turns the
140 PRINT 20, (II(J), J=1,5)   reader back on.
150 20 FORMAT(5I10)           The seven lines of the program are
160 END                        read in without interruption.
RNH                            The command to run the program is read
? 11111222223333444455555      in and the reader turned off.
                               Processing reaches the READ statement
11111 22222 33333 44444 55555   (line 120) and the system prints ?.
                               The system then turns the reader back
                               on and the line of data is read in.
                               Then the reader is turned off to allow
                               data processing.
                               Resultant printout
                               END.

REPLACE, DEMO=TAPE1

This command is read in and the reader turned off. A copy of the program demo is made an indirect access permanent file with the name TAPE1. Then the reader is turned back on.

These three lines of modification are read in from the tape without interruption.

The RESEQ command is read in and the reader turned off. When resequencing is accomplished according to specifications, the reader is turned back on.

This command is read from tape and the tape reader turned off. Then the system lists the primary file which contains the above modifications and resequenced format. When the listing is completed, the reader is turned on again.

This command is read in, the reader turned off, and the modified program executed. The system prints the ? and then turns the reader on. The line of data is read in from the tape and the reader turned off. The data is processed and results printed.

The reader is turned back on. It runs through the trailer of rubouts and then turns itself off.

If, at this point, the user has no more tapes to run, he should exit tape mode by issuing the NORMAL command.
The following list describes the mass storage devices supported by KRONOS and the size of blocks allocated for direct access files.

</tbody>
</table>

In this table, n indicates the unit count for multiunit devices.

If the user's validation permits (refer to LIMITS command, section 4), the maximum size indirect access file is determined by the device limit less the space allocated for catalog information and other files.

The size of a direct access file is limited only by the device; there are no system limitations.
This is a list of the commands available under Text Editor. For additional information, refer to the Text Editor (EDIT) Reference Manual.

END
Several file names are reserved for system use or have special significance to the system. These reserved names protect the user from accidentally destroying some of his own files. The message RESERVED FILE NAME indicates that the user has attempted to use one of these file names.

The reserved file names are:

INPUT
OUTPUT
PUNCH
PUNCHB
P8
SCR
SCR1
SCR2
SCR3
SCR4

An attempt is not always made to prevent the use of these file names. Many of the 6000 product set members, such as the COMPASS assembler, use other scratch files in addition to those listed. A user should consult the appropriate reference manuals for a complete list of these files. System integrity does not depend on preventing the use of these reserved file names.
SAMPLE SESSION AT THE TERMINAL

This appendix presents a typical interaction of a beginning user with the KRONOS Time-Sharing System. After log-in, the user tries basic operations in the various subsystems and tests a cross section of the commands available.

The left half of the page is the terminal (Teletype model 33) printout of the interaction. The right half of the page gives explanations. In a few places the terminal printout has been vertically expanded to allow spacing for the inclusion of the relevant comments.

72/12/28. 10.34.14.
KRONOS TIME SHARING SYSTEM - VER. 2.1.
USER NUMBER: USER123
PASSWORD  ************
TERMINAL: 40, TTY
RECOVER/SYSTEM: NULL
OLD, NEW, OR LIB FILE: NEW, TEST
READY.

The user intends to create a primary file that he will use for experimental purposes. He will preserve this file as an indirect access permanent file. However, he does not want a particular subsystem associated with the file. Accordingly, he enters the NULL subsystem.

LINE 1: ABCDEFGHIJ
LINE 2: BCDEFGHIJK
LINE 3: CDEFGHIJKL
? LIST:/JKL/
LINE 3: CDEFGHIJKL

Remembers that Text Editor can only operate on a single record. He suspects he has created more than one record and calls for a listing with end-of-record marks. His suspicions are confirmed.

The PACK command compresses the file into one record.

This is verified with another listing.

In addition to using this file in the subsequent EDIT operations, the user feels he may need it for other testing and makes a permanent file (indirect access) called TEXT1. The original copy, called TEST, remains as the primary file.

Enters the Text Editor

List the first line. Pointer remains at the first line.

List the first three lines.

List the first line in which the phrase /JKL/ occurs.

? OO
? OO/
READY.

Calls for text to be entered after the fourth line.

Calls for text to be entered after the first line in which /MNO/ occurs.

Calls for text to be entered immediately after the phrase /MNO/.

The pointer is moved down eight lines and then the next two lines are deleted. Taking into account the above insertions, it should stop at /THIRD INSERTION/ and then eliminate that line and the next one (line 7).

The pointer is moved back to start and a listing made of the entire file.

The user would like to get back the original format of this file. Since the original is an indirect access permanent file, he calls for a copy to be entered as the primary file (GLD). But commands cannot be entered from the Text Editor. Accordingly, he exits from EDIT, enters his OLD, and then reenters EDIT.

Change the first three lines to the text that follows.

Change the first line with the phrase /JKLM/ to the text that follows.
A listing of the modified file verifies the changes.

-END OF FILE-
Exits from the Text Editor.

READY.

Enter the BASIC subsystem.

READY.

Establishes new primary file.

READY.

Enters AUTO mode so that the system will supply line numbers

Deletes this line so he can type

NORMAL and exit AUTO mode.

Adds comments to beginning of program.

Resequences line numbering to begin at 1000 and increase in increments of 1000.

READY.

# GLOSSARY

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alphanumeric</td>
<td>A combination of intermixed alphabetic and numeric characters.</td>
</tr>
<tr>
<td>Answerback code</td>
<td>A character code which uniquely identifies a teletypewriter unit. If this code is present in the user's validation file, the user's activities are limited to this particular unit. The code is set on a drum within the TTY. KRONOS checks only the first ten characters.</td>
</tr>
<tr>
<td>APL</td>
<td>A Programming Language. An interactive interpreter available to the time-sharing user.</td>
</tr>
<tr>
<td>ASCII</td>
<td>American National Standard Code for Information Interchange; the 128-character set utilized by KRONOS for the terminal user.</td>
</tr>
<tr>
<td>Auxiliary device</td>
<td>Mass storage permanent file device used to supplement storage provided by the normal permanent file devices associated with the system (refer to family device).</td>
</tr>
<tr>
<td>BASIC</td>
<td>Beginner's All-purpose Symbolic Instruction Code; an elementary programming language available to the KRONOS user.</td>
</tr>
<tr>
<td>Catalog</td>
<td>The list of permanent files saved under a particular user number; this list also contains information about the permanent files.</td>
</tr>
<tr>
<td>Compile</td>
<td>To translate a program from a higher level programming language (for example, FORTRAN or BASIC) into machine instructions.</td>
</tr>
<tr>
<td>Control card</td>
<td>Instruction to the operating system to perform a specified task or utility.</td>
</tr>
<tr>
<td>Direct access file</td>
<td>A permanent file which can be attached to the user's job. All changes to this file are made on the file itself rather than to a working copy of the file. (Refer to indirect access file.)</td>
</tr>
<tr>
<td>Display code</td>
<td>An internal code set used by CDC CYBER 70 series and 6000-series computers to represent alphanumeric and special characters. (Refer to Table B-2 in appendix B.)</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>EOF</td>
<td>End-of-file</td>
</tr>
<tr>
<td>EOI</td>
<td>End-of-information</td>
</tr>
<tr>
<td>EOR</td>
<td>End-of-record</td>
</tr>
<tr>
<td>Escape key</td>
<td>The ESC key on ASCII code terminals which allows the user to delete the current line of input.</td>
</tr>
<tr>
<td>Family device</td>
<td>Mass storage permanent file device associated with a specific KRONOS system. A family may consist of 1 to 63 logical devices. Normally, a system runs with one family of permanent file devices available. However, additional families may be introduced during normal operation. This enables the users associated with the additional families to access their permanent files via an alternate system.</td>
</tr>
<tr>
<td>Field length</td>
<td>Number of central memory words required to process a job.</td>
</tr>
<tr>
<td>File</td>
<td>Either a program or data, made up of one or more groups of data separated by EORs and EOFs and terminated by an EOI.</td>
</tr>
<tr>
<td>Flag</td>
<td>A character or bit that signals the occurrence or presence of a particular condition.</td>
</tr>
<tr>
<td>FORTRAN</td>
<td>The FORmula TRANslatation compiler that converts algebraic and scientific problems into machine language instructions.</td>
</tr>
<tr>
<td>Indirect access file</td>
<td>A permanent file which is accessed by use of a working copy of the file rather than by working on the file directly.</td>
</tr>
<tr>
<td>Interactive</td>
<td>Job processing in which the user and the computer communicate with each other, rather than the user merely submitting his job, receiving output, and having no control over the job while processing occurs.</td>
</tr>
<tr>
<td>Library file</td>
<td>A permanent file residing under the special user number LIBRARY.</td>
</tr>
<tr>
<td>Local file</td>
<td>Any file assigned to a user while he is logged in at a terminal. Same as a working file.</td>
</tr>
<tr>
<td>Locked file</td>
<td>A file on which a user cannot write.</td>
</tr>
<tr>
<td>Logical record</td>
<td>A record whose length is a function of the information it contains rather than the device on which it is stored.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Master device</td>
<td>Mass storage device that contains the user's permanent file catalog, all his indirect access files, and all, part, or none of his direct access files.</td>
</tr>
<tr>
<td>Object code</td>
<td>Executable machine language instructions. An object code program need not be recompiled each time it is executed.</td>
</tr>
<tr>
<td>On-line</td>
<td>Equipment under direct control of the computer.</td>
</tr>
<tr>
<td>Order-dependent</td>
<td>Items which must appear in a specific order.</td>
</tr>
<tr>
<td>Order-independent</td>
<td>Items which need not be given in any specific order. Parameters may be order-independent. For example, the UN=User parameter in the GET command is order-independent.</td>
</tr>
<tr>
<td>Parameter</td>
<td>A variable that is given a specific value for a particular purpose or process.</td>
</tr>
<tr>
<td>Permanent file</td>
<td>A file which is created by a user, stored under his user number in the permanent file system, and is removed from permanent file storage only when specified by the user.</td>
</tr>
<tr>
<td>Permanent file family</td>
<td>Permanent files which reside on the family devices of a specific KRONOS system.</td>
</tr>
<tr>
<td>Physical record unit (PRU)</td>
<td>The standard unit of data storage defined by the device on which a file resides.</td>
</tr>
<tr>
<td>Port</td>
<td>The point at which a communication line is attached to the computer system.</td>
</tr>
<tr>
<td>Post radix</td>
<td>A letter following a numeral that indicates the base numbering system.</td>
</tr>
<tr>
<td>Prefix character</td>
<td>A character that has a special significance to a program or the operating system.</td>
</tr>
<tr>
<td>Primary file</td>
<td>Any working file defined with the OLD and LIBRARY command or initiated with the NEW command. The primary file is assumed to be the file on which most operations are performed unless another file is specified. The primary file is automatically sorted by the system and rewound after each use.</td>
</tr>
<tr>
<td>Private auxiliary device</td>
<td>Auxiliary device associated with a specific user. Only that user may create files on the device, although he may permit other users to access files which reside on the device.</td>
</tr>
</tbody>
</table>
Public auxiliary device

Auxiliary device available for access by all validated users knowing the correct packname. Note that additional validation is required to create or replace files on an auxiliary device (refer to LIMITS command in section 4).

Rollout file

A file containing a job (and system information) that has been temporarily removed from the main processing area of the system.

Rubout characters

Characters created by pressing the RUBOUT key on the terminal. These are considered null input by the system and are required in paper tape input.

Source code

Code input to the computer for later translation into executable machine language instructions (object code).

Swapping

The process of removing one job from central memory and replacing it with another job.

System file

A file that can be accessed only by a system program.

System utilities

System programs used to perform system functions.

Time slice

The amount of CPU time a job is allowed to use before the system lowers its priority to allow other jobs to execute.

TTY

Teletypewriter.

Validation file

File containing validation information for all users (user numbers, passwords, resources allowed, etc.)

Working file

Any file assigned to a user while he is logged in at a terminal.

EXECUTE command 4-7
EXECUTE subsystem 1-2; 4-7
Execution of program 2-4; 3-6; 4-7, 8, 17
19; 6-10
EXIT control card image 8-5, 6
Exit from BATCH subsystem 9-2
Export/Import 4-21; 8-1, 5

Family name 6-5
Field length required for control cards 4-7; 9-1
Field length specified on RUN command 4-17
File
catalog 5-1
category 5-3
direct access 5-1, 2
indirect access 3-2; 5-1
inhibit sorting 3-4
name entry 2-3; 3-2, 6; 4-6, 9; 5-2, 6;
6-8; 8-1
organization 3-1
permission information 5-13
positioning 3-3; 4-17
processing 3-1
reformatting 8-2
residency 5-4, 14
space specification 5-5
sorting 3-3; 4-19
status entry 2-3; 4-6, 40; 6-8; 8-1
structure 3-1
subsystem association 3-3
usage 3-1
working 3-2
working copy of 5-1, 2
FORTRAN command 4-3
FORTRAN subsystem 1-2; 4-8; 7-2
FULL command 4-4
Full duplex/half duplex (FDX/HDX) switch 2-1; 4-4; 6-4

Index-2
Generate binary (object code) file 4-17; 6-11
GET command 3-2; 5-9, 10, 22; 9-2
GOODBYE command 3-7; 4-11; 5-7; 6-11
Guide to first session 2-1

HALF command 4-4
HELLO command 3-7; 4-11; 5-7
HELP command 4-12

I key 4-12; 7-3
Improper log-in 6-6
Increment jobs field length 4-17
Index to commands (see inside front cover)
Indirect access files 3-2; 5-1
Inhibiting header messages 4-5
Input to executing program 6-3
Input/output conventions 6-1
Inserting statements in program 7-1
Interrupt program 4-12, 19; 6-3; 7-3; B-3
Introduction to KRONOS 1-1; 2-1
Invalid commands 4-2

JOB card image 8-2
Job
name 4-21; 8-2
status 4-20
suspension 4-12; 7-3
termination 4-19, 21

KCL (KRONOS control language) 4-22; 8-1
Keyboard configuration B-2
Keyword 5-2, 3, 12
Kilo physical records 4-13
KRONOS character set B-5, 6
KRONOS control language (KCL) 4-22; 8-1

LENGTH command 4-12, 13
Length of input/output lines 6-2
-Line (procedure call) 4-22
LIBRARY command 3-2, 6; 4-13; 5-1, 7, 10, 22
LIMITS command 4-13, 23
Line feed (LF) character C-2
Line numbers 3-3; 4-3
Line overflow 6-4
LIST command 3-4; 4-14
LNH (list-no-header) command 4-14
Local files (see working files)

Locked file 4-13
Logical record 3-1
LOGIN command 3-7; 4-14; 5-7
Log-in procedure 2-1; 6-4
Log-off procedure 2-5; 6-11
Lost data 4-4
Lost files 7-6

MEMAPL (see TERM command)
Minimum number of characters in command 4-1
Modify mode 5-3
Multi-file file 3-1
Multiple file requests 9-2

NEW command 3-2, 6; 4-14; 5-7
NODROP command 3-6; 4-7, 14; 14, 15; 5-10
NORMAL command 4-5
Normal mode 4-5
NOSORT command 3-4; 4-12, 14, 15, 17
NULL command 4-9
NULL subsystem 102; 3-3; 4-6, 9; 5-10, 12

Object code execution 4-7, 8
Object code generation 4-17; 6-11
Odd parity 4-5
OLD command 3-2, 6; 4-6, 8, 15; 5-1, 7, 10, 22; 6-9; 9-2
Operating procedures 6-4
Order dependent options 4-17; 7-3
Order independent options 5-2, 12
Output file name 5-14

PACK command 3-5; 4-15, 22
Pack working file 3-5; 4-15, 19
PACKNAM command 5-10
Packname specification 5-5, 14
Paper tape operations C-1
Paper tape punch control keys C-1
Paper tape reader 4-5
Paper tape reader control keys C-1
PARITY command 4-5
Parity switch 2-1; 6-4
PASSWOR command 4-16
Password 2-2; 4-16; 5-3; 6-5
Permanent file
catalog 5-1
command format 5-2
commands 5-1, 6
family (see family name)
storage 3-3; 4-8
mode of access 5-1, 2
name 5-13
types 5-1, 2
Permission 5-13, 19
Permission mode 5-3
PERMIT command 5-11
Post radix 4-2
Primary file 3-2, 3, 4, 6, 7; 4-6, 7, 9, 13, 14, 15, 16, 19, 21; 5-7, 10, 12; 6-1
Private files 5-3, 18
Procedure file usage 4-22
Program editing 3-5; 6-1; 7-1, 2
Program execution 2-4; 3-6; 4-7, 8, 17
PRU (physical-record-unit) 3-1
Public files 5-3, 21
Punching a paper tape off-line C-2
Punching a paper tape on-line C-3
Punch paper tape leader/trailer B-3, C-3
PURGE command 5-11

Question mark 6-3; 7-4

Read mode 5-3
Read with append mode 5-4
Read with modify mode 5-4
RECOVER command 4-12, 16
Recovery 7-3, 5, 6, 7, 8, 9
Recovery of two or more users 7-7
Reformatting a file 8-2
Reformatting directives 8-3
Releasing permanent files (see PURGE command)
Releasing working files 3-2, 6, 7; 4-11
Remote job entry 4-21; 8-1
RENAME command 4-16
REPLACE command 4-8; 5-11; 7-2; 8-5
Requests for input 6-3; 7-4
RESEQ command 4-16
Resequencing line numbers 4-16; 7-2
Reserved file names F-1
RESOURC control card image 5-6, 15
RESTORE statement 3-3
RETURN command 4-17; 5-7
RETURN key 1-2; 6-2
REWIND command 3-3; 4-17
RFI control card image 9-1
RNH (run-no-header) command 4-19
ROUT command 4-5
RUN command 2-4; 3-6; 4-7, 17; 6-10
SAVE command 3-3; 4-6, 8; 5-1, 10, 12; 9-2
Semiprivate file 5-3, 20
Set time limit 4-19
SETTL command 4-19; 7-3
Short form log-in 6-9
S key 4-19
SORT command 3-4; 4-19
Sort flag 3-4; 4-19
Source code 3-3
Standard character set B-5, 6
Standard input lines 6-1
Standard print selection (see TERM command)
STATUS command 3-4; 4-6, 20
Steps in job processing 6-4
STOP command 4-21; 7-4
SUBMIT command 4-21; 8-1
Submit error processing 8-5
Subsystem association with permanent files
(see Subsystem flag)
Subsystems available under KRONOS 1-2
Subsystem exit 9-2
Subsystem flag 3-3; 4-6, 8, 9; 5-12; 6-9
Subsystem selection, automatic 3-3, 4
Subsystem selection commands 2-2; 4-6; 6-7
Successful recovery 7-6
Suspend job 4-12; 7-3
System commands 4-1
System malfunction 7-5

TAPE 8-4
TAPE command 4-5; 7-3
Tape mode 4-5; C-3
TERM command 4-5
Terminals 1-1
Terminal
  control commands 4-2
  control keys B-5
  identification 2-2; 4-20; 6-4, 5
  job processing 6-4
  number 2-2; 4-20; 6-7; 7-6
  parity 4-5; 6-4
  print type (see TERM command)
Terminate
  executing program 6-3
  input line 6-2
  output 4-19
  program 4-19, 21; B-3
TEXT command 4-21, 22
Text editing 3-5; 6-1; 7-1, 2
Text Editor 4-11; 6-1; 7-1
Text Editor commands E-1
Text mode 3-3, 4; 4-21; 6-1; B-3
Time limit specification 4-19, 23; 7-4, 5
Time-Sharing job commands 4-9
Time-Sharing job processing 6-1
T, nnnn 7-4
Transparent mode 8-2
TTY (see TERM command)
Types of permanent files 5-1

Unsuccessful log-in 2-1; 6-6
Unsuccessful recovery 7-6
User number, entry of 2-2; 6-5

Validation
limits 4-13, 23

user 4-2, 13, 16, 17, 19, 23, 24, 25; 5-1,
5-5, 8, 11, 12, 15; 8-1

Working copy of file 5-1
Working files 3-2; 4-6, 9
Working file control 3-6
Write interlock 5-2
Write mode 5-3, 7, 8

X, nnnn 9-2
X-OFF character C-2
X-ON character 4-5
