EL 1600 Development System
For Motorola 68000/EC/HC000 and Toshiba 68003/301/303/305

Highlights

- Full 16 MHz support for all 68000/EC000/HC000 variants
- Powerful, multi-windowed C/C++ debugger runs on Sun SPARC, HP 9000, and PC hosts
- Debugger operates stand-alone or in the MRI MasterWorks environment
- Compatible with MRI, GNU, DIAB Data and Intermetrics compilers (IEEE695 and a.out OMF)
- Installs no monitor in target memory; all 68000 features available
- Auto-configured Performance Analysis System runs at full bus-cycle frequency, monitors unlimited modules
- RTOS-Link™/KA option provides high-level view of RTOS data structures and allows task qualification for breakpoints from within MWX-ICE
- Trace memory with timestamp or LSA captures 72 bits of information about each bus cycle with depth of 8 K frames
- Monitor up to 8 parallel events at once or use 4 event system groups to find deeply nested bugs
- Overlay memory (1 MB and 2 MB) to effectively replace target ROM
- Single-window correlated assembly-to-source trace display clearly describes effect of compiler optimizations
- Fully isolated probe-tip, diagnostic scope loops, and trace memory help verify hardware design and diagnose problems
- Probe-tip has exceptional AC timing performance for accurate emulation
- Compact probe-tip simplifies target connection

Do it Better
The EL 1600 Emulator from Applied Microsystems is customized to the unique needs of 68000 developers. And it offers utility that spans the entire product development process. Whether you're working on software or debugging production hardware, the EL 1600 makes developing MC68000 products easier, faster, and better.

During specification, EL 1600 overlay memory helps your team analyze algorithms in real-time. A powerful trace and event system tracks data through the various software layers, while the fully-buffered probe tip and diagnostic scope loops accelerate hardware verification and diagnosis. Get through the critical integration phase with non-intrusive emulation and the help of Applied’s experienced Application Support Group. And with its ability to accept regression scripts and isolate production problems, the EL 1600 keeps giving value as the product is released to manufacturing.
Helping You Build It
Easier. That's the difference between a tool you use, and one that sits on the bench. The EL 1600 makes the capabilities of a full-scale emulator so accessible that you'll actually use all that power.

The EL 1600 makes it simple right from the start. Just plug in the probe tip; no need for special adaptors or complicated wiring. And because no target hardware resources are used, you don't have to worry about compensating for the emulator or modifying your hardware design.

Best of all, working with the EL 1600 is easy. The graphical windowed interface puts you in control, with shortcuts for experienced users and intuitive operation and help for new or occasional users. And full network support lets you work where you want.

Faster. That's what your tools are all about. And while any development team gets value from logic analyzers and monitors, a well-designed emulator gives you the breadth and depth that can make all the difference in meeting your schedule.

The EL 1600 is designed to help the whole team get done sooner. From software or hardware engineers to manufacturing technicians, the EL 1600 delivers information about your product that you can't get as easily—or at all—with any other tool. And because it's designed just for the 68000, the emulator offers complete visibility of even the most esoteric processor activity, but doesn't intrude on the operation of your application.

Better. The EL 1600 for 68000 makes it easy to do a better job, and that makes a better product. And when you're ready to move to other 68000 family designs, Applied offers tools that use the same interface, so you already know how to get the job done.

Debugging Made Better
Whether you use a debugger every day or just every so often, you can easily be comfortable and productive with this intuitive, function-rich Sun SPARC-, HP 9000-, or PC-hosted C/C++ source- and assembly-level debugger.

The notebook feature eliminates the need to remember debugger command language—you can just point and click. And the context-sensitive hypertext help system saves time spent hunting through manuals.

The windowed graphical interface lets you visually organize your approach to solving a problem. You don't have to grapple with complex modes and functions to fully exploit the power of the emulator. And whether you prefer to work with a mouse or from the command line, you get simple, straightforward control of your target and the emulator.

Even when you have a target that can't be stopped for troubleshooting, you can still debug using dynamic run mode. You can also display source code together with the corresponding assembly language to clarify the relationship between them and verify compiler performance.

Optional language tools include an ANSI C/C++ optimizing compiler, assembler, and an instruction set simulator. And because the debugger fits seamlessly into the MasterWorks environment from Microtec Research, you can easily enjoy the advantages of integrated graphical development.
Trace System Simplifies Problem Analysis
The last thing you want to do is spend your time figuring out the relationship between execution history and your source code. The EL 1600 handles all of that for you with its highly approachable trace system.

Four trace display modes let you see information in the format most useful to you. High-Level Mode supports application developers using C or C++. Low-Level Mode supports team members writing device drivers. Combined High/Low-Level mode supports anyone interested in the relationship between source and compiler-generated assembly language. Raw Trace Mode permits analysis of hardware activity on a bus cycle or clock cycle basis.

For complete capture of execution history, the system provides 72 bits of width and 8K frames of depth. The Event System can qualify trace to help focus your search for a problem. For targets that can’t be stopped to debug a problem, you can examine trace while the emulator runs the target. To quickly find the information you want, you can scroll trace frames and search for any combination of address, data, and status information.

Trace Disassembler Reveals Critical Information
The custom 68000 trace memory disassembler helps you understand how your code operates and manipulates data. It also provides valuable information about interrupt and stacking activity and function calls.

Breakpoint System Easily Tracks Code Execution
The EL 1600 Breakpoint System lets you readily determine the execution trail of code without having to modify your code with printf statements or semaphores. You can quickly and easily place up to 64 transparent breakpoints anywhere in code.

Intuitive Event System Pinpoints Problems
The advanced Event System helps you rapidly track down deeply nested, real-time problems. The system can be easily configured using familiar names and symbol references. It supports address, data or status qualification, or any combination of the three.

The event system language is both simple to understand and powerful. With a full complement of event system actions, you have a complete tool kit for isolating a problem. Available actions include: stop emulation; turn-on trace; turn-off trace; trace one bus cycle; increment, reset, or toggle a counter; reset timestamp; change event group; jump to a user-specified routine; and generate an external trigger for operations such as synching an oscilloscope.

EL 1600 emulator probe tip dimensions.
**Versatile Overlay Memory**
EL 1600 overlay memory helps extend the utility of the emulator to early stages of the development cycle. Before target hardware is available, the emulator probe tip overlay memory and simulated I/O capability provide an execution vehicle without the need for an evaluation board.

Mapping overlay in place of target memory also eliminates time wasted burning ROMs to verify a code fix. And overlay simplifies and accelerates hardware-software integration by letting you gradually implement target memory. Simply use overlay until the target hardware is debugged.

Overlay can be mapped on 2 KB boundaries anywhere in memory. Two memory sizes of 1 MB or 2 MB let you match overlay to the requirements of your target.

**Real Time Kernel Support**
The RTOS-Link/KA package allows you to debug your application running with a commercial RTOS without changing tools. RTOS-Link/KA provides a high-level view of OS structures and task status. Using RTOS-Link/KA, you can qualify breakpoints to specific tasks.

**Network Support and Fast Code Downloads**
With Ethernet network support for workstations and PCs, the EL 1600 lets you get out of the lab and work where you are most comfortable. Exceptional download speeds help accelerate code modification cycles. And for PC hosts without networks, a high-speed parallel interface speeds code delivery to your target.

**Non-Intrusive Performance Analysis**
The Performance Analysis system puts no demands on target operation or resources, so you get an accurate view of where your code spends its time. The system monitors an unlimited number of modules, address ranges or data variables at the full bus cycle frequency of the processor.

The Performance Analysis System is easy to use: it is automatically configured and can quickly be re-configured from the command line. The system gathers performance data to describe execution activity, code timing, interrupt timing and fault detection. Data is presented in an easily understood histogram format, and the system helps you generate reports to document software and product performance.

**Keeping You Satisfied**
Because our success depends on your success, we take product support very seriously. In fact, at Applied Microsystems we call our program Total Customer Satisfaction.

Keeping you satisfied means more than just answering your questions. Our on-site training and engineering assistance, technical guidance on emulation issues, and expedited product service can help you get your product to market on time and on budget.

**Do It Now**
To see how the EL 1600 emulator can help build your products, call 1-800-426-3925 today for information or a product demonstration.

Our Applications Engineering Group is backed by a network of experienced Field Application Engineers, our own design teams, and the commitment of the entire company. And with over 15,000 installed solutions and more than fourteen years of leadership in embedded hardware and software development tools, our team is an important asset to have on your team.
EL 1600 Emulator for Motorola 68000/EC/HC000

**Microprocessors Supported**
Motorola 68000/EC/HC at 8 MHz to 16 MHz
Toshiba 68003/301/303/305 at 8 MHz to 20 MHz

**Packages Supported**
PGA, PLCC

**Minimum Host Requirements**
PC386, Microsoft Windows 3.0 or higher, 16 MB RAM, ISA or EISA slot
Sun SPARC, Sun OS 4.1, 20 MB swap
HP 9000, HP-UX 9.0 or above, 20 MB swap

**Communications**
*Windows PC Environment*
IEEE 802.3 10base2, 10base5, 10baseT (effective download speed 4 MB/min)

*Sun Sparc and HP 9000 Environment*
IEEE 802.3 10base2, 10base5, 10baseT (effective download speed 4 MB/min)

**Optional Code Generation Tools**
ANSI C / C++ cross-compiler
Cross-assembler
Embedded linking loader
Object module librarian
Instruction set simulator

**Source-Level Debugger**
*Integrated source level debugger*
Window-oriented interface (X-Win window support on SUN)
Support for C, C++ and assembler
Access to source code variables
Disassembled source view for machine-level debug and patch
Access to all global, local, stack-based and register-based symbols
Full C-typing features

*Execution control and full access to the emulator*
Soft switches provide interactive instrument control
Execution breakpoints can be set on line numbers, C statements, program labels and memory addresses
Display trace in raw, assembly, and high-level formats or disassembled
Monitor real and simulated I/O
High-level control of event system set-up and operation
Perform emulator operations while the target is running

**In-line assembler/memory functions**
Assemble code in target memory using Motorola mnemonics
Display and modify memory

**Performance analysis**
Display relative time spent in functions or groups of functions

**Advanced testing and set-up capabilities**
Construct complex macros containing C-like statements and debugger commands
Record and play back debugging sessions

**File format compatibility**
IEEE 695, A.OUT, COFF, S-record

**RTOS Support**
ISI pSOS+ via Applied’s RTOS-Link™

**Extended Trace History**
8K deep x 72 bit wide trace buffer records information in real-time
Display CPU bus cycle information, including address, data and control lines with symbols
Search for trace frames containing any combination of address, data, and status information
Display executed code, both assembly level and C source level, with symbols
Save trace to file
Record timestamp information using the optional Timestamp Module (selectable resolutions from 100 ns to 1 ms)
Perform emulator operations while the target is running
Record external 16-bit logic state inputs (available with the optional Logic State Analysis probe)

**Performance Analysis**
Gathered on every bus-cycle at full processor speed
Unlimited number of modules

**Target Diagnostics**
Fully buffered probe tip allows attachment to defective target hardware
Built-in diagnostic routines to debug target hardware before running target code
Run RAM tests over target or overlay memory in byte or word mode
Run scope loops to debug target hardware problems, such as inoperative address, data, or control lines
High-speed scope loops allow measurement of signals in target without a storage oscilloscope

**Breakpoints**
64 software execution breakpoints

**Event System**
4 independent groups
Up to 8 parallel comparisons per group
1 event counter per group
Up to 8 conditional statements per group
for a total of 32 event statements
1 trigger-output via BNC connector

**Event Actions (may be combined)**
Break emulation
Change event group
Trace on/off/trace-one
Jump to user-specified routine
Count one, toggle on/off
Reset counter
Trigger output

**Overlay Memory**
Overlay size: 1 MB or 2 MB
High-speed, zero wait state static RAM
Write and Read/Write protection
Mappable anywhere, with minimum resolution of 2K bytes
User-selectable wait states on overlay access

**In-Line Assembler/Memory Functions**
Assemble code in target memory using Motorola mnemonics
View target & trace memory in
source with assembly in trace with symbols; view C source or C assembly language

**Environmental Specifications**
Input power: 115 VAC, 47 Hz–63 Hz or 230 VAC, 47 Hz–63 Hz
Power consumption: < 200 watts
Emulator pod dimensions: 3.2 cm x 21.6 cm x 29.2 cm (1.25” x 8.5” x 11.5”)
Weight: Chassis with pod assembly 11.4 kg (25 lbs)
Shipping weight 15.5 kg (34 lbs)
Chassis dimensions: 16.3 cm x 44.4 cm x 37.5 cm (6.5” x 17.5” x 14.75”)
Ambient humidity: 0–90% non-condensing
Operating temperature: 0–40° C
EL 1600 Emulator for Motorola 68000/EC/HC000
